Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Field Name ==>	Product Name	Unit	Qty per config	Provider Part Number	Version Major	Version Minor	Version Build	Manufacturer ID	Equipment Code	Price per unit \ Per Month

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Field Name ==>	**Product Name**	**Unit**	**Qty per config**	**Provider Part Number**	**Version Major**	**Version Minor**	**Version Build**	**Manufacturer ID**	**Equipment Code**	**Price per unit \ Per Month**

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Field Name ==>	**Product Name**	**Unit**	**Qty per config**	**Provider Part Number**	**Version Major**	**Version Minor**	**Version Build**	**Manufacturer ID**	**Equipment Code**	**Price per unit \ Per Month**

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Field Name ==>	Product Name	Unit	Qty per config	Provider Part Number	Version Major	Version Minor	Version Build	Manufacturer ID	Equipment Code	Price per unit \ Per Month

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Field Name ==>	Product Name	Unit	Qty per config	Provider Part Number	Version Major	Version Minor	Version Build	Manufacturer ID	Equipment Code	Price per unit \ Per Month

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Field Name ==>	Product Name	Unit	Qty per config	Provider Part Number	Version Major	Version Minor	Version Build	Manufacturer ID	Equipment Code	Price per unit \ Per Month

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Field Name ==>	Product Name	Unit	Qty per config	Provider Part Number	Version Major	Version Minor	Version Build	Manufacturer ID	Equipment Code	Price per unit \ Per Month

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Field Name ==>	Product Name	Unit	Qty per config	Provider Part Number	Version Major	Version Minor	Version Build	Manufacturer ID	Equipment Code	Price per unit \ Per Month

Catalog of Services

(a) Offeror should only input in highlighted (yellow) cells.

(b) Pricing for individuals config items should only include the price for the identified unit.

(c) Pricing for the managed tiers (ex. "Fully Managed (1) - Platinum Tier") should only include cost for the management of the identified configuration.

Field Name ==>	Product Name	Unit	Qty per config	Provider Part Number	Version Major	Version Minor	Version Build	Manufacturer ID	Equipment Code	Price per unit \ Per Month

Within Schedule I, Description and Instructions tab under the Additional Notes (item c) section, the Commonwealth specifically requires that the Offeror must verify that all calculations, subtotal costs and grand total costs are accurate. In order to comply with this Commonwealth's requirement within the Offeror Pricing Forms (Schedule I), Unisys would like to bring to the Commonwealth's attention specific actions that were performed within the Offeror Pricing Forms (Schedule I). Unisys was required to make the following adjustments within Schedule I to allow the calculations, subtotal costs and grand total costs to be accurate. It is important to note that the adjustments were made with the sole purpose for allowing the Commonwealth to receive accurate costs from Unisys.

Adjustments required in order for all the calculations, subtotal costs and grand total costs to be accurate:

1) Catalog of Services, cells K627 through T627 had the value zeroed out to eliminate the double counting of the production machines
2) Catalog of Services, cells K619 through T621, K624 through T626, K630 through T632, K636 through T638 were modified by removing the "multiplication" (*) in the formula and replaced with "addition" (+) so the formula added infrastructure to Labor rather multiplying these figures.

Please note that the above adjustments are the specific areas within Schedule I that were modified to allow the calculations, subtotal cost and grand total costs to be accurate. Other calculations within Schedule I may have been impacted where these specific areas were included as part of the calculation in other sections of Schedule I.

As a result of these changes, the accurate Unisys grand total costs for the 10 year view to the Commonwealth totals $ 1,307,723,598. If the calculations were not modified within Schedule I, then the grand total costs for the 10 year view would have totaled $ 18,761,284,558 resulting in a material overstatement of the costs to the Commonwealth.

APPENDIX B - PROPOSAL COVER SHEET
COMMONWEALTH OF PENNSYLVANIA
OFFICE OF ADMINISTRATION – OFFICE FOR INFORMATION TECHNOLOGY
RFP# 6100022698

Enclosed in three separately sealed submittals is the proposal of the Offeror identified below for the above-referenced RFP:

Offeror Information:	
Offeror Name	Unisys Corporation
Offeror Mailing Address	4750 Lindle Road Harrisburg, Pennsylvania 17111
Offeror Website	www.unisys.com
Offeror Contact Person	Dean Shaner
Contact Person's Phone Number	(717) 526-1267
Contact Person's Facsimile Number	(717) 526-1175
Contact Person's E-Mail Address	dean.shaner@unisys.com
Offeror Federal ID Number	[redacted]
Offeror SAP/SRM Vendor Number	163299

Submittals Enclosed and Separately Sealed:

Small Diverse Business (SDB) Participation Submittal (RFP Requirement II-9)

1.1 Introduction

Unisys carefully considered all available certified Small Diverse Businesses (SDB) in the Commonwealth of Pennsylvania that both complimented and extended Unisys' capabilities and operations providing CoPA with a strong and qualified team (Figure 1). These selected SDBs have these requirements in addition to their experience in the required area of support and their dedication to quality.

In addition to managing and coordinating SDB support requirements, Unisys is committed to mentoring SDB leadership and fostering their growth. The intention is to provide opportunities for them to excel and to provide feedback and dialog that improves and strengthens the SDBs' performance. This philosophy strengthens CoPA's SDBs workforce for this current CoPA project and future projects as well.

Figure 1. Unisys and Small Diverse Businesses (SDB) Provide a Synchronized Team. *Unisys and the SDBs combined functionality provide CoPA with a fully coordinated team.*

1.2 A – Proof of SDB Qualifying Data

RFP	*Requirement*
II-9 A	*To receive credit for being a Small Diverse Business or for subcontracting with a Small Diverse Business (including purchasing supplies and/or services through a purchase agreement), an Offeror must include proof of Small Diverse Business qualification in the Small Diverse Business participation submittal of the proposal, as indicated below:* • *A Small Diverse Business verified by BSBO as a Small Diverse Business must provide a photocopy of their verification letter.*

Unisys has partnered with 11 subcontractors and suppliers that qualify as Pennsylvania Small Diverse Businesses (SDB). Each is currently verified by the Pennsylvania Department of General Services Bureau of Small Business Opportunities (BSBO). Table 1 summarizes proof of the qualifying data. Copies of BSBO verification letters follow this table.

CERTIFICATIO NO: **163086-2012-07-S**
EXPIRATION DATE: **July 31, 2013**

The Bureau of Small Business Opportunities has reviewed your Recertification Application together with supporting documents. I am pleased to inform you that your company has been approved based on your certification application and your small business self-certification registration through the Small Business Procurement Initiative (SBPI). The Commonwealth now recognizes your company as a Small Business and a Small Diverse Business.

Through the application process, you have presented documentation that your company is engaged in providing certain products and/or services. Information regarding these products and/or services for which you have been certified has been electronically listed in the DGS database for use by all Commonwealth agencies. Please understand that your certification is a tool that you can use to market your goods or services to Commonwealth agencies.

Your certification is valid until the expiration date noted above. For additional information or assistance, please contact Bureau staff at (717) 783-3119 or by email at gs-bsbo@pa.gov. Best wishes in your business endeavors.

Sincerely,

[redacted]

1100 Bent Creek Boulevard
Mechanicsburg, PA 17050

CERTIFICATIO NO: **368740-2012-10-S**
EXPIRATION DATE: **October 02, 2013**

Dear Laura J Martin:

The Bureau of Small Business Opportunities has reviewed your Certification Application together with supporting documents. I am pleased to inform you that your company has been approved based on your certification application and your small business self-certification registration through the Small Business Procurement Initiative (SBPI). The Commonwealth now recognizes your company as a Small Business and a Small Diverse Business.

Through the application process, you have presented documentation that your company is engaged in providing certain products and/or services. Information regarding these products and/or services for which you have been certified has been electronically listed in the DGS database for use by all Commonwealth agencies. Please understand that your certification is a tool that you can use to market your goods or services to Commonwealth agencies.

Your certification is valid until the expiration date noted above. For additional information or assistance, please contact Bureau staff at (717) 783-3119 or by email at gs-bsbo@pa.gov. Best wishes in your business endeavors.

Sincerely,

[redacted]

Curtis Burwell
Equal Opportunity Manager

pennsylvania
DEPARTMENT OF GENERAL SERVICES

June 4, 2013

Jennifer Connolly
President
The Metropolitan Technology Services Group LLC
22 Wagner Farm Lane
Millstone, NJ 08535

Certification Number: **370936-2013-05-S**
Expiration Date: **May 10, 2014**
Business Types: **Information Technology**

Dear Jennifer Connolly:

The Bureau of Small Business Opportunities has reviewed your request for verification along with your supporting documents. I am pleased to inform you that your company has been verified as a Woman Business Enterprise (WBE) based on your certification with the Women's Business Enterprise National Council (WBENC) and your small business self-certification registration through the Small Business Procurement Initiative (SBPI). The Commonwealth now recognizes your company as a Small Diverse Business (WBE).

Please understand that the information that you provided for verification was represented as being true and correct. Please know that the Commonwealth shall treat any misstatement as fraudulent concealment of the true facts punishable as a crime under Section 4904 of the Pennsylvania Crime Code, Title 18, of Pa. Consolidation Statutes relating to unsworn falsification to authorities

Your verification is valid until the expiration date noted above. For additional information or assistance, please contact Bureau staff at (717) 783-3119 or by email at ra-bsboverification@pa.gov. Best wishes in your business endeavors.

Sincerely,

[redacted]

1.3 B – Small Diverse Business Participation

RFP	Requirement
II-9 B	*In addition to the above verification letter, the Offeror must include in the Small Diverse Business participation submittal of the proposal the following information:* 1. *Offerors must include a numerical percentage which represents the total percentage of the work (as a percentage of the total amount paid to the Offeror under the contract) that the Offeror commits to paying to Small Diverse Businesses (SDBs) as subcontractors. To support its total percentage SDB subcontractor commitment, Offeror must also include:* a) *The percentage of each subcontract commitment to a Small Diverse Business.* b) *The name of each Small Diverse Business. The Offeror will not receive credit for stating that after the contract is awarded it will find a Small Diverse Business.* c) *The services or supplies each Small Diverse Business will provide, including the timeframe for providing the services or supplies.* d) *The location where each Small Diverse Business will perform services.* e) *The timeframe for each Small Diverse Business to provide or deliver the goods or services.* f) *A completed and signed letter of intent, in the format set forth in Appendix J - SDB Letter of Intent, for each Small Diverse Business.* g) *The name, address and telephone number of the primary contact person for each Small Diverse Business.* 2. *The total percentages and each SDB subcontractor commitment will become contractual obligations once the contract is fully executed.* 3. *The name and telephone number of the Offeror's project (contact) person for the Small Diverse Business information.*

Our partners were selected based on their experience in providing quality goods and services to Unisys and the Commonwealth. Each firm selected participated in a bidding process with the Unisys Procurement organization to ensure requirements were clearly communicated and the best value for the Commonwealth was obtained through a competitive RFP with our suppliers. The firms listed below were allocated a specific percentage of the Total Contract Value based upon Unisys' evaluation of their capabilities to supply quality IT resources, hardware products, and office facility leasing/administration.

1.3.1 Numerical Percentage of Work Performed by the Small Diverse Businesses

RFP	Requirement
II-9 B 1	*In addition to the above verification letter, the Offeror must include in the Small Diverse Business participation submittal of the proposal the following information:* *1. Offerors must include a numerical percentage which represents the total percentage of the work (as a percentage of the total amount paid to the Offeror under the contract) that the Offeror commits to paying to Small Diverse Businesses (SDBs) as subcontractors.*

Unisys commits to paying the selected Small Diverse Businesses (SDBs), as subcontractors and/or suppliers, a numerical total percentage of 10.60% based on the percentage of the Total

Contract Value that represents the total percentage of the total cost submitted in the Cost Volume.

1.3.1.1 (a) Percentage of Dollar Amount – Each Subcontract Commitment to Small Diverse Business

RFP	*Requirement*
II-9 B 1a	*To support its total percentage SDB subcontractor commitment, Offeror must also include:* *a) The percentage of each subcontract commitment to a Small Diverse Business.*

Small Diverse Business	Percentage Each SDB Subcontractor
Acclaim Systems, Inc.	0.24%
American Personnel Managers & Consultants, Inc.	0.43%
Credo Technology Solutions, Inc.	0.67%
Domino Technologies, Inc.	0.69%
E & E IT Consulting Services, Inc.	0.73%
Info-Matrix Corporation	0.78%
Innovative Business Concepts, Inc.	0.81%
Latus Capital Advisors Inc.	0.59%
Metropolitan Technology Services Group LLC	0.70%
PC Network, Inc.	0.54%
Pierson Computing Connection, Inc.	4.42%

1.3.1.2 (b) Identified Small Diverse Business Entity

RFP	*Requirement*
II-9 B 1b	*To support its total percentage SDB subcontractor commitment, Offeror must also include:* *b) The name of each Small Diverse Business. The Offeror will not receive credit for stating that after the contract is awarded it will find a Small Diverse Business.*

1. Acclaim Systems, Inc.
2. American Personnel Managers & Consultant, Inc. (APMC)
3. Credo Technology Solutions, Inc.
4. Domino Technologies, Inc.
5. E & E IT Consulting Services, Inc.

6. Info-Matrix Corporation
7. Innovative Business Concepts, Inc.
8. Latus Capital Advisors Inc.
9. Metropolitan Technology Services Group LLC
10. PC Network, Inc.
11. Pierson Computing Connection, Inc.

1.3.1.3 (c) Services or Supplies and Timeframe Provided By Each Small Diverse Business

RFP	*Requirement*
II-9 B 1c	*To support its total percentage SDB subcontractor commitment, Offeror must also include:* *c) The services or supplies each Small Diverse Business will provide, including the timeframe for providing the services or supplies.*

Small Diverse Business	Service or Supply	Timeframe
Acclaim Systems, Inc.	Technical services labor	Full contract term
American Personnel Managers & Consultants, Inc.	Technical services labor	Full contract term
Credo Technology Solutions, Inc.	Technical services labor	Full contract term
Domino Technologies, Inc.	Technical services labor	Full contract term
E & E IT Consulting Services, Inc.	Technical services labor	Full contract term
Info-Matrix Corporation	Technical services labor	Full contract term

Rakesh Khetawat
Director
Acclaim Systems Inc.
110 E Pennsylvania Blvd.
Feasterville, PA 19053

Dear Mr. Khetawat:

This letter serves as confirmation of the intent of Unisys Corporation to utilize Acclaim Systems Inc. on RFP 6100022698 (Data Center Computing Services) issued by the Commonwealth of Pennsylvania Office of Administration/Office for Technology.

If Unisys Corporation is the successful vendor, Acclaim Systems shall provide Technical services labor for the duration of the contract term and renewal periods.

These services represent 0.24% of the total amount Unisys Corporation will be paid under the initial term of the contract. The dollar value that the fixed percentage commitment represents will depend on the final negotiated contract pricing and actual contract usage or volume.

Acclaim Systems represents that it meets the small diverse business requirements set forth in the RFP and all required documentation has been provided to Unisys Corporation for its SDB submission.

We look forward to the opportunity to serve the Office of Administration/Office for Technology on this project. If you have any questions concerning our small diverse business commitment, please feel free to contact me at the number below.

Sincerely,

RE: **Request for Proposal (RFP Number 6100022698) for the Commonwealth of Pennsylvania Data Center Computing Services**

Dear Ms. Brown:

Unisys Corporation is pleased to submit this proposal in response to Request for Proposals (RFP Number 6100022698) for the Commonwealth of Pennsylvania Data Center Computing Services. We reviewed the detailed requirements of the RFP and developed our proposal to meet them. We are confident that our proposal presents a sound approach, a proven team, technology, services, Commonwealth-specific knowledge experts, and a mature methodology for meeting the Commonwealth's main objective to implement a cost-effective, flexible, new data center service model based on usage.

Unisys offers world-class infrastructure standards and practices. Our company holds the coveted ISO 20000 certification for Service Provider Organizations. The Unisys ITSM practice was assessed by Underwriters Laboratories, Inc., which found Unisys to be in compliance with the ISO/IEC 20000-1:2005 standard, resulting in a 3-year certification. Unisys was the eighth company to be certified in the United States: the unique distinction of being the first service provider organization to receive the certification for its global operations.

Through this proposal and subsequent delivery of services, Unisys will align all participating agencies with ITIL and introduce operational efficiencies to improve the mean-time-to-resolve times and reduce service incidents overall. We employ state-of-the-art monitoring and knowledge-based escalation procedures to dramatically improve uptime and overall system performance. This gives our approach significantly improved reliability, consistency, responsiveness, and reduced mean time to repair while simultaneously reducing the total cost of ownership by reducing labor costs for routine or predefined tasks.

For this opportunity, we supplemented our extensive managed services experience at both the Data PowerHouse (DPH) and the Enterprise Server Farm (ESF) with key and proven partners like IBM and Deloitte Consulting because they bring to this engagement an extensive knowledge of the Commonwealth's current infrastructure and business systems environments. Currently performing as your primary services provider, we could think of no one better than these key partners—we are very pleased to have them on our team.

Should you have any questions about this proposal or need additional information, please contact:

Dean R. Shaner
4750 Lindle Road
Suite 301
Harrisburg, PA 17111
Telephone: (717) 526-1267
E-mail: dean.shaner@unisys.com

We appreciate this opportunity to provide IT Infrastructure support services to support your mission.

Sincerely,

[redacted]

Chairman and CEO

UNISYS

Statement of Understanding

The information contained herein has been prepared by Unisys Corporation ("Unisys") for evaluation and consideration by the Commonwealth of Pennsylvania ("Commonwealth") to buy the deliverables and services in this proposal in response to the Commonwealth Request for Proposal #6100022698 for Data Center Computing Services. By receipt of this proposal, the Commonwealth is not obligated to buy any products or services. Only a written contract that is signed by authorized representatives of Unisys and the Commonwealth will create any obligations for either party arising from, or related to, the services described in this proposal.

This proposal, including the fixed and Resource Unit (RU) price charges outlined in Unisys submission have been prepared in accordance with, and is submitted on the basis of Unisys understanding of the State's requirements based on the information provided in the RFP and as further described in its proposal. For greater certainty all references to "costs" refer to the proposed cost to the Commonwealth based on Unisys proposed charges and not to Unisys costs.

As allowed by the RFP, there are terms and conditions in the RFP (Appendix A and related Exhibits and Schedules) that Unisys would like to negotiate with the Commonwealth, and there are additional terms and conditions that Unisys would like to add to the contract. As per the RFP instructions, these areas of concern are included in our RFP response. Unisys requests that the Commonwealth and Unisys enter into a period of negotiation prior to the execution of a formal contract.

This proposal contains trade secrets and confidential proprietary information, as well as other information that is not subject to public disclosure under the Pennsylvania Right-to-Know-Law, 65 P.S. § 67.101, et seq., as follows:

- Data center addresses
- SSAE-16 reports
- Availability reports
- The personal contact information provided for Unisys customer references
- Organization charts and names (if included) as well as named resources in the response should be excluded to protect employee privacy and company proprietary information (delivery structure).

In consideration of the receipt of this document, Unisys requests that the Commonwealth not reproduce or make this information available in any manner to persons outside the group directly responsible for evaluation of its contents, except as

may be required by applicable public access law and/or regulation. Unisys is a registered trademark of Unisys Corporation. All other trade names, brands, and products referenced in this proposal are the service marks, trademarks, or registered trademark of the respective manufacturer of supplier.

1.0 Statement of the Problem

1. STATEMENT OF THE PROBLEM 1-3

This page intentionally left blank.

1. Statement of the Problem

RFP	Requirement
II-1	Statement of the Problem. State in succinct terms your understanding of the problem presented or the service required by this RFP.

Governor Corbett and the Commonwealth's IT Leadership seek greater efficiencies from state government's IT compute function. In part, this is driven by the need to cut costs through consolidation, shift to a financial model where the Commonwealth no longer owns the IT infrastructure, and pays only for the amount of IT compute resources actually used through the use of an agile, flexible, and fully transparent pricing model. Of equal importance, the Commonwealth's Request for Proposal (RFP) outlines a completely new model to further improve service quality and delivery. This model includes enhanced IT service management leveraging ITIL V3 framework for process, adoption of best practices, a comprehensive service catalog tailored to meet individual agency needs, and many other improvements. Our proposal will demonstrate how the Unisys Team will help the Commonwealth achieve its vision to implement a new "compute" service model to modernize its computing environments, reduce costs, and strive for ever higher levels of accountability, efficiency, flexibility, security, and transparency for all agencies.

As Governor Corbett's 2013–2014 budget submission stated, "Fiscal discipline and continued self-refinement remain guiding principles for this budget as Pennsylvania looks to the future." Unisys understanding of this RFP stresses alignment with and support for the Governor's vision of "self-refinement" and "fiscal discipline" by seeking a highly qualified service provider to deliver compute services on a consumptive basis. This model will serve as a means to achieve better fiscal discipline and predictability for the Commonwealth.

As your current service provider, we understand your need for a single, accountable, reliable partner as this is the relationship we have defined with you over the last 13 years. We also recognize that today's operating model needs to change. The new operating model will be much different from today's. It will feature variable pricing, greater flexibility through a capacity on-demand approach, more transparency and allow the Commonwealth to scale according to changing business needs. The new operating model will provide the opportunity to lower costs of service while providing the means to tailor services to specific needs. As your current service provider, we welcome and embrace these changes.

The Commonwealth will enter into a single agreement with a company or consortium of companies (with a single prime contractor) for compute services that support the Commonwealth's transformation to an information-focused enterprise. These services will replace the existing Data PowerHouse (DPH) contract and consolidate at least five other compute facilities. We understand the Commonwealth requires vendor-provided facilities in addition to the use of the Commonwealth's Enterprise Data Center (EDC).

This procurement continues the evolution of the successful data center-centric model that began in 1999. In 2008, the next iteration occurred when the Commonwealth and Unisys achieved significant savings by adopting an enterprise shared infrastructure model. The Commonwealth has now defined a new innovative model.

To achieve additional efficiencies, the current model needs to change by adopting innovations such as the implementation of a flexible, agile, and transparent pricing model; a descriptive service catalog; secure capacity-on-demand capability; greater resiliency of your compute resources; disaster recovery services; and high-quality IT service management processes. Unisys applauds the Commonwealth's direction in these areas. Unisys experiences with other public sector agencies that have adopted similar innovations, such as the Defense Information System Agency (DISA), the Internal Revenue Service (IRS) and The California State University System (CSU) have yielded significant efficiencies similar to those anticipated by the Commonwealth.

Finally, training, knowledge transfer, and a well-defined organizational structure with effective communication, governance, management, and support resources are critical to deliver the required compute services and to meet service level agreements. A more definitive list of requested services is presented later in this section.

Vision — Achieving Greater Government Efficiency

During the latter half of the 1990s and into the early 2000s, the Commonwealth became one of the most technologically advanced and innovative state governments in the nation. During that time, the Commonwealth was consistently recognized as a leader in prestigious studies such as the Digital State Surveys and was repeatedly identified as a national best practice leader for IT in state governments. Much of this recognition was due to the Commonwealth's early vision in adopting several innovative enterprise IT initiatives. Few states, even after years of effort, have achieved the same level of success as Pennsylvania. Specifically, the Commonwealth achieved national leadership on the following initiatives:

- **Consolidation of Telecommunications Services –** In its time, the largest transition to competitive telecommunication services in the nation. More recently, a unified communications model including VoIP was implemented.
- **Consolidated Messaging –** The establishment of a statewide e-mail system that today remains one of the largest single public sector instances of Microsoft Exchange.
- **Cyber Security –** The Commonwealth was one of the first states to implement a comprehensive cyber security program that today is recognized as one of the best in the nation.
- **Data PowerHouse** and **Enterprise Data Center –** Recognized as national best practices: the DPH and the EDC were the first successful statewide consolidations and outsourcing (in the case of the DPH) of mission-critical systems in the nation.
- **Imagine PA –** The first statewide ERP implementation in the nation.

These widely recognized innovations fueled performance improvements and enhanced citizen and employee access to services throughout the Commonwealth. They also reduced cost by eliminating many duplicate services, which saved well over $500 million for the citizens of the Commonwealth.

The model outlined in this RFP will yield similar large-scale benefits. The Commonwealth's approach is visionary for state government, creating a totally new environment where services—and only those services you need—are purchased and where the Commonwealth sheds the heavy burden of owning and operating data centers and focuses on its core business of serving citizens.

Challenging Times — Drivers of Change for the Commonwealth

Budget Challenges. Beginning in 2002, significant budget constraints, driven largely by the poor macroeconomic environment, negatively affected the Commonwealth and other states nationwide. These budget constraints led to re-allocation of funds—traditionally targeted for IT investments—to basic Commonwealth services. This made it extremely difficult for the Commonwealth to continue maintenance and reinvestment in an efficient and robust IT infrastructure.

Impact on Commonwealth IT. Because of this economic downturn, the success of the Commonwealth's enterprise approach to IT was hampered, and agencies sought individual solutions to meet their immediate business needs. This led to the emergence of a loosely coupled network of separate IT solutions, redundant agency IT infrastructures and data centers, resulting in varying levels of performance, unused capacity, and inefficient use of resources. This model drove up costs and created a sub-optimized enterprise solution that at times, despite the excess capacity, could not efficiently support the Commonwealth's needs. Recognizing this reality, Executive Order 2004-8 was amended in 2007 to address the need for coordinated IT planning and resource utilization by directing the consolidation of some agency information technology organizations under the Office for Information Technology.

In 2008, economic conditions deteriorated even further, driven by the worst recession since the Great Depression. Tax revenue declined dramatically, and citizen filings for unemployment compensation and human services assistance skyrocketed, creating major budget and IT challenges.

In response, the Commonwealth collaborated with Unisys to adopt an enterprise shared infrastructure model, driving IT costs lower and improving the agility of agencies. For example, during peak tax processing season, Pennsylvania Department of Revenue has leveraged unused capacity shared with other agencies in the Data PowerHouse. In addition to providing greater agility to Commonwealth agencies, this shared model allowed Unisys and the Commonwealth to renegotiate the DPH agreement and generate $240 million in savings to the Commonwealth. Even though significant benefits were achieved in 2008, the Corbett administration recognized early that more could be done through further consolidation and sharing of resources, including IT.

Driving Greater Efficiencies. Shortly after his election in 2011, Governor Tom Corbett recognized the need to renew and reinvigorate the focus on greater government efficiency. Driven by challenging budget conditions, one of Governor Corbett's very first initiatives on his 2011 swearing-in was IT consolidation. Governor Corbett directed the Office of Administration and Department of General Services to work with all Commonwealth agencies to consolidate services, especially information technology. Improving efficiency in government through consolidation of services, including IT, was once again back in focus for the Commonwealth, further reinforcing the tenets of Executive Order 2004-8 as amended in 2007.

The Vision. Given the Governor's mandate for greater efficiency, the Commonwealth CIO and agency IT leadership developed a completely new and innovative model for providing IT compute services. Its focus is to eliminate inefficiencies, improve performance, and safeguard these critical services through enhanced security and service recovery in case of an emergency. The net result will be better services at a reduced cost.

Major Issues addressed by the RFP:

- *Need to consolidate IT resources to achieve economies of scale*
- *Need to eliminate duplication*
- *Need to finance future IT resources based on usage, not a fixed price*
- *Need for greater resiliency and DR for critical IT systems to maintain COG*
- *Need for a flexible service catalog to meet the unique needs of individual agencies*
- *Need to adopt industry performance standards like ITIL for service and operations*
- *Need for high-quality staff training and timely knowledge transfer*
- *Need for additional security enhancements*
- *Need for faster provisioning of services*
- *Need for a greater pricing transparency, predictability, and consistency*
- *Need to establish a new compute services contract*
- *Need for a multi-data center architecture*
- *Need for multitier service environments*
- *Need for primary support for the EDC*
- *Need to comply with Commonwealth contractual, regulatory, and policy requirements for security, architecture, and SDLC standards*
- *Need for SLAs*

And, of critical importantance…

Need for a service provider that can successfully deliver on its promises

Commonwealth IT leaders identified a number of specific needs:

As previously mentioned, the agency infrastructure and data center facilities that emerged during the economic challenges adds to the cost of maintaining numerous data center facilities and creates duplication with unused capacity. The Commonwealth operates at least five individual agency data centers, the DPH and the Enterprise Data Center. This does not include numerous other individual agencies' disaster recovery data center facilities. This decentralized model impedes the ability to achieve savings by limiting the capability to implement a "true" enterprise on-demand compute environment that optimizes the use of server, storage, and network capacity encapsulated by a common enterprise service management model and strong security framework.

The lack of a common provisioning platform is increasing the time required to provision compute resources and is another detriment of an inefficient decentralized model. A common provisioning platform used with an enterprise compute model can eliminate redundant administrative resources that repeat the same tasks multiple times in multiple centers. Automation of these functions will optimize resources, lead to significant savings, and improve response time for agencies that need to provision services quickly.

Another challenge to the Commonwealth is refreshing the technology to limit the risk of infrastructure failures and thereby realize savings from improved reliability and performance. In difficult budget times, gaining approval for large capital outlays is difficult at best.

A better approach (and one the Commonwealth is pursuing) is a consumptive model in which services—not hardware and software—are purchased as needed. This eliminates the challenge of large capital outlays at times when the Commonwealth does not have sufficient funds. This model also affords optimization of technology processing resources by significantly reducing the existence of excess IT compute capacity.

In addition to financial incentives, the Commonwealth seeks an enterprise compute services model to drive improvements to service management, a goal that will yield significant benefits in accountability and service quality. Decentralization raised barriers to establishing true interoperability and implementing enterprise service management best practices and processes such as the Information Technology Infrastructure Library (ITIL V3). The new enterprise model includes adopting a stronger set of enterprise governance policies for effective oversight and improved enterprise architecture implemented in a secure, low-risk transition model. It is clear that any new model must provide enhanced controls for security and data integrity to achieve compliance with applicable policies, laws, regulations, and controls. This new model is extremely important to the efficient and effective management of a major state government compute operation like what exists at the Commonwealth.

As your service provider for many years, we thoroughly understand that the criticality of Commonwealth services supported by the technology infrastructure demands a robust,

comprehensive, and effective disaster recovery capability. Maintaining numerous data centers that host dependent yet separated applications make planning and recovery significantly more complex. An example of this is the interdependencies among the Commonwealth Law Enforcement Assist Network (CLEAN) system at Pennsylvania State Police, JNET, and the Commonwealth Automated Registration and Titling System (CARATS) and Driver License and Commercial(DL&C) systems at PennDOT. Engineering a solution that provides resiliency and a robust recovery strategy at the enterprise level makes sound business sense and is a critical technical component of this procurement. To that end the Commonwealth has specified a geographically dispersed 2+ data center architecture as depicted in **Figure 1-1,** which will be overlaid with a key service framework consisting of:

- Program Management Services
- Technical Services
- Facilities Management Services
- Managed Hosting Services
- Capacity of Demand and Additional Services.

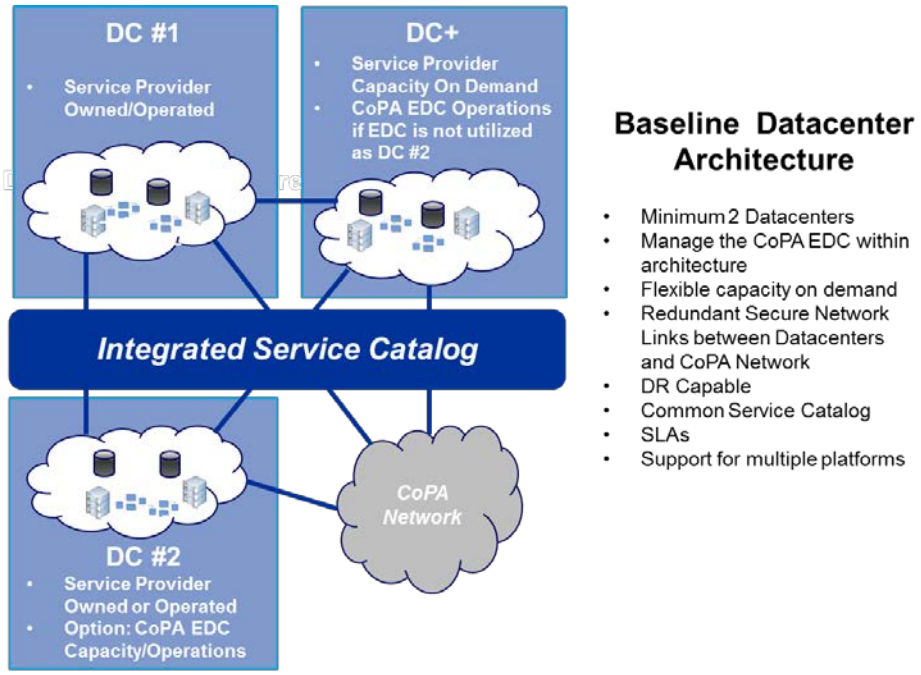

Figure 1-1. Baseline Data Center Architecture (as shown in the RFP)

Services Requested

The Commonwealth-specific needs were then detailed as services and requested in the RFP as follows:

- Minimize risk and disruption of critical services during the transition of existing systems and related computer resources to the new compute model
- Implement a comprehensive enterprise service catalog enabling agencies to select only those services they need
- Provide self-provisioning of selected resources for server and storage capacity in a well-documented, comprehensive enterprise service catalog that recognizes individual needs of the various agencies
- Implement an enterprisewide ITIL V3 IT Service Management platform to support the requirements in this RFP that will assist in continuous improvement and allow further cost savings over time
- Apply a transparent, consistent, and predictable pricing structure to facilitate accurate and timely budget projections
- Assist the Commonwealth with the transition, transformation, and then continual improvement of compute services through innovation and adoption of industry best practices
- Adhere to the Commonwealth's contractual, regulatory, and policy compliance requirements for security, architecture, and Systems Development Life Cycle (SDLC) standards articulated in this procurement
- Establish a tiered managed service capability to support high-availability hosting, backup, and disaster recovery services to maintain continuity of operations
- Properly train Commonwealth staff on new processes such as service ordering, tools, and security; transfer knowledge where appropriate for Commonwealth staff to achieve self-sufficiency
- Offer a variety of optional services such as an assessment of converting the Commonwealth from IPv4 to IPv6.

To successfully deliver the services above, a number of major challenges will need to be addressed, including:

- Migrating the data center services in the DPH that expire in December 2014, as well as additional services outlined in the RFP, with no unplanned service interruptions—all on an aggressive timeline
- Implementing an entirely new process and methodology for acquiring compute services based on a service catalog and consumptive pricing
- Maintaining security of the Commonwealth's sensitive data at all times during transition and then during steady state operations

- Providing proper infrastructure needed to mitigate possible latency and other application integration problems when moving applications that have dependencies on other applications.

To help mitigate the risk of these major challenges, the Data Center Computing Services RFP seeks to place the accountability on a single experienced service provider and the benefits of a consortium's shared experience and knowledge. We agree with this approach. The single service provider and the consortium must have detailed knowledge for both the Commonwealth agencies and their applications and a technical staff with the experience and knowledge and commitment to provide security solutions that safeguard Commonwealth data and resources throughout the contract's period. This "one leading many" strategy will dramatically improve the probability of success.

The real question is how do we achieve the new vision for a service-based consumptive model of compute services, user support, and consolidated data centers? The new model will emerge first through transition and then through transformation and result in an innovative compute model enabling the future of IT in the Commonwealth.

Transition and Transformation — Critical Success Factors

The future compute services model outlined in this procurement will provide the Commonwealth with substantial benefits. However, the path to the new model is complex, challenging, and if not managed appropriately, high risk. Agencies depend on compute services to meet the basic needs of the citizens of Pennsylvania. For example, systems in this RFP process Commonwealth driver license records, motor vehicle records, and state police records; provide critical services that keep our citizens safe; collect taxes and deliver benefits to the Commonwealth's most vulnerable and unemployed citizens; and support elections. These are just a few of the critical services dependent on a successful transition.

We respect the individual needs of each agency with strong consideration for their current business cycles and future business objectives in our planning activities for transition and transformation.

The Unisys Advantage: Incorporate the unique understanding of the Commonwealth business cycle requirements when developing transition and transformation plans.

Impact: Institutional knowledge and relationships gained over the past 13 years dramatically reduce the risk of failure because of our realistic approach to planning and our business process understanding.

Experience Matters. Meeting such a challenge is not new to Unisys. The Unisys Team successfully completed the Commonwealth's first transition to a consolidated data center model in 1999 and a transition to a shared technology model in 2008. Both happened on time, within budget, and with minimal disruption to the critical services provided to Pennsylvania's citizens. The experienced Unisys Team has successfully managed much of the Commonwealth's compute infrastructure for the past 14 years. In fact, Unisys and our team members

currently manage nearly 75 percent of the infrastructure within scope of this RFP.

Commonwealth Experience is CRITICAL. The valuable lessons learned from our team's collective one-of-a-kind experience confirms that the transition and successful operation of the Commonwealth's compute infrastructure is less about the hardware and more about a thorough understanding of the hundreds of agency applications that support critical services for citizens. Any successful transition must also respect each individual agency's business needs and business cycles. Our team has the needed level of knowledge, expertise, and experience specific to Commonwealth agencies that is critical to transition success. **In its absence, the risk of failure increases exponentially.**

Transition is Hard Work but Necessary. Only after a successful transition to the new model can the transformation to a consumptive approach and a program of continual improvement commence. Such a program will help the Commonwealth maximize the investment in compute services technologies and achieve even greater performance for the many critical services delivered by Commonwealth agencies.

Transformation Drives Additional Efficiencies. As systems and applications are transitioned to Unisys, they immediately will be operating on the new compute services model, thereby transformed and meeting all RFP requirements. Then, an active program of continual improvement will begin to enable the Commonwealth to adopt whatever new technologies or best practices emerge during the entire contract period. We are committed to making the Commonwealth the gold standard for government compute services.

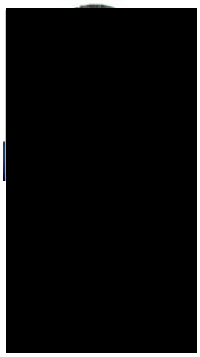
Success is Achievable. The Commonwealth seeks a service provider that can successfully deliver a new compute services model. This new model builds on the Commonwealth's IT success to date and will continue to enhance delivery of government services, improve efficiency and security of operations, and reduce the cost of government. That model needs to provide efficiencies for the Commonwealth going forward and achieve or exceed the performance standards mandated by this procurement. Unisys can successfully deliver and achieve the Commonwealth's vision and objectives.

In Summary

This RFP maps a new direction and offers a real vision for a new compute model to deliver critical services that benefit Pennsylvania's citizens. Unisys and our team of premier technology companies are confident we can assist the Commonwealth to achieve this new model while offering the lowest risk and best outcome to providing compute services efficiently for the contract's entire term.

In 1999, we accepted the challenge of consolidating the Commonwealth's 17 data centers and succeeded. In 2008, we accepted the challenge of reinventing Commonwealth operations to shared services, saved $240 million and succeeded. Now in 2013 and beyond, we are totally committed to accept this new challenge and successfully deliver the results expected in this RFP.

"For the past 12 years I have had the privilege to personally lead the Unisys Team that supports all of our business partnerships with the Commonwealth, and specifically the current DPH and EDC data center services engagements. My philosophy has been simple.....I am the person accountable to our Commonwealth clients...either Commonwealth agencies are completely satisfied with our services or we must make it right. Over these many years I have spent considerable time talking with IT leaders in the various agencies, personally listening to their ideas and concerns and when necessary dealing directly with any concerns. As a Unisys Vice President, my position provides considerable autonomy such that many concerns and issues can be resolved locally and without delay. In rare cases where concerns or issues must be elevated to our corporate leadership I have a direct line to the Unisys senior leadership team, including our CEO, and they have been extremely responsive to me and to matters affecting the Commonwealth. If given the privilege of continuing to deliver services under a new contract, I pledge my commitment to quality service will be stronger than ever."



Vice President, Unisys

2. Management Summary

RFP	*Requirement*
II-2	*Management Summary. Include a narrative description of the proposed effort and a list of the items to be delivered or services to be provided.*

This RFP is much broader and far more significant than consolidating infrastructure. The essence of this opportunity is optimized "compute services," supporting the Commonwealth's applications by providing the right service in the right capacity when it is needed and in a way that is cost effective, transparent, and secure. When the transition is complete and the benefits are realized, the industry will recognize this initiative for what it is—a paradigm shift in service delivery for state government.

2.1 The Path Forward

This engagement is an innovation effort to transform information technology (IT) at the Commonwealth to a robust yet flexible offering that supports current and future capacity and service levels that evolve, expand, and contract with the flow of changes in the Commonwealth's business and operating environment. No longer is it acceptable to carry fixed costs that burden the Commonwealth financially when changes in the economy, government funding, or government needs occur. IT at the Commonwealth must be an enabler of these changes to optimize your operating environment going forward.

The Commonwealth is seeking a fundamental shift in the way it acquires and operates IT by implementing a fully consumptive, secure private cloud services utility model. The model is based on an IT Service Management platform that leverages ITIL V3 best practices and Lean Six Sigma methods to create an "optimization framework" for an enterprise-centric IT infrastructure.

Ultimately, the Commonwealth and its chosen service provider will move the current Commonwealth applications to an Infrastructure as a Service (IaaS) operating model in which agencies can scale transactions and compute capacity based on need, therefore optimizing the cost of supporting these applications. **That is much different from today's contract which features fixed pricing for most services, limited transparency, and little flexibility to scale according to changing needs. The new model will provide the opportunity to lower costs of service and the means to tailor services to specific needs. As your current service provider, we welcome these changes.**

2.2 The Unisys Team

To be successful and to mitigate risk to the greatest degree possible, this innovative effort must start with a world-class team delivering specific and proven experience with the Commonwealth of Pennsylvania. Unisys, as the prime contractor, will be totally responsible for successfully delivering the compute services in this RFP's scope. As a Pennsylvania-based company with approximately 23,000 employees worldwide, Unisys has a long and successful record of accomplishment of working with you and other prestigious organizations on similar innovative efforts.

Innovation - Flexible Pricing Models

Unisys Experience with:

- *Defense Information Systems Agency (DISA)*
- *Internal Revenue Service (IRS)*
- *City of Minneapolis*
- *American Red Cross*
- *California State University System(CSU)*

For this engagement, we will bring forward many local IT experts—currently more than 150—who support the Commonwealth today and we build on that core group with new staff and skills to actively pursue robust new programs for continuous innovation and improvement. We again have partnered with **IBM** and others you know but also have engaged several new partners, including **Deloitte Consulting** (Deloitte). All have been carefully selected for their unique skills, knowledge or resources to enable success of this engagement, to deliver on time and on budget, and to meet the Commonwealth's high expectations for flexibility, service quality, and client satisfaction. We are blending resources most experienced with your applications and systems with new skills and new ideas to drive ongoing innovation and efficiencies.

Stability and reliability of your compute services environment will be our top priority. We estimate that our team – The Unisys Team – currently manages approximately 75 percent of your in-scope compute capacity. That level of knowledge and experience is a key differentiator between the Unisys Team and others that claim they have the credentials necessary to transition the Commonwealth's most important systems.

IBM and Deloitte are exclusive partners to the Unisys Team. Both are premier companies and experienced providers of services and technology to the Commonwealth. As illustrated in **Figure 2-1,** we considered many factors when we selected IBM and Deloitte for our core, "best of breed" team to deliver compute services to the Commonwealth.

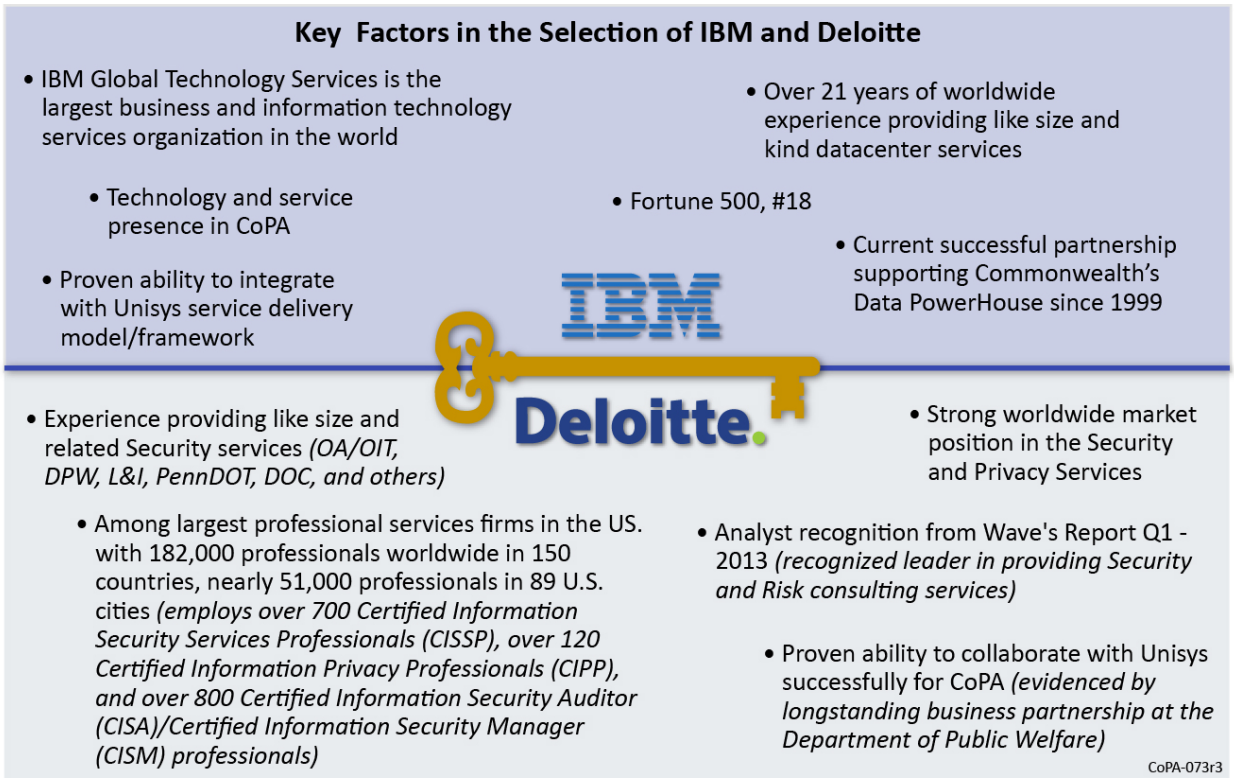

Figure 2-1. Key Factors

Figure 2-2 highlights the entire Unisys Team and each team member's role. Recognizing the value of the Commonwealth's approach with its own staff augmentation contract, Unisys assembled a large pool of Small Diverse Businesses (SDBs) to improve our ability to source the best technical resources at the best value while helping the local, small and diverse business community. Those SDB firms include **American Personnel Managers, Acclaim Systems, Credo Technology Solutions, Domino Technologies, e & e IT Consulting Systems, Info-Matrix Corporation, Innovative Business Concepts,** and **PCN.** We also selected **Pierson Computing Connection Incorporated** to provide certain technology components of our solution, and **Latus Commercial Realty** to provide commercial real estate services. In addition, we have added **Harrisburg University of Science and Technology** to provide educational and training support.

With added focus on innovation and emerging technologies, our team also includes BMC, Cisco, EMC, Microsoft, PMG, PureShare, Juniper, and VMware. These companies are on the leading edge of new technologies that can transform the way we operate and in turn deliver significant efficiencies. Section 4 of our proposal provides a detailed perspective of Unisys qualifications and additional details on the members of our team.

Figure 2-2. The Unisys Team

This consortium is world class. It includes the two primary inventors and suppliers—Unisys and IBM—of the technology infrastructure and system software running nearly all of the Commonwealth's business application systems. Therefore, the Unisys Team will have a direct line to software developers and technical support experts worldwide for issues that require around-the-clock problem solving.

We know success revolves around the Commonwealth's business application systems and keeping them fully operational. Unisys and IBM together offer more than 100 years of working knowledge of the Commonwealth's business application systems. Further, we augmented our team with Deloitte, the largest, most experienced applications integrator, developer, and application maintenance provider in support of the Commonwealth's business application systems. Deloitte also provides a variety of mission-critical IT

Committed to the Commonwealth

Local Knowledgeable Resources

In Pennsylvania, Unisys, IBM, and Deloitte Consulting employ 6,962 people with more than 900 people in the metropolitan Harrisburg area.

security services to the Commonwealth. Our team will leverage Deloitte's application knowledge and security capabilities extensively, further promoting success overall.

The Unisys Team has unsurpassed collective knowledge of your applications, business, history, nuances, people, policies, processes and systems. The Unisys Team has an unmatched – unrivaled record of accomplishment in the managed infrastructure services, security, and application services space for the Commonwealth. For example:

- We have consistently met high levels of availability and met or exceeded service level requirements
  - Specifically:
    - **Achieved overall 99.9915 percent availability** in the DPH since 2008
    - **Achieved greater than 99 percent of all SLAs** since 2008
- We have had no security breaches in the DPH
- We successfully completed a number of innovative initiatives, including:
  - Implementation of the enterprise shared infrastructure
  - Inclusion of tiered service levels and rate card
  - Piloting of self-provisioning
  - Near 100 percent ITIL V3 Foundation certification of all Unisys DPH and EDC delivery staff

Bottom line—we have assembled a team with by far the most experience and knowledge specific to the Commonwealth supplemented by a global network of experts to assist, as necessary. This team comprises experienced staff—many of whom you already know—starting with our executive leadership.

2.3 Our Executive Leadership Team

Because of this engagement's importance and our commitment to the Commonwealth of Pennsylvania, Ed Coleman, Unisys Chairman and CEO, has chosen to serve as Executive Sponsor and will personally ensure our company's complete commitment to its success.

In addition to Ed Coleman's role as Executive Sponsor, Unisys established an Executive Leadership Committee to support the efforts of our Harrisburg-based service delivery leadership team. This committee, which consists of senior business and service delivery executives from Unisys, IBM and Deloitte, was established to provide direct visibility into our respective organizations to

"We have an excellent service delivery team assigned to this initiative. [redacted] and [redacted] are some of the very best in service delivery. I trust their judgment and have empowered them to make the necessary decisions locally to keep the project on schedule and meet your expectations. Their team is complemented by a Unisys Executive Leadership Committee focused on providing whatever additional corporate resources and support are necessary to succeed."

—Ed Coleman
Commonwealth Executive Sponsor
Chairman & CEO

enable us to meet our commitments to the Commonwealth during transition and steady state operations. This committee also will be tasked to resolve issues that may arise but cannot be resolved locally. The committee will provide executive leadership, support, and direction throughout the engagement's entire life and will be a vital component of the transition and steady state governance model. **Figure 2-3** identifies the members of our Executive Leadership Committee.

Figure 2-3. Unisys Executive Leadership Committee

Our Service Delivery Team

The Harrisburg-based Unisys leadership team, depicted in **Figure 2-4,** will be led by [redacted] As Engagement Executive, Ann has worked closely with key Commonwealth executives to manage many aspects of the current Data PowerHouse (DPH) Program over the past five years. On joining Unisys, Ann oversaw the successful transition to shared services in 2008. This transformed service delivery and saved the Commonwealth $240 million.

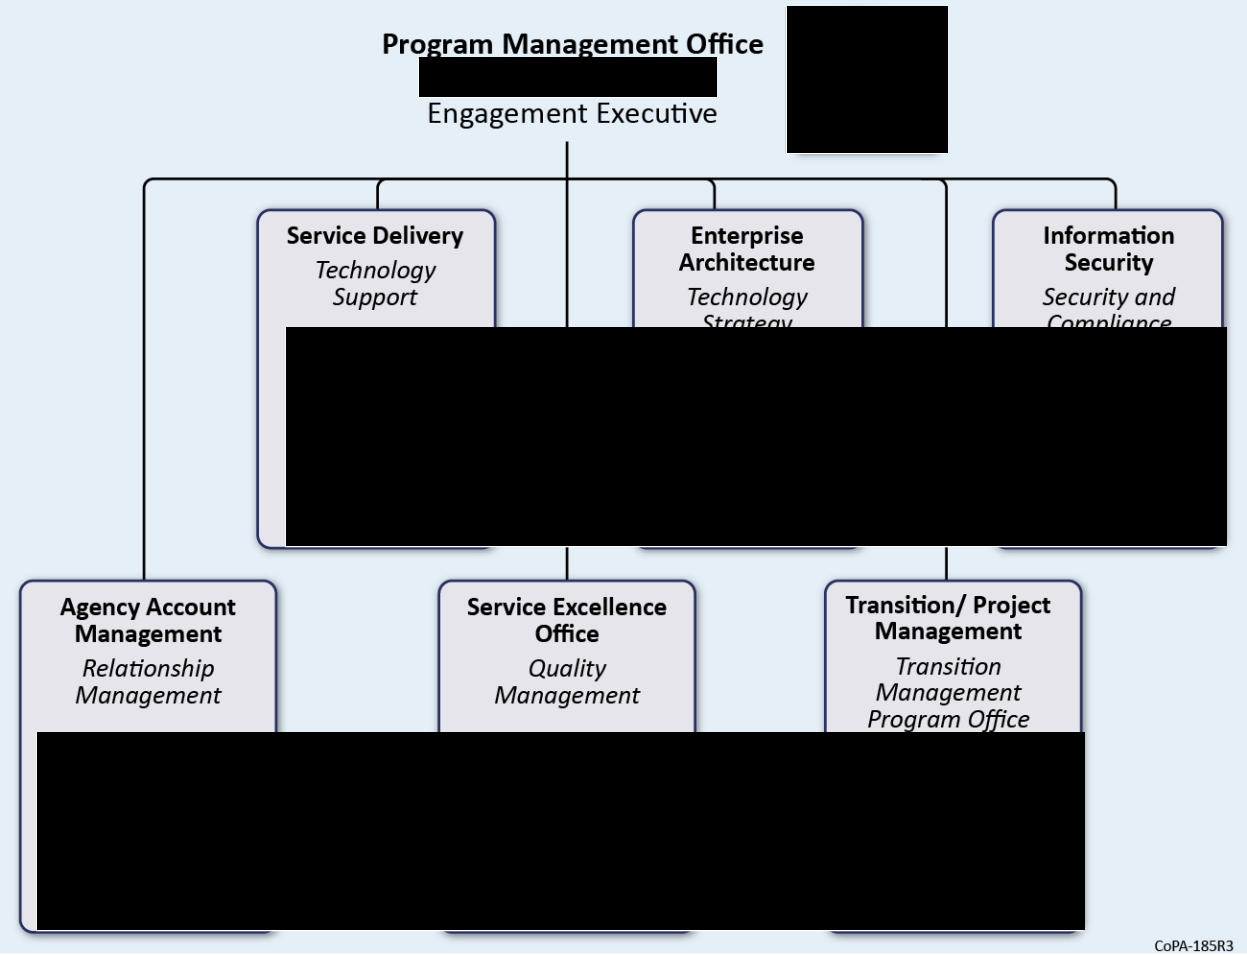

Figure 2-4. Unisys Harrisburg Service Delivery Team

During her tenure with Unisys, Ann spearheaded a number of innovative technology solutions, including server virtualization that reduced costs for the Commonwealth. She also fostered the evolution of the DPH architecture to new technology concepts, including disk-based backup solutions and flexible service offerings. Ann has demonstrated great sensitivity when it comes to customer satisfaction by implementing a number of in-depth survey processes designed to take the customer's pulse at many different levels on all aspects of service. She has held her team accountable to document issues and follow-up actions in collaboration with the agencies. These activities improved customer satisfaction significantly. Ann's Certifications – ITIL V3 Foundation.

[redacted] was presented with the 2012 Outstanding Leadership and Innovation ("Ollie") award from former Commonwealth CIO George White for his efforts at OA-Information Technology (OIT) to support the Pennsylvania State Police. The "Ollie" award is sponsored by the Office of Administration's Office for Information Technology and Government Technology magazine.

[redacted] will serve the Commonwealth as lead Agency Account Manager. Pete is a 23-year Unisys employee who has worked at the Commonwealth of Pennsylvania since 2002 in a variety of Project Management and Client Services Management roles supporting numerous Commonwealth organizations. Since 2005, he has worked on site at the Commonwealth Technology Center in very close collaboration with the Commonwealth CTO, CISO, Client Management, Enterprise Data Center, Enterprise Networking and Security, Enterprise Services, GIS, PMO, and many agencies. Certifications—ITIL V3 Foundation and PMP.

[redacted] will serve the Commonwealth as the Service Delivery Executive (Program Manager). Ricky brings 14 years of experience leading large Service Delivery organizations, most recently supporting outsourced engagements for Computer Sciences Corporation (CSC). Ricky will leverage his experience with leading large-scale data center delivery teams, including a team at Textron, where he directed the consolidation of 10 sites with multiple mainframes and more than 800 open systems servers and then managed an ongoing Service Delivery team of 500 employees. Certification—ITIL V3 Foundation.

[redacted] will serve the Commonwealth as PMO Transition Manager. Scott brings 27 years of IT delivery experience working for large IT outsourcing firms before joining Unisys at the beginning of this year. As a Transition Management leader working for Dell Services (formerly Perot Systems), Scott led multiple large-scale data center transitions, migrations, and system upgrades during his 5-year tenure. Scott managed Perot Systems' Healthcare Business Unit portfolio of transitions and data center migrations. Certifications—ITIL V3 Foundation and PMP.

[redacted] will serve the Commonwealth as the Senior Enterprise Architect under the new contract. He has 16 years of IT industry experience working for IBM in several architect roles before joining Unisys in 2011 as the Lead Client Architect managing the Unisys North American Client Architect team, which includes oversight of the Client Architects supporting the Commonwealth. While working for IBM, Bryan served as Transformation Integration Architect, leading a large team of architects to develop technical components to build a multitenant data center to support the State of Georgia's strategic consolidation plans. Certifications—ITIL V3 Foundation, Open Group Master IT Architect, and IBM IT Architect Certifications.

[redacted] will serve the Commonwealth as the Chief Security Manager. Mike brings more than 38 years of technical and management experience, working with a number of federal and state government agencies, including the Pennsylvania State Police (PSP), for which he managed security for the new Commonwealth Law Enforcement Assistance Network (CLEAN). He also collaborated with JNET to provide access to CLEAN by JNET users without requiring additional authentication and assisted Office of Administration/Office for Information Technology (OA/OIT) leadership with creating Security ITBs. Mike's efforts enabled deployment of the new Megan's Law application to its full user base much faster than would have been achievable otherwise, enabling PSP to meet its legislatively mandated deadline. Certifications—CISSP (Certified Information Systems Professional) and SANS GSEC (Global Information Assurance Certification Security Essentials Certification).

[redacted] will serve the Commonwealth as the Service Excellence Officer. Michael is currently the Operations Director for Unisys in North America responsible for all Unisys customers; Michael will be 100 percent dedicated to the Commonwealth. A 32-year employee with Unisys, Michael brings considerable successful experience across our client base. In his current role, he led a number of key initiatives under our ITIL V3 and Lean Six Sigma-based Continual Service Improvement Program. Michael led several service improvement initiatives for the Commonwealth, including multiple Kaizen Process Optimization workshops with the Unisys Team supporting the Commonwealth of Pennsylvania. One of these workshops laid the groundwork to transition the DPH contract from an antiquated Remedy system to the current ITSM 7.6 Remedy system. Certifications—Six Sigma Lean Black Belt and ITIL V3 Foundation.

Section 5 of our proposal provides a detailed description of the entire Unisys staffing plan, including other key personnel on the Unisys Team.

Our team is organized around your needs and largely based in Harrisburg -- close to you. That will help facilitate more effective coordination and communications. **Figure 2-5** is a high-level description of the functions of each of our seven core teams.

Figure 2-5. Seven Functional Teams

To illustrate the interaction between our team and the Commonwealth team, we present **Figure 2-6.** It is a high-level graphical depiction of the coordination and flow of communications between our respective organizations. Having significant experience with the Commonwealth, Unisys understands that it is not as simple as one Unisys point of contact to a single Commonwealth counterpart. The Commonwealth organization is multidimensional; each agency has its own management structure and IT support team, and the OA manages the contract on behalf of the agencies.

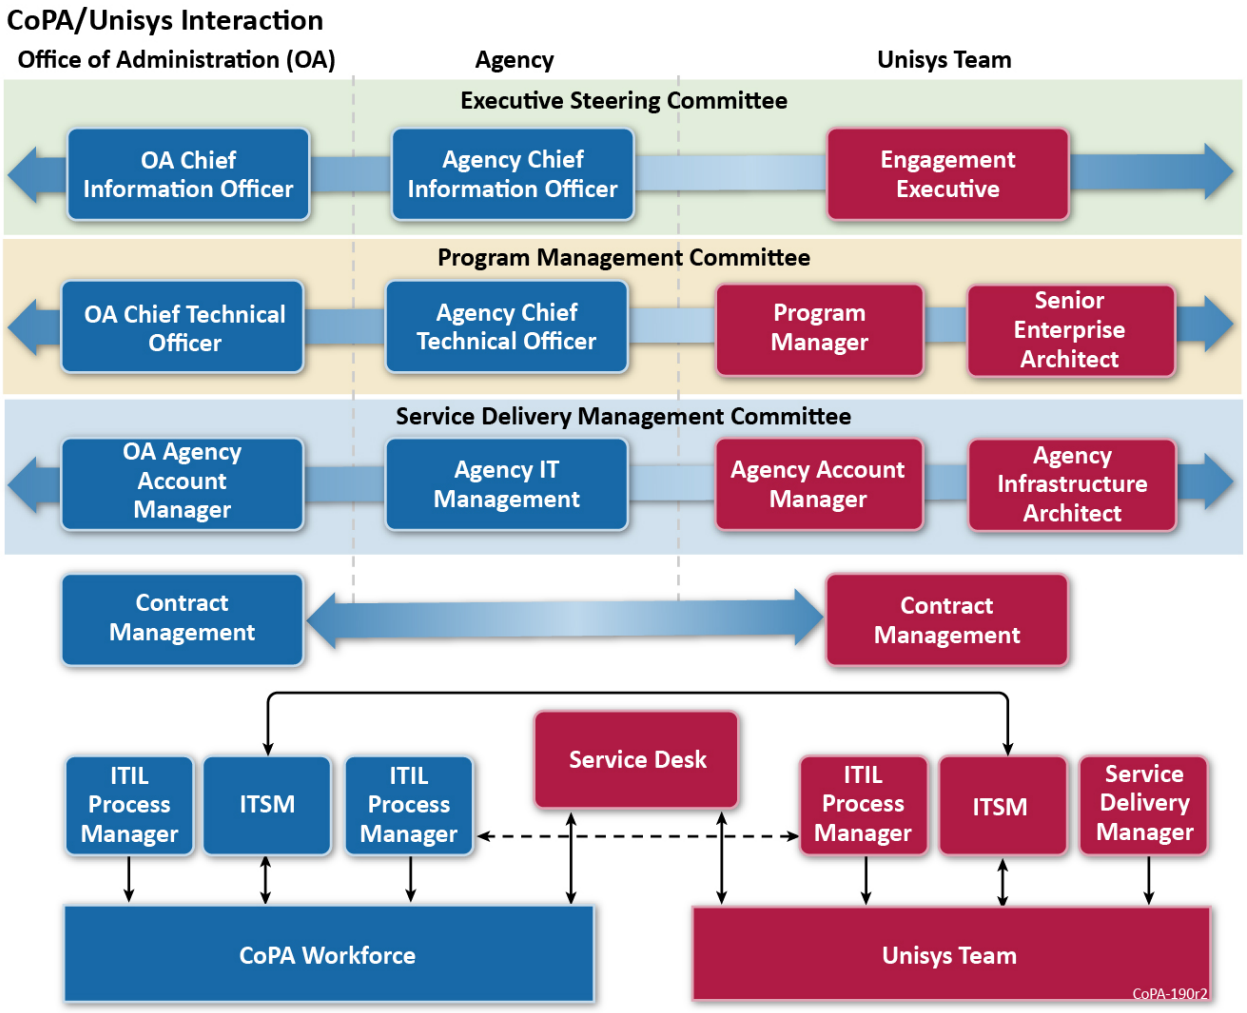

Figure 2-6. Commonwealth and Unisys Communication and Interaction Flow

As part of our deliverables, Unisys will develop, with you, a comprehensive stakeholder communications plan involving our leadership team in addition to our project and service delivery staff. That will enable those affected but not included above to have the necessary information on each stage of the transition.

Now that you have been introduced to the Unisys Team and our key leadership staff, the sections that follow highlight the solution strategy we followed to meet the Commonwealth's requirements as well as an overview of our proposed solution.

2.4 Unisys Solution

2.4.1 Unisys Tenets

Given our knowledge of the Commonwealth, and a detailed review of the RFP's requirements, we carefully selected our consortium partners, and designed a solution based on the following tenets:

- **"Do no harm" –** Every aspect of the engagement must be performed without any unplanned interruption of services
- **"Align compute services with the business" –** Our proposed solution must provide a transparent and flexible compute services environment aligned with the business needs of the agencies
- **"Achieve success together" –** Work closely with Commonwealth staff, understand and address their individual issues, and provide needed training to facilitate knowledge transfer and adoption of best practices
- **"Focus on moving software applications rather than moving hardware" –** This is about moving software applications that support the most important functions of Pennsylvania state government
- **"Managing change is key to success" –** We must implement strong change management practices, a solid training plan, and effective communications when transforming the Commonwealth to its future model
- **"Recognize and respect differences among individual agencies" –** We must recognize that agencies will have their autonomy to execute their business goals while assisting the Office of Administration with achieving its enterprise objectives
- **"Innovation is a must" –** In all aspects of our solution, we must look ahead…not back
- **"Security is paramount" –** We must encapsulate everything we do with a strong security framework that protects all Commonwealth data and IT resources.

2.5 The Proposed Solution

Our proposed solution is designed to eliminate any application latency risks to the Commonwealth's applications while providing an ongoing cost-effective solution to meet the Commonwealth's security, operational, and financial objectives. To deliver the required services and meet the RFP's requirements, we carefully architected two key components: the **Data Center Infrastructures** that will underpin the services delivered through a **Component-based Operating Model,** both of which are described below.

Data Center Infrastructures

As depicted in **Figure 2-7,** Unisys will provide a network of Tier 3 data centers interconnected to provide the optimum data center environment. This network improves resiliency and largely mitigates any application latency issues with the move of the DPH

and other agency data centers to the new compute environment. In addition to the EDC, our data center approach will be to leverage two additional compute facilities in [redacted] and [redacted] A contributing reason we chose the [redacted] facility as a primary production site is its location, which is within a 120-mile radius of Harrisburg—an important metric relative to the reduction of any potential latency issues with moving the Commonwealth's applications to a new location. Also, there is a robust telecommunications infrastructure in the [redacted] area to locate the workloads that currently exist in the DPH. Remaining agency data centers will be located in either the [redacted] or [redacted] facilities. During data gathering, we will study network latency and other factors with the productions applications in the agency data centers to determine the best location for the workloads based on potential latency issues that need to be mitigated. An important consideration in the selection of [redacted] as a data center is to provide geographical separation for disaster recovery workloads to better protect the Commonwealth in the event of a natural disaster occurring on the East Coast. Today, Commonwealth disaster recovery workloads are greater than 50 miles apart, but they are in the same geographical zone which poses a risk to the Commonwealth. [redacted] provides the ability to locate disaster workloads in the EDC or vice versa if geological separation is desired.

We plan to leave the EDC "as is" during migration to mitigate risk and to focus on other transition activities. Unisys will establish the IT Service Management (ITSM) infrastructure for the Commonwealth in the EDC initially and then a redundant copy in [redacted] to provide the compute services outlined in this proposal and to accommodate existing applications.

Unisys will deploy a network-operating environment that is fully fault tolerant and provides the scalability and flexibility needed going forward while reducing network-operating costs. Furthermore, this network will be integrated into COPANET to interconnect the compute facilities in **Figure 2-7**.

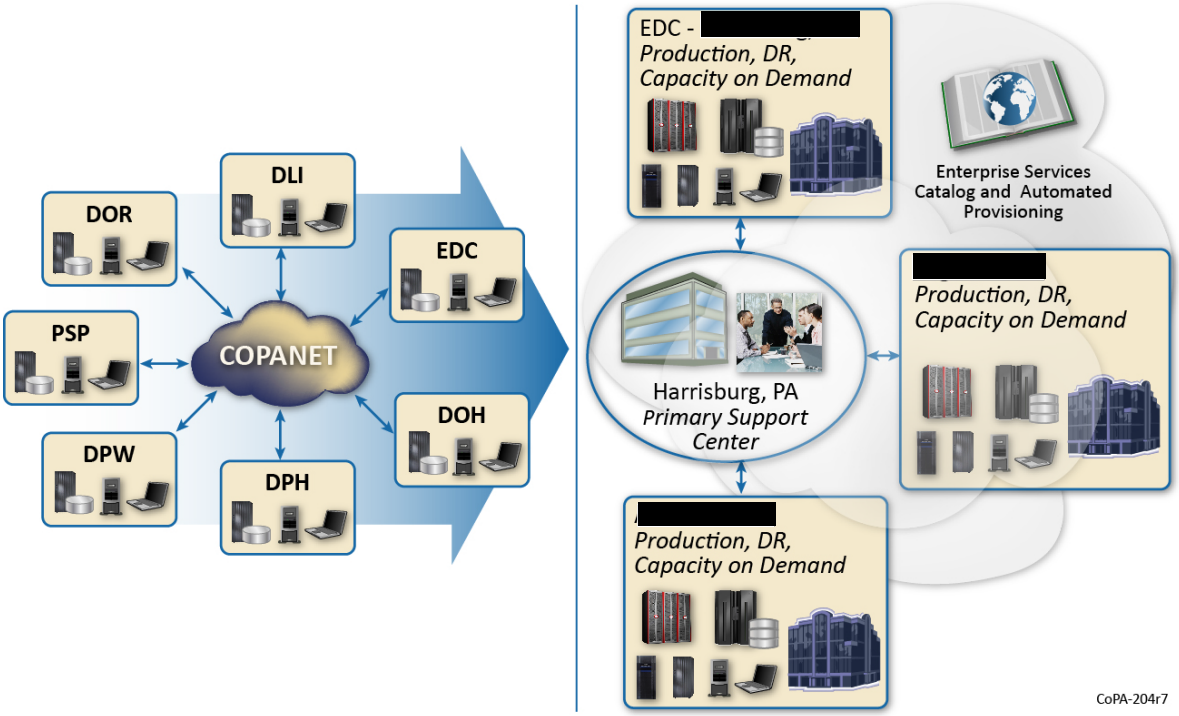

Figure 2-7. Proposed Data Center Architecture

Unisys also will deliver a modern disaster recovery plan and framework that leverages the use of Capacity-on-Demand computing to have the right amount of compute resources when needed eliminating the expense of having dedicated systems sitting idle. The Unisys approach to disaster recovery is based on systems as workloads that can be located in any facility that in turn can leverage capacity-on-demand models to make disaster recovery cost-effective moving forward.

While our compute centers are geographically dispersed to provide the maximum protection (risk reduction) flexibility and cost efficiencies, their operations will be integrated through the Component Based Operating Model depicted in **Figure 2-9**. The primary support center that will operate this model will be in the Harrisburg area, thereby providing not only convenient access by Commonwealth staff but also the opportunity to base the vast majority of our delivery and support team in Harrisburg avoiding the typical phone support only model provided by others

Common Infrastructure Architecture

Within each of the data centers is a common infrastructure architecture to support the Managed Hosting and Capacity-on-Demand Services. It is important to note there is no difference in the infrastructure platform to support Managed Hosting or Capacity-on-Demand thereby simplifying the management and provisioning efforts which enables the

ability to optimize and scale of workloads, which leads to cost efficiencies. The components that make up the infrastructure architecture are depicted in **Figure 2-8** below.

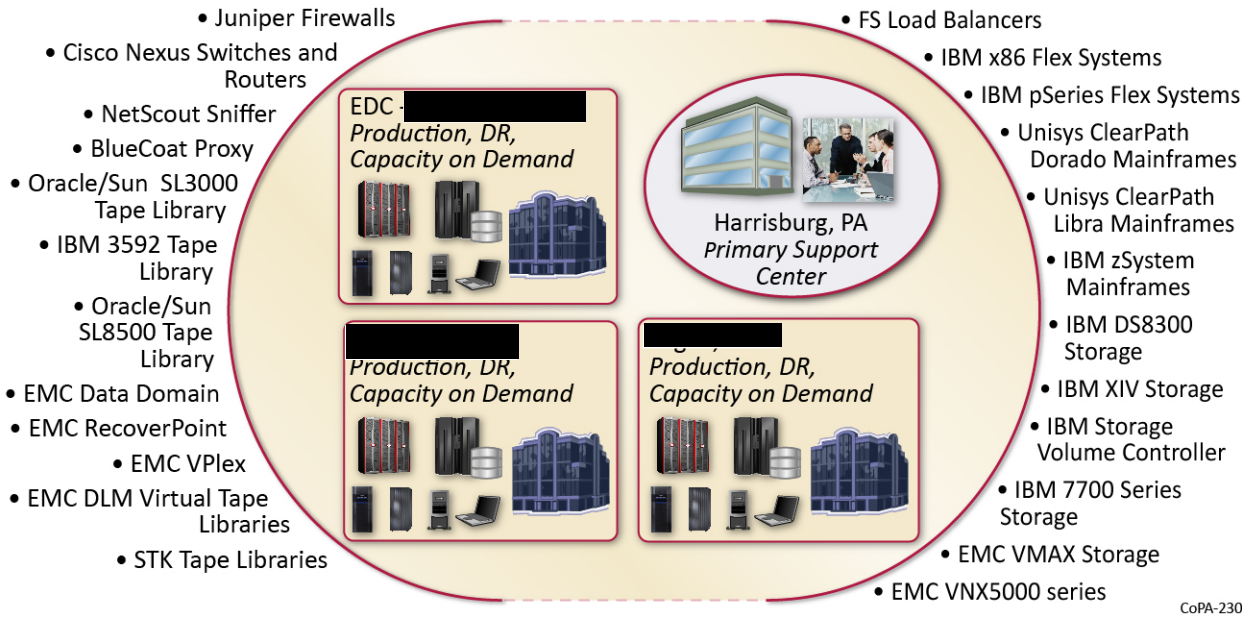

Figure 2-8. Common Infrastructure Architecture

Component Based Operating Model

To achieve the RFP's requirements, Unisys developed a component-based operating model as depicted in **Figure 2-9.** This model encompasses the requirements in the RFP and reflects a logical view that the Commonwealth can easily visualize. This compute services model illustrates the main deliverables and services and will sit on top of all compute data center facilities in **Figure 2-7** that Unisys provides for Commonwealth workloads, whether production or disaster recovery based.

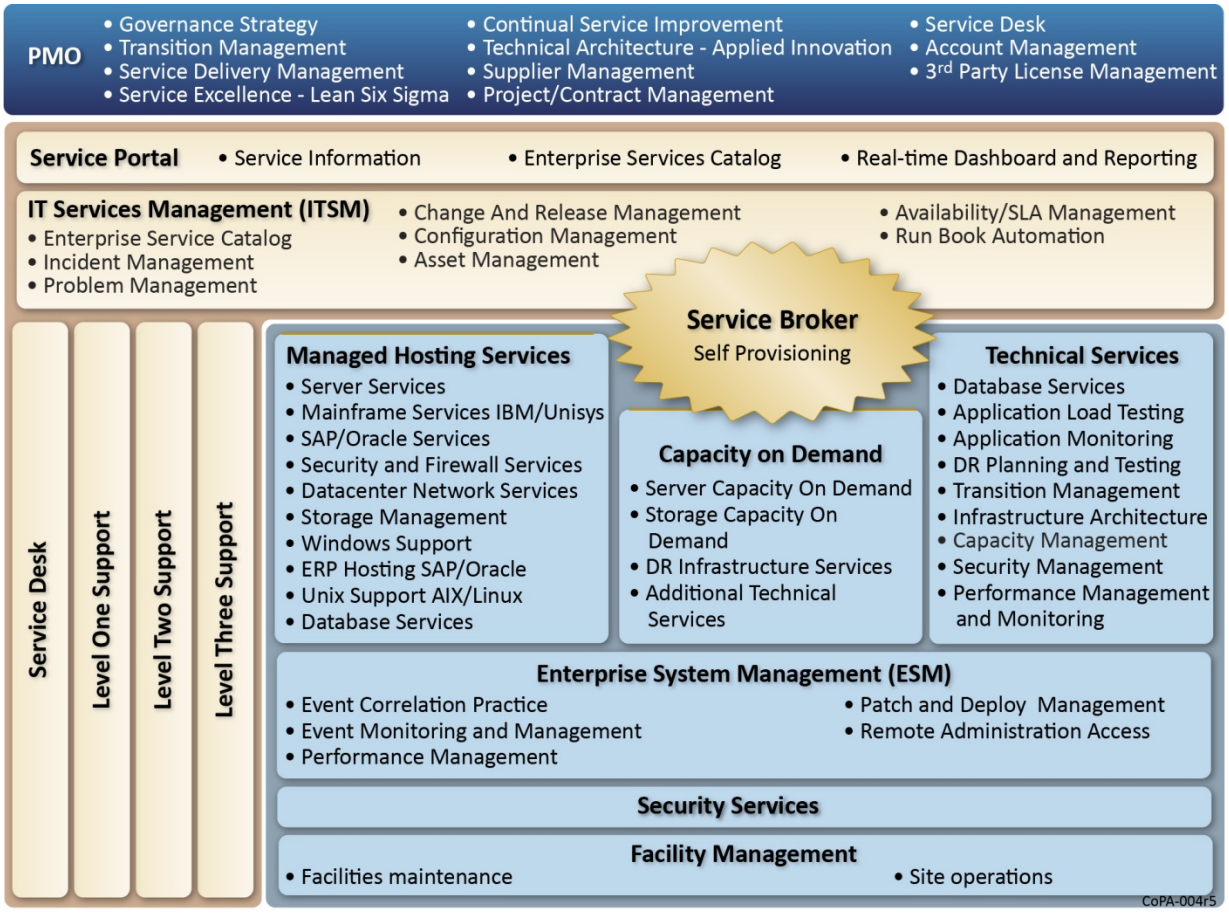

Figure 2-9. Component Based Operating Model

The Component Based Operating Model is broken down into the following components to support the requirements within the RFP:

1. **Program Management Office –** Establish a local and dedicated Program Management and Service Excellence Office that provides a focus on governance, a drive toward continued value, and cost savings by deploying Lean Six Sigma practices based on studies of cycle time and defect analysis from events that are extracted from the IT Service Management platform. By removing cycle time waste and defects of the operating environment, Unisys will provide the Commonwealth with continued cost savings and a higher quality IT compute environment. This same office is responsible for the ongoing governance of driving continuous service improvement and innovation.

2. **Service Portal –** Create an enterprise services portal, enterprise services catalog, and real-time dashboard to provide a single interface to all agencies to interact, provision, and be able to determine the performance of the IT operating environment in near real time. Each agency will have the ability to develop its own

personality with its service portal. Agencies will be able to configure their portals to develop their own "look and feel," determine the services they want to publish or offer, provision, and report on, in near real time, while still having access to the overall view of the enterprise as appropriate.

3. **IT Service Management –** Deliver an enterprise IT Service Management platform based on ITIL V3 best practices and Lean Six Sigma methods that drive the maturity of the IT operating model with a goal of achieving an efficiency gain of 5 percent year over year. Of significant importance is the development of an enterprise wide Configuration Management Database (CMDB) that defines the service that IT delivers to the Commonwealth. The creation of services in the CMDB will allow the Commonwealth to proactively determine business impact by determining a fault before it occurs and allowing maximum use of IT resources to reduce ongoing cost. Each agency will have its own instance in the service management environment to provide operating autonomy. Unisys will provide a federated service management environment to the OA so it has the overall view of the total IT operating environment at the Commonwealth. The Commonwealth can be comfortable knowing that Unisys supports a multitude of IT Service Management Systems, including BMC Remedy and ServiceNow. Our Component-based Operating model can be enabled with any one of the named IT Service Management Platforms.

4. **Managed Hosting Services and Capacity on Demand –** Enable an adaptive, flexible, and secure hardware compute environment that is based on a consumptive utility model with a "no volume commit" attribute that provides the agencies with the autonomy to perform their IT functions and meet their business requirements. In the Unisys compute model, there is fundamentally no difference between Managed Hosting Services and Capacity on Demand because they are served from the same hardware platforms and managed by the same ITSM management platform. As an innovation effort and to make sure the Commonwealth is aligned with market trends, the Unisys Team includes optional Virtual Private Cloud offerings from Microsoft and VMware in the Catalog of Services. From Microsoft, we included Azure, Office 365, and Dynamics as optional services. From VMware, we included its new offering in the marketplace for virtual private cloud capacity for Windows as an optional service.

5. **Service Broker –** Unisys will provide the Commonwealth with a consolidated, optimized, and centralized multitenant compute environment in which the agencies will not have to compromise their control by being able to self-provision workloads through the use of an enterprise service portal and catalog. Once ordered from the service catalog, the request will be processed through ITSM for change approval. When the request is approved, the Service Broker will invoke an automated runbook to execute the provisioning effort. Once the provisioning effort is complete, the runbook will update the Configuration Management Database. Agencies will be able to maintain a very real level of control over their compute environment required to meet the business need. As an innovation effort, the Service Catalog and

Service Broker will be an integrated pair to provision not only capacity from the private cloud environment we are providing the Commonwealth, but also all services from partners such as IBM, Microsoft, and VMware. Our vision for the Service Catalog and Service Broker is you can provision any service from any provider at any time with "no commit" that is then managed by the Component Based Compute Model provided in this RFP. One provisioning model and one management model will unify the compute model for the Commonwealth and provide the business flexibility and optimized compute environment the Commonwealth is looking for.

6. **Technical Services –** Unisys will provide a set of selectable services that can be procured from the services catalog to manage given applications in the Commonwealth agencies. These technical services can be people- or management-based services and can be procured in a consumption-based approach.

7. **Security Services –** Achieve and maintain a robust and comprehensive security environment that meets the IT Security policies set forth by the Commonwealth. This security environment will be managed by Deloitte, which has years of experience working with the Commonwealth to create, implement, and manage security policies.

8. **Facility Management –** Provide the ongoing management for all data centers whether Unisys or Commonwealth owned facilities.

9. **Service Desk –** The Service Desk will take calls from IT support staff to log incidents that were not automatically generated from the event monitoring system. The Service Desk will use knowledge management to try to resolve an event within an agreed time. If the event cannot be resolved in the agreed time, it will be escalated to Level One Support.

10. **Level One Support –** Level One Support manages all events that are automatically generated from the hardware and application environments as well as resolving incidents that are received from the Service Desk. Level One will use various tools, runbooks, and knowledge management to resolve incidents. If the incident is not resolved within a given time, it will be escalated to Level Two Support.

11. **Level Two Support –** Level Two Support is a team of very knowledgeable resources who can solve a wide array of Commonwealth compute issues. This team largely knows the individuals in the agencies and has an ongoing relationship with them. When Level Two Support believes it cannot resolve the incident in a timely way, it will pull in Level Three Support resources.

12. **Level Three Support –** Level Three Support is a team of architecture experts that deeply understands the compute architecture that supports the Commonwealth applications. This team is also an integral part of driving continuous improvement plan by identifying inefficiencies in the compute architecture.

Because of the Component Based Operating Model already described and the innovative approach to provisioning compute services, Commonwealth IT professionals may ask questions about how to provision workloads, how to manage and report on the workloads, and how to drive continuous improvement. To answer those expected questions, we provide brief summaries below.

"How do I provision workloads?"

The process will begin with logging onto the services portal that will be configured with a look and feel for each agency. In accordance with the agency and personal login credentials, users will be presented with the services they may provision. Provisioning a service will be an "Amazon-like" experience in which a user will select services from the catalog and provide quantity and key information to order the service. Once the "shopping cart" is filled, the order will be submitted and provisioned using the Service Broker. Each order processed by the ITSM system will have to be preapproved or approved when submitted. No runbook will be generated until a change is approved. Once a change is approved, the runbook will be executed to provision the desired service. Equally important, the CMDB will be automatically updated with the configuration information and the up- and downstream relationships as part of the runbook's execution.

"How do I manage and report in near real time the performance of those workloads?"

With the move to "IT as a business," it is imperative to be able to report in near real time the active performance, health, and quality of the IT services being provided to the Commonwealth. Unisys will provide real-time dashboards that are configurable by user preferences, meaning there are base profiles created for views for a CIO, CTO, Program Manager, and IT professional that enable these users to select the items they want to view on the dashboard. **Figure 2-10** is a representative example of a real-time dashboard.

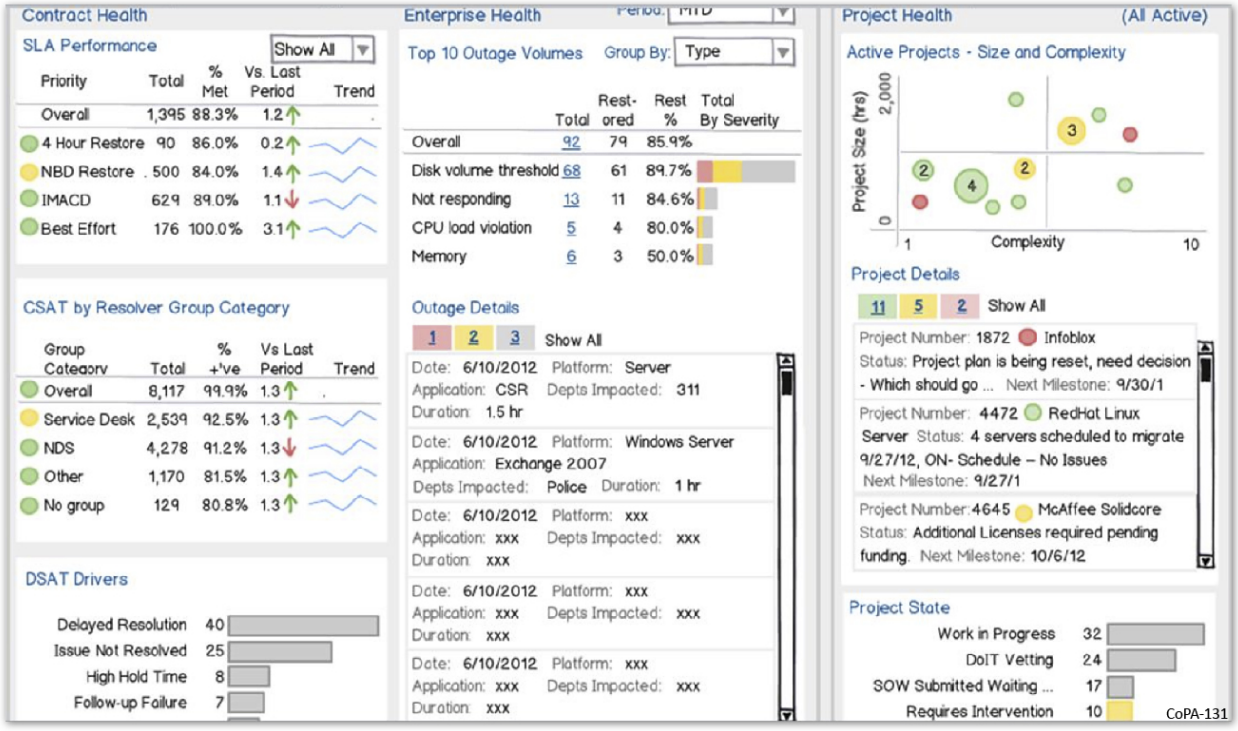

Figure 2-10. Real-time Dashboard

"How do I drive continuous improvement to drive greater value and cost containment?"

The Unisys team will provide a fulltime, dedicated Service Excellence Office. The office is responsible for driving Continuous Service Improvement to the Commonwealth throughout the entire ITIL V3 life cycle, across all Commonwealth Agencies, IT domains, and applications infrastructures. Unisys will apply Lean Six Sigma methodologies to analyze current and trending cycle times and defects collected from industry leading measurement tools. The Service Excellence Office will proactively eliminate anomalies to improve the operating environment from the time services are automatically provisioned through transition, implementation, and the ongoing IT Service Management. This will provide the Commonwealth with reduced costs, drive greater value, and increases quality while providing the Commonwealth with the highest client satisfaction experience.

To deliver and fully realize these solution's benefits, Unisys will develop and execute a comprehensive and reasonable work plan that focuses on the work effort to:

1. **Transition –** implement the component based operating model depicted in **Figure 2-9** across all future state data centers

2. **Migrate applications –** migrate the Commonwealth's applications to the new secure compute environment and immediately adopt the service reference architecture

3. **Implement Continual Service Improvement and Innovation Program (CSIIP) –** implement a continuous improvement program that drives out costs, generates additional value, and improves ongoing quality and client satisfaction.

Work Plan Overview – Simplified, Low Risk, and Based on Experience

Because of the critical nature of the Commonwealth's business systems, you cannot afford to have a service provider that needs to learn on the job. Unisys and our partners fully understand that the Commonwealth's critical business systems cannot be put at risk and that no unexpected downtime is acceptable. In building our proposed work plan, Unisys leveraged our knowledge and experience with the Commonwealth's infrastructure and business systems.

Work Plan – Low Risk and Based on Experience

Our competition may know the outsourcing business, but they do not know the Commonwealth to the degree of the Unisys Team. That is a critical distinction.

Our plan is realistic and achievable. During the first 28 months, the Commonwealth and our team will drive significant change. The realism of the Transition Work Plan is key to minimizing risk to the Commonwealth while we transform your current delivery processes and organization, implement new processes and organizations, and migrate applications from existing data centers to new locations.

On contract approval, Unisys will immediately initiate several actions. For example, the Unisys Team will mobilize in Harrisburg to begin the process of planning and initiating the transition. We will do this quickly because many of the identified resources are already on site and available to assist. Another action will be to formally stand up various governance teams and begin the flow of information. Some of our technical staff will prepare the various data center sites for migration and begin to install the network connections to COPANET. Concurrently, discussions will begin immediately to plan the EDC transition and DPH migration.

During this period and continuing through transition, our main responsibility will be confirming the current production systems are fully operable. Some of our current experts on these systems will actively engage with key members of the project teams; while others will maintain their focus on providing the high levels of service the Commonwealth has come to expect from our team. These experts will come together in the steady state to continue to provide and improve services that will meet or exceed all contractual commitments. **Figure 2-11** depicts the timeline for the various activities in the program.

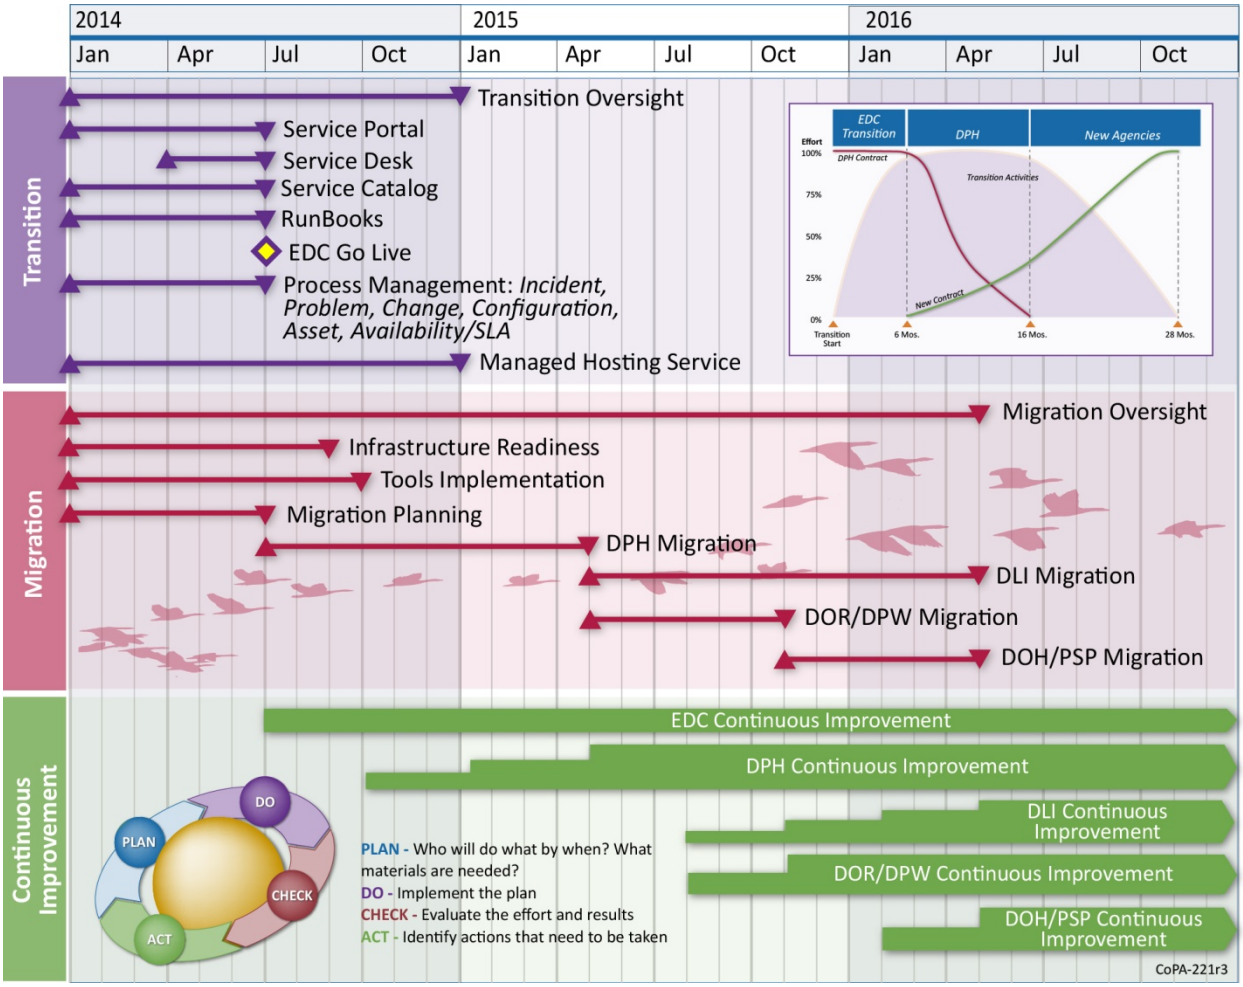

Figure 2-11. Work Plan Timeline

Transition

A major transition from the current operating model is required to achieve the objectives outlined in this RFP. Our approach to transition embodies our tenet of "Do No Harm." Therefore, we will use our detailed knowledge of the Commonwealth systems and lessons learned from prior transitions to mitigate risk. These include finalizing an aggressive but realistic transition plan with significant input from and approval of OA/OIT and the affected agencies.

Transition activities center on People (our team and your team), Process (policies, methodologies and procedures), and Technology (tools)—all required to successfully deliver the new component based operating model. One of the first tasks will be standing up our Program Management Office because it will play a key role throughout transition, transformation, and beyond.

At the core of our service delivery model is an IT Service Management Platform that supports the new processes and tools being implemented. This platform facilitates high-quality service delivery as well as improved sharing of information among all the new data centers, including the EDC. However, achieving the new model differs, depending on where current applications are hosted. The major difference is that the EDC will not be moving; therefore, all the tasks for a physical move of IT infrastructure and applications will be unnecessary for the EDC. An advantage for the Unisys Team is that we currently have significant technical resources helping to manage the EDC. Also, one of our partners, Domino, manages the PennDOT systems in the EDC. Together, we have knowledge of nearly all the technology. Therefore, we are very confident that we can methodically transfer total responsibility to our team in 6 months and very quickly the EDC will begin realizing the new model's benefits.

Transition and transformation of the DPH and the other agency data centers will require a complete relocation of applications and adoption of the new component based operating model. To accelerate the benefits of the new model to the Commonwealth, we architected the transition so that as applications are transferred to the new facility, they are operating in the transformed environment. That means you will receive value more quickly, and at the end of the transition, all systems will be transformed, in the steady state, and ready for a program of continuous improvement.

Application Migration

To migrate applications to the new data centers, the Unisys Team will be required to prepare the new data centers. These activities include establishing connectivity between COPANET and the data centers; establishing Commonwealth-specific infrastructure such as core LAN services; and implementing the infrastructure to support tools and shared infrastructure devices such as firewalls, backup, and monitoring. This project, Infrastructure Readiness, combined with the transition activities described above together will achieve the Operational Readiness milestone defined by the Commonwealth.

Because several migrations are required (DPH and five agency data centers), we will start with the DPH and then generally repeat the process (transition, infrastructure readiness, and so forth) above, incorporating additional lessons learned as we proceed. Again, a "Do no harm" strategy will be used to mitigate the risk of unplanned outages for all transitions and migrations.

In the Application Migration activities, there are three major focus areas:

- The first is **Operational Readiness,** which will provide the infrastructure and processes required to host applications. In these tasks, our team will create detailed designs and implement the Wide Area Network (WAN), Local Area Network (LAN), Storage and Backup infrastructure, Monitoring, Tools, Server Management, Dashboard, and Information Technology Service (ITSM) infrastructures.

- The second major focus area is the **Application Migration (AP) Planning,** which runs in parallel with Operational Readiness. In the planning framework, the AP team will analyze application affinity information gathered electronically as well as in meetings with the agencies and their application owners to determine application move groups. Draft application move group packages based on the information gathered will be created, results of the analysis will show which applications are related to share infrastructure with potential latency dependencies, schedule restrictions, size, complexity, or relate to and depend on other applications. A typical move package will not exceed 125 servers, instances, or images, including Wintel, Linux, or AIX instances and mainframe images. Applications will be targeted to the facility that provides the most benefits, but the Commonwealth will be the final approving authority of any plan.

- The last is the **execution of the migration plan** that overall will move thousands of agency applications in manageable phases. This by far will be the most intensive and most important of all the activities. Even though our team has significant knowledge of the various applications, this must be a collaborative effort with agencies to prevent unexpected interruption of the business of government. The Unisys Team will work closely with the OA/OIT and the agencies to develop detailed plans for each application to be migrated. These plans will include an Hour-by-Hour (HxH) plan, which will detail the step-by-step plans for the test, re-IP, and move events, which will include all precautions required to provide the appropriate level of security needed, fallback plans, testing and acceptance criteria, which will be used to determine the event's success.

As illustrated in **Figure 2-11**, the EDC's transition and transformation are planned to occur within 6 months, DPH within 16 months, and all agency data centers within 28 months. This schedule exceeds the requirements of the RFP and we believe is reasonable.

To oversee all these transition and migration activities is Unisys Transition and Program/Project Management. The Transition Executive, [redacted] will provide a collaborative, transparent, and candid process for the development and management of the plans, adherence to the plans through verified accomplishments, risk management, issue management, quality deliverables, and process improvement. The emphasis of our approach is to provide clear analysis of progress, identify opportunities for improvements, review lessons learned, and implement best practices for each project.

The Unisys Program Management Office (PMO) will have overall responsibility for meeting the contract requirements. Also, guiding and overseeing the Transition Program will be a Program Steering Committee comprising members from OA, agencies, Unisys, and our partner IBM. Also, Project Steering Committees will be used to guide and oversee each of the agency-focused projects.

Continuous Improvement

Unisys will establish a dedicated Service Excellence Office that proactively manages continuous service improvement, ITIL V3 process management, quality, and customer satisfaction through a comprehensive Quality Plan. This quality plan will focus on continuous service improvement, reducing risk, improving service quality, client satisfaction, and transparency, while reducing overall IT costs. We believe this is a key differentiator in our partnership with the Commonwealth. Unisys will develop, implement, manage and govern two detailed Quality Plans. The initial Quality Plan will be a Transition Quality Plan to make sure that quality is a primary focus in the critical Transition of the Commonwealth agencies to the new IT Services contract. Unisys will then develop and manage the IT Services Management Quality Plan, for steady state ongoing operations.

As applications are migrated to the new data centers, they will operate using the new tools and processes, thereby realizing the benefits of the new compute services model. Once applications and systems are transformed, they will reach the steady state. The future steady state model will leverage disciplined processes aligned with ITIL V3 best practices and accountability to deliver against stringent SLAs across more than 30 categories. This evolution from the current state to the future state will leverage state-of-the-art technology and tools coupled with the component based operating model as defined in **Figure 2-9**, and up-to-the-minute statistical reporting across the enterprise displayed on high-tech dashboards at the fingertips of Commonwealth agencies.

To keep these systems optimized, we propose an active and ongoing program to continually find new technologies or new processes that improve performance or lower the cost of operations. We call this our Continual Service Improvement and Innovation Program (CSIIP).

To optimize performance for the Commonwealth during steady state operations, Unisys will implement an ongoing program of Continual Improvement, as depicted in **Figure 2-12**. We developed and use a methodology that has worked well for our clients worldwide, and we will implement it at the Commonwealth. Collaboration is the main premise, and we know from experience that the Commonwealth wants to actively participate in bringing positive change to its compute operations. This program will be led and sponsored by the Service Excellence Office on the Unisys Team.

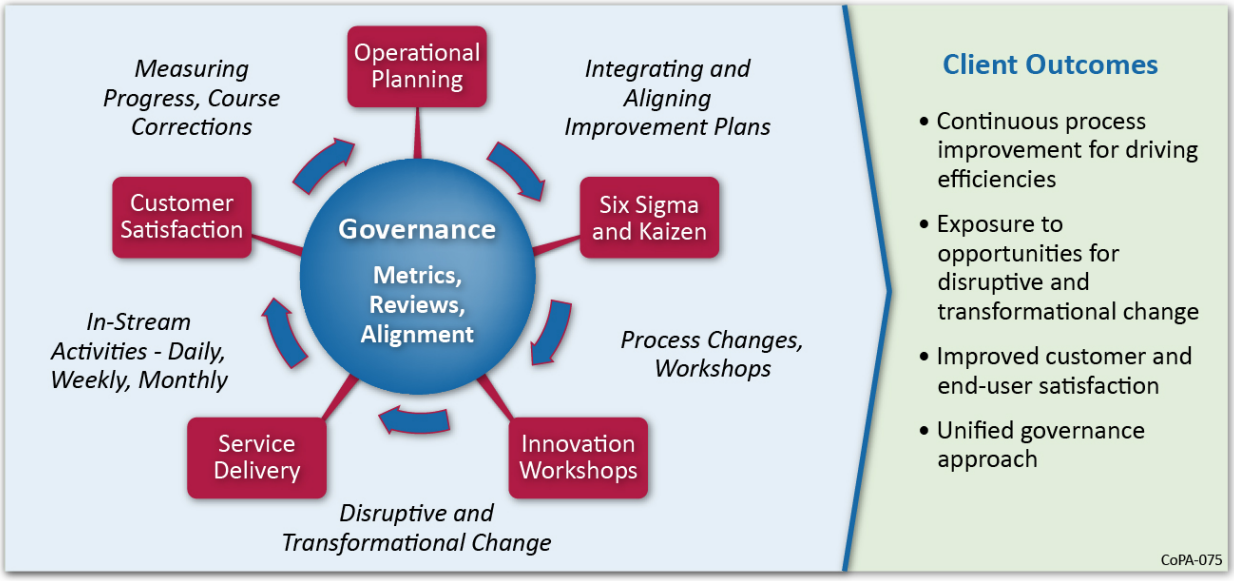

Figure 2-12. Continual Service Improvement and Innovation Program (CSIIP)

Rather than an ad hoc compilation of capabilities, tools, and methods, the CSIIP provides Unisys with a continuous and systematic way to deliver improvement and innovative outcomes for the Commonwealth by leveraging a highly structured yet flexible approach depicted in **Figure 2-12**. Two key elements include our CSIIP and Innovation Workshops.

The CSIIP process includes two types of workshops, Improvement/Kaizen or Innovation Workshops. We will use a global pool of trained facilitators who have conducted workshops across a wide range of industries worldwide.

Improvement/Kaizen workshops are joint sessions between the Commonwealth and Unisys, which focus on identifying opportunities for improvements and categorizing, prioritizing, and developing high-level business cases and implementation roadmaps for the most promising opportunities. Opportunities are governed on a SharePoint portal to provide agencies with visibility and transparency to the continual improvement process.

One of the CSIIP's major features is the ability to consolidate and analyze the many inputs required to effectively develop an innovation and improvement plan. This will provide the Commonwealth with the necessary information to make informed decisions based on relative cost/benefit, alignment with strategy, and ROI for various actions of varying scale from incremental through to truly "breakthrough" initiatives.

Unisys will also collaborate with the Commonwealth by hosting innovation workshops to drive continuous innovation. These workshops will focus on opportunity identification, categorization, prioritization of innovation opportunities, and then on the development of high-level business cases and implementation roadmaps for the most promising opportunities identified.

Innovation is what drives businesses and organizations to excel and is required to meet the ever increasing need for 'faster-better-cheaper.' Unisys' approach looks at all aspects of innovation (strategy, people, process and technology). All are required to be aligned for a program to be successful and impactful. Unisys will work with the Commonwealth and its agencies to clearly understand their strategic IT vision and then work with the each to provide a programmatic approach to innovation. Unisys will work with the Commonwealth to implement a "high-yield innovation pipeline" process to identify and incorporate new innovations into the Commonwealth Agency's IT and infrastructure for the Pennsylvania citizens receiving services.

"The Commonwealth has been a valued Unisys customer for many years. Together, we successfully completed major projects that have provided significant innovations and value like the DPH. I am confident that, if entrusted with this most important engagement, our team will raise the bar even higher for the Commonwealth and its citizens."

—Ed Coleman
Commonwealth Executive Sponsor
Chairman & CEO

The work plan we identified will provide a thoughtful, realistic, and achievable roadmap to meet the RFP's requirements, and just as important your high expectations for delivering a solution that will make the Commonwealth a leader in enterprise compute services.

Innovation Workshops

Unisys Innovation Workshops are collaborative workshops with the Commonwealth designed to explore opportunities for disruptive and transformational change. We will expose the Commonwealth to the latest disruptive technologies and trends and collaboratively examine opportunities for strategic business benefit.

Why the Commonwealth Should Choose the Unisys Team?

All critical services delivered by Commonwealth agencies will depend on this engagement's success. Therefore, it is vital to identify and mitigate all risks so the transition to a new operating model can happen without unplanned outages or reduction in service levels. The consequences of failure are immense and frankly unthinkable.

The Unisys Team of premier technology and service companies has the most experience and knowledge specific to the Commonwealth. As the Unisys Team has been the sole provider of managed DPH services to the Commonwealth, no other offerer can claim this level of expertise. Our experience includes a 13-year track record—measured and reported monthly—that no other team can claim. We have vast knowledge of the existing infrastructure, thousands of agency applications, and Commonwealth processes and business environment. This experience and knowledge will be essential to mitigate risk associated with this innovative endeavor and ultimately meet your high expectations.

And because we are your current service provider, we have greater flexibility and offer more opportunities to customize the work plan to further mitigate risk and meet individual needs of the many agencies that depend on these services. The challenge of the DPH contract's termination on December 31, 2014 will become much less of an issue.

In 1999, we accepted the challenge of consolidating the Commonwealth's 17 data centers and succeeded. In 2008, we accepted the challenge of reinventing Commonwealth operations to shared services, saved $240 million and succeeded. Now in 2013 and beyond, we are totally committed to accept this new challenge and successfully deliver the results expected by this RFP.

3.0 Work Plan

3. WORK PLAN (RFP REQUIREMENT II-3) 3-3

3.1 WORK PLAN OVERVIEW 3-4
3.1.1 Unisys Team Qualifications 3-4
3.1.2 Work Plan Description 3-6
3.2 DETAILED TASK PLAN 3-12
3.2.1 Transition Services 3-14
3.2.1.1 Account Organization 3-14
3.2.1.2 Enterprise Data Center (EDC) to Managed Services Model 3-15
3.2.1.3 Tools Implementation 3-16
3.2.2 Application Workload Migrations 3-17
3.2.2.1 Operational Readiness 3-17
3.2.2.2 Agency Application Workload Migrations 3-18
3.2.3 Transition Program Management 3-19

ATTACHMENT 3–8 — SCHEDULE K: KEY PROGRAM DELIVERABLES 3-61
ATTACHMENT 3–9 — SCHEDULE J.3: SERVICE LEVEL AGREEMENTS 3-63

"Over the past few years, I have seen a rapid change in focus from individual technology and component management to integrated services and management. Using integrated service management, along with of ITIL V3 based processes and hybrid cloud services, IT organizations have improved capabilities to align IT usage and design with business requirements and strategic direction. By taking the integrated service management approach and selecting the technologies which meet the current requirements while providing the flexibility to adjust to future needs while maintaining the expected level of service delivery."

North America Lead Solution Architect
Global Managed Services

3. Work Plan (RFP Requirement II-3)

RFP	*Requirement*
II-3	*Work Plan. Describe in narrative form your technical plan for accomplishing the work. Use the task descriptions in Part IV of this RFP and Schedule F as your reference point. Modifications of the task descriptions are permitted; however, reasons for changes should be fully explained. Indicate the number of person hours allocated to each task. Include a Program Evaluation and Review Technique (PERT) or similar type display, time related, showing each event. If more than one approach is apparent, comment on why you chose this approach.*

This work plan presents the key steps we will take to transform the delivery of information technology to the Commonwealth. Our work plan implements a forward-looking vision of the Commonwealth requirements that shape how we will conduct ourselves and carry out our mission within the Commonwealth. This vision provides a roadmap for addressing the Commonwealth's enterprise-level technology transition, migration, and operations for the next decade. Many of the projects in this plan are not easy; they will test the resolve of our team and the Commonwealth as we move towards completion. However, we are extremely confident our plan is strong, our people are stronger, and the on-demand service delivery model will be successful.

What follows in this section is a detailed explanation of how we will accomplish transition of services, migration of infrastructure, operations and program management over the life of the project. As we have been guided by the RFP, this section responds to Part II, **Part IV,** and **Schedule F** task descriptions in our narrative, followed by related information contained in **Schedules C, E, F, H, J.3, K**, and **M**. Where appropriate, we will make references from the narrative text to information in these schedules.

We begin with a brief overview of the personnel responsible for the accomplishment of the work plan, their qualifications, and a discussion of the high-level summary timeline for the activities in the program. Then a narrative describing the specific tasks at a more detailed level follows this overview. We include a discussion of the program management we will employ on this program, followed by a narrative about the project's first phase—transition of services, which sets the stage for ongoing operations and management of the program in the steady state.

Following the transition services section, we discuss the migration for the hardware infrastructure, including achieving operational readiness and the actual data center moves.

We then discuss project governance, a key element for the program's success, followed by a discussion of the reporting we will provide to enable ongoing communications of the overall and individual areas of performance, issues, and risks.

Additional service requirements from the RFP, Part IV are then covered, including Emergency Preparedness, Service Level Agreements, the Enterprise Services Catalog, the locations for various program activities, and business and technical requirements. This section also includes additional acknowledgement of your conditions for using Small Diverse Businesses, authorization of any changes to the services provided, and conditions for payment.

3.1 Work Plan Overview

3.1.1 Unisys Team Qualifications

The team of Unisys, IBM, Deloitte, and our small business partners deliver more than 150 years of combined corporate experience working with the Commonwealth to deliver hardware infrastructure, system software, applications, and related services. No other team can deliver our depth, experience, and level of knowledge of agency applications and the supporting infrastructure.

Our People Are Our Strength

With experience gained in providing successful services under the existing Data PowerHouse (DPH) and Enterprise Data Center (EDC) contracts over the past 13 years, our team understands agency and multi-agency application interdependencies. For example, PSP's Criminal Law Enforcement Assist Network (CLEAN) system and that application system's interdependency on the availability of both JNET's gateway services and PennDOT's vehicle registration system. To properly support the Commonwealth's critical business ongoing and especially during a transition, the Commonwealth needs an experienced service provider and can ill afford a vendor that will be learning on the job.

Our people have Significant Transition Experience with the Commonwealth—this fact will facilitate success during the transition and significantly mitigates risk;

- *Our team is expert in the technology required to support your applications.*
- *Our experience delivers a solution design optimized to drive the performance, stability, and security of your applications.*

Since our team either invented or supplied most of the current infrastructure within the scope of this RFP, we are experts in the technology required to support your applications. Both our unique infrastructure experience and knowledge of the Commonwealth's business applications were leveraged to provide a solution design that is optimized to drive the performance, stability, and security of your business applications.

While other service providers will struggle to understand how to perform a successful migration of this size, we will use our combined experience and unique knowledge of Commonwealth applications to mitigate risk in all areas and successfully execute as we have in the past:

- Our transition strategy focuses intently on risk mitigation
- We clearly understand that transition requires moving your applications and data, not simply replacing hardware and shuffling people.

[redacted] Engagement Executive, will be leading the PMO and supporting [redacted] Transition Executive and [redacted] Sr. Enterprise Architect in the development and execution of the Work Plan. These three executives have extensive experience in defining, directing, and executing successful transitions, migrations, and steady state operations for large clients with complex outsourced infrastructure environments.

Ann thoroughly understands the Commonwealth's goals for the new Data Center Services contract. She has achieved success managing similar consolidation and Data Center compute services migration initiatives as Vice President of Technical Services at Cegedigm-Dendrite. Under her direction, the team had many successes, including designing and building a world-class data center from the ground up, then migrating dozens of customers to the center without disruption. The initiative's scope included consolidation of 3 data centers and 45 customer migrations. In 2008 and 2009, she oversaw the Commonwealth's major transformation and infrastructure consolidation initiative with the existing Unisys DPH contract extension. Ann has a deep and detailed knowledge of the DPH's current operations. She will leverage that knowledge in the planning and execution of the transition and migration to the new data center model we propose.

[redacted] comes to Unisys from Dell Services after serving as the Transition Manager for many and directly leading of its largest transitions and migrations. In January, Scott joined the Unisys Team locally and has worked closely with many on the DPH contract to understand the current relationship as well as chart the course for the Commonwealth's Data Center Consolidation effort. Understanding the importance of a successful transition, Unisys was willing to make this investment early. To properly migrate a project of this size, Unisys recognized the need for a dedicated and local Transition Manager and unlike our competition, Unisys did not want to wait to see if we would be awarded this business. He brings a strong background in Transition, Transformation, and Data Center Migration programs, including large hospital corporations as well as the hospitality industry. Scott also brings the unique understanding of how accounts need to execute and adjust to the

client's needs from his time as a client delivery executive serving clients in industries as diverse as steel, retail, publishing, telecommunications, and gaming. This experience, along with his skills in program and project management, provides a strong blend that will help the Unisys Team to succeed.

[redacted] joined Unisys in 2011, working primarily in Harrisburg and gaining an understanding of the current DPH environment, after working as a transition and transformation architect at IBM for 8 years. Bryan, who will also be based in Harrisburg, developed the initial rate card for our proposed Self-Provisioning Project for the Commonwealth and provided architecture support for the successful pilot conducted in 2012. He was instrumental in developing of the overall technical solution of our proposed compute services in response to this RFP. While at IBM, Bryan led the Transition and Transformation architectural team for the State of Georgia's data center migration plan, which included many of the computer services requested by the Commonwealth, including a centralized data center, common compute services architecture for the state, and well-planned application migrations to the central data center. Bryan also led the Transition and Transformation team in the migration and consolidation of a medium-sized telecommunications corporation from multiple data centers and service models to a single managed data center. Bryan's understanding of developing multitenant data center architectures and the impact of federal and state regulations will enable the Commonwealth to migrate to the Compute Services model while also maintaining the flexibility to meet individual agency requirements.

This is a brief introduction of our core team that developed the overall strategy for the program's Transition and Migration phases. They have worked closely with the architectural team to plan these critical phases of the project leading to steady state operations. They hold key management positions in the new ongoing organizational structure. Details on the Unisys key staff and our complete organization can be found in Section 5 Personnel.

3.1.2 Work Plan Description

The program activities have been designed in three primary parts or phases: (1) Transition, (2) Migration, and (3) Steady State Operations, which is expected to be achieved by Month 28 of the program schedule. The overall program is supported by a program management framework which includes detailed planning, effective communication, and status tracking. This section includes a high level narrative of our proposed work plan along with selected pictures of the detailed work plan which is included in Attachment 9 to Section 3.0 – Schedule M. This section also includes details on the Unisys methodology that was used to design our proposed program plan and will be used to refine it based on Commonwealth feedback.

Transition activities build the foundation that the steady state organization needs to function including development of the final organizational plan, the communications plan, the financial management plan, and the development of policies and procedures, which will govern and guide the program's steady state operation. This activity sets plans and executes the transition from the current steady state operations model to the new operating model.

Transition consists of projects and tasks that will be executed to support the implementation of the resources, processes, procedures, and tools required to effectively deliver steady state data center compute services to the Commonwealth. In other words, we will create the IT service management infrastructure to support the new environment's hardware and software infrastructure. Transition will be broken further into smaller projects such as Tools Implementation, Transition of Services, and Service Desk Implementation. Examples of these types of activities include the implementation of BMC's Remedy system, implementation of revisions to Service Management processes like change management, hiring and training of transition PMO staff, and knowledge transfer for implementation of Managed Services. In this phase, we will leverage our significant knowledge and broad experience with the Commonwealth to speed this process.

Migration activities focus on the relocation and provisioning of both the physical infrastructure and planned movement of applications to the target platforms. The re-envisioning of the current DPH, EDC, and incorporation of agencies currently outside the managed services contract will be planned, focused teams will be established to address each migration, and they will execute the individual actions required to accomplish the migration.

Migration will be comprised of activities that prepare the receiving data centers for the migration of applications, often called Infrastructure Readiness, as well as projects that will migrate applications and their data from Commonwealth Data Centers to Unisys facilities. The projects will be organized around migrating applications from each data center and be broken into manageable sizes. For example, the DPH Data Center will be broken into approximately nine smaller projects with scope based on inter-application dependencies, number of servers, and applications.

Transition Program Management activities consist of tasks that the Transition Program Office will execute to improve each project's performance in quality and performance to schedule. This will include tasks such as quality reviews; gathering and distribution of lessons learned, status meetings, and reports; and oversight of the project schedule rollup. Key attributes of these tasks are consistency, sharing, adjustments, and oversight.

As the incumbent vendor, Unisys will continue to provide outstanding service to the Commonwealth's mission-critical application infrastructure hosted in the DPH and staff augmentation services to the operations in the EDC until each location is fully transitioned to the new model. Our incumbency provides us with the uncommon ability to seed the transition and migration teams with knowledgeable resources who understand the

Commonwealth infrastructure, considerably reducing ramp-up time training staff on basic infrastructure support and each agency's priorities and nuances. It is during this time that we will accelerate our focus on reforming our organizational structure and work processes to meet the new model's changing requirements.

Once the transition activities conclude, **Steady State Operations** begins using the new operating model, which is developed during the Transition and Migration phases. Continuous Service Improvement activity commences during this phase providing opportunities to assess, design, and implement changes to the program processes to increase the value of the services to Commonwealth.

Table 3-1 below shows a projection of the work effort required to complete the transition by major activity.

Table 3-1. Transition Work Effort by Major Activity

Task Activity	Total Person Hours Allocated
Transition Project Management	42,705
Transition of Services	157,186
Tools Implementation Project	18,784
Infrastructure Readiness Project	45,869
Application Workload Migrations	56,998

The following Gantt chart shown in **Figure 3-2** provides a very high-level view of the timelines for the overall activities of this program.

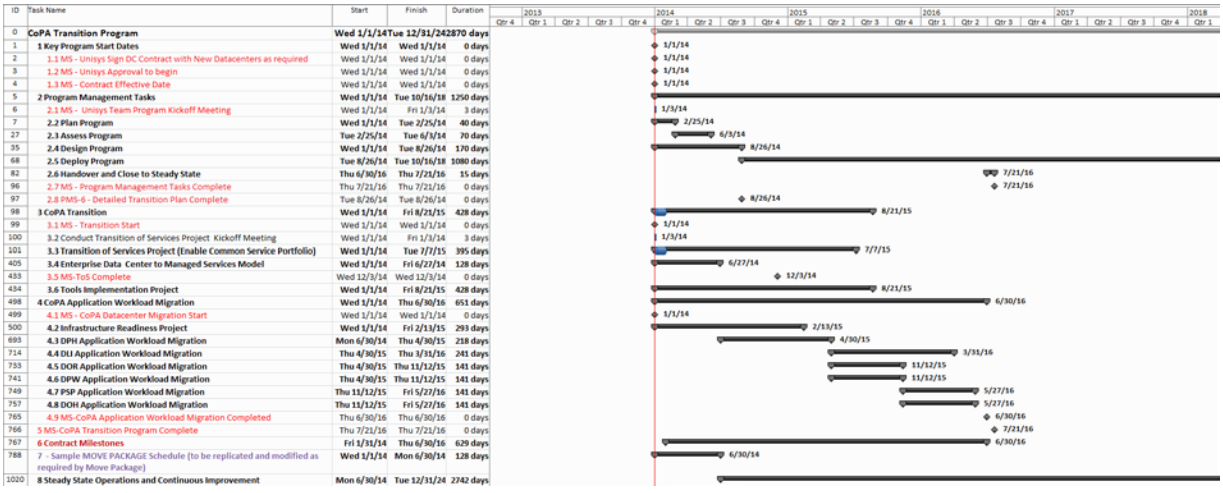

Figure 3-2. High-level Schedule of the Commonwealth's Transition Program

Transition Program Management Office – Project Start up

During **Month 1** of the program, much focus will be placed on program startup and long lead-time activities such as placing orders for the establishment of the telecommunications infrastructure. Executive planning sessions will be held to confirm a common understanding of scope, priorities, and timing. The Unisys Team will work with the Commonwealth to begin reviews and joint planning sessions for the Transition of Services, Tools Implementation, and Operational Readiness, which are critical to the EDC's transition to a Managed Services model. Unisys, IBM, and Deloitte are in the exceptional position to be able to leverage existing knowledge to expedite the turnover to the Unisys Team. Also, our account architecture team will create the architecture deliverables and review them with the Commonwealth to allow for long lead-time items such as circuits, core network equipment and storage, x86, AIX, and mainframe 'seed' equipment to be ordered.

During **Month 1** we bring key personnel on board to support the new contract starting with our Engagement Executive, [redacted] our Transition Executive, [redacted] our second Transition Manager, [redacted] and our Senior Enterprise Infrastructure Architect, [redacted] We will backfill positions currently held by Ann and Dave on the DPH contract. This team will lead all aspects of the transition efforts. We will also bring on our Service Excellence Officer, [redacted] to build our Service Excellence Office that will initially reform workflows of existing ITIL V3-aligned processes to meet the new services model requirements.

Transition Assessment and Data Gathering

Months 2 and 3 will contain many design and data gathering activities. We will begin the Tools Implementation tasks. The data center migration teams will begin analyzing the data collected from the BMC Atrium Discovery and Dependency Mapping (ADDM) tool to create move packages. Move Packages are defined as a group of dependent applications and data across several infrastructure components. We will conduct initial planning sessions with the Commonwealth stakeholders to solidify the order and timing of data center migrations. During this period, our key personnel will acclimate, and our Transition Program Management Office (TPMO) will be taking shape. As we move into Month 2, a team will begin detailed planning on the EDC's transition to quickly facilitate the transition to the Managed Services model.

It is also during **Months 2 and 3** that our executive leadership will work with Commonwealth executive leadership to solidify our approach to governance, communication, and reporting for steady state ongoing services, which will begin from the day an application is migrated to a Unisys Data Center, or workload in the EDC transitions to the managed services model. As dates are assigned to move packages, we will finalize the specific staff transition timeline for moving existing staff with Commonwealth knowledge to the new contract and we will start infusing our teams on both sides with new resources from IBM, Deloitte, and our SDB partners. We will on-board our Agency Account

Managers to acclimate the agencies to the changes in procedure and the support organization between the existing contract and the new model.

Transition Program Development – Process/Tool Refinement and Implementation

Many contract milestones will be completed in **Months 4 through 8.** To accomplish these milestones, we will complete the implementation and integration of the ITSM System with the Commonwealth ITSM system along with drafting of the CCPM. The ITIL V3 processes will be finalized and rolled out to the team. The Unisys Data Center core infrastructures will be installed, tested, and connected to COPANET, which will result in operational readiness. Toward the end of this period, the Data Center Migration Teams will begin detailed planning on the DPH migration to facilitate complete migration within 16 months. The Unisys Team will initiate training of the Commonwealth stakeholders that will cover many aspects of the contract, operational procedures, and review of strategy and plans aligned with program key deliverables.

At this time, the Unisys Team will complete the transition of the Enterprise Data Center from the current staff augmentation model to the new managed services model. Existing Unisys Team members augmented with additional staff will completely assume the site's management responsibilities. After the Enterprise Data Center is operating in the steady state, agencies with applications hosted in the EDC can order additional services through the Enterprise Services Catalog and change order processes, and the Unisys Team will be accountable for EDC Service Level Agreements (SLAs) under the new contract.

DPH Application Workload Migration

Months 9 through 16 will focus almost exclusively on planning and executing the DPH migration. To achieve this, Unisys, IBM, and the Commonwealth will work closely to plan the migration projects. The Unisys Team will be augmented with additional project management and technical resources that will perform migration tasks directly, or backfilling DPH team members who will be reassigned to provide a strong foundation of knowledge and experience to the DPH migration effort. The Commonwealth will verify the move packages that were identified by the Migration Team, develop and refine test plans for each application, and participate alongside the Unisys Team throughout the project to deliver a successful move. During this period, the Migration Team will put a strong communications strategy in place and plan to enable all stakeholders to have access to schedules and project plans. Unisys will develop a communications cadence of notifying affected users 30, 7, and again 2 days before any significant events such as re-IP events (if necessary) and move events.

Because the DPH will be migrated in at least nine separate move packages, an agency could have application infrastructure managed at the Willow Oak Data Center and the Unisys Data Center concurrently. As the migration move packages are relocated to the Unisys Data Center and the application infrastructure for each application is operating in the steady state, agencies with applications hosted in the Unisys Data Center can order

additional services through the Enterprise Services Catalog and Change Order processes, and the Unisys Team will be accountable for SLAs under the new contract. For all application infrastructures that remain at the Willow Oak Data Center, the Unisys Team will be accountable for SLAs under the current DPH contract until the infrastructure is relocated to the Unisys Data Center. By Month 16, the Unisys Team will complete the migration of the Data PowerHouse agency application infrastructure from the Willow Oak Data Center to the Unisys Data Centers.

At the end of **Month 16**, the DPH contract will officially expire, and all relevant staff supporting the existing DPH and EDC workloads will have transitioned to the new contract.

Unisys recognizes the importance of maintaining uninterrupted focus on the DPH migration due to its size, application interdependency complexity, and importance to the Commonwealth. With this in mind, no other migrations are planned during that time.

Agency Application Workload Migration – DLI, DPW, and DOR

As the DPH migrations are wrapping up in **Month 16,** the migration teams will turn their effort to the DLI, DPW, and DOR Data Centers in **Months 17 through 22.** DLI was chosen for the second wave of moves because of its size and complexity. The migration team is allowing up to 12 months for this move. IBM will take the lead on this migration because of its knowledge and experience with the Department of Labor & Industry (DLI). The Department of Revenue (DOR) is also included in this wave to avoid over allocation of DOR resources during its busy tax season. This wave also includes the Department of Public Welfare (DPW) Data Center.

Agency Application Workload Migration – PSP, DOH

In **Months 23 through 28,** the migration team will plan and relocate the applications within the Pennsylvania State Police (PSP) and Department of Health (DOH) Data Centers. Again, we took the time of year into account for the PSP Data Center migration. This wave is planned to begin in January 2016 and complete in June 2016, which will avoid busy summer and year-end holiday months.

As each agency application migration completes, the Unisys Team will officially assume responsibility for providing managed services to the agency from the Unisys Data Center, and when operational in steady state, the Unisys Team will be accountable for the achievement of service level commitments.

As Unisys and the Commonwealth conduct detailed Migration Planning beginning in Month 4, the order and combinations of data centers by wave may change as we continue to refine the planning and movement of the various agencies' infrastructure.

After transition and migration are complete, our fully populated steady state organization, processes and tools will be fully deployed and operating in the new environment. New

capabilities of capacity on demand, self provisioning, an expanded Service Desk capability, and ITIL V3 processes will be available and in use at this time. Further details of the transition from the current state to the new state of the Commonwealth's compute environment can be found in the following sections; a thorough discussion of the topic is provided in **Schedule M.**

3.2 Detailed Task Plan

The Unisys Work Plan is focused on the accomplishment of transition, migration, and steady state. Transition begins with a series of projects, tasks, and activities. Transition includes the required steps to implement a managed services model. Our Team will work closely to design and implement the processes, tools, and organizational structures required to deliver continuous services to the Commonwealth and stakeholders. The work products from these services will support the PMO and the rest of the team during execution of ongoing operations. A key element of the transition is transfer and implementation of the Unisys standard management toolset. This includes BMC Remedy ITSM, (Nagios) for monitoring, and BMC's Atrium Discovery and Dependence Mapping (ADDM) tool.

Our team will work with the Commonwealth to identify a technology refresh plan for existing hardware in the EDC during the EDC transition. Unisys will work with the Commonwealth to address a continuance of hardware maintenance until the infrastructure is replaced.

The daily TPMO operations will be tightly aligned with the PMO operations. [redacted] and her executive leadership team will drive effective handoffs of transition projects to the steady state. For transition architecture strategy and support, the TPMO will interface directly with the Senior Enterprise Infrastructure Architect, [redacted] and his team of Agency Infrastructure Architects.

Figure 3-3 shows the proposed Level 2 schedule for the Commonwealth's Transition Program.

ID	Task Name	Start	Finish	Duration
0	**CoPA Transition Program**	**1/1/14**	**12/31/24**	**2870 days**
1	**1 Key Program Start Dates**	**1/1/14**	**1/1/14**	**0 days**
2	1.1 MS - Unisys Sign DC Contract with New Datacenters as required	1/1/14	1/1/14	0 days
3	1.2 MS - Unisys Approval to begin	1/1/14	1/1/14	0 days
4	1.3 MS - Contract Effective Date	1/1/14	1/1/14	0 days
5	**2 Program Management Tasks**	**1/1/14**	**10/16/18**	**1250 days**
6	2.1 MS - Unisys Team Program Kickoff Meeting	1/1/14	1/3/14	3 days
7	**2.2 Plan Program**	**1/1/14**	**2/25/14**	**40 days**
27	**2.3 Assess Program**	**2/25/14**	**6/3/14**	**70 days**
35	**2.4 Design Program**	**1/1/14**	**8/26/14**	**170 days**
68	**2.5 Deploy Program**	**8/26/14**	**10/16/18**	**1080 days**
82	**2.6 Handover and Close to Steady State**	**6/30/16**	**7/21/16**	**15 days**
96	2.7 MS - Program Management Tasks Complete	7/21/16	7/21/16	0 days
97	2.8 PMS-6 - Detailed Transition Plan Complete	8/26/14	8/26/14	0 days
98	**3 CoPA Transition**	**1/1/14**	**7/17/15**	**403 days**
99	3.1 MS - Transition Start	1/1/14	1/1/14	0 days
100	3.2 Conduct Transition of Services Project Kickoff Meeting	1/1/14	1/3/14	3 days
101	**3.3 Transition of Services Project (Enable Common Service Portfolio)**	**1/1/14**	**3/27/15**	**323 days**
405	**3.4 Enterprise Data Center to Managed Services Model**	**1/1/14**	**6/27/14**	**128 days**
433	3.5 MS-ToS Complete	12/30/14	12/30/14	0 days
434	**3.6 Tools Implementation Project**	**1/1/14**	**7/17/15**	**403 days**
498	**4 CoPA Application Workload Migration**	**1/1/14**	**6/30/16**	**651 days**
499	4.1 MS - CoPA Datacenter Migration Start	1/1/14	1/1/14	0 days
500	**4.2 Infrastructure Readiness Project**	**1/1/14**	**2/13/15**	**293 days**
693	**4.3 DPH Application Workload Migration**	**6/30/14**	**4/30/15**	**218 days**
714	**4.4 DLI Application Workload Migration**	**4/30/15**	**3/31/16**	**241 days**
733	**4.5 DOR Application Workload Migration**	**4/30/15**	**10/27/15**	**128 days**
741	**4.6 DPW Application Workload Migration**	**4/30/15**	**10/27/15**	**128 days**
749	**4.7 PSP Application Workload Migration**	**10/27/15**	**4/24/16**	**129 days**
757	**4.8 DOH Application Workload Migration**	**10/27/15**	**4/24/16**	**129 days**
765	4.9 MS-CoPA Application Workload Migration Completed	6/30/16	6/30/16	0 days
766	5 MS-CoPA Transition Program Complete	7/21/16	7/21/16	0 days
767	**6 Contract Milestones**	**1/31/14**	**6/30/16**	**629 days**
768	6.1 CM-1 - Key Staffing Completed	1/31/14	1/31/14	0 days
769	6.2 CM-2 - Contract Management Plan	4/1/14	4/1/14	0 days
770	6.3 CM-3 - Staffing Completed	9/9/14	9/9/14	0 days
771	6.4 CM-4 - Data Center Architecture Complete	9/9/14	9/9/14	0 days
772	6.5 CM-5 - Data Gathering Completed	9/9/14	9/9/14	0 days
773	6.6 CM-6 - Detailed Transition Plan Completed	8/26/14	8/26/14	0 days
774	6.7 CM-7 - Commonwealth Compute Procs Manual (CCPM) Completed	6/17/14	6/17/14	0 days
775	6.8 CM-8 - Network Connectivity Completed	6/17/14	6/17/14	0 days
776	6.9 CM-9 - Security Arch, Soln, Policies and Procedures Completed	9/9/14	9/9/14	0 days
777	6.10 CM-10 - ITSM Systems Integration Completed	9/9/14	9/9/14	0 days
778	6.11 CM-11 - Financial Management Complete	9/9/14	9/9/14	0 days
779	6.12 CM-12 - Operational Readiness	12/2/14	12/2/14	0 days
780	6.13 CM-13 - SSAE 16 Audit of EDC Complete	12/3/14	12/3/14	0 days
781	6.14 CM-14 - DPH DCM Completed	6/30/15	6/30/15	0 days
782	6.15 CM-15 - EDC Transition Completed	12/30/14	12/30/14	0 days
783	6.16 CM-16 - L&I DCM Completed	6/30/16	6/30/16	0 days
784	6.17 CM-17 - DOR DCM Completed	6/30/16	6/30/16	0 days
785	6.18 CM-18 - PSP DCM Completed	6/30/16	6/30/16	0 days
786	6.19 CM-19 - DPW DCM Completed	6/30/16	6/30/16	0 days
787	6.20 CM-20 - DOH DCM Completed	6/30/16	6/30/16	0 days
788	7 - Sample MOVE PACKAGE Schedule (to be replicated and modified as required by Move Package)	**1/1/14**	**6/30/14**	**128 days**
789	7.1 DCM_MP - PLAN MIGRATION	**1/1/14**	**6/30/14**	**128 days**
915	7.2 DCM_MP - MIGRATION TO DC1	**1/28/14**	**4/3/14**	**46.75 days**
1020	**8 Steady State Operations and Continuous Improvement**	**6/30/14**	**12/31/24**	**2742 days**
1021	8.1 Operations Monitoring	6/30/14	12/31/24	2742 days
1022	8.2 Service Request Management	6/30/14	12/31/24	2742 days
1023	8.3 Disaster Recovery Testing	6/30/14	12/31/24	2742 days
1024	8.4 Security Testing	6/30/14	12/31/24	2742 days

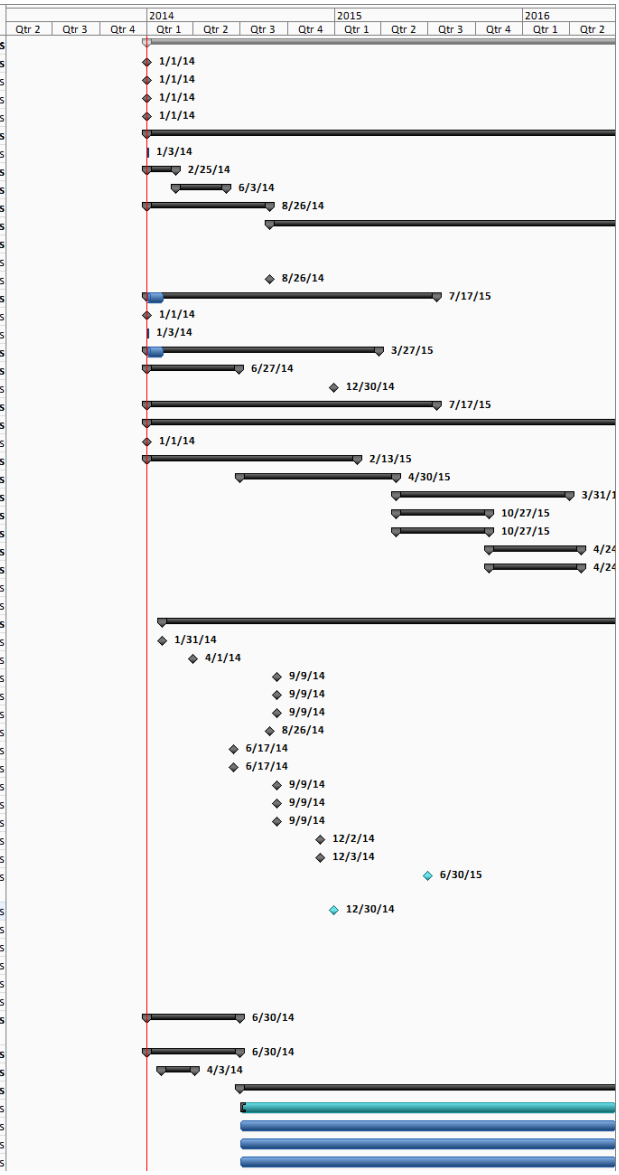

Figure 3-3. Level 2 Schedule of the Commonwealth's Transition Program

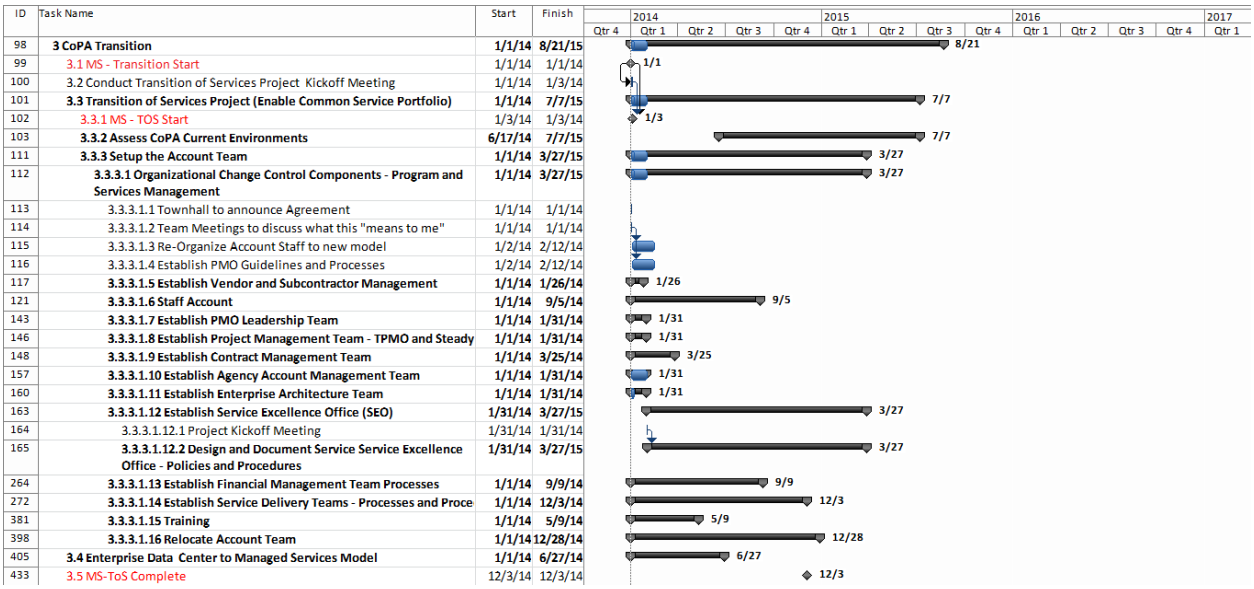
Our approach on transition timing was developed with the Commonwealth's goals in mind. Our initial focus is on transition of the EDC to a managed services model followed by data center migrations to move agency applications from the Willow Oak Data Center to a Unisys Data Center. These priorities will enable the Commonwealth to transition all obligations under the current DPH contract to the new data center compute services contract. In parallel, we are focusing on the accomplishment of key program deliverables within specified time frames. Remaining agency migrations will then take place between Months 17 and 28 with fewer constraints and priority than those for the DPH and EDC migrations.

3.2.1 Transition Services

Transition Services are the cornerstone of a successful relationship between the Commonwealth and the Unisys Team. In the Transition Services projects, tasks, and activities, the Commonwealth and the Unisys Team will work closely to design and implement the processes, tools, and organizations that are necessary to provide excellent services continuously to the Commonwealth and your stakeholders. The outputs from these services will assist the PMO and the rest of the entire team in executing the program's ongoing operations.

Among the important outcomes from the Transition Services projects will be deliverables such as the Commonwealth Computing Procedures Manual (CCPM), which will provide both the Commonwealth and the Unisys Team with a defined set of expectations. Along with the CCPM, these projects will establish the Program Management Office and the tools and processes they need to successfully deliver services to the Commonwealth. These tools and processes will include those that are needed to effectively support the ITIL V3 framework, provide the Commonwealth transparency into the billing, and establish the Service Desk. **Figure 3-4** below shows the Transition phase of the project.



ID	Task Name	Start	Finish
98	**3 CoPA Transition**	**1/1/14**	**8/21/15**
99	3.1 MS - Transition Start	1/1/14	1/1/14
100	3.2 Conduct Transition of Services Project Kickoff Meeting	1/1/14	1/3/14
101	**3.3 Transition of Services Project (Enable Common Service Portfolio)**	**1/1/14**	**7/7/15**
102	3.3.1 MS - TOS Start	1/3/14	1/3/14
103	**3.3.2 Assess CoPA Current Environments**	**6/17/14**	**7/7/15**
111	**3.3.3 Setup the Account Team**	**1/1/14**	**3/27/15**
112	**3.3.3.1 Organizational Change Control Components - Program and Services Management**	**1/1/14**	**3/27/15**
113	3.3.3.1.1 Townhall to announce Agreement	1/1/14	1/1/14
114	3.3.3.1.2 Team Meetings to discuss what this "means to me"	1/1/14	1/1/14
115	3.3.3.1.3 Re-Organize Account Staff to new model	1/2/14	2/12/14
116	3.3.3.1.4 Establish PMO Guidelines and Processes	1/2/14	2/12/14
117	**3.3.3.1.5 Establish Vendor and Subcontractor Management**	**1/1/14**	**1/26/14**
121	**3.3.3.1.6 Staff Account**	**1/1/14**	**9/5/14**
143	**3.3.3.1.7 Establish PMO Leadership Team**	**1/1/14**	**1/31/14**
146	**3.3.3.1.8 Establish Project Management Team - TPMO and Steady**	**1/1/14**	**1/31/14**
148	**3.3.3.1.9 Establish Contract Management Team**	**1/1/14**	**3/25/14**
157	**3.3.3.1.10 Establish Agency Account Management Team**	**1/1/14**	**1/31/14**
160	**3.3.3.1.11 Establish Enterprise Architecture Team**	**1/1/14**	**1/31/14**
163	**3.3.3.1.12 Establish Service Excellence Office (SEO)**	**1/31/14**	**3/27/15**
164	3.3.3.1.12.1 Project Kickoff Meeting	1/31/14	1/31/14
165	**3.3.3.1.12.2 Design and Document Service Service Excellence Office - Policies and Procedures**	**1/31/14**	**3/27/15**
264	**3.3.3.1.13 Establish Financial Management Team Processes**	**1/1/14**	**9/9/14**
272	**3.3.3.1.14 Establish Service Delivery Teams - Processes and Proce**	**1/1/14**	**12/3/14**
381	**3.3.3.1.15 Training**	**1/1/14**	**5/9/14**
398	**3.3.3.1.16 Relocate Account Team**	**1/1/14**	**12/28/14**
405	**3.4 Enterprise Data Center to Managed Services Model**	**1/1/14**	**6/27/14**
433	3.5 MS-ToS Complete	12/3/14	12/3/14

Figure 3-4. Initial Organization Set Up and EDC Transition

3.2.1.1 Account Organization

Unisys understands we are only as strong as our team. Early in the transition process, we will focus on training existing staff on changes brought on by the new contract; acquiring outstanding supplemental resources to deliver services; and providing the tools, processes, and work environment to enable them to be successful.

The activities for Account Organization will provide the framework to establish an effective Program Management Office.

3.2.1.1.1 Establish PMO Guidelines and Processes

Establishing the PMO guidelines and processes will include developing the interim Contract Management procedures as necessary, developing the vendor and Subcontractor Management policies and procedures, and modifying the existing Billing processes.

3.2.1.1.2 Organize Account Personnel

Organize Account Personnel will include tasks supporting talent acquisition and staff training, providing work space, and implementing standard work processes.

The Unisys Team identified individuals who will fill key positions as required by the Commonwealth. During these activities, Unisys will move individuals to these key roles by identifying and training them to assume the new roles. We will also identify other roles that are required early to lead organizations through the transition period.

Staffing plans for the technical and support teams will be reviewed and revised during the PMO's formation, including the PMO leadership team and the Project Management team, including the Transition Project Management team, the Enterprise Architecture team, and the Service Excellence team. Unisys will develop this plan to assign resources to the appropriate roles during the transition. We will engage Small Diverse Business partners to supply services and staffing requiring the establishment of processes for interaction among partners.

Contract, role, and industry-specific training will be planned and provided as appropriate to the staff as they move to their roles. This training includes CCPM, billing, Advanced ITIL V3, PMP, ITIL Foundation, and others as necessary. Unisys will partner with Harrisburg University to coordinate and deliver training.

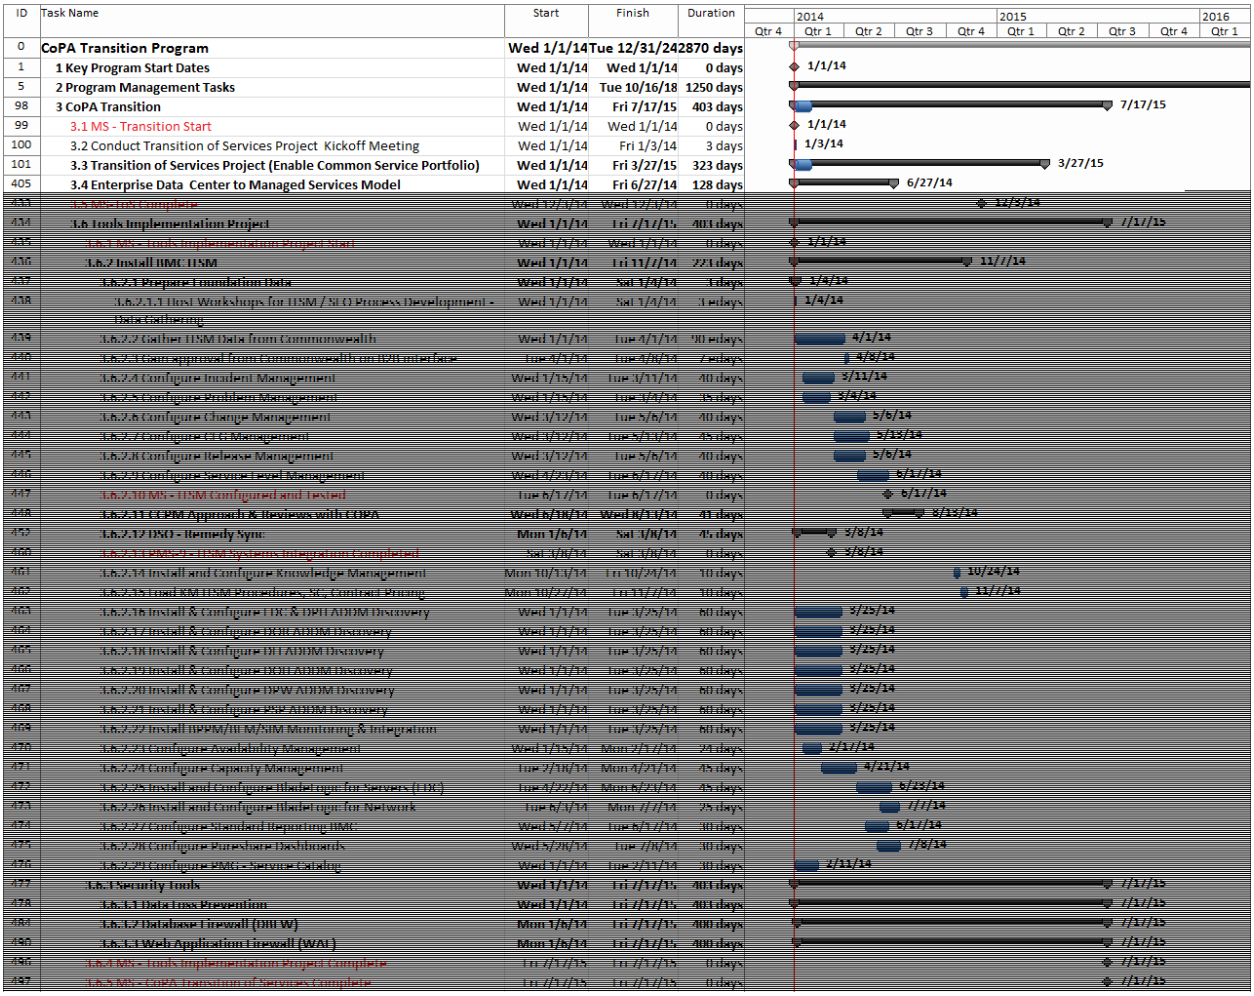
Establishment of the Service Excellence Office will enable and drive the reformation of existing ITIL V3 processes, the drafting of the Commonwealth Compute Procedures Manual, and the implementation of quality processes and policies.

3.2.1.2 Enterprise Data Center (EDC) to Managed Services Model

The EDC will transition to a Managed Services model. Key to this project is knowledge transfer and implementation of the Unisys standard management toolset. Unisys is uncommonly positioned to enable this transition quickly, using our current team that supports the EDC. This team is very knowledgeable of the Commonwealth's current environment, which will enable an expeditious knowledge transfer process. This project will depend on the implementation and customization of the BMC Remedy ITSM Toolset, Nagios for monitoring, and BMC's Atrium Discovery and Dependence Mapping (ADDM)

tool. During the EDC's transition, Unisys will work with the Commonwealth to identify a technology refresh plan for existing hardware in the EDC. Until the infrastructure is replaced, Unisys will work with the Commonwealth to include continuance of hardware maintenance.

3.2.1.3 Tools Implementation



ID	Task Name	Start	Finish	Duration
0	CoPA Transition Program	Wed 1/1/14	Tue 12/31/24	2870 days
1	1 Key Program Start Dates	Wed 1/1/14	Wed 1/1/14	0 days
5	2 Program Management Tasks	Wed 1/1/14	Tue 10/16/18	1250 days
98	3 CoPA Transition	Wed 1/1/14	Fri 7/17/15	403 days
99	3.1 MS - Transition Start	Wed 1/1/14	Wed 1/1/14	0 days
100	3.2 Conduct Transition of Services Project Kickoff Meeting	Wed 1/1/14	Fri 1/3/14	3 days
101	3.3 Transition of Services Project (Enable Common Service Portfolio)	Wed 1/1/14	Fri 3/27/15	323 days
405	3.4 Enterprise Data Center to Managed Services Model	Wed 1/1/14	Fri 6/27/14	128 days
433	3.5 MS - ITSM Complete	Wed 12/1/14	Wed 12/1/14	0 days
434	3.6 Tools Implementation Project	Wed 1/1/14	Fri 7/17/15	403 days
435	3.6.1 MS - Tools Implementation Project Start	Wed 1/1/14	Wed 1/1/14	0 days
436	3.6.2 Install BMC ITSM	Wed 1/1/14	Fri 11/7/14	221 days
437	3.6.2.1 Prepare Foundation Data	Wed 1/1/14	Sat 1/4/14	4 days
438	3.6.2.1.1 Host Workshops for ITSM / SLO Process Development - Data Gathering	Wed 1/1/14	Sat 1/4/14	4 days
439	3.6.2.2 Gather ITSM Data from Commonwealth	Wed 1/1/14	Tue 4/1/14	90 days
440	3.6.2.3 Gain approval from Commonwealth on ITSM interface	Tue 4/1/14	Tue 4/8/14	7 days
441	3.6.2.4 Configure Incident Management	Wed 1/15/14	Tue 3/11/14	40 days
442	3.6.2.5 Configure Problem Management	Wed 1/15/14	Tue 3/4/14	35 days
443	3.6.2.6 Configure Change Management	Wed 3/12/14	Tue 5/6/14	40 days
444	3.6.2.7 Configure CCB Management	Wed 3/12/14	Tue 5/13/14	45 days
445	3.6.2.8 Configure Release Management	Wed 3/12/14	Tue 5/6/14	40 days
446	3.6.2.9 Configure Service Level Management	Wed 4/23/14	Tue 6/17/14	40 days
447	3.6.2.10 MS - ITSM Configured and Tested	Tue 6/17/14	Tue 6/17/14	0 days
448	3.6.2.11 CCBM Approach & Reviews with COPA	Wed 6/18/14	Wed 8/13/14	41 days
452	3.6.2.12 DSO - Remedy Sync	Mon 1/6/14	Sat 3/8/14	45 days
460	3.6.2.13 MS - ITSM Systems Integration Completed	Sat 3/8/14	Sat 3/8/14	0 days
461	3.6.2.14 Install and Configure Knowledge Management	Mon 10/13/14	Fri 10/24/14	10 days
462	3.6.2.15 Load KM ITSM Procedures, SC, Context Proces	Mon 10/27/14	Fri 11/7/14	10 days
463	3.6.2.16 Install & Configure TDC & DPH ADDM Discovery	Wed 1/1/14	Tue 3/25/14	60 days
464	3.6.2.17 Install & Configure DOH ADDM Discovery	Wed 1/1/14	Tue 3/25/14	60 days
465	3.6.2.18 Install & Configure DT ADDM Discovery	Wed 1/1/14	Tue 3/25/14	60 days

Figure 3-5. Tools Implementation Project Activities and Timeline

Unisys developed a technical architecture to support a multi-data center environment, network and security, and data center support architecture. The tools implementation project (**Figure 3–5**) is the precursor and basis for many other activities in the transition of services. Unisys will implement tools such as BMC's Remedy Suite for ITSM, PMG for Services Catalog and billing data, SolarWinds and Nagios for monitoring, BladeLogic for provisioning, and PureShare for dashboards along with other tools to form the architecture, which will be wrapped by processes and performed by Unisys, IBM, and

Deloitte. The PMG Services Catalog is unique in the industry because it provides an active service catalog and workflow that can begin at the customer's request. Much of the industry focuses the service catalog on self-provisioning and other IT tasks. The Real-time Dashboard is also unique because it provides an active CIO dashboard that can be set up with much of the report data while also sharing the data at the right level of detail for a variety of management levels and uses.

3.2.2 Application Workload Migrations

At Unisys, we believe the term Data Center Migration is a misnomer. The focus is and should be on the applications. The processes the team will follow require much input and participation from the Commonwealth application owners. Automated tools such as ADDM alongside traditional tools are used to minimize the dependency on customer input and maximize accuracy. Each migration project will last about 3 months. On the project, technical teams and applications teams will work closely to define the exact scope, plan tasks, identify risks, develop solutions, and identify optimum times for outages that will minimize the impact on the end users. In the 3-month project, much of the effort is spent on planning, verifying, and re-planning, all with the goal of a successful migration.

But before any applications can be moved, the receiving data center must be made operationally ready. This includes implementing the infrastructure components required to meet or exceed the service levels required.

3.2.2.1 Operational Readiness

ID	Task Name	Start	Finish	Duration
607	**4.2.3 Data Center Buildout**	**1/1/14**	**2/13/15**	**293 days**
608	**4.2.3.1 DC1 - Buildout - MP0**	**1/1/14**	**2/13/15**	**293 days**

684	4.2.3.2.10 Execute SSAE 16 Audit for DC2	1/1/14	4/22/14	4 mons
685	4.2.3.2.11 MS - DC2 - Buildout - MP0 - COMPLETED	5/16/14	5/16/14	0 days

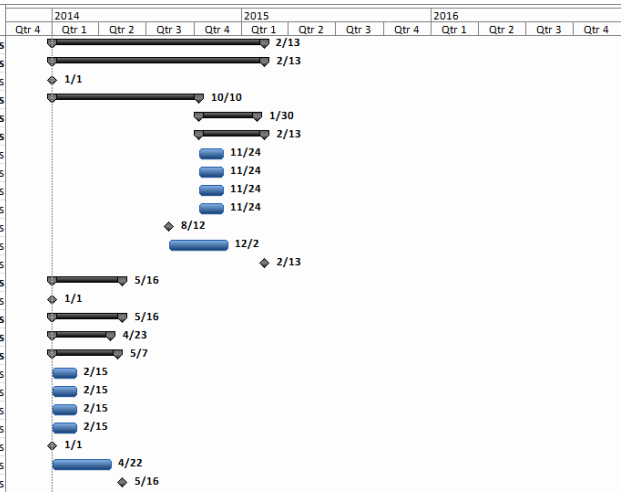

Figure 3-6. Operational Readiness Timeline

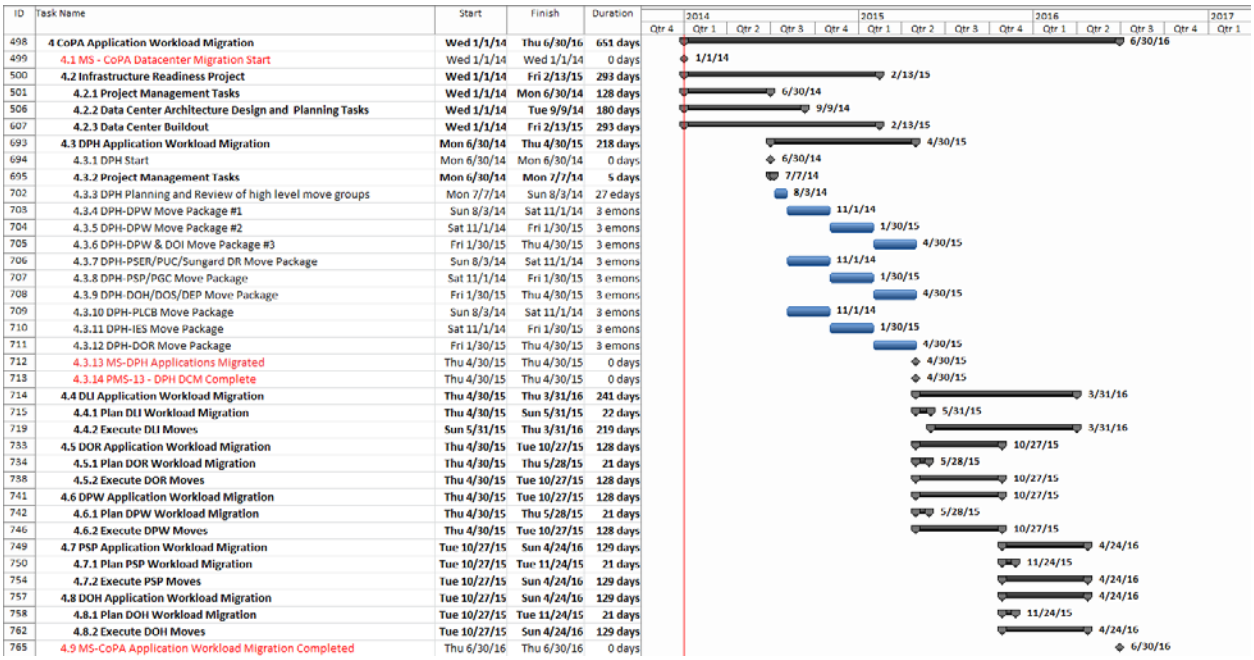
To achieve operational readiness, the data center must be prepared by connecting the data center to COPANET and have a local area network designed, built, tested and operational, including data security devices such as firewalls and intrusion detection and prevention.

Tools such as Remedy by BMC must be installed and operational to support ITIL V3 processes for incident, problem, change, release, asset, configuration, and service level management. Supporting tools such as PMG for billing and service catalog, ADDM for automated discovery, BladeLogic for provisioning and automated patching, PureShare for dashboards, and Nagios for monitoring must also be operational. Infrastructure such as storage, virtual servers, physical servers, monitoring, and backup must be in place. Operational Readiness activities and timeline are shown in **Figure 3–6.**

3.2.2.2 Agency Application Workload Migrations



ID	Task Name	Start	Finish	Duration

765	4.9 MS-CoPA Application Workload Migration Completed	Thu 6/30/16	Thu 6/30/16	0 days

Figure 3-7. Agency Application Workload Phased Migrations

The application workloads supported in the agency data centers are planned to be moved in three phases, as shown in **Figure 3–7.** The first phase is focused on the Data PowerHouse Data Center; the second will be the Department of Labor & Industry, Department of Public Welfare, and Department of Revenue. Application workloads supported in the Pennsylvania State Police and Department of Health data centers will move last in the third and final phase. Unisys determined the order of agency migrations based on lower periods of activities, but also recognize that due to in-flight projects and other activities, these priorities may change. Each of these agency data centers will be divided into multiple projects based on size, complexity, and number of applications. Each project includes a similar set of tasks including documenting the application scope and supporting infrastructure, determining the move strategy for each component, such as "over the wire" or "lift-n-shift", and order of application migrations. This activity is

followed by detailed planning; identification of hardware in the receiving data center; remediation of hardcoded IP addresses in the application; test plan creation; data transfer, which will be planned to avoid peak work periods, and finally testing.

The Unisys plan includes over-the-wire transfer of data and when appropriate, operating systems and applications. This approach will minimize risk that may occur during reinstallation activities by using the current operating system and application setting and minimize outages by synchronizing periodically throughout the weeks leading to the migrating events, and can be more easily scheduled around peak work times for the agencies.

Each plan will include notifications to Commonwealth stakeholders 30, 7, and 2 days before events. Application owners will be expected to verify each application successfully migrated through appropriate testing activity.

3.2.3 Transition Program Management

The activities in the Transition Program Management section of the program schedule will predominantly be executed and overseen by the Transition Executive or one of the Deputy Transition Executives. This section includes tasks such as Program Executive Kickoff, Executive Planning Sessions, and other activities aimed at developing and strengthening agreement and like-mindedness among the Commonwealth and the Unisys Team. Items such as goals and objectives for each project will be shared and discussed, development/refinement of guiding principles, setting priorities between time, resources and quality. A consistent program cadence for status communications, risk and issues reviews and mitigation strategies will be developed. The Transition Program Management Office (TPMO) and governance structure will enable individuals filling important roles in the program such as the Commonwealth's Transition Executive and staff to quickly collaborate from the start with an organized and standardized approach.

The TPMO will be tightly aligned with the PMO executives; [redacted] and her executive leadership team promote effective handoffs of transition projects to the steady state. For transition architecture strategy and support, the TPMO will interface directly with the Senior Enterprise Infrastructure Architect, [redacted] and his team of Agency Infrastructure Architects.

3.2.4 Steady State

The steady state organization is the culmination of many months of hard work on behalf of the Unisys Team and the Commonwealth in joint collaboration to reach a common goal. It is the endgame, and it does not look at all like it does today. How does it look to you as a Commonwealth leader? How will you navigate the new processes and procedures to meet your business IT needs? How will you know that your IT infrastructure is in good hands and supporting the business the way it should be?

The year is 2016, the date is April 15th, and you have the typical anxiety that tax day brings on to the average American, but it is a little worse for you because you are the CIO of the Department of Revenue, and this is your heaviest processing day of the year. First thing that morning, you log on to your secure workstation and click on the link to your Real-time Dashboard. The tax systems running on the mainframe and the Integrated Tax System hosted on the SAP environment are showing heavy activity but performing optimally with enough headroom to make it through the rest of this important day.

You recall the meeting you and your team had last quarter with your Unisys Agency Account Manager, Agency Infrastructure Architect, and Capacity Planning Manager. That quarterly Capacity Planning Meeting provided the forum to walk through the performance of the systems and capacity averages and peaks over the previous year. It was clear during the meeting that based on Unisys projections, last quarter's capacity would never carry you through the processing peak expected in April. The Unisys Team recommended taking advantage of the Capacity on Demand service to get through this processing peak.

At a user friendly interface, the Agency IT Manager signed into the Enterprise Services Catalog and requested the additional server capacity in March to allow time for your application team to prepare the additional servers for peak processing. It was as simple as selecting several servers with standardized processing and memory capacity to support the expected load generated by last-minute taxpayers. Through self-provisioning, the capacity was made available within a few days, after you approved the request in the Enterprise Services Catalog, and turned over to your application team. This capacity can be leveraged for the time needed, and you plan to remove it from service at the end of May. Pennsylvania agencies can save thousands of dollars by judiciously using IT resources in a model in which they pay only for resources used.

The new steady state operations are collaborative, proactive, efficient, and cost-effective. The narrative that follows outlines several of the new operating model's benefits.

Contract Management

In the steady state, ordering services will be a lot different than it is in the DPH today. Agencies have multiple options on how to proceed with acquisition of resources needed to support their application infrastructure. The Unisys Enterprise Services Catalog contains thousands of items that an agency can select at an online interface with preconfigured approval workflows. Selection of additional capacity from the Enterprise Services Catalog is as simple as purchasing items on the Amazon Web site. Through the automation built into the Enterprise Services Catalog contract services schedule and exhibit information will be updated automatically.

For more custom solutions, agencies can still use the Enterprise Services Catalog to place an order for a custom solution to be architected by their Agency Infrastructure Architect, and ultimately purchased through the Enterprise Services Catalog. Through automated

billing and chargeback systems, Unisys Contract Management can easily track projects against federal funding streams for the agencies as needed.

Innovative Service Offerings

Unlike the fixed-price DPH contract, the new service model offers Capacity on Demand capabilities with consumption-based pricing models. Often, a Commonwealth agency user has the capability to log on to the Enterprise Services Catalog, request resources, and provision the servers from his or her own desktop. When the servers are no longer needed, the user can return to the same portal to request decommission of the servers. Under this service offering, the agency is charged only for resources available during the period, at least 1 month.

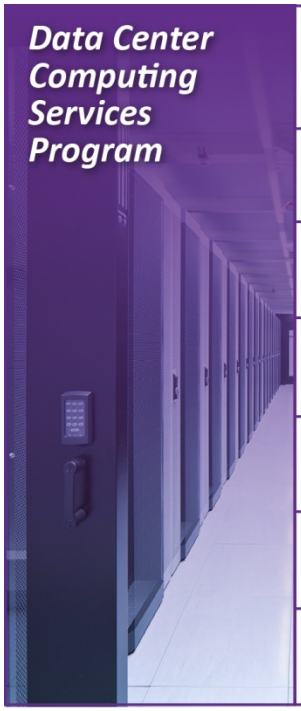
Operational Transparency

In the new world, Commonwealth leaders at all levels have access to a Real-time Dashboard that provides a view into the performance of services and applications being monitored by the Unisys Team at that time, outstanding service requests and incident tickets, upcoming changes to the environment, SLA status, and current customer satisfaction levels. The dashboard is a one-stop shop for agency status information.

How We Organize the Team

Details on the organization structure and functions can be found in **Section 5.0, Personnel.** At a high level, our team is organized into seven core functions, including the overall Program Management Office that includes the organization's executive layer and supporting personnel; the Agency Account Management team that provides liaison services to every agency using the Data Center Compute Services; the Service Delivery organization that is the core team providing infrastructure management services; the Transition Program Management Office that oversees transition and migration initiatives as well as steady state project management; the Service Excellence Office that oversees all ITIL V3-aligned processes, innovation, and customer satisfaction; the Enterprise Architecture team that develops and manages the technology management program for the services delivered; and the Security Office that oversees all aspects of the project to confirm compliance with security standards and requirements.

Figure 3-8 provides a high-level description of the functions of each of our seven core teams.



Program Management Office: Oversees all facets of the engagement. Provides oversight and management of the contract, financial functions, third-party software administration, and subcontract management. Responsible for detailed management of service level agreements and credits.
Account Management: Facilitates understanding of leveraging the contract to meet agency needs. Acts as the liaison and develops strategic relationships with agency leaders. Keeps agencies abreast of new technology. Handles pricing discussions.
Service Delivery: Provides all technology and service support functions, including data center operations, service desk, system administration, mainframe services, database administration, and network and security management.
Service Excellence Office: Includes all ITILV3 process management functions, customer satisfaction program management, reporting, and capacity planning. Confirms smooth execution of compliant processes. Analyzes and reports trends and corrective actions.
Enterprise Architecture: Provides overall development and management of technology strategy. Responsible for engineering of detailed data center services design at the agency level. Verifies currency of the service catalog offerings.
Transition/Project Management Office: Provides technical expertise and leadership during the transition from current state data center services through to steady state data center management services.
Chief Security Office: Oversees all aspects of the project to maintain compliance with security standards and requirements. Develops policies and performs periodic audits of processes and data to confirm compliance.

CoPA-187r4

Figure 3-8. Data Center Compute Services Program

Agency-Centric Staffing Approach

We understand that each agency is a unique and distinct customer of our services; therefore, a key to success is putting the agency at the center of our staffing model. Our model will enable the Commonwealth to realize savings from economy of scale without losing the personalized focus on the agencies that could be lost if a model aligned with technology domains was implemented. We give you the best of both worlds.

From the agency's perspective, a server is more than a box, and storage is more than just disks inside a frame. Outages to these devices can have a major impact on the functioning of an agency's application, and ultimately a negative effect on Commonwealth citizens. The alignment of our agency-centric model facilitates accountability at the agency and application level, in contrast with many outsourcing providers that structure their people and services around technology components without regard for the customer and applications supported. In those models, you are just a number.

There are six of these teams in the overall program, each providing personalized services to a subset of agencies participating in the program. Our model in **Figure 3-12** includes a three person leadership team for every Agency-Centric Team: an Agency Account Manager who manages the relationship with each agency supported and all aspects of the contract; an Agency Infrastructure Architect who manages the Technology Strategy for assigned agencies; and the Service Delivery Manager who is responsible for end-to-end delivery performance and direct oversees the management of all technicians aligned with the

agencies supported by the team. Most important, all our team members are aligned with the agency at the center of the model.

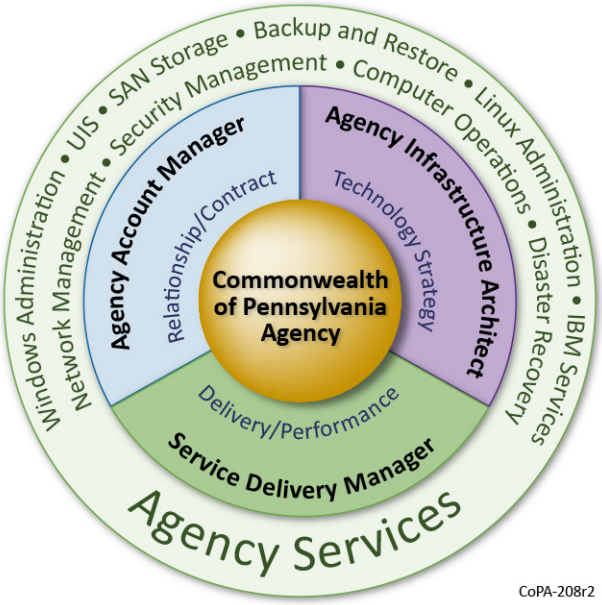


Figure 3-9. Agency-centric Service Delivery Team Structure

Governance

Strong governance and effective communication are cornerstones to an effective program. The established model promotes communications at all levels of the organization across every agency and the Office of Administration. Details on the governance program can be found in **Attachment 1 to Section 3.0 - Schedule B**.

The governance structure will be developed early in collaboration with the Commonwealth. Unisys recommends three levels of governing steering committees that convene regularly to address various aspects of the program. This structure will facilitate accountability for service levels; meeting the contract's requirements; and enable key stakeholders from the Commonwealth and the Unisys Team to jointly set the program's overall direction.

Communication

Details on how we interact with the Commonwealth staff can be found in Section 5.8, Interface with the Commonwealth. Organized, centralized, and targeted communication is essential to the success of a program of this magnitude. Our team will be located mainly in Harrisburg, close to the locations of Commonwealth agencies that will be using the services to facilitate effective communication and collaboration.

After working with the Commonwealth for many years, we understand that it is not as simple as one Unisys point of contact to a single Commonwealth counterpart. The Commonwealth organization is multidimensional; each agency has its own management structure and IT support team, and the Office of Administration manages the contract on behalf of the agencies. Our model effectively supports this organization.

In today's DPH organization, communication can flow to and from many directions, depending on the topic and the urgency. Formalization and centralization of the flow of communication from the Commonwealth workforce to the Unisys Team through the Unisys Service Desk will greatly simplify interactions and documentation of requests and issues in our connected ITSM systems that will provide ITIL V3 process compliance with every request.

The Commonwealth workforce has multiple options for communicating requests and reporting issues to the Unisys Team. They can call the Service Desk, which will receive requests from Commonwealth agencies, document them in the ITSM system, and assign requests to the Unisys Team. Alternatively, the Commonwealth workforce can enter a request directly into the Commonwealth's ITSM system, and the request will be replicated in the Unisys ITSM system. The Service Desk monitors the queues and will confirm that these requests are assigned to the Unisys Team, thus providing end-to-end support.

The Knowledge Management Portal is a new addition to our service offering. This portal will provide the Commonwealth and the Unisys Team with access to documentation and procedures used to provide services. It will serve as a repository for many aspects of the program, including the CCPM, Frequently Asked Questions, and Runbooks.

Quality

In the steady state, the Unisys Team will operate following disciplined processes that are tailored to promote an optimized workflow and ITIL V3 conformance. The Service Excellence Office (SEO) process management team consists of key leaders and executives with advanced ITIL V3 certification and education on Six Sigma methodologies who will work directly with Commonwealth Process Managers to provide compliance, proper documentation, timely approvals, and participation on joint Advisory Boards.

The quality of our services will be measured by performance metrics, and equally important in our rigorous Customer Satisfaction Management Program that takes your pulse from many perspectives, including Service Desk interactions, Agency Satisfaction Surveys, Executive OA leadership interactions, and more intensive satisfaction improvement initiatives as needed.

Continual Service Improvement and Innovation Program (CSIIP)

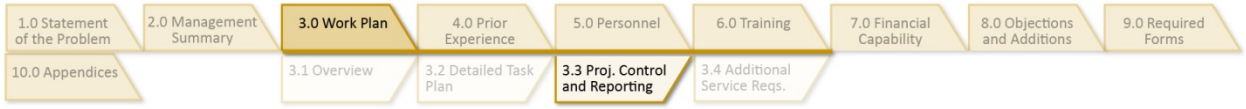
Through our Continual Service Improvement and Innovation Program (CSIIP), Unisys will provide a standard framework for aligning our improvement focus with your strategic

priorities. At the agency level, you will participate in CSIIP workshops to create an ongoing, formal program that encourages the proactive identification and introduction of measurable improvements in a specific work area or work process and to introduce "innovation in context" to those areas. One of this program's major features is the ability to consolidate and analyze the many inputs required to effectively develop an innovation and improvement plan.

The CSIIP process uses a structured approach to gathering and analyzing important factors to build a comprehensive roadmap to cover remediation, improvement, and innovation opportunities. This will provide the Commonwealth with the necessary information to make informed decisions based on relative cost/benefit, alignment with strategy, and return on investment for various actions, of varying scale from incremental through to truly breakthrough.

Our Enterprise Architect Team will host Innovation Workshops regularly to facilitate open communication and brainstorming the use of technology solutions to solve today's business challenges facing agency CIOs.

3.3 Project Control and Reporting



Successful management and control of a large project or program relies heavily on project controls and effective reporting. This section addresses two main components of governance and status reporting during transition and through the steady state of operations.

3.3.1 Governance

The Governance Strategy defined in Attachment 1 to Section 3.0 **Schedule B**, **Governance** presents a review of the overall approach to governance throughout transition and steady state phases of the project.

3.3.2 Status Reports

RFP Req	Requirement
IV-5.B	*Status Reports. Monthly progress reports covering activities, problems, risks and recommendations. This report should be keyed to the work plan the Offeror developed in its proposal, as amended or approved by the Issuing Office. During the Transition period of this project additional progress reports are required.* *Monthly Service Level, Change Management, Incident/Problem, Operational, and Billing Reports are to be provided. These reports will be developed in cooperation with the Commonwealth during the early stages of the engagement.*

Unisys has standard status and problem identification reports for managing transition activities and projects, ongoing requested projects, and operational ITSM processes. We recommend the reports below and will work with the Commonwealth during transition to review each report and make any adjustments or additions required to manage the contract's status reporting.

Unisys will provide the Commonwealth with two types of status reports:

- Monthly progress reports for transition activities and projects based on project management disciplines:
  - Risk Management
  - Scope Management
  - Quality Management
  - Time Management
  - Cost Management
  - Procurement Management
  - Integration Management
- IT Service Management (ITSM) status reports for critical processes, including:
  - Service Level Management
  - Change Management
  - Incident Management
  - Problem Management
  - Operations Management
  - Financial Billing Management.

Project Management Status Reporting

The Unisys SDF project management method employs a comprehensive set of reporting procedures as a crucial activity on every project. This approach to reporting requires early, frequent, and regular face-to-face and written reports with the Commonwealth agency Project Manager or PMO and as-needed reporting to project stakeholders and Commonwealth project team members.

The basis of these reporting procedures is factored on the following reporting principles:

- Reporting is essential to communicate accurate and timely project information
- Reporting mitigates project risk through early discovery of potential problems or issues
- Reporting is essential to managing expectations for the solution and its impact on stakeholders
- Reporting increases awareness of the project's overall status among all stakeholders
- Reporting improves the timing of the delivery of information between project phases so that interested parties all have the same understanding of the project's deliverables, tasks, and business rules
- Reporting creates goodwill and cooperation among the interested parties, thereby improving trust
- Reporting builds an internal commitment to realizing the business benefits of the operational and technological improvement opportunities for Commonwealth agencies and all the key stakeholders.

Reporting may be provided in a variety of formats from formal written reports to informal e-mail and voicemail. **Table 3-10** provides a standard set of **Status and Problem Identification Reporting** methods that Unisys recommends. We will review them with Commonwealth agencies and tailor or amend them to provide the Commonwealth with the desired reporting types and formats. Standard reports in the table below that indicate availability in an online repository will be available on the reports portal.

Table 3-10. Unisys Recommended Project Reporting

Method	Type of Information	Vehicle	Frequency	Responsible	Comments
Weekly Project Status Report	Executive summary; status of priority items, including activities delays, and disruptions; status of the action items in the project repository; identification of meeting cancellations and impacts; status of the project schedule	Report posted in an online Project Repository	Weekly	Unisys Project Manager	Priority items will change over time and be determined by the Commonwealth and Unisys Project Managers.
Issues and Action Items Report	Open issues and action items, responsible parties, scheduled dates, and impacts	Report posted in an online Project Repository	Weekly	Unisys Team	Final format to be determined by the Commonwealth and Unisys
Risk Register Report	Risk-related items identified, rated, and tracked with probabilities, mitigation strategies, and expected outcomes and recommendations Excel spreadsheet	Report posted in an online Project Repository	Weekly	Unisys Team	Unisys standard register format; final format to be determined by the Commonwealth and Unisys
Project Schedule	Current project schedule	Schedule posted in an online Project Repository	Weekly	Unisys Team	In Microsoft Project
Problem Identification Reports	Identifies problem areas describing each problem and its impact on the overall project and affected tasks and remediation options,	Report posted in an online Project Repository	As needed	Unisys Team	

IT Service Management Reporting

Unisys delivers operational ITSM reports to analyze and summarize service-affecting defect drivers and that provide data to help manage process improvement plans. Inputs are collected reactively from closed Incident, Problem, Change, Asset, and Configuration Management and Service Level Management data, as well as the Unisys Service Desk and Commonwealth management survey data, and proactively from performance and monitoring tools that scan and monitor the in-scope infrastructure and applications.

Weekly and monthly reports provide visibility to defect percentages and trends as well as an overall baseline of quality. These reports enable precise action for targeted defects and provide an overall, highly measurable perspective on quality.

Unisys will configure the reporting system for the Commonwealth to deliver the detailed and summary reports required for day-to-day operations and measuring overall performance. The reporting system is based on Remedy Analytics, PureShare Dashboard, and the standard reporting solution for our implementation of ITSM. Our implementation of analytics and dashboards provides standard best practice reports, ad hoc reporting capabilities, drill-down capabilities, and a consolidated dashboard view for overall service management. We will leverage this standard Unisys solution in creating our proposed solution.

Unisys will use Nagios, SolarWinds BMC ProactiveNet, and Performance Management (BPPM) to provide performance reporting. We will provide standard and ad hoc reporting for the in-scope infrastructure and application monitoring, which will be provided as views to the Commonwealth personnel for informational purposes. Unisys will provide the Commonwealth with monthly summary-level reports on the reports portal. The Commonwealth standard ITSM reports are included in **Table 3-11.**

Table 3-11. Standard ITSM Reports

Report Category	Standard Reports
Asset/Configuration Standard Reporting	Software License Compliance Compliance Summary for Software Products Configuration Item Costs Lease Payments and Expiration Ongoing Payments to vendors Asset Aging Inventory Profile CI Relationship Profile Scorecard Analysis Business Service Supported by a CI CMDB reconciliation analysis Discovered data staleness report Services profile

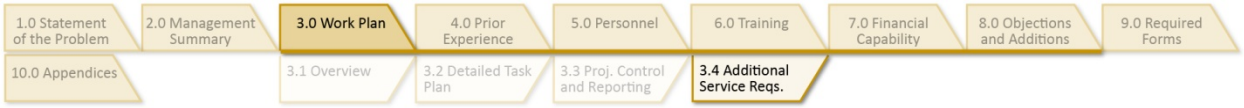
3.4 Additional Service Requirements



The Commonwealth noted a number of ancillary requirements for inclusion in the Work Plan that were not addressed in the Work Plan narrative, including topics such as Emergency Preparedness, Office Location, and Business and Technical Requirements. These are addressed in the following sub sections.

3.4.1 Emergency Preparedness

3.4.1.1 COOP Strategy

RFP	*Requirement*
	F. Emergency Preparedness. *To support continuity of operations during an emergency, including a pandemic, the Commonwealth needs a strategy for maintaining operations for an extended period of time. One part of this strategy is to ensure that essential contracts that provide critical business services to the Commonwealth have planned for such an emergency and put contingencies in place to provide needed goods and services.* *1. Describe Offeror anticipates such a crisis will impact its operations.* *2. Describe Offeror's emergency response continuity of operations plan. Please attach a copy of the plan, or at a minimum, summarize how the plan addresses the following aspects of pandemic preparedness:*

a) *Employee training (describe Offeror's training plan, and how frequently it plan will be shared with employees)*
b) *Identified essential business functions and key employees (within Offeror's organization) necessary to carry them out*
c) *Contingency plans for:*
   i.) *How Offeror will handle staffing issues when a portion of key employees are incapacitated due to illness.*
   ii.) *How Offeror employees will carry out the essential functions if contagion control measures prevent them from coming to the primary workplace.*
d) *How Offeror will communicate with staff and suppliers when primary communications systems are overloaded or otherwise fail, including key contacts, chain of communications (including suppliers), etc.*
e) *How and when Offeror's emergency plan will be tested, and if the plan will be tested by a third-party.*

The Commonwealth benefits from a Continuity of Operations (COOP) strategy, which is guided by an umbrella policy based on the ISO 22301-2003 business continuity standard. This strategy, combined with a multiple data center technical design to accommodate rapid recovery of systems and applications, addresses platform redundancy, continuity of shared infrastructure, disaster recovery for business application platforms, plans to address non-technical events such as inclement weather and pandemic threats, and staffing models in the event that human resources are unavailable.

3.4.1.2 Essential Business Services addressed by COOP

For this proposal, essential business services are identified as any service dependent on vendor-managed technology whose interruption would be detrimental to the Commonwealth's citizens or the goods and services they rely on from state government. Examples would include any technology platform that supports human health and welfare (DPW), safety and law enforcement (PSP), or transportation services (DOT).

3.4.1.3 Types of Events that Trigger the COOP

The Commonwealth will benefit from Unisys active management of potential continuity events, including:

- Pandemics
- Inclement weather and other natural disasters
- Data center power outages
- Emergency changes
- Security breaches
- Shared platform outages (host, network, or storage)
- Individual system failures
- Staff shortages.

Technical and logistical planning will alleviate outages to the managed service, and there is no anticipation these events will disrupt essential business functions. The COOP plan will call for regular exercises to address existing and emerging threats.

3.4.1.4 COOP Approach

Unisys will take great care in planning and implementing preventive measures to maintain the safety and security of our people, equipment, and the data that is maintained in the service center. With all these preventive measures, the service center must still plan for the "worst case" disaster. Planning for the worst case enables lesser disruptions to be adequately covered. Good planning as well as training and testing are the keys to a successful plan.

Recovery Concepts

A disaster is defined as any unplanned continuity event that renders a site or critical part of the managed service inoperable or inaccessible. The disaster's source may be:

- **Natural:** Such as flood, tornado, hurricane, or lightning
- **Human:** Such as sabotage accidental damage
- **Technical:** Such as mechanical failure hardware malfunctions

Regardless of the disaster's source, the recovery process is composed of the following major phases:

- Vital Record Protection
- Emergency Call Escalation
- Initial Damage Assessment
- Disaster Declaration
- Contingency Processing Procedures
- Primary Site Restoration.

3.4.1.4.1 Employee COOP training

Arrangements can be made for annual COOP desktop exercises together with the Commonwealth's Continuity of Government (CoG) Office, and agency DR tests will publish on the shared Services Portal. The COOP for Commonwealth Data Center services will be addressed in annual security training and each time a platform or application recovery test is conducted.

3.4.1.4.2 COOP for Illness

During a pandemic or an illness affecting many staff, Unisys will arrange for our global human resource function to backfill positions as needed with like-for-like personnel and cross-train staff members in primary and backup functions to provide staff continuity. Other options for staff continuity will be the use of trusted partners such as IBM, Deloitte, and a variety of Small Diverse Businesses familiar with outsourced data operations. Secure remote access will also comprise a major part of our planning for staff shortages to hinder the spread of disease or illness.

3.4.1.4.3 COOP for Contagion Control Measures

During a contagion event that prevents staff from working from their primary workplace, we will provide secure, two-factor remote connectivity for full-time and contractor personnel and test it periodically. Also, we will engineer redundant data center connectivity if staff cannot work in the primary facility. When necessary, we will provide hands-on personnel with respirators and other contagion prevention methods to allow staff to perform duties requiring physical access to the data center.

3.4.1.4.4 COOP for Communication Systems Anomalies

During a failure of normal communication of the COOP plan by shared portal or e-mail, we will use a combination of global Internet infrastructure, data center redundancy, mobile phone network, remote access capabilities, unified communications, and COOP training to address command and control center contingencies with its staff, contractors, and suppliers.

3.4.1.4.5 COOP Testing

Unisys will perform periodic COOP exercises audited by a third-party at a set interval and design them to test facility infrastructure between exercises to identify and avoid single points of failure in our managed services platform. Normal monthly maintenance of key infrastructure components such as water, power, cooling, and ventilation will test the continuity plan's physical aspects. We will address the plan's human components through awareness training, platform recovery tests, evacuation drills, and the use of planned failover to redundant infrastructure as appropriate.

3.4.2 Service Level Agreements

Unisys understands and supports the need for multiple SLA tiers to provide a flexible compute environment that optimizes the cost of computing. Furthermore, we understand the importance of measuring application availability.

Equally important, we understand the need to implement a quality office to drive continuous improvement efforts; we will establish a Service Excellence Office that drives

continued value and cost savings by deploying Six Sigma Lean practices based on studying cycle time and defect analysis from events that are extracted from the IT Service Management platform.

The Unisys proposed solution provides a common collection point and presentation for SLA data at our Services Portal described throughout our responses to **Schedule F,** Section 3.2.1 subsections.

Within **Attachment 7 to Section 3 - Schedule J.3: Service Level Agreements,** Unisys describes how the detailed input for the SLA measurements is collected, calculated, and presented. Many of the collection or calculation methods will require collaboration with the Commonwealth during transition.

3.4.3 Service Catalog

RFP	*Requirement*
IV-3.D	*Service Catalog* *The Offeror must complete Schedule C - Services Catalog as part of its technical submittal.* *a. DO NOT INCUDE ANY PRICING INFORMATION WITHIN THIS SCHEDULE*

Unisys provides an Enterprise Services Catalog, which will enable the Commonwealth to maintain services and have the flexibility to request additional services as needed to support changing business needs, business cycles, and new technologies.

The services in the Enterprise Services Catalog can be ordered within the tool. Each of these services will be processed as a Service Request and a solution developed. Some of these services are available to be automatically provisioned by the Enterprise Services Catalog tool. Our Enterprise Services Catalog is made up of the following sections:

1. **Catalog of Services**: The catalog is a copy of **Schedule I, Catalog of Services** but without the pricing.
2. **Description of Services**: This section describes each of the services listed in the Catalog of Services, including the service name; description of the service; units available to be ordered; specific customers if there are limitations, prerequisites, or co-requisites to support the service; activity to request the service; and the terms of use, which can include available services levels for the service.
3. The description of services is set up with the following sections:
   a. Fully Managed Services
   b. Managed Only Services
   c. Co-Location Services

d. Additional Technical Services (Per Hour)

e. Additional Technical Services (Technology Services).

The Unisys Enterprise Services Catalog in **Attachment 2 to Section 3 - Schedule C: Services Catalog** represents entries that are explicitly called out by the Commonwealth's RFP **Schedule I,** and many suggested by the RFP's other documents include **Schedule F** and the exhibits. Unisys experience with the Commonwealth for the past 13 years has been called on to augment these entries to enrich the choices to the Enterprise Services Catalog suggested by the RFP.

The Enterprise Services Catalog describes the specific entries shown, including related Enterprise Services Catalog items that will be needed to put a selection into its proper context. For example, the selection of a Gold Windows physical server will require the inclusion of an additional, identical server to provide the infrastructure capable of meeting the SLA. Similar instances exist throughout the Enterprise Services Catalog and are described. These dependencies are noted in each item's definition.

The Commonwealth's Enterprise Services Catalog will be accessible from the Unisys Services Portal and support user-based authentication and privileges along with support for associating agency and project-level accounting for each requested item. If the Commonwealth advises Unisys that a request may move directly to ordering or provisioning, the Enterprise Services Catalog tool may trigger automated ordering and deployment of the request. If change management must include approvals and scheduling, the Enterprise Services Catalog tool interfaces with the ITSM environment to participate in the process and gain the approvals and privilege necessary to trigger automated or staff processes to put the requests into motion.

The Enterprise Services Catalog in **Attachment 2 to Section 3 - Schedule C: Services Catalog** includes a rich selection of logical IT resources from servers and storage to networking. There is also a set of physical components such as racks, cages, and technical staff services available from the Enterprise Services Catalog. Ultimately, this wide selection is expandable. Unisys anticipates that transition will point out other IT services and resources that may be needed or helpful to the Commonwealth. Unisys is ready to enlarge and augment the Enterprise Services Catalog as quickly and responsively as the Commonwealth shows need.

The Enterprise Services Catalog is further defined and described in **Attachment 2 to Section 3 - Schedule C: Services Catalog.**

3.4.4 Locations

RFP	Requirement
IV-3.B	*Office Location.* *The selected Offeror must maintain an office in the Harrisburg, PA area during the term of the contract. If the selected Offeror does not currently have an office in the Harrisburg, PA area, it must establish an office within two (2) months of award of the contract.*

Unisys maintains an office in the Harrisburg area to support our current Commonwealth contracts. Since most of our resources are already local to Harrisburg, Unisys will continue to maintain a major presence within the Harrisburg area to support the services and relationship with the Commonwealth. The Commonwealth will benefit from local access to the Unisys account management and transition project management teams as well as space for combined Unisys and Commonwealth meetings. The Unisys Team's Service Desk, Operations, and local services support will also use this office.

Unisys will also maintain an office at each data center to provide local support functions. These functions will include hardware checkout support and tape management operations.

3.4.5 Business and Technical Requirements

RFP	Requirement
IV-3.A	*Business and Technical Requirements.* *The business and technical requirements are detailed in Schedule F of this RFP.*

As shown in **Figure 3-12** the Commonwealth's infrastructure environment has a diverse set of service management and technical requirements supporting the Commonwealth's applications and their related business activities and needs. By applying an integrated approach of people, processes, and technologies, Unisys will provide data center infrastructure management services that cover the requirements the Commonwealth describes in **Schedule F** and enables the Commonwealth to benefit from the delivery of consistent and transparent technical services, a detailed data center migration program, and the flexibility to adjust to changing business needs.

The work plan described in **Schedule F** covers the program and service management functions, technical services, and transition planning services to support the Commonwealth's needs with transparency, flexibility, and quality.

By establishing an integrated service management architecture for IT Services Management (ITSM) and Enterprise System Management (ESM) based on ITIL V3 and other industry best practices, the Commonwealth will gain visibility into the overall

management of the infrastructure services from initial requesting of the service through project implementation and into ongoing operations. The Unisys integrated service management platform is based on three technology areas operating in a common set of processes. The Services Portal provides access to the online service management portal, Enterprise Services Catalog, and online operational dashboard and other reporting information. The ITSM platform supports tracking for changes, incidents, problems and assets, the configuration management database, SLA management, and workflow-based automation. The ESM platform provides the event monitoring and correlation as well as the infrastructure management for the managed services.

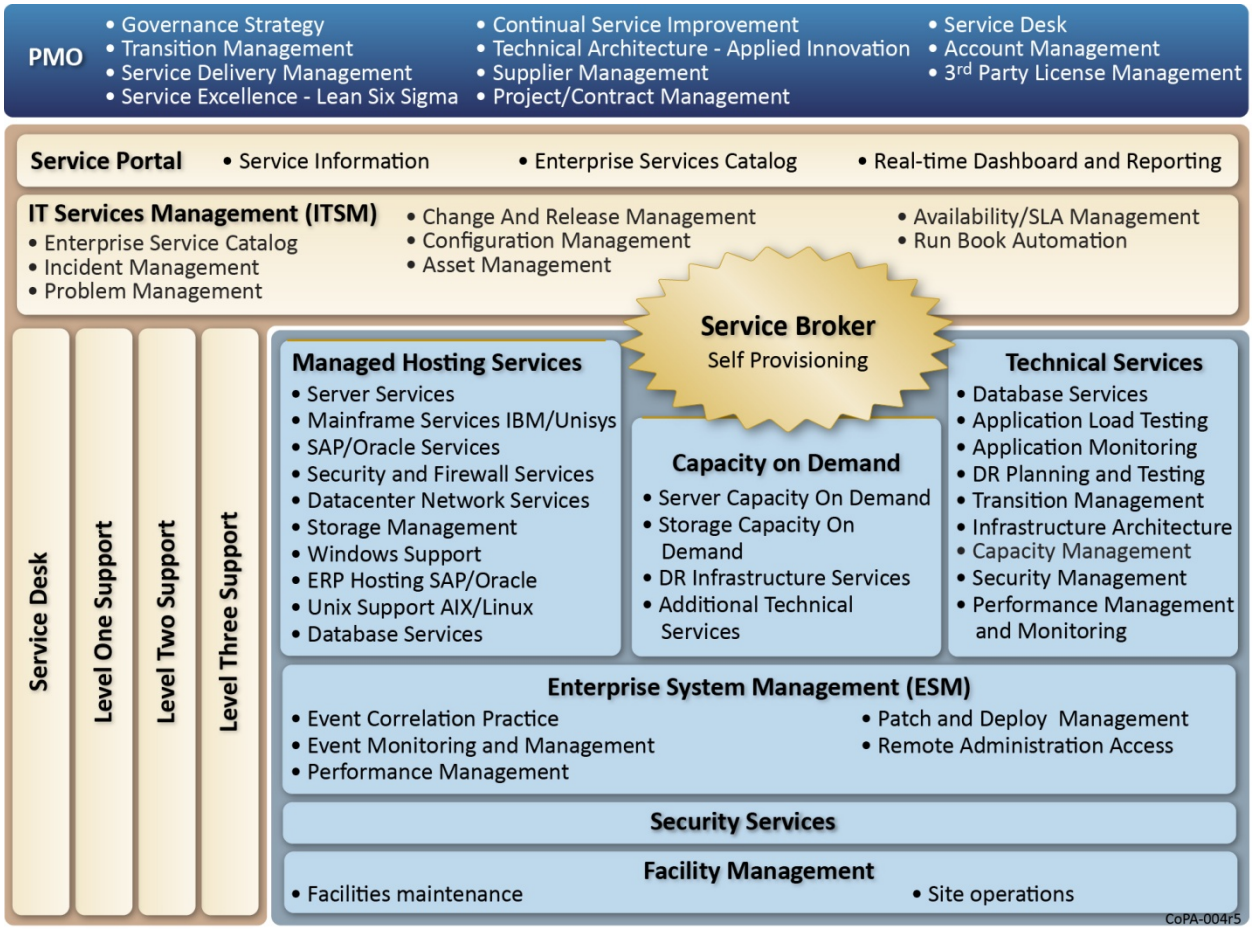


Figure 3-12. Unisys Service Management Model. *Using an integrated service management model as the foundation to provide the Commonwealth's managed infrastructure services.*

3.4.5.1 Program Management (A.1)

The Unisys Program Management Office (PMO) is the management team and primary interface for service delivery, projects, escalation, reporting, and billing. Our PMO supports and oversees account governance, transition management, continual improvement through service excellence, applied innovation through service and technology architecture, and management of the contract and suppliers.

The functional responsibilities for this team will be outlined in the technical solutions document in Schedule F, Section 3.2.1. By providing the following service management functions, the PMO will enable the Commonwealth to receive cost-effective, transparent, and flexible consumption-based services.

- Program and Service Management
- Availability and SLA Management
- Change and Release Management
- Service Desk
- Technical Architecture
- Account Management
- Configuration Management
- Third-party License Management.

The PMO will implement the service management, governance, and CSIIP functions during transition. As part of the service management implementation, Unisys will implement ITIL V3-based and ISO 20000-certified processes and integrated service management tools to monitor, manage, track, and report on the services and projects supporting the Commonwealth infrastructure. Through the implementation of the governance and CSIIP processes during transition, the Commonwealth will benefit from open communications, transparency, and continuous improvement for all services and activities supporting the common service portfolio.

3.4.5.2 Data Center Architecture (A.2)

With multiple data centers in the United States, the Commonwealth will benefit from the capability to migrate to fewer facilities, which can provide the managed infrastructure services and enable access to optional cloud hosting services. To support each agency's needs while also providing cost-effective services for the Commonwealth, the data centers are designed to support multi-tenant hosting services and infrastructure. The multi-tenant support includes network and security architectures that can enable separation between the agencies while sharing infrastructure components when possible to cost-effective services that can scale and adjust to specific requirements.

These facilities have the capability to provide several business continuity options to support the requirements of each agency's applications.

Unisys selected these data centers to limit the impact of network latency due to distance from Harrisburg and support the functionality for Tier 3 uptime compliance.

Our Data Center Architecture encompasses the following design functions and is located in Schedule F, Section 3.1:

- Multi-Data Center Environment (2+ Architecture)
- Network and Security Architecture
- Data Center Architecture and Technology.

3.4.5.3 Technical Services (A.3)

To support the Commonwealth's business and application environment changes, the infrastructure services will need to have the flexibility to change and adjust to the Commonwealth's needs as well as industry and technology advancements. Through the Technology Services, the Commonwealth will receive the ability to make changes in the services as well as implement new options to support the change in requirements.

The Technology Services support enables the introduction of new customers to the managed services and new or modified services to the Commonwealth. As part of the integrated service management processes, the Technology Services will also enable the Commonwealth to use new and updated technologies in the managed services as well as plan for changes in business needs due to usage, regulations, or legislation.

Our Technology Services encompass the following design functions and are located in Schedule F, Section 3.2.2.

- Transition Management (New Customer and/or Services)
- Infrastructure Architecture
- Capacity Management
- DR Planning and Testing
- Security Management
- Performance Monitoring and Management

3.4.5.4 Facility Management

Our approach to Facilities Management addresses all facets of managing the physical data center environment. Unisys selected geographically dispersed facilities to provide security and processing capability for the Commonwealth. When selecting the facilities, we searched for sites that simplified the monitoring activities displayed low risk for service

interruptions from unauthorized access, weather incidents, power incidents, damage to hardware, or injury to staff. We looked carefully at details such as power distribution, cooling, heating, ventilation, fire detection, fire suppression, access controls, and environmental controls.

We also selected facilities that supported our site operations objectives enabling data center staff and management to deliver world-class services to the Commonwealth; interface with the Commonwealth; and successfully implement our best practices for operational elements such as compute platforms, storage, networking, security, firewall, tape backup, and off-site tape rotation systems.

Our Facility Management section encompasses the following design functions and is located in Schedule F, Section 3.2.3:

- Facility Architecture and Maintenance
- Site Operations.

3.4.5.5 Managed Hosting Services (A.5)

Managed Hosting Services provide the people, process, and technologies to support each independent service while also being connected with the rest of the services by the integrated service management processes and platforms. For each of our services, we selected the technologies and people to provide a reliable, cost-effective solution for the Commonwealth to host and operate its applications.

Our Managed Hosting Services encompass the following design functions and are located in Schedule F, Section 3.2.4:

- Windows Support
- Storage Management
- ERP Hosting for SAP and Oracle
- UNIX Support for AIX and Linux
- Mainframe Services
- Security and Firewall
- Database Management Services
- Limited-Use Colocation Services.

3.4.5.6 Capacity on Demand Services (A.6)

Building capacity on demand that is realistic and relevant to the Commonwealth's business and technical requirements necessitates requires extensive experience and an extremely clear understanding of the underlying driver that the service demands. Only Unisys can

deliver this depth of understanding. Our server and storage capacity-on-demand model takes into account the business cycles experienced by the Commonwealth from a seasonal and longer legislative decision process that generates ebbs and flow in server demand. Our Disaster Recovery infrastructure on demand service model considers the need for servers, storage, and networks to support recovery of business applications and data when trouble strikes. Through Unisys use of similar technology platforms between the managed and capacity-on-demand services, the Commonwealth will have a flexible and manageable path of migration to the capacity-on-demand services.

By applying the integrated service management tools and processes for capacity and performance management and automation services, our capacity-on-demand services are designed to provide the necessary resources to address surges or long-term increases in processing requirements while providing reliable and cost-effective services.

Our Capacity on Demand Services encompasses the following design functions and are located in Schedule F, Section 3.2.5:

- Server Capacity on Demand
- Storage Capacity on Demand
- DR Infrastructure on Demand
- Additional Technical Services

3.4.5.7 Transition Services (A.7)

The Unisys Transition model is a critical mass for this contract. We alone have the background and skill to properly transition the Commonwealth from the current state to the proposed state specifically given our business knowledge.

We looked at the shared enterprise facilities and the individually owned agency data centers. We have a solid plan to transition the operations, applications, and data to our data centers with no impact on the user community.

We will pay careful attention to software licenses, protect Commonwealth interests, and add and subtract licenses to provide continued operations. We will maintain the integrity of data center configurations with regard to mainframes, servers, SAP, Oracle, and the other systems necessary to support business operations. Our strong governance model will oversee, control, and accomplish our transition plan.

Our Transition Services encompass the following design functions and are located in Schedule F, Section 3.3:

- Transition Plan
- Transition Program Management
- Security Transition Activities.

3.4.6 Contract Requirements - Small Diverse Business Participation (RFP IV-6

RFP	Requirement
IV-6	*Contract Requirements—Small Diverse Business Participation.* *All contracts containing Small Diverse Business participation must also include a provision requiring the selected contractor to meet and maintain those commitments made to Small Diverse Businesses at the time of proposal submittal or contract negotiation, unless a change in the commitment is approved by the BSBO. All contracts containing Small Diverse Business participation must include a provision requiring Small Diverse Business subcontractors to perform at least 50% of the subcontracted work.* *The selected contractor's commitments to Small Diverse Businesses made at the time of proposal submittal or contract negotiation shall, to the extent so provided in the commitment, be maintained throughout the term of the contract and through any renewal or extension of the contract. Any proposed change must be submitted to BSBO, which will make a recommendation to the Contracting Officer regarding a course of action.* *If a contract is assigned to another contractor, the new contractor must maintain the Small Diverse Business participation of the original contract.* *The selected contractor shall complete the Prime Contractor's Quarterly Utilization Report (or similar type document containing the same information) and submit it to the contracting officer of the Issuing Office and BSBO within ten (10) workdays at the end of each quarter the contract is in force. This information will be used to determine the actual dollar amount paid to Small Diverse Business subcontractors and suppliers. Also, this information will serve as a record of fulfillment of the commitment the selected contractor made and for which it received Small Diverse Business participation points. If there was no activity during the quarter then the form must be completed by stating "No activity in this quarter."* *NOTE: EQUAL EMPLOYMENT OPPORTUNITY AND CONTRACT COMPLIANCE STATEMENTS REFERRING TO COMPANY EQUAL EMPLOYMENT OPPORTUNITY POLICIES OR PAST CONTRACT COMPLIANCE PRACTICES DO NOT CONSTITUTE PROOF OF SMALL DIVERSE BUSINESS STATUS OR ENTITLE AN OFFEROR TO RECEIVE CREDIT FOR SMALL DIVERSE BUSINESS UTILIZATION.*

The Commonwealth of Pennsylvania recognizes the role that small businesses play in growing the economy. The Small Business Procurement Initiative announced by Governor Tom Corbett in July 2012 is another example of the Commonwealth's efforts to provide more business opportunities for small business in Pennsylvania.

As a Pennsylvania-based company, Unisys is committed to supporting the economic growth of small diverse businesses in Pennsylvania. Our proposal reflects this commitment through the use of several DGS-verified Small Diverse Businesses as subcontractor partners and suppliers in our proposed solution.

The Commonwealth of Pennsylvania is focused on economic growth by providing more business opportunities for small businesses and Unisys Corporation has a plan to support the Commonwealth's growth objectives. Our proposed solution for Data Center Computing Services includes the utilization of 11 Pennsylvania DGS-verified small diverse businesses to assist us in providing quality services to the Commonwealth. The Small Diverse Business Participation Submittal of this proposal provides information about our partners, the services and supplies that they will provide, and the economic value of their contribution. Procurement contract agreements have been established with each of our

partners to confirm that program scope, service level agreements, service responsibilities and compensation are clearly communicated. Letters of intent describing our commitment to each partner are included in Volume II of our proposal for Commonwealth review. Unisys will keep commitments made to Small Diverse Businesses as documented in our SDB submittal throughout the term of the contract and through any renewal of extension of the contract.

All Unisys subcontracts with our DGS-certified Small Diverse Business partners will include provisions (terms) requiring that the firm retain performance of at least 50% of the subcontracted work. In addition, Unisys agrees that if a contract is assigned to another contractor that the new contract will maintain the Small Diverse Business participation of the original contract if this can be achieved without adversely affecting service to the Commonwealth.

Providing the economic growth opportunities envisioned by the Small Business Procurement Initiative is important to the Commonwealth of Pennsylvania and to Unisys Corporation. In developing our solution, we carefully evaluated several DGS verified small diverse business firms for inclusion on the Unisys Team and selected those with the appropriate skills and company culture to support the delivery of high quality services and supplies to the Commonwealth. The Small Diverse Business Participation Submittal of our proposal provides details on each of these firms and the planned role for each in our managed services solution. The SDB Participation Submittal also includes the planned financial commitment for each of these firms which Unisys expects to maintain through the duration of the contract.

Unisys understands that all proposed changes to the Small Diverse Business participation included in our proposed solution need to be submitted to the Commonwealth of Pennsylvania's Bureau of Small Business Opportunities (BSBO) for review. In all cases, Unisys will offer our recommended plan to the Bureau of Small Business Opportunities for addressing changes to the scope of Small Diverse Business content while meeting or exceeding economic commitments to these partners.

The Commonwealth has indicated a need for accurate and timely information regarding the participation of Small Diverse Business (SDB) firms within the Data Center Compute Services project to be reported on a quarterly basis. Unisys Corporation will prepare and submit a Prime Contractor's Quarterly Utilization Report to the DGS contracting officer and the Bureau of Small Business Opportunities within ten (10) workdays at the end of each quarter that the contract is in force.

3.4.7 Proposed Services

RFP	Requirement
IV-3.C	*Proposed Services.* *The selected Offeror shall not significantly alter or discontinue any service defined in this RFP or proposed by the Offeror without prior written authorization from the Commonwealth.*

Unisys recognizes that services should not be significantly altered or discontinued without notification and written approval from the Commonwealth. The Commonwealth benefits from our open communications on significant changes to any proposed or defined services. As these changes, including discontinuation, are identified, Unisys will work with the Commonwealth to review the changes and request approval for any services or contract changes.

3.4.8 Payment for Services

RFP	Requirement
IV-3.E	*Payment for Services* *The selected Offeror may bill for a Service once the Commonwealth accepts the Service via ITSM.*

Unisys recognizes the Commonwealth should receive a completed work product or implementation before billing for the service. We will use the acceptance of a service request in the ITSM system as the Commonwealth's approval to begin the billing process.

SCHEDULE B

GOVERNANCE

1. **Management Meetings**. There shall be weekly meetings of the Management Committee during the Transition Period and monthly meetings thereafter. The purpose of such meetings shall be to (1) track the progress of the Transition and Transformation Plan, (2) review Contractor's performance of the Services Levels, (3) resolve disputes, (4) track the progress of the Services and other projects, (5) coordinate and plan for any new hardware or software acquisitions and service deployments, and (6) address any other matters properly brought before the Management Committee.

2. **Management Committee**. "Management Committee" shall be a committee comprised of ten members, five of whom shall be appointed by Commonwealth and five of whom shall be appointed by Contractor from Contractor's executive management staff. Commonwealth and Contractor shall each have one (1) vote with respect to matters that are brought before the Management Committee for resolution. Commonwealth shall designate one of its members on the Management Committee to act as the chairperson of the Management Committee. Both Commonwealth and Contractor can change the individuals on the Management Committee on an as-needed basis. The Management Committee shall be authorized and responsible for (1) generally overseeing the performance of this Contract, (2) providing input and advise to the Governor's Office of Administration regarding Commonwealth's strategic and tactical decisions in respect of the Services, the Systems and any other aspect of the business relationship between Commonwealth and Contractor under this Contract, and (3) monitoring and attempting to resolve disputes regarding the provision of the Services and the Services Levels.

3. **Commonwealth Computing Procedures Manual**. For each Commonwealth Agency and as part of the Services, Contractor shall establish procedures pursuant to which Contractor proposes that policies of Commonwealth and Contractor will be adhered to during the Term for the Commonwealth, and shall deliver to Commonwealth, not later than thirty (30) days prior to the commencement of the activities contemplated under the Transition Plan for the Commonwealth's approval or comment, a draft Commonwealth Computing Procedures Manual generally summarizing (1) the Services, (2) the computer hardware and software environments in which, and the various Services Locations at which, the Services will be performed, (3) the documentation, if any, which provides further details regarding the Services, (4) the procedures Contractor intends to use, and the activities Contractor proposes to undertake, in order to manage the Services, and (5) the procedures of a management reporting system that Contractor will use to manage this Contract and communicate to and with Commonwealth. Commonwealth may, at its request, participate to whatever degree it desires in the preparation of the draft Commonwealth Computing Procedures Manual. Contractor may periodically propose and, at the request of Commonwealth, shall promptly propose updates of the Commonwealth Computing Procedures Manual to reflect any changes in the operations or procedures described therein, all of which proposed changes shall be subject to Commonwealth's approval or comment. Reference Schedule H - Commonwealth Computing Procedures Manual for additional details.

UNISYS RESPONSE:

Management Meetings

There shall be weekly meetings of the Management Committee during the Transition Period and monthly meetings thereafter. The purpose of such meetings shall be to (1) track the progress of the Transition and Transformation Plan, (2) review Contractor's performance of the Services Levels, (3) resolve disputes, (4) track the progress of the Services and other projects, (5) coordinate and plan for any new hardware or software acquisitions and service deployments, and (6) address any other matters properly brought before the Management Committee.

Unisys understands the need for meetings to effectively and efficiently communicate important information to program stakeholders as part of a good governance model. Management meetings, however, are but one component of that communication and governance model.

A three-tier meeting structure will provide visibility at all levels in our respective organizations.

- **Tier 1 – Executive Governance and Steering Committees —** The objective of these meetings is to focus on the engagement's strategy and goals. This will serve to better align the IT initiatives with the Commonwealth's business goals. These meetings will develop and review strategy for the engagement. They will provide a forum for sharing insights on the application of industry best practices. These meetings are held monthly early on the contract and quarterly as steady state operations are achieved.
- **Tier 2 – Program Management —** Program management meetings focus on operational performance. The objectives of these meetings are to manage performance and effectiveness, manage SLAs and communications, and provide a platform for continuous improvement. These meetings occur weekly in the Transition Phase and monthly as operations reach the steady state.
- **Tier 3 – Service Delivery Management Teams —** These meetings are meant to handle day-to-day issues. They will focus on daily operations, escalation management, third-party management and handoffs, and end-to-end incident management. These meetings occur daily during the transition and weekly after the steady state is achieved.

All meetings require controlled agendas to enable them to be held according to their mutually agreed frequency and to make the meetings productive for all parties. All points for improvement can be added to the CSIIP library to be jointly addressed by Unisys and the Commonwealth.

Examples of subject matter addressed by the governance teams and processes include the following:

- **Transition and Transformation Plan Tracking —** Gather status and metrics from transition and transformation activities, assess status and risk, identify issues and

risks, design and implement mitigation for risks and corrective actions for issues, and track issues to closure at subsequent meetings

- **Contractor Performance Reviews —** Gather status and metrics from service level activities, gather status and metrics from the transition, assess status and risk, identify issues and risks, design and implement mitigation for risks and corrective actions for issues, and track issues to closure at subsequent meetings
- **Dispute Management —** Gather the facts, distill them to relevant information, develop possible solutions, negotiate potential solutions with the disputing organizations, find common ground or acceptable compromise, implement solutions, and track disputes for recurring problems until the situation is closed
- **Issues/Risk Database —** Track the progress and usefulness of the deployed services, track the availability of unused services, track the status and risk for services, and track the status and risk for projects. Produce reports for review and comment at meetings, gather information and assignments from meetings, confirm the staff responsible for the issue or risk is aware of guidance from leadership, and record the status from staff working the issue or risk.
- **Acquisition Planning —** Coordinate and conduct planning sessions to address the enterprise impacts on new hardware of software acquisitions, service deployments, and projects. Document findings in the issues and risks database, confirm the staff responsible for the issue or risk is aware of guidance from leadership, and record the status from staff working the issue or risk.
- **Agenda Development —** For each meeting, appoint a moderator who will write and maintain the agenda for the meeting and confirm that all matters are presented to the correct level of management to evaluate and render decisions.

The objective of the Executive Steering Committee (ESC) is to provide strategic direction and oversight to the engagement, maintaining alignment with business objectives for each organization and monitoring the delivery of services to maintain continued business value. The ESC's roles and responsibilities include:

- Provide direction to the engagement and alignment with strategic initiatives
- Review account planning documents
- Provide final resolution of escalated issues
- Review business and technical proposals submitted by business sponsors
- Advise and guide the Program Management Committee as appropriate
- Review performance (reports and recommendations provided by the Program Management Committee)
- Review continuous improvement initiatives, achievement of milestones, and deliverables
- Review service levels annually and reset them as necessary
- Review key performance metrics (SLAs, and so forth) as needed
- Review decisions by key personnel
- Discuss overall satisfaction with the engagement.

The Program Management Committee (PMC) provides overall management of the relationship and delivery of the program, enabling the program to be aligned with the objectives set forth by the ESC and confirming the achievement of those objectives. The PMC's roles and responsibilities include:

- Assist with the alignment of service delivery with the Commonwealth's business strategy
- Assist in the development of a technology roadmap enabling efficient and effective management of IT resources
- Report the status and progress to the ESC each quarter
- Review change proposals
- Review performance
- Discuss overall satisfaction
- Create and review plans for continuous improvement
- Implement continuous improvement initiatives
- Resolve disputes
- Review personnel decisions
- Oversee day-to-day delivery of services.

The Service Delivery Management Committee (SDMC) provides overall management for day-to-day delivery streams, attains service delivery objectives set by the ESC, and makes recommendations to support program strategy. The SDMC's roles and responsibilities include

- Manage day-to-day operations
- Report progress to the Program Managers
- Review change proposals
- Review delivery performance
- Resolve delivery issues
- Review personnel decisions
- Make recommendations to support program objectives
- Implement continuous improvement initiatives
- Resolve disputes.

Management Committee

"Management Committee" shall be a committee comprised of ten members, five of whom shall be appointed by Commonwealth and five of whom shall be appointed by Contractor from Contractor's executive management staff. Commonwealth and Contractor shall each have one (1) vote with respect to matters that are brought before the Management Committee for resolution. Commonwealth shall designate one of its members on the Management Committee to act as the chairperson of the Management Committee. Both Commonwealth and Contractor can change the individuals on the Management Committee on an as-needed basis.

The Management Committee shall be authorized and responsible for (1) generally overseeing the performance of this Contract, (2) providing input and advise to the Governor's Office of Administration regarding Commonwealth's strategic and tactical decisions in respect of the Services, the Systems and any other aspect of the business relationship between Commonwealth and Contractor under this Contract, and (3) monitoring and attempting to resolve disputes regarding the provision of the Services and the Services Levels.

The Management Committee forms the heart of the project's governance.

"Governance is the set of processes that ensure the effective and efficient use of IT in enabling and organization to achieve its goals."

Source: Gartner, IT Governance Key Initiative Overview, July 22, 2011

The Management Committee includes governance at the strategic and tactical levels and maintains clarity of purpose, responsibility, and direction to allow proper focus on collaboration between the Commonwealth and the Unisys Team to achieve the Commonwealth's IT governance objectives.

Unisys developed a three-tier management committee structure. The Executive Governance Committee provides a clear description of this committee. The committee's membership will include five Commonwealth members and five Contractor members. Within the first 3 days of the contract, Unisys will collaborate with the Commonwealth Contracting Officer to identify the five Commonwealth members for this committee. The first meeting of the Executive Governance Committee will occur within 5 business days of the contract's start.

During the meetings, when voting is required to make decisions, each member of the Executive Governance Committee will have an equal vote on the decision, without regard to his or her respective employer (the Commonwealth or Unisys).

The chairperson of the Executive Governance Committee will be a Commonwealth employee. The committee's moderator and scribe will be a Unisys employee.

Membership of the Executive Governance Committee will be fluid, and as needed. Membership will be adjusted to address changes in employment or other needs (skills or experience) in the committee's structure.

The moderator will establish meeting agendas that include contract performance, strategic and tactical service decisions, system decisions, Commonwealth and Unisys business relationship issues, contract risks, and service level provision issues.

A recent TPI research study indicates that 5 percent to 30 percent of a transaction's expected value is lost through ineffective governance.

There are significant benefits to the Commonwealth when good governance is practiced, including:

- Improved business value
- Stronger relationships between the Commonwealth and the Unisys Team
- Enabled strategic partnering
- Improved communications
- Increased focus and proper prioritization
- Increased understanding of the Commonwealth's expectations and what is needed to accomplish them
- Clarification of accountability across Commonwealth and Unisys teams.

The Unisys approach to governance is focused on

- **Meeting objectives and honoring commitments —** By thoroughly evaluating the planned IT environment and analyzing the scope identified in the RFP, we plan on meeting our objectives and honoring our commitments. We will make thorough use of the Unisys JRM Builder tool to clarify responsibilities across the environment. We will employ the CSIIP program to manage and monitor focal points for collaboration.
- **Teaming for efficiency and removing barriers to excellence —** We will establish partnership principles that recognize we are vested in each other's success. We will build a Governance Program Plan that will fully operationalize governance and continually drive governance maturity.
- **IT goals focused on business outcomes and people computing —** Applying good process and technology is important to the success of any outsourcing project, but by focusing on people, the greatest potential is achieved. By applying People Computing concepts, we will increase collaboration at all levels—including the executive level—and maintain alignment and participation. We will seek to develop direct relationships with end user communities. We will understand and respond to changing business needs. We will do this by putting people first, before technology and process.

  We will also build a focus on the future by understanding our impact on future business outcomes. We will perform strategic and tactical planning. We will perform with continual innovation and improvement embedded in our activities, and we will regularly recalibrate our services and delivery to keep things fresh and current.

The Unisys approach strives to provide optimized IT with a mature governance model. The Unisys governance strategy involves two primary areas:

1. The definition of a well-documented Strategic Program Plan

2. A definition of the processes, organization, and relationships that will be used to govern the program.

The Strategic Program Plan

The Strategic Program Plan will involve the following:

- Developing a clear understanding of the Commonwealth's "business" and why Unisys services are vital to your constituents to help the account team put their work into proper context.
- Developing a framework for exactly what outcomes you are expect from this engagement.

The partnership's guiding principles should include mutual understanding of the key goals, values, and contributions required from each member of the team (including the Commonwealth). This will lead to faster decision-making and communications that are more direct.

A Governance Maturity Assessment is a first step to proper governance. In this phase of the project, the combined team, along with a draft framework plan, will complete a Governance Maturity Assessment Matrix. The five-stage maturity model will measure key attributes of good collaborative governance against five levels of maturity from nonexistent to optimized. The outcome will be an understanding of our organization's current governance maturity level, and it will identify the areas for greatest improvement that are linked to business issues being experienced.

A Governance Management System should be established and based on the Commonwealth's values for what is key to be communicated or alerted and should include early warning signals to warn of any potential failures to allow redress instead of remediation. The proposed communications and governance metric should be a simple visual control—red or green stickers in a common area to rate the week's communications success, for example.

One of the objectives for the PMO communication plan should be to assess communications events for the Unisys Team and the Commonwealth with an aim to prevent any individual or communication event from becoming a single point of failure in the relationship. A clear set of management escalation processes, escalation levels, and criteria should be developed to resolve business issues in a timely way. This process should also include a de-escalation process.

Instead of being "rear-view mirror" controls (telling you what happened after it takes place), focus should be made on alerting the team to unwelcome conditions that allow it to take immediate and predefined actions to proactively address the situation.

Communication Management is an important component of the Strategic Program Plan. In this discipline, a cadence for communications is established—and daily, weekly, or monthly communications are implemented to communicate information such as improvements, innovations, pro-activity, and changes using various forms of communication. Each agency leader will have an assigned Agency Account Manager serving as the primary point of contact from the Unisys Team who will promote effective two-way communication.

Defining the Processes, Organization, and Relationships

Defining roles and responsibilities is the first step of this portion of the strategy. A roles and responsibilities matrix will be developed to define the various actives. Defining roles and responsibilities will enable each critical activity to be covered by individuals who are either responsible or accountable for it, and all key people to be informed or consulted.

Then, a Joint Responsibility Matrix (JRM) will be developed. This will assign the Unisys Enterprise Services Catalog—based on ITIL V3—to the Commonwealth's environment. This activity will foster alignment and attempt to eliminate potential gaps. It will make use of a Unisys proprietary tool—JRM Builder—to facilitate and generate output that is color coded for easy reference.

Understanding the Commonwealth and Unisys organizational counterparts for each role on the project team is important in understanding the need to share ownership and work together to collaboratively manage the services that are provided. A simple template will facilitate the clear communication of the relationships for each role.

Effective governance is a critical success factor for this complicated transformation. The Unisys Team fully understands the Commonwealth's management structure and the independence of agency leadership. We have the relationships and experience to work with the Commonwealth to quickly establish a governance structure that facilitates rapid transition to the new model in a way that leverages optimizations from the new infrastructure model while respecting the individuality of agencies.

Introduction

The Unisys Enterprise Services Catalog represents entries that have been explicitly called out by the Commonwealth's Compute Services Request for Proposal (RFP) Schedule I Many additional suggestion came from other RFP's documents including Schedule F and the associated Exhibits. Unisys' experience with the Commonwealth augmented these entries enriching the choices contained in the Unisys Enterprise Services Catalog as suggested by the RFP.

The Enterprise Services Catalog provides descriptions for the specific entries shown including descriptions of related Enterprise Services Catalog items that will be needed to place a selection into its proper context. For example, the selection of a Gold Windows physical server will require the inclusion of an additional, identical server to provide the infrastructure capable of meeting the SLA. Similar instances exist, and are described, throughout the Enterprise Services Catalog. These dependencies are noted within the definition of each item.

The Commonwealth's Enterprise Services Catalog will be accessible from Unisys' Service Portal and support user-based authentication and privilege along with support for agency and project level accounting association with each requested item. Where the Commonwealth has advised Unisys that a request may move directly to ordering or provisioning, the Enterprise Services Catalog tool may trigger automated ordering and deployment of the request. Where change management must include approvals and scheduling, the Enterprise Services Catalog tool interfaces with the ITSM environment to participate in the process and gain the approvals and privilege necessary to trigger automated or staff processes to put the requests into motion.

The Enterprise Services Catalog that follows includes a rich selection of logical IT resources from servers and storage to networking. There is also a set of physical components such as racks, cages, and technical staff services available from the Enterprise Services Catalog. Ultimately, the Enterprise Services Catalog is a dynamic tool that is expandable to the Commonwealth's requirements. Unisys anticipates that transition will uncover other Information Technology (IT) services and resources that may be needed by the Commonwealth. The Enterprise Services Catalog is laid out with the following sections.

1) Catalog of Services

2) Enterprise Services Catalog Template

3) Compute Services - Fully Managed Services

4) Compute Services - Managed Only Services

5) Compute Services - Co-location Services

6) Compute Services - Mainframe Services

7) Compute Services – Infrastructure as a Service

8) Third-Party Software

9) Additional Technical Resources

10) Additional Technical Services

Compute Services - Fully Managed Services

Fully Managed - X86 (Windows and Linux)

X86 (Windows or Linux) Physical Configuration - Configuration Components

Service Attribute	*Service Attribute Description*	
Service Name	Windows / Linux Physical Server – Configuration 1 – 2 way Quad-Core 2.0 GHz	
Detailed Description	Two socket, 4 cores per socket CPU's running at 2.0 GHz	
Service Customers / Users	Cannot Be Ordered Separately	
Service Prerequisites	1) Cannot Be Ordered Separately	
Request the Service	Cannot Be Ordered Separately	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310001-A	Windows pConfig-1 - 2-way Quad-Core 2.0 GHz	Per Physical Server
CCSU13310035-A	Linux pConfig-1 - 2-way Quad-Core 2.0 GHz	Per Physical Server

Service Attribute	*Service Attribute Description*	
Service Name	Windows / Linux Physical Server – Configuration 2, 4, 5 – 2 way Six-Core 2.4 GHz	
Detailed Description	Two socket, 6 cores per socket CPU's running at 2.4 GHz	
Service Customers / Users	Cannot Be Ordered Separately	
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	Cannot Be Ordered Separately	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310002-A	Windows pConfig – 2,4,5 - 2 way Six-Core 2.4 GHz	Per Physical Server
CCSU13310036-A	Linux pConfig – 2,4,5 - 2 way Six-Core 2.4 GHz	Per Physical Server

Service Attribute	*Service Attribute Description*	
Service Name	Windows / Linux Physical Server – Configuration 3 – 2 way Six-Core 2.0 GHz	
Detailed Description	Two socket, 6 cores per socket CPU's running at 2.0 GHz	
Service Customers / Users	Cannot Be Ordered Separately	
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	Cannot Be Ordered Separately	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310003-A	Windows pConfig – 3 - 2 way Six-Core 2.0 GHz	Per Physical Server
CCSU13310037-A	Linux pConfig – 3 - 2 way Six-Core 2.0 GHz	Per Physical Server

Service Attribute	*Service Attribute Description*	
Service Name	Windows / Linux pConfig – 1, 2, 3, 4, 5 - GB RAM	
Detailed Description	1 GB of Physical Random Access Memory (RAM)	
Service Customers / Users	Cannot Be Ordered Separately	
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	Cannot Be Ordered Separately	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310004-A	Windows GB RAM	Per GB
CCSU13310038-A	Linux GB RAM	Per GB

Service Attribute	*Service Attribute Description*	
Service Name	Windows / Linux pConfig – 1,2,4,5 – Mirrored 146 GB 15K Hard Drives	
Detailed Description	Two internal 146 GB 15K Hard Drives, Mirrored	
Service Customers / Users	Cannot Be Ordered Separately	
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	Cannot Be Ordered Separately	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310005-A	Windows Mirrored 146 15K Hard Drives	Per Primary + Mirrored
CCSU13310039-A	Linux Mirrored 146 15K Hard Drives	Per Primary + Mirrored

Service Attribute	*Service Attribute Description*	
Service Name	Windows / Linux pConfig – 3 – SAN Attached Storage	
Detailed Description	Short write up on what the Catalog item will do	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	What is required before this service or service element be ordered? 1) Selection of another service (what service?) 2) Solution Request submittal 3) Etc.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310006-A	Windows SAN Attached Storage	Per GB
CCSU13310040-A	Linux SAN Attached Storage	Per GB

Service Attribute	*Service Attribute Description*	
Service Name	Windows – pConfig 1,2,3,4,5 – Windows Server 2008 R2	
Detailed Description	Windows Server 2008 R2 License for One (1) physical server.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) One physical server configuration 1, 2, 3, 4, or 5 2) One Commissioning/Decommissioning Service	
Request the Service	Cannot Be Ordered Separately	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310007-A	Windows pConfig-1, 2, 3, 4, 5 – Windows Server 2008 R2	Per License

Service Attribute	*Service Attribute Description*	
Service Name	Linux – pConfig 1, 2, 3, 4, 5 – Red Hat or SUSE	
Detailed Description	Red Hat or SUSE License for One (1) physical server.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	3) One physical server configuration 1, 2, 3, 4, or 5 1) One Commissioning/Decommissioning Service	
Request the Service	Cannot Be Ordered Separately	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310041-A	Linux pConfig-1,2,3,4,5 – Red Hat or SUSE	Per License

Service Attribute	*Service Attribute Description*	
Service Name	Windows / Linux pConfig – 4 – Disaster Recovery Server with 24 hour Recovery Point Objective	
Detailed Description	Provides two physical configuration 4 servers, with one configured as a disaster recovery server. The disaster recovery server has a 24 hour Recovery Point Objective.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1. For Platinum, servers must be ordered in groups of three 2. For Gold, servers must be ordered at a minimum in a pair of two (2) 3. Must order a commissioning/decommissioning service, one for each server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310008-A	Windows pConfig - 4 – Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization Site's Local SAN Storage from hourly	Per Service

	data synchronization	
CCSU13310042-A	Windows pConfig - 4 – Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization Site’s Local SAN Storage from hourly data synchronization	Per Service

Service Attribute	*Service Attribute Description*	
Service Name	Windows / Linux pConfig – 5 – Disaster Recovery Server with 72 hour Recovery Point Objective	
Detailed Description	Provides two physical configuration 5 servers, with one configured as a disaster recovery server. The disaster recovery server has a 24 hour Recovery Point Objective.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1. For Platinum, servers must be ordered in groups of three 2. For Gold, servers must be ordered at a minimum in a pair of two (2) 3. Must order a commissioning/decommissioning service, one for each server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310009-A	Windows pConfig - 5 - Disaster Recovery Server with a Restoral Interval of 72 hours via Backup Restoral from off-site tape Backups	Per Service

CCSU13310043-A	Linux pConfig - 5 - Disaster Recovery Server with a Restoral Interval of 72 hours via Backup Restoral from off-site tape Backups	Per Service

X86 (Windows or Linux) Physical Configuration - Orderable Configurations

Service Attribute	*Service Attribute Description*	
Service Name	Windows Physical Server – Configuration 1	
Detailed Description	One physical Windows server with 2 physical CPU's, each with 4 cores operating at 2.4 GHz with 4 GB of RAM and 2 mirrored internal 146 GB Hard Drives operating at 15K RPM's.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1. For Platinum, servers must be ordered in groups of three 2. For Gold, servers must be ordered at a minimum in a pair of two (2) 3. Must order a commissioning/decommissioning service, one for each server. 4. Selection of appropriate tier (Platinum, Gold, Silver, Bronze, Basic) of server support	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310219-A	Windows pConfig-1	Per Physical Server

Service Attribute	*Service Attribute Description*	
Service Name	Windows Physical Server – Configuration 2	
Detailed Description	One physical Windows server with 2 physical CPU's, each with six (6) cores operating at 2.4 GHz with 16 GB of RAM and 2 mirrored internal 146 GB Hard Drives operating at 15K RPM's.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1. For Platinum, servers must be ordered in groups of three 2. For Gold, servers must be ordered at a minimum in a pair of two (2) 3. Must order a commissioning/decommissioning service, one for each server. 4. Selection of appropriate tier (Platinum, Gold, Silver, Bronze, Basic) of server support	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog

Service Attribute	*Service Attribute Description*	
Service Name	Windows – Virtual Configuration 1, 2, 3, 4, 5 – Windows Server 2008 R2	
Detailed Description	A copy of Windows Server 2008 R2 for a virtual machine.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310073-A	Windows vConfig-1, 2, 3, 4, 5 – Windows Server 2008 R2	Per License

Service Attribute	*Service Attribute Description*	
Service Name	Linux – Virtual Configuration 1, 2, 3, 4, 5 – Red Hat or SUSE	
Detailed Description	A copy of Red Hat or SUSE Linux for a virtual machine.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310109-A	Linux vConfig-1, 2, 3, 4, 5 – Red Hat or SUSE	Per License

Service Attribute	*Service Attribute Description*	
Service Name	Windows / Linux Virtual Configuration-1,2,3,4,5 – Firewall/IDS	
Detailed Description	One Firewall/IDS for a Windows or Linux virtual machine	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310074-A	Windows vConfig-1, 2, 3, 4, 5 – Firewall/IDS	Per License
CCSU13310110-A	Linux vConfig-1, 2, 3, 4, 5 – Firewall/IDS	Per License

Service Attribute	*Service Attribute Description*	
Service Name	Windows / Linux Virtual Configuration-1, 2, 3, 4,5– Site to Site VPN	
Detailed Description	One Site to Site VPN for a Windows or Linux virtual machine.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**

Fully Managed - P-Series Server (AIX)

P-Series (AIX) Server Configuration - Configuration Components

Service Attribute	*Service Attribute Description*	
Service Name	AIX Config – 1, 2, 3, 4, 5 – 3.0GHz POWER7 Server	
Detailed Description	AIX Config – 1, 2, 3, 4, 5 – 3.0GHz POWER7 Server	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Not eligible for separate purchase; must be purchased in conjunction with a Fully Managed AIX Config and AIX Config – 1, 2, 3, 4, 5 – AIX License	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
Unisys assigned	AIX Config – 1, 2, 3, 4, 5 – 3.0GHz POWER7 Server	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	AIX Config – 1,2 ,3 ,4 ,5 – Cores	
Detailed Description	AIX Config – 1, 2, 3, 4, 5 – Cores	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	May be optionally added to purchase of AIX Config – 1, 2, 3, 4, 5 – 3.0GHz POWER7 Server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310141-A	AIX Config – 1, 2, 3, 4, 5 – Cores	Per .5 Core

Service Attribute	*Service Attribute Description*	
Service Name	AIX Config – 1, 2, 3, 4, 5 – GB RAM	
Detailed Description	AIX Config – 1, 2, 3, 4, 5 – GB RAMs	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	May be optionally added to purchase of AIX Config – 1, 2, 3, 4, 5 – 3.0GHz POWER7 Server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310142-A	AIX Config – 1, 2, 3, 4, 5 – GB RAMs	Per 1.0 GB RAM

Service Attribute	*Service Attribute Description*	
Service Name	AIX Config – 1, 2, 3, 4, 5 – AIX License	
Detailed Description	AIX Config – 1, 2, 3, 4, 5 – AIX License	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Not eligible for separate purchase; must be purchased in conjunction with a Fully Managed AIX Config and AIX Config – 1, 2, 3, 4, 5 – 3.0GHz POWER7 Server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310143-A	AIX Config – 1, 2, 3, 4, 5 – AIX License	Per AIX License

Service Attribute	*Service Attribute Description*	
Service Name	AIX Config-4 DR Server	
Detailed Description	Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Must be purchased in conjunction with a Fully Managed AIX Config and its prerequisites.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310145-A	AIX Config-4 DR Server	Per Config

Service Attribute	*Service Attribute Description*	
Service Name	AIX Config-5 DR Server	
Detailed Description	Disaster Recovery Server with a Restoral Interval of 72 hours via Backup Restoral from off-site tape Backups	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Must be purchased in conjunction with a Fully Managed AIX Config and its prerequisites.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310146-A	AIX Config-5 DR Server	Per Config

P-Series (AIX) Server Configuration – Orderable Configurations

Service Attribute	*Service Attribute Description*	
Service Name	P-Series (AIX) Physical Server – Configuration 1	
Detailed Description	One AIX Server with 3.0GHz POWER7, 0.5 Cores, 6 GB RAM, AIX	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Selection of appropriate tier (Platinum, Gold, Silver, Bronze, Basic) of server support	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSI13310239-A	AIX Config-1	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	pSeries (AIX) Server – Configuration 2	
Detailed Description	One AIX Server with 3.0GHz POWER7, 1.0 Cores, 12 GB RAM, AIX	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Selection of appropriate tier (Platinum, Gold, Silver, Bronze, Basic) of server support	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog

Compute Services - Managed Only Services

Managed Only Services – X86 (Windows and Linux)

Service Attribute	*Service Attribute Description*	
Service Name	Managed Only Services for Agency Owned Windows or Linux Server Support	
Detailed Description	Windows management services or Commonwealth owned Windows service, in alignment to the requirements in Schedule F, Section 3.2.4.1	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) For Platinum, three Commonwealth owned Windows servers must be shipped to the data centers. 2) For Gold, two Commonwealth owned servers must be shipped to the data center. 3) For Bronze and Basic, one Commonwealth server must be shipped to the data center. 4) Must order a commissioning/decommissioning service, one for each server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**

CCSU13320001-A	Windows / Linux – Platinum Tier	Per Server Instance
CCSU13320002-A	Windows / Linux - Gold Tier	Per Virtual Server
CCSU13320003-A	Windows / Linux – Silver Tier	Per Virtual Server
CCSU13320004-A	Windows / Linux – Bronze Tier	Per Virtual Server
CCSU13320005-A	Windows / Linux– Basic Tier	Per Virtual Server

Managed Only Services – P-Series (AIX)

Service Attribute	*Service Attribute Description*	
Service Name	Managed Only Services for Agency Owned AIX Server Support	
Detailed Description	AIX management services for Commonwealth owned AIX service, in alignment to the requirements in Schedule F, Section 3.2.4.4	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSI13320006-A	AIX – Platinum Tier	Per Server Instance
CCSI13320007-A	AIX - Gold Tier	Per Virtual Server
CCSI13320008-A	AIX – Silver Tier	Per Virtual Server
CCSI13320009-A	AIX – Bronze Tier	Per Virtual Server
CCSI13320010-A	AIX– Basic Tier	Per Virtual Server

Fully Managed - Storage and Backup

Storage Services

Service Attribute	*Service Attribute Description*	
Service Name	Fully Managed – Storage Service – Dedicated – Config 1 – SAN RAID 5	
Detailed Description	Storage Service – Dedicated – Config 1 – SAN Raid 5	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSZ13310172-A	Dedicated – Config 1 – SAN RAID 5	Per GB

Service Attribute	*Service Attribute Description*	
Service Name	Fully Managed – Storage Service – Dedicated – Config 2 – SAN Raid 10	
Detailed Description	– Storage Service – Dedicated – Config 2 – SAN Raid 10	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSZ13310173-A	Dedicated – Config 10 – SAN RAID 10	Per GB

Service Attribute	*Service Attribute Description*	
Service Name	Fully Managed – Storage Service – Dedicated – Config 3 – Net Attached	
Detailed Description	Storage Service – Dedicated – Config 3 – Net Attached	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSZ13310174-A	Dedicated – Config 3 – Net Attached	Per GB

Tape and Backup Services

Service Attribute	*Service Attribute Description*	
Service Name	Fully Managed – Tape and Backup – Server Tape Stored	
Detailed Description	– Tape and Backup – Server Tape Stored	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310175-A	Server Tape Stored	Per GB Stored

Service Attribute	*Service Attribute Description*	
Service Name	Fully Managed – Storage Service – Tape and Backup – Offsite Tape Storage	
Detailed Description	Storage Service – Tape and Backup – Offsite Tape Storage	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310176-A	Offsite Tape Storage	Per Tape

Compute Services - Co-Location Services

Co-Location Services - Configuration Components

Service Attribute	*Service Attribute Description*	
Service Name	Co-Location Services - Cabinet	
Detailed Description	Co-Location Services - Cabinet	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13330001-A	Co-Lo Config-1	Per ¼ Rack (10U) Configuration
CCSU13330002-A	Co-Lo Config-2	Per ½ Rack (21U) Configuration
CCSU13330003-A	Co-Lo Config-3	Per Rack (42U) Configuration

Service Attribute	*Service Attribute Description*	
Service Name	Colocation Services – Network Bandwidth	
Detailed Description	Colocation Services – Network Bandwidth	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13330004-A	Network Bandwidth	Per GB

Service Attribute	*Service Attribute Description*	
Service Name	Colocation Service – 100 Mb/s Uplink	
Detailed Description	Colocation Service – 100 Mb/s Uplink	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13330005-A	100 Mb/s Uplink	Per Uplink

Service Attribute	*Service Attribute Description*	
Service Name	Colocation Service – IP Address	
Detailed Description	Colocation Service – IP Address	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13330006-A	IP Address	Per IP address

Service Attribute	*Service Attribute Description*	
Service Name	AC Circuit	
Detailed Description	AC Circuit	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13330007-A	110V AC Circuit	Per Circuit

Co-Location Services – Combined Configurations

Service Attribute	*Service Attribute Description*	
Service Name	Co-Location Services –Config-1 - ¼ Cabinet Configuration	
Detailed Description	Includes 10U bay – includes 6 IP addresses, 5,000 GB of network bandwidth, 100Mb/s uplink, 5 110VAC circuits	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13330008-A	Co-Lo Config-1	Per ¼ Rack (10U) Configuration

Service Attribute	*Service Attribute Description*	
Service Name	Co-Location Services –Config-2 - ½ Cabinet Configuration	
Detailed Description	Includes 21U bay – includes 14 IP addresses, 10,000GB of network bandwidth, 100Mb/s uplink, 10 110VAC circuits	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13330009-A	Co-Lo Config-2	Per ½ Rack (21U) Configuration

Service Attribute	*Service Attribute Description*	
Service Name	Co-Location Services –Config-3 - Full Cabinet Configuration	
Detailed Description	Includes 42U cabinet – includes 30 IP addresses, 20,000GB of network bandwidth, 100Mb/s uplink, 20 110VAC circuits	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13330010-A	Co-Lo Config-3	Per Rack (42U) Configuration

Compute Services - Mainframe Services

IBM Mainframe Storage and Backup

IBM Mainframe Storage Services

Service Attribute	*Service Attribute Description*	
Service Name	IBM Mainframe Allocated DASD	
Detailed Description	IBM Mainframe Allocated DASD	
Service Customers / Users	Any participating Commonwealth agency or department.	
Service Prerequisites	None	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310177-A	IBM Mainframe Allocated DASDs	Per GB

IBM Mainframe Backup and Tape Services

Service Attribute	*Service Attribute Description*	
Service Name	IBM Tapes in Storage – Virtual Tape Storage (VTS)	
Detailed Description	IBM Tapes in Storage - VTS	
Service Customers / Users	Any participating Commonwealth agency or department.	
Service Prerequisites	None	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310178-A	IBM Tapes in Storage - VTS	Per 1.0 GB

Service Attribute	*Service Attribute Description*	
Service Name	IBM Offsite Tape Storage	
Detailed Description	IBM Offsite Tape Storage	
Service Customers / Users	Any participating Commonwealth agency or department.	
Service Prerequisites	None	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310179-A	IBM Offsite Tape Storage	Per Tape

IBM Mainframe Service

IBM Mainframe Configuration - Configuration Components

Service Attribute	*Service Attribute Description*	
Service Name	IBM System zEnterprise Processor z/OS	
Detailed Description	IBM System zEnterprise Processor z/OS	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310180-A	IBM Mainframe – Config-1 - IBM System zEnterprise Processor z/OS	Per MIP

Service Attribute	*Service Attribute Description*	
Service Name	IBM System zEnterprise Processor Virtual Linux Production IFL	
Detailed Description	3 IBM System zEnterprise Processor Virtual Linux Prod IFLs	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310181-A	IBM Mainframe Config 2,3 - IBM System zEnterprise Processor Virtual Linux Prod IFL	Per MIP

Service Attribute	*Service Attribute Description*	
Service Name	IBM iSeries (AS/400)	
Detailed Description	IBM iSeries (AS/400)	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310182-A	IBM AS400 Config-1,2 - IBM iSeries (AS/400)	Per CPW

Service Attribute	*Service Attribute Description*	
Service Name	IBM Mainframe Config-3 – Disaster Recovery Server with 24 hour Recovery Point Objective	
Detailed Description	Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) A corresponding IBM Mainframe Config	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSI13310183-A	IBM Mainframe Config-3 – Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization Site's Local SAN Storage from hourly data synchronization	Per Config

Service Attribute	*Service Attribute Description*	
Service Name	IBM AS400 Config-2 – Disaster Recovery Server with 24 hour Recovery Point Objective	
Detailed Description	Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) A corresponding AS400 Config	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSI13310184-A	IBM AS400 Config-2 – Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization Site's Local SAN Storage from hourly data synchronization	Per Config

IBM Mainframe Configuration – Orderable Configurations

Service Attribute	*Service Attribute Description*	
Service Name	IBM System zEnterprise Processor z/OS – Config-1	
Detailed Description	IBM System zEnterprise Processor z/OS	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Selection of appropriate tier (Platinum, Gold, Basic) of server support	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310244-A	IBM Mainframe – Config-1 - IBM System zEnterprise Processor z/OS	Per MIP

Service Attribute	*Service Attribute Description*	
Service Name	IBM System zEnterprise Processor Virtual Linux Production IFL – Config-2	
Detailed Description	IBM System zEnterprise Processor Virtual Linux Production IFL	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Selection of appropriate tier (Platinum, Gold, Basic) of server support	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310245-A	IBM Mainframe Config 2 - IBM System zEnterprise Processor Virtual Linux Prod IFL	Per MIP

Service Attribute	*Service Attribute Description*	
Service Name	IBM System zEnterprise Processor Virtual Linux Production IFL – Config-3	
Detailed Description	IBM System zEnterprise Processor Virtual Linux Prod IFL Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Selection of appropriate tier (Platinum, Gold, Basic) of server support	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310246-A	IBM Mainframe Config 3 - IBM System zEnterprise Processor Virtual Linux Prod IFL	Per MIP

Service Attribute	*Service Attribute Description*	
Service Name	IBM iSeries (AS/400) – Config-1	
Detailed Description	IBM iSeries (AS/400)	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Selection of appropriate tier (Platinum, Gold, Basic) of server support	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310247-A	IBM AS400 Config-1 - IBM iSeries (AS/400)	Per CPW

Service Attribute	*Service Attribute Description*	
Service Name	IBM iSeries (AS/400) – Config-2	
Detailed Description	IBM iSeries / AS400 Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Selection of appropriate tier (Platinum, Gold, Basic) of server support	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13310248-A	IBM AS400 Config-2 - IBM iSeries (AS/400)	Per CPW

BM Mainframe Tiers of Service

Service Attribute	*Service Attribute Description*	
Service Name	IBM Mainframe Fully Managed Server Support	
Detailed Description	Management of Mainframe servers, in alignment to Schedule F, section 3.2.4.5	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	IBM Mainframe Config – 1 IBM System zEnterprise Processor z/OS, or IBM Mainframe Config – 2, 3 IBM System zEnterprise Processor Virtual Linux Prod IFL.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSI13310185-A	IBM Mainframe Config-1 Fully Managed – Platinum Tier	Per Physical Server
CCSI13310186-A	IBM Mainframe Config-1 Fully Managed – Gold Tier	Per Physical Server
CCSI13310187-A	IBM Mainframe Config-1 Fully Managed – Basic Tier	Per Physical Server
CCSI13310188-A	IBM Mainframe Config-2 Fully	Per Physical Server

	Managed – Platinum Tier	
CCSI13310189-A	IBM Mainframe Config-2 Fully Managed – Gold Tier	Per Physical Server
CCSI13310190-A	IBM Mainframe Config-2 Fully Managed – Basic Tier	Per Physical Server
CCSI13310191-A	IBM Mainframe Config-3 Fully Managed – Platinum Tier	Per Physical Server
CCSI13310192-A	IBM Mainframe Config-3 Fully Managed – Gold Tier	Per Physical Server
CCSI13310193-A	IBM Mainframe Config-3 Fully Managed – Basic Tier	Per Physical Server

Service Attribute	*Service Attribute Description*	
Service Name	IBM iSeries (AS/400) Managed Server Support	
Detailed Description	Management of Mainframe servers, in alignment to Schedule F, section 3.2.4.5	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Must be ordered with IBM AS400 Config 1, 2 IBM iSeries / AS400.	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSI13310194-A	IBM Mainframe Config-1 Fully Managed – Platinum Tier	Per Physical Server
CCSI13310195-A	IBM Mainframe Config-1 Fully Managed – Gold Tier	Per Physical Server
CCSI13310196-A	IBM Mainframe Config-1 Fully Managed – Basic Tier	Per Physical Server
CCSI13310197-A	IBM Mainframe Config-2 Fully Managed – Platinum Tier	Per Physical Server
CCSI13310198-A	IBM Mainframe Config-2 Fully Managed – Gold Tier	Per Physical Server
CCSI13310199-A	IBM Mainframe Config-2 Fully Managed – Basic Tier	Per Physical Server

Unisys Mainframe Storage and Backup

Unisys Mainframe Storage Services

Service Attribute	*Service Attribute Description*	
Service Name	UNISYS Mainframe – Allocated DASD	
Detailed Description	UNISYS Mainframe – Allocated DASD	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310200-A	UNISYS Mainframe Allocated DASD	Per GB

Unisys Mainframe Backup and Tape Services

Service Attribute	*Service Attribute Description*	
Service Name	UNISYS Mainframe – Tapes in Storage – Virtual Tape Storage (VTS)	
Detailed Description	UNISYS Mainframe – Tapes in Storage – Virtual Tape Storage (VTS)	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310201-A	UNISYS Tapes in Storage - VTS	Per GB Stored

Service Attribute	*Service Attribute Description*	
Service Name	UNISYS Mainframe – Offsite Tape Storage	
Detailed Description	UNISYS Mainframe – Offsite Tape Storage	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310202-A	UNISYS Offsite Tape Storage	Per Tape/Reel

Unisys Mainframe Service

Unisys Mainframe Configuration - Configuration Components

Service Attribute	*Service Attribute Description*	
Service Name	Unisys Mainframe (ClearPath Dorado) – Config-1,3	
Detailed Description	Provides Unisys Dorado (OS 2200) mainframe MIPS and operating system. Config -1 Production Only Config – 3 Production and DR	
Service Customers / Users	Department of Public Welfare Pennsylvania State Police	
Service Prerequisites	What is required before this service or service element be ordered? 1) Solution Request submittal to confirm requested system meets application processing requirements 2) For Config -3 Total of Production and DR MIPS identified	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13310203-A	Unisys Mainframe Config 1, 3 - Unisys (ClearPath / Dorado)	Per MIP

Service Attribute	*Service Attribute Description*	
Service Name	Unisys Mainframe (ClearPath Libra) – Config2,4	
Detailed Description	Provides Unisys Libra (MCP) mainframe MIPS and operating system. Config -2 Production Only Config -4 Production and DR	
Service Customers / Users	Pennsylvania Game Commission	
Service Prerequisites	What is required before this service or service element be ordered? 1) Solution Request submittal to confirm requested system meets application processing requirements 2) For Config -3 Total of Production and DR MIPS identified	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13310204-A	Unisys Mainframe Config- 2, 4 - Unisys (ClearPath / Libra)	Per MIP

Service Attribute	*Service Attribute Description*	
Service Name	Unisys Mainframe Config-3 – ClearPath / Dorado Disaster Recovery Server with 24 hour Recovery Point Objective	
Detailed Description	Provides Unisys Dorado (OS 2200) mainframe MIPS and operating system. Provides both Production and DR MIPS	
Service Customers / Users	Department of Public Welfare Pennsylvania State Police	
Service Prerequisites	What is required before this service or service element be ordered? 1) Solution Request submittal to confirm requested system meets application processing requirements 2) Total of Production and DR MIPS identified 3) Data replication services ordered	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310205-A	Unisys Mainframe Config-3 – Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from	Per Config

	hourly data synchronization Site's Local SAN Storage from hourly data synchronization	

Service Attribute	*Service Attribute Description*	
Service Name	Unisys Mainframe Config-4 – ClearPath / Libra Disaster Recovery Server with 24 hour Recovery Point Objective	
Detailed Description	Provides Unisys Libra (MCP) mainframe MIPS and operating system. Provides both Production and DR MIPS	
Service Customers / Users	Pennsylvania Game Commission	
Service Prerequisites	What is required before this service or service element be ordered? 1) Solution Request submittal to confirm requested system meets application processing requirements 2) Total of Production and DR MIPS identified 3) Data replication services ordered	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310206-A	Unisys Mainframe Config-4 – Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization Site's Local SAN Storage from	Per Config

	hourly data synchronization	

Unisys Mainframe Configuration – Orderable Configurations

Service Attribute	*Service Attribute Description*	
Service Name	Unisys Mainframe (ClearPath Dorado) – Config-1	
Detailed Description	Provides Unisys Dorado (OS 2200) mainframe MIPS and operating system. Provides Production MIPS	
Service Customers / Users	Department of Public Welfare Pennsylvania State Police	
Service Prerequisites	What is required before this service or service element be ordered? 1) Solution Request submittal to confirm requested system meets application processing requirements	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13310249-A	Unisys Mainframe Config 1 - Unisys (ClearPath / Dorado)	Per MIP

Service Attribute	*Service Attribute Description*	
Service Name	Unisys Mainframe (ClearPath Libra) – Config 2	
Detailed Description	Provides Unisys Libra (MCP) mainframe MIPS and operating system. Provides both Production and DR MIPS	
Service Customers / Users	Pennsylvania Game Commission	
Service Prerequisites	What is required before this service or service element be ordered? 1) Solution Request submittal to confirm requested system meets application processing requirements 2) Total of Production and DR MIPS identified 3) Data replication services ordered	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13310250-A	Unisys Mainframe Config- 2 - Unisys (ClearPath / Libra)	Per MIP

Service Attribute	*Service Attribute Description*	
Service Name	Unisys Mainframe (ClearPath Dorado) – Config-3	
Detailed Description	Provides Unisys Dorado (OS 2200) mainframe MIPS and operating system. Provides both Production and DR MIPS	
Service Customers / Users	Department of Public Welfare Pennsylvania State Police	
Service Prerequisites	What is required before this service or service element be ordered? 1) Solution Request submittal to confirm requested system meets application processing requirements 2) Total of Production and DR MIPS identified 3) Data replication services ordered	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13310251-A	Unisys Mainframe Config 3 - Unisys (ClearPath / Dorado)	Per MIP

Service Attribute	*Service Attribute Description*	
Service Name	Unisys Mainframe (ClearPath Libra) – Config-4	
Detailed Description	Provides Unisys Libra (MCP) mainframe MIPS and operating system. Provides both Production and DR MIPS	
Service Customers / Users	Pennsylvania Game Commission	
Service Prerequisites	What is required before this service or service element be ordered? 1) Solution Request submittal to confirm requested system meets application processing requirements 2) Total of Production and DR MIPS identified 3) Data replication services ordered	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13310252-A	Unisys Mainframe Config-4 - Unisys (ClearPath / Libra)	Per MIP

Unisys Mainframe Tiers of Service

Service Attribute	*Service Attribute Description*	
Service Name	UNISYS Mainframe Fully Managed Server Support	
Detailed Description	Provides hardware, operating system and operational support to meet required service level	
Service Customers / Users	Department of Public Welfare Pennsylvania State Police Pennsylvania Game Commission	
Service Prerequisites	What is required before this service or service element be ordered? 1) Solution Request submittal 2) Solution Request to confirm requested system and staff meets application processing requirements	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13310207-A	UNISYS Mainframe Config-1 Fully Managed – Platinum Tier	Per Physical Server
CCSU13310208-A	UNISYS Mainframe Config-1 Fully Managed – Gold Tier	Per Physical Server
CCSU13310209-A	UNISYS Mainframe Config-1 Fully Managed – Basic Tier	Per Physical Server
CCSU13310210-A	UNISYS Mainframe Config-2 Fully Managed – Platinum Tier	Per Physical Server

CCSU13310211-A	UNISYS Mainframe Config-2 Fully Managed – Gold Tier	Per Physical Server
CCSU13310212-A	UNISYS Mainframe Config-2 Fully Managed – Basic Tier	Per Physical Server
CCSU13310213-A	UNISYS Mainframe Config-3 Fully Managed – Platinum Tier	Per Physical Server
CCSU13310214-A	UNISYS Mainframe Config-3 Fully Managed – Gold Tier	Per Physical Server
CCSU13310215-A	UNISYS Mainframe Config-3 Fully Managed – Basic Tier	Per Physical Server
CCSU13310216-A	UNISYS Mainframe Config-4 Fully Managed – Platinum Tier	Per Physical Server
CCSU13310217-A	UNISYS Mainframe Config-4 Fully Managed – Gold Tier	Per Physical Server
CCSU13310218-A	UNISYS Mainframe Config-4 Fully Managed – Basic Tier	Per Physical Server

Compute Services - Infrastructure as a Service

Infrastructure as a Service (IaaS) – Windows and Linux

IaaS Windows/Linux Configuration - Configuration Components

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service - Windows / Linux Virtual Configuration 1 – 2 vCPU	
Detailed Description	Two virtual CPU's for a Virtual Windows or Linux Server	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	A previously ordered configuration 1 virtual Windows or Linux server	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340001-A	IaaS Windows vConfig-1 – 2 vCPU	Per Virtual Server
CCSU13340012-A	IaaS Linux vConfig-1 – 2 vCPU	Per Virtual Server

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service - Windows / Linux Virtual Configuration 2, 4, 5 – 4 vCPU	
Detailed Description	Four virtual CPU's for Windows or Linux virtual machine.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) A previously ordered configuration 2,4, or 5 virtual Windows or Linux server 2) For configuration 4 and 5, incremental CPU's must be ordered for both virtual servers. A previously ordered configuration 1 virtual Windows or Linux server 3) For configuration 4 and 5, incremental CPU's must be ordered for both virtual servers.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340002-A	IaaS Windows vConfig – 2, 4, 5 – 4 vCPU	Per Virtual Server
CCSU13340013-A	IaaS Linux vConfig – 2, 4, 5 – 4 vCPU	Per Virtual Server

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service - Windows / Linux Virtual Configuration 3 – 8 vCPU	
Detailed Description	Eight virtual CPU's for configuration 3 Windows and Linux virtual Servers	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	A previously ordered configuration 3 virtual Windows or Linux server	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340003-A	IaaS Windows vConfig – 3 – 8 vCPU	Per Virtual Server
CCSU13340014-A	IaaS Linux vConfig – 3 – 8 vCPU	Per Virtual Server

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service - Windows / Linux Virtual Configuration – 1, 2, 3, 4, 5 - GB RAM	
Detailed Description	One GB of Random Access Memory for a virtual Windows or Linux machine.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) A previously ordered configuration virtual Windows or Linux server 2) For configuration 4 and 5, incremental memory must be ordered for both virtual servers.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340004-A	IaaS Windows vConfig-1, 2, 3, 4, 5 - GB RAM	Per GB
CCSU13340015-A	IaaS Linux vConfig-1, 2, 3, 4, 5 - GB RAM	Per GB

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service - Windows – Virtual Configuration 1, 2, 3, 4, 5 – Windows Server 2008 R2	
Detailed Description	A Windows Server 2008 R2 License for a virtual windows server	
Service Customers / Users		
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340005-A	IaaS Windows vConfig-1, 2, 3, 4, 5 – Windows Server 2008 R2	Per License

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service - Linux – Virtual Configuration 1, 2, 3, 4, 5 – Red Hat or SUSE	
Detailed Description	A RedHat or SUSE Linux License for a virtual Linux server	
Service Customers / Users		
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340016-A	IaaS Linux vConfig-1, 2, 3, 4, 5 – Red Hat or SUSE	Per License

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service - Windows / Linux Virtual Configuration-1, 2, 3, 4, 5 – Firewall/IDS	
Detailed Description	One Firewall/IDS for a Windows or Linux virtual machine	
Service Customers / Users		
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340006-A	IaaS Windows vConfig-1, 2, 3, 4, 5 – Firewall/IDS	Per License
CCSU13340017-A	IaaS Linux vConfig-1, 2, 3, 4, 5 – Firewall/IDS	Per License

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service - Windows / Linux Virtual Configuration-1, 2, 3, 4, 5– Site to Site VPN	
Detailed Description	One Site to Site VPN for a Windows or Linux virtual machine.	
Service Customers / Users		
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340007-A	IaaS Windows vConfig-1, 2, 3, 4, 5 – Site to Site VPN	Per License
CCSU13340018-A	IaaS Linux vConfig-1, 2, 3, 4, 5 – Site to Site VPN	Per License

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service - Windows / Linux VConfig-1, 2, 3, 4, 5 - VPN Client	
Detailed Description	One VPN Client for a Windows or Linux virtual machine.	
Service Customers / Users		
Service Prerequisites	Cannot Be Ordered Separately	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340008-A	IaaS Windows vConfig-1, 2, 3, 4, 5 – VPN Client	Per License
CCSU13340008-A	IaaS Linux vConfig-1, 2, 3, 4, 5 – VPN Client	Per License

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service - Windows / Linux vConfig – 4 – Disaster Recovery Server with 24 hour Recovery Point Objective	
Detailed Description	Provides two virtual configuration 4 servers, with one configured as a disaster recovery server. The disaster recovery server has a 24 hour Recovery Point Objective.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) At least two servers must be ordered for this configuration. 2) Must order a commissioning/decommissioning service, one for each server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340010-A	IaaS Windows vConfig-4 – Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization Site's Local SAN Storage from hourly data synchronization	Per Service

CCSU13340021-A	IaaS Linux vConfig-4 – Disaster Recovery Server with a Restoral Interval of 24 hours via Backup Restoral from Backup Site's Local SAN Storage from hourly data synchronization Site’s Local SAN Storage from hourly data synchronization	Per Service

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service - Windows / Linux vConfig – 5 – Disaster Recovery Server with 72 hour Recovery Point Objective	
Detailed Description	Provides two physical configuration 5 servers, with one configured as a disaster recovery server. The disaster recovery server has a 72 hour Recovery Point Objective.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) At least two servers must be ordered for this configuration. 2) Must order a commissioning/decommissioning service, one for each server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340011-A	IaaS Windows vConfig-5 - Disaster Recovery Server with a Restoral Interval of 72 hours via Backup Restoral from off-site tape Backups	Per Service
CCSU13340022-A	IaaS Linux vConfig-5 - Disaster Recovery Server with a Restoral Interval of 72 hours via Backup Restoral from off-site tape	Per Service

	Backups	

IaaS Windows Configuration – Orderable Configurations

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure As a Service – Windows vConfig 1	
Detailed Description	One virtual Windows server with 2 virtual CPU's, with 4 GB of RAM	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Must order a commissioning/decommissioning service, one for each server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340029-A	IaaS Windows vConfig-1	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Windows vConfig-2	
Detailed Description	One virtual Windows server with 4 virtual CPU's, with 16 GB of RAM	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Must order a commissioning/decommissioning service, one for each server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340030-A	IaaS Windows Config-2	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Windows vConfig-3	
Detailed Description	One virtual Windows server with 8 virtual CPU's, with 64 GB of RAM	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Must order a commissioning/decommissioning service, one for each server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340031-A	IaaS Windows vConfig-3	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Windows vConfig-4	
Detailed Description	One virtual Windows server with 4 virtual CPU's, with 16 GB of RAM	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) Must order a commissioning/decommissioning service, one for each server. 2) A minimum of two servers must be ordered 3) Disaster recovery services must be ordered	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340032-A	IaaS Windows Config-4	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Windows vConfig-5	
Detailed Description	One virtual Windows server with 4 virtual CPU's, with 16 GB of RAM	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) Must order a commissioning/decommissioning service, one for each server. 2) A minimum of two servers must be ordered 3) Disaster recovery services must be ordered	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340033-A	IaaS Windows Config-5	Per Server

IaaS Linux Configuration – Orderable Configurations

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure As a Service – Linux vConfig 1	
Detailed Description	One virtual Linux server with 2 virtual CPU's, with 4 GB of RAM	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Must order a commissioning/decommissioning service, one for each server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340034-A	IaaS Linux vConfig-1	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Linux vConfig-2	
Detailed Description	One virtual Linux server with 4 virtual CPU's, with 16 GB of RAM	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Must order a commissioning/decommissioning service, one for each server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340035-A	IaaS Linux vConfig-2	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Linux vConfig-3	
Detailed Description	One virtual Linux server with 8 virtual CPU's, with 64 GB of RAM	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Must order a commissioning/decommissioning service, one for each server.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340036-A	IaaS Linux vConfig-3	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Linux vConfig-4	
Detailed Description	One virtual Linux server with 4 virtual CPU's, with 16 GB of RAM	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) Must order a commissioning/decommissioning service, one for each server. 2) A minimum of two servers must be ordered 3) Disaster recovery services must be ordered	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340037-A	IaaS Linux vConfig-4	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Linux vConfig-5	
Detailed Description	One virtual Linux server with 4 virtual CPU's, with 16 GB of RAM	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) Must order a commissioning/decommissioning service, one for each server. 2) A minimum of two servers must be ordered 3) Disaster recovery services must be ordered	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340038-A	IaaS Linux vConfig-5	Per Server

Infrastructure as a Service (IaaS) – Storage

IaaS Storage Configuration - Configuration Components

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Storage – IaaS Storage Config-1, 2 - SAN Attached Storage	
Detailed Description	SAN Attached Storage	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	Service Option Name	Orderable Unit
CCSU13340023-A	IaaS Storage Config-1, 2 - SAN attached Storage	Per GB

Service Attribute	*Service Attribute Description*
Service Name	Infrastructure as a Service – Storage – IaaS Storage Config-3 - Network Attached Storage
Detailed Description	Network Attached Storage
Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog

Provider Part Number(s)	**Service Option Name**	**Orderable Unit**
CCSU13340024-A	IaaS Storage Config-3 - Network attached Storage	Per GB

Service Attribute	*Service Attribute Description*
Service Name	Infrastructure as a Service – Storage – IaaS Storage Config-1 - RAID 5
Detailed Description	RAID 5
Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog

Provider Part Number(s)	Service Option Name	Orderable Unit
CCSU13340025-A	IaaS Storage Config-1 - RAID 5	Per GB

Service Attribute	*Service Attribute Description*
Service Name	Infrastructure as a Service – Storage – IaaS Storage Config-2 - RAID 10
Detailed Description	RAID 10
Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog

Provider Part Number(s)	Service Option Name	Orderable Unit
CCSU13340026-A	IaaS Storage Config-2 - RAID 10	Per GB

Service Attribute	*Service Attribute Description*
Service Name	Infrastructure as a Service – Storage – IaaS Storage Config-1,2 - 10-15K RPM Discs
Detailed Description	10-15K RPM Discs
Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog

Provider Part Number(s)	Service Option Name	Orderable Unit
CCSU13340027-A	IaaS Storage Config-1,2 - 10K-15K RPM Discs	Per GB

Infrastructure as a Service – Storage – Orderable Configurations

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Storage – SAN Attached – RAID 5	
Detailed Description	Infrastructure as a Service – Storage – SAN Attached – RAID 5	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340039-A	IaaS Storage Config-1	Per GB

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Storage – SAN Attached – RAID 10	
Detailed Description	Infrastructure as a Service – Storage – SAN Attached – RAID 10	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340040-A	IaaS Storage Config-2	Per GB

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Storage – Network Attached Storage	
Detailed Description	Infrastructure as a Service – Storage – Network Attached Storage	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13340041-A	IaaS Storage Config-3	Per GB

Infrastructure as a Service - Backup

Service Attribute	*Service Attribute Description*	
Service Name	Infrastructure as a Service – Backup	
Detailed Description	Remote Offsite backup per GB	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**

Third Party Software Management Service

Third Party Software – Unisys Supplied License and Management

Service Attribute	*Service Attribute Description*
Service Name	Third Party Software
Detailed Description	Each of the software items below are defined within Exhibit B.4. Unisys will provide the software license and ongoing maintenance.
Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	1) Fully Managed or Mainframe Servers for each installation The listed software-- • is a co-requisite for DPH IBM Mainframe Service Catalog Offering; • must be purchased together, i.e., all the respective Service Catalog entries must be purchased; • requires a one-year commitment; • will be invoiced monthly; and • is subject to the additional conditions shown below. <u>Limited to use by PennDOT for a capacity of 1000 MIPS of DPH IBM Mainframe total capacity of 2130 MIPS:</u> BMC Software Database Director (D2) BMC Software Eclipse iBuild BMC Software Eclipse iChange BMC Software Eclipse iCheck BMC Software Eclipse iCopy BMC Software Eclipse iExtract BMC Software Eclipse iLM BMC Software Eclipse iLoad

Additional Technical Resources

Service Attribute	*Service Attribute Description*	
Service Name	Additional Technical Resources	
Detailed Description	In addition to the standard managed infrastructure services, the Commonwealth can request the use of additional technology resources and services to support activities which are not provided as part of a managed infrastructure service. The Commonwealth has the flexibility to use additional technical support personnel to support short and long term assignments for projects and ongoing support activities.	
Service Customers / Users	*Any participating Commonwealth agency or office*	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSZ13360001-A	**Infrastructure (mainframe, mid-range and x86) Architects/Engineers**	**Per Hour**
CCSZ13360002-A	**Microsoft Product Specialists (e.g. Exchange, SharePoint)**	**Per Hour**
CCSD13360003-A	**Basis and SAP Oracle support**	**Per Hour**

CCSZ13360004-A	**Performance Specialists**	**Per Hour**
CCSZ13360005-A	**Mainframe Systems Programmers**	**Per Hour**
CCSZ13360006-A	**Batch Administrators**	**Per Hour**
CCSZ13360007-A	**3rd Party Software Product Specialists**	**Per Hour**
CCSZ13360008-A	**System Administrator (Windows, AIX, Linux)**	**Per Hour**
CCSZ13360009-A	**System Administrator (Middleware support)**	**Per Hour**
CCSZ13360010-A	**Storage Administrator**	**Per Hour**
CCSZ13360011-A	**Data Backup Administrator**	**Per Hour**
CCSZ13360012-A	**Database Administrator**	**Per Hour**
CCSZ13360013-A	**Database Architects**	**Per Hour**
CCSZ13360014-A	**Database Analysts**	**Per Hour**
CCSZ13360015-A	**Project Management Support**	**Per Hour**
CCSZ13360016-A	**Network Administrator**	**Per Hour**
CCSZ13360017-A	**Facilities Administrator**	**Per Hour**
CCSZ13360018-A	**Security Administrator**	**Per Hour**

Additional Technical Services

Database Management Services

Database Management Services

Service Attribute	*Service Attribute Description*
Service Name	Database Management Service - Platinum
Detailed Description	The Database Management Services service provides agencies with foundational Database Administration services to support the installation, configuration, backup/recovery and operational management of the Database. Services are provided through various tiers that provide basic to full service coverage and capabilities. Services Include: Database Creation / Management • Install and patch Database software • Create and maintain shell database instance sized appropriately based on supplied requirements Backup Management • Create and Establish Database backups integrated with the larger system backup strategy • Monitor and analyze successful execution, retention and storage of backups Database Recovery • Support database recovery from backup or archive log • Support Disaster Recovery planning, rehearsing and execution Application Release Management • Execute defined tasks to support deployment management through various test environments per defined work plans • Execute physical deployment of application objects within

	the database Data Management • Refresh data from Backup/Export periodically • Create and execute data alteration/extract solutions periodically via supplied requirements • Proactive Database Performance Analysis • Proactively monitor and report on database health and performance • Provide periodic reports highlighting performance trends and consumption patterns • Execute database system level tuning and maintenance to support performance goals • Proactive SQL Analysis / Tuning Recommendations • Proactively monitor and report on database SQL performance in the production environment • Provide monthly reports highlighting performance trends and a list of SQL tuning opportunities • Development of tuning options for identified performance opportunities Provide Level 2/3 Technical Help Desk Support • Support triage and resolution of calls from the Level 1 Help Desk • Collect and report metrics, solutions and outcomes of said support Tools used • Erwin, Oracle Enterprise Manager, Microsoft Management Studio, Sybase Central, IBM Data Studio, Toad, Oracle SQL Developer Platforms Supported • Oracle, DB2, SQL Server, Sybase 500 hour per month per request Full time resources proactively monitoring and recommending leading practices. Available 24x7x365 (on-site coverage averages

	96 hrs/week not to exceed 500 hrs/month) with responsiveness SLAs. Resources are vendor certified (where applicable) with over 10 years of experience
Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	1) Fully Managed Windows, Linux, AIX, Unisys Mainframe or IBM Mainframe server service for the number of servers or MIPS required to support the database. 2) Database Software Licensing and Maintenance a. Option 1: Unisys Database Management Service Supplied Software, or b. Option 2: Agency supplied Software
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog

Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370001-A	Database Management Service – Platinum (up to 500 hours per month)	Per Request / Up to 500 hours per request

Service Attribute	*Service Attribute Description*
Service Name	Database Management Service – Gold
Detailed Description	The Database Management Services service provides agencies with foundational Database Administration services to support the installation, configuration, backup/recovery and operational management of the Database. Services are provided through various tiers that provide basic to full service coverage and capabilities. Services Include: • Database Creation / Management • Install and patch Database software • Create and maintain shell database instance sized appropriately based on supplied requirements Backup Management • Create and Establish Database backups integrated with the larger system backup strategy • Monitor and analyze successful execution, retention and storage of backups Database Recovery • Support database recovery from backup or archive log • Support Disaster Recovery planning, rehearsing and execution Application Release Management • Execute defined tasks to support deployment management through various test environments per defined work plans • Execute physical deployment of application objects within the database Data Management • Refresh data from Backup/Export periodically • Create and execute data alteration/extract solutions periodically via supplied requirements

	• Proactive Database Performance Analysis • Proactively monitor and report on database health and performance • Provide periodic reports highlighting performance trends and consumption patterns • Execute database system level tuning and maintenance to support performance goals • Proactive SQL Analysis / Tuning Recommendations • Proactively monitor and report on database SQL performance in the production environment • Provide monthly reports highlighting performance trends and a list of SQL tuning opportunities • Development of tuning options for identified performance opportunities Provide Level 2/3 Technical Help Desk Support • Support triage and resolution of calls from the Level 1 Help Desk • Collect and report metrics, solutions and outcomes of said support Tools used • Erwin, Oracle Enterprise Manager, Microsoft Management Studio, Sybase Central, IBM Data Studio, Toad, Oracle SQL Developer Platforms Supported • Oracle, DB2, SQL Server, Sybase 375 hour per month per request Full time resources proactively monitoring and recommending leading practices. Available 24x7x365 (on-site coverage averages 80 hrs/week not to exceed 375 hrs/month) with responsiveness SLA's. Resources are vendor certified (where applicable) with over 8 years of experience

Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	1) Fully Managed Windows, Linux, AIX, Unisys Mainframe or IBM Mainframe server service for the number of servers or MIPS required to support the database. 2) Database Software Licensing and Maintenance a. Option 1: Unisys Database Management Service Supplied Software, or b. Option 2: Agency supplied Software

Service Attribute	*Service Attribute Description*
Service Name	Database Management Service - Silver
Detailed Description	The Database Management Services service provides agencies with foundational Database Administration services to support the installation, configuration, backup/recovery and operational management of the Database. Services are provided through various tiers that provide basic to full service coverage and capabilities. Services Include: Database Creation / Management • Install and patch Database software • Create and maintain shell database instance sized appropriately based on supplied requirements Backup Management • Create and Establish Database backups integrated with the larger system backup strategy • Monitor and analyze successful execution, retention and storage of backups Database Recovery • Support database recovery from backup or archive log • Support Disaster Recovery planning, rehearsing and execution • Application Release Management • Execute defined tasks to support deployment management through various test environments per defined work plans • Execute physical deployment of application objects within the database Data Management • Refresh data from Backup/Export periodically • Create and execute data alteration/extract solutions periodically via supplied requirements

	• Proactive Database Performance Analysis • Proactively monitor and report on database health and performance • Provide periodic reports highlighting performance trends and consumption patterns • Execute database system level tuning and maintenance to support performance goals • Proactive SQL Analysis / Tuning Recommendations • Proactively monitor and report on database SQL performance in the production environment • Provide monthly reports highlighting performance trends and a list of SQL tuning opportunities • Development of tuning options for identified performance opportunities Provide Level 2/3 Technical Help Desk Support • Support triage and resolution of calls from the Level 1 Help Desk • Collect and report metrics, solutions and outcomes of said support Tools used • Erwin, Oracle Enterprise Manager, Microsoft Management Studio, Sybase Central, IBM Data Studio, Toad, Oracle SQL Developer Platforms Supported • Oracle, DB2, SQL Server, Sybase 250 hour per month per request Full time resources proactively monitoring providing operational status. Available 24x7x365 (on-site coverage averages 60 hrs/week not to exceed 250 hrs/month) with responsiveness SLA's. Resources have over 6 years of qualified experience

Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	1) Fully Managed Windows, Linux, AIX, Unisys Mainframe or IBM Mainframe server service for the number of servers or MIPS required to support the database. 2) Database Software Licensing and Maintenance a. Option 1: Unisys Database Management Service Supplied Software, or b. Option 2: Agency supplied Software
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog

Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370003-A	Database Management Service – Silver (up to 250 hours per month)	Per Request / Up to 250 hours per request

Service Attribute	*Service Attribute Description*
Service Name	Database Management Service - Bronze
Detailed Description	The Database Management Services service provides agencies with foundational Database Administration services to support the installation, configuration, backup/recovery and operational management of the Database. Services are provided through various tiers that provide basic to full service coverage and capabilities. Services Include: Database Creation / Management • Install and patch Database software • Create and maintain shell database instance sized appropriately based on supplied requirements Backup Management • Create and Establish Database backups integrated with the larger system backup strategy • Monitor and analyze successful execution, retention and storage of backups Database Recovery • Support database recovery from backup or archive log • Support Disaster Recovery planning, rehearsing and execution • Application Release Management • Execute defined tasks to support deployment management through various test environments per defined work plans • Execute physical deployment of application objects within the database Data Management • Refresh data from Backup/Export periodically • Create and execute data alteration/extract solutions periodically via supplied requirements

- Proactive Database Performance Analysis
- Proactively monitor and report on database health and performance
- Provide periodic reports highlighting performance trends and consumption patterns
- Execute database system level tuning and maintenance to support performance goals
- Proactive SQL Analysis / Tuning Recommendations
- Proactively monitor and report on database SQL performance in the production environment
- Provide monthly reports highlighting performance trends and a list of SQL tuning opportunities
- Development of tuning options for identified performance opportunities

Provide Level 2/3 Technical Help Desk Support

- Support triage and resolution of calls from the Level 1 Help Desk
- Collect and report metrics, solutions and outcomes of said support

Tools used

- Erwin, Oracle Enterprise Manager, Microsoft Management Studio, Sybase Central, IBM Data Studio, Toad, Oracle SQL Developer

Platforms Supported

- Oracle, DB2, SQL Server, Sybase

160 hour per month per request

Shared resources proactively monitoring providing operational status. Available 24x7x365 on-site coverage averages 40 hrs/week not to exceed 160 hrs/month) with responsiveness SLA's.

Resources are available from a pool of qualified DBA's with over 4 years of experience

Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	1) Fully Managed Windows, Linux, or AIX server service for the number of servers required to support the database. 2) Database Software Licensing and Maintenance a. Option 1: Unisys Database Management Service Supplied Software, or b. Option 2: Agency supplied Software

Database Software

Service Attributes	*Service Attribute Description*	
Service Name	Database Software - MS SQL Enterprise 2012 SPLA License - Based Upon Physical Configuration 3 (4 CPU / 6 Core)	
Detailed Description	As part of the Database Management service, the MS SQL Enterprise 2012 SPLA License provides the database functionality to support applications requiring MS SQL. MS SQL Enterprise includes additional capabilities over MS SQL Standard to support database high availability. This service is based upon licensing to Windows pConfig-3. If the database server uses another physical configuration, a quote will be necessary. The number of units to be ordered is based on the number of servers requested.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) Fully Managed Windows Server Physical Configuration 3 for each database server. 2) Database Management Service – Database Management Support (Platinum, Gold, Silver, Bronze, or Basic)	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370006-A	Database –Software - MS SQL Enterprise 2012 SPLA License - Based Upon Physical Configuration 3 (4 CPU / 6	Per Server Instance

	Core)	

Service Attribute	*Service Attribute Description*	
Service Name	Database Software - MS SQL Standard 2012 SPLA License - Based Upon Physical Configuration 3 (4 CPU / 6 Core)	
Detailed Description	As part of the Database Management service, the MS SQL Standard 2012 SPLA License provides the database functionality to support applications requiring MS SQL. This service is based upon licensing to Windows pConfig-3. If the database server uses another physical configuration, a quote will be necessary. The number of units to be ordered is based on the number of servers requested.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) Fully Managed Windows Server Physical Configuration 3 for each database server 2) Database Management Service – Database Management Support (Bronze, Gold, Silver, Bronze, or Basic)	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog

CCSU13370007-A	Database –Software - MS SQL Standard 2012 SPLA License - Based Upon Physical Configuration 3 (4 CPU / 6 Core)	Per Server Instance

Service Attribute	*Service Attribute Description*	
Service Name	Database Software - MS SQL Enterprise 2012 SPLA License - Based Upon Virtual Configuration 3 (8vCPU) - Must have number of vCPUs to match vCPUs used and number of VMWare servers in cluster	
Detailed Description	As part of the Database Management service, the MS SQL Enterprise 2012 SPLA License provides the database functionality to support applications requiring MS SQL. MS SQL Enterprise includes additional capabilities over MS SQL Standard to support database high availability. This service is based upon licensing to Windows vConfig-3. If the database server uses another physical configuration, a quote will be necessary. This license service is based upon the Platinum Application Availability SLA. The number of units to be ordered is based on the number of servers requested and number of VMWare ESX cluster physical servers supporting the database servers.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) Fully Managed Windows Server Virtual Configuration 3 for each database server 2) Database Management Service – Database Management Support (Platinum, Gold, Silver, Bronze, or Basic)	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog

CCSU13370010-A	Database –Software - Oracle Enterprise 11g License - Based Upon Physical Configuration 3	Per Server Instance

	(4 CPU / 6 Core)	

Service Attribute	*Service Attribute Description*
Service Name	Database Software - Oracle 11g Real Application Cluster (RAC) - Based Upon Physical Configuration 3 (4 CPU / 6 Core) - Perpetual License
Detailed Description	As part of the Database Management service, the Oracle 11g Enterprise Perpetual License provides the database functionality to support applications requiring Oracle databases. Oracle 11g Enterprise includes additional capabilities over Oracle 11g Standard to support database high availability and larger databases. With the addition of Oracle Real Application Clustering, these functions are enhanced. This service is based upon licensing to Windows pConfig-3. If the database server uses another physical configuration, a quote will be necessary. The number of units to be ordered is based on the number of servers requested running Oracle 11g and require clustering.
Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	1) Fully Managed Windows Server Physical Configuration 3 for each database server 2) Database Management Service – Database Management Support (Platinum, Gold, Silver, Bronze, or Basic) 3) Database Software – Oracle Real Application Cluster Software – Annual Maintenance 4) Requires a 12 month commitment during first year of purchase.
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog

Provider Part Number(s)	Service Option Name	Orderable Unit / Restrictions per Unit
CCSU13370011-A	Database –Software – Oracle Real Application Cluster License - Based Upon Physical Configuration 3 (4 CPU / 6 Core)	Per Server Instance

Service Attribute	*Service Attribute Description*	
Service Name	Database Software - Oracle 11g Standard - Based Upon Physical Configuration 3 (4 CPU / 6 Core) - Perpetual License	
Detailed Description	As part of the Database Management service, the Oracle 11g Standard Perpetual License provides the database functionality to support applications requiring Oracle databases. This service is based upon licensing to Windows pConfig-3. If the database server uses another physical configuration, a quote will be necessary. The number of units to be ordered is based on the number of servers requested running Oracle 11g and require clustering.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) Fully Managed Windows Server Physical Configuration 3 for each database server 2) Database Management Service – Database Management Support (Platinum, Gold, Bronze, Bronze, or Basic) 3) Database Software – Oracle 11g Standard – Annual Maintenance 4) Requires a 12 month commitment during first year of purchase.

Database Management Deployment and Support Services - AIX

Service Attribute	*Service Attribute Description*
Service Name	Oracle Build p-Series Standard (1 server)
Detailed Description	Identify performance and availability requirements Perform hardware selection; solicit physical build from client Baseline current environment and utilization (e.g., CPU, memory) Create high-level design using requirements in Assess phase and baseline build documentation Develop a project plan with milestones, dependencies and resource allocations Plan, track, document, and coordinate activities for the project Create data base or WAS-specific test plans and develop acceptance criteria Request Storage allocations per defined standards Install and configure AIX v6.x on 1 LPAR per server Install and configure Bundle Middleware Package Configure AIX and Bundle Middleware per customer build requirements Test hardware and software according to documented test plan Turn-over system to customer and obtain sign-off Build from base level hardware with no OS pre-installed, physical servers are pre-installed in racks with all hardware installed, base OS, I/O, and HA configuration only (no applications), with base images and configuration standards supplied by customer.
Service Customers / Users	Any participating Commonwealth agency or office.
Service Prerequisites	Software and/or hardware to complete service

	Access to affected systems and/or facilities.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370016-A	Oracle Build p-Series Standard	Per Request

Service Attribute	*Service Attribute Description*
Service Name	Oracle Build p-Series Complex (2 servers in clustered pair)
Detailed Description	Identify performance and availability requirements Perform hardware selection; solicit physical build from client Baseline current environment and utilization (e.g., CPU, memory) Create high-level design using requirements in Assess phase and baseline build documentation Develop a project plan with milestones, dependencies and resource allocations Plan, track, document, and coordinate activities for the project Create data base or WAS-specific test plans and develop acceptance criteria Request Storage allocations per client defined requirements Work with SO to confirm power up and burn-in of Server Install and configure AIX v6.x on 1 LPAR per server Install and configure Bundle Middleware Package Configure AIX and Bundle Middleware per customer build requirements Test hardware and software according to documented test plan Validate acceptance criteria have been met Turn-over system to customer and obtain sign-off Build from base level hardware with no OS pre-installed, physical servers are pre-installed in racks with all hardware installed, base OS, I/O, and HA configuration only (no applications), with base images and configuration standards supplied by customer.
Service Customers / Users	Any participating Commonwealth agency or office.

Service Prerequisites	Software and/or hardware to complete service Access to affected systems and/or facilities.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370017-A	Oracle Build p-Series Complex	Per Request

Service Attribute	*Service Attribute Description*
Service Name	Oracle Upgrade p-Series Standard (1 server)
Detailed Description	Identify performance and availability profile Collect Performance Baseline Create high-level design using requirements in Assess phase and baseline build documentation Develop a project plan with milestones, dependencies and resource allocations Plan, track, document, and coordinate activities for the project Create application-specific test plans and develop acceptance criteria Request new hardware requirements based upon performance requirements Install and configure current version of target Bundle on 1 LPAR per server Test software according to document test plan Validate acceptance criteria have been met Turn-over system to customer and obtain sign-off This is Upgrade of DB only - 1 version level upgrade only, OS will be at a version(s) which support the upgraded DB, base images and configuration standards to be supplied by client. Storage and SAN Fabric are client or other Bundle responsibility, with remote delivery for services is primary alternative, with on-site when necessary.
Service Customers / Users	Any participating Commonwealth agency or office.
Service Prerequisites	Software and/or hardware to complete service Access to affected systems and/or facilities.

CCSI13370040-A	DB2 Maintenance z-Series Complex	Per Request

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Database Administrator for DB2 (5TB)	
Detailed Description	This services bundle is to provide database administration for DB2 databases on System z. 1 to 40 databases totaling up to maximum of 5TB. 1 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12- month commitment	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370041-A	z-Series Database Administrator for DB2 (5TB)	Per Request / up to 40 databases with a total of 5 TB stored data

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Database Administrator for DB2 (10TB)	
Detailed Description	This services bundle is to provide database administration for DB2 databases on System z. 41 to 80 databases totaling up to maximum of 10TB. 2 FTEs in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12- month commitment	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370042-A	z-Series Database Administrator for DB2 (10TB)	Per Request / Up to 80 databases with a total of 10 TB stored data

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Database Administrator for DB2 (15TB)	
Detailed Description	This services bundle is to provide database administration for DB2 databases on System z. 81 to 120 databases totaling up to maximum of 15TB. 3 FTEs in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12- month commitment	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370043-A	z-Series Database Administrator for DB2 (15TB)	Per Request / Up to 120 databases with a total of 15 TB data stored

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Database Administrator for IMS (5TB)	
Detailed Description	This services bundle is to provide database administration for IMS databases on System z. 1 to 40 databases totaling up to maximum of 5TB. 1 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12- month commitment	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370044-A	z-Series Database Administrator for IMS (5TB)	Per Request / Up to 40 databases with a total of 5 TB data stored

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Database Administrator for IMS (10TB)	
Detailed Description	This services bundle is to provide database administration for IMS databases on System z. 41 to 80 databases totaling up to maximum of 10TB. 2 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12- month commitment	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370045-A	z-Series Database Administrator for IMS (10TB)	Per Request / Up to 80 databases with a total of 10 TB data stored

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Database Administrator for IMS (15TB)	
Detailed Description	This services bundle is to provide database administration for IMS databases on System z. 81 to 120 databases totaling up to maximum of 15TB. 3 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12- month commitment	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370046-A	z-Series Database Administrator for IMS (15TB)	Per Request / Up to 120 databases with a total of 15 TB data stored

Service Attribute	*Service Attribute Description*	
Service Name	z-Series High Availability Databases: IMS or DB2 DataSharing (25 databases)	
Detailed Description	This services bundle is to provide database administration for DBA HA for IMS or DB2 DataSharing. This is support for 1 to 25 clustered databases. 1 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Standard Database Administrator Enterprise Services Catalog offering. 12- month commitment	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370047-A	z-Series High Availability Databases: IMS or DB2 DataSharing (25 databases)	Per Request / Up to 25 clustered databases

Service Attribute	*Service Attribute Description*	
Service Name	z-Series High Availability Databases: IMS or DB2 DataSharing (50 databases)	
Detailed Description	This services bundle is to provide database administration for DBA HA for IMS or DB2 Data Sharing. This is support for 26 to 50 clustered databases. 2 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Standard Database Administrator Enterprise Services Catalog offering. 12- month commitment	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370048-A	z-Series High Availability Databases: IMS or DB2 DataSharing (50 databases)	Per Request / Up to 50 clustered databases

Service Attribute	*Service Attribute Description*	
Service Name	z-Series High Availability Databases: IMS or DB2 DataSharing (75 databases)	
Detailed Description	This services bundle is to provide database administration for DBA HA for IMS or DB2 DataSharing. This is support for 51 to 75 clustered databases. 3 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Standard Database Administrator Enterprise Services Catalog offering. 12- month commitment	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370049-A	z-Series High Availability Databases: IMS or DB2 DataSharing (75 databases)	Per Request / Up to 75 clustered databases

Batch and Job Scheduling

Service Attribute	*Service Attribute Description*	
Service Name	Batch and Job Scheduling –Job Creation or Modification	
Detailed Description	This service is for creating or modifying batch jobs and for scheduling and monitoring batch jobs in production.	
Service Customers / Users	Any participating Commonwealth agency or office Application Owners	
Service Prerequisites	Batch jobs must be run on the Unisys managed infrastructure that is in-scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370050-A	Batch and Job Scheduling – Job Creation or Modification – Small	Per Script / up to 25 Steps
CCSU13370051-A	Batch and Job Scheduling – Job Creation or Modification – Medium	Per Script / up to 50 Steps
CCSU13370052-A	Batch and Job Scheduling – Job Creation or Modification – Large	Per Script / up to 100 Steps

Service Attribute	*Service Attribute Description*	
Service Name	Batch and Job Scheduling –Scheduling and Monitoring	
Detailed Description	This Service will setup a batch job in the production scheduling tool and provide monitoring for the batch job to help confirm successful completion.	
Service Customers / Users	Any participating Commonwealth agency or office Application Owners	
Service Prerequisites	What is required before this service or service element be ordered? 1) Batch job has been created and tested successfully as part of the Change Management and Release and Deployment processes	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370053-A	Batch and Job Scheduling – Scheduling and Monitoring - Small	Per Script / up to 25 Steps
CCSU13370054-A	Batch and Job Scheduling – Scheduling and Monitoring - Medium	Per Script / up to 50 Steps
CCSU13370055-A	Batch and Job Scheduling – Scheduling and Monitoring - Large	Per Script / up to 100 Steps

Service Attribute	*Service Attribute Description*	
Service Name	Batch and Job Scheduling –Scheduling and Monitoring – Control M License	
Detailed Description	This Service will setup a batch job in the production scheduling tool and provide monitoring for the batch job to help confirm successful completion.	
Service Customers / Users	Any participating Commonwealth agency or office Application Owners	
Service Prerequisites	What is required before this service or service element be ordered? 1) Batch job has been created and tested successfully as part of the Change Management and Release and Deployment processes 2) Batch Job is monitored by Batch and Job Scheduling – Scheduling and Monitoring service.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370511-A	Batch and Job Scheduling – Scheduling and Monitoring – Small –Control M License	Per Script / up to 25 Steps
CCSU13370512-A	Batch and Job Scheduling – Scheduling and Monitoring – Medium – Control M License	Per Script / up to 50 Steps

CCSU13370513-A	Batch and Job Scheduling – Scheduling and Monitoring – Large – Control M License	Per Script / up to 100 Steps

Service Attribute	*Service Attribute Description*	
Service Name	AIX Production Batch Operations Support (50,000 jobs per year)	
Detailed Description	AIX Production Batch Operations Support will be performed by remote US and on-site batch operators. AIX Production Batch Operations Support provides the following: 1. Schedule batch jobs; 2. Start and re-start batch jobs; 3. Monitor scheduled batch jobs; 4. Resolve non-application batch scheduling conflicts for root cause analysis and change management purposes; 5. Monitor scheduler-related incidents, and develop and recommend changes to the scheduler database; 6. Perform required batch setup activities, such as ad hoc requests; 7. Schedule batch jobs that require immediate execution upon request; 8. Invoke resolution and restart procedures in case of batch job failure; 9. Alert Commonwealth as set forth in CCPM; 10. Recover customer's batch environment; and 11. Log each batch job.	
Service Customers / Users	Any participating agency/department. Annual commitment, invoiced monthly.	
Service Prerequisites	AIX environment	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**

CCSI13370056-A	AIX Production Batch Operations	Per Package of 50,000 jobs per year

Service Attribute	*Service Attribute Description*
Service Name	IBM Mainframe Production Batch Operations Support (50,000 jobs per year)
Detailed Description	IBM Mainframe Production Batch Operations Support will be performed by remote US and on-site batch operators. IBM Mainframe Production Batch Operations Support provides the following: 1. Schedule batch jobs; 2. Start and re-start batch jobs; 3. Monitor scheduled batch jobs; 4. Resolve non-application batch scheduling conflicts for root cause analysis and change management purposes; 5. Monitor scheduler-related incidents, and develop and recommend changes to the scheduler database; 6. Perform required batch setup activities, such as ad hoc requests; 7. Schedule batch jobs that require immediate execution upon request; 8. Invoke resolution and restart procedures in case of batch job failure; 9. Alert Commonwealth as set forth in CCPM; 10. Recover customer's batch environment; and 11. Log each batch job.
Service Customers / Users	Any participating agency/department. Annual commitment, invoiced monthly.
Service Prerequisites	IBM Mainframe environment.
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.

Provider Part Number(s)	Service Option Name	Orderable Unit / Restrictions per Unit
CCSI13370057-A	IBM Mainframe Production Batch Operations	Per Package of 50,000 jobs per year

Service Management

Custom Reports

Service Attribute	*Service Attribute Description*	
Service Name	Service Management Custom Report	
Detailed Description	The Service Management Custom Report Service will allow Commonwealth personnel to request a custom report in support of the Governance of the Contract. The report request will be reviewed and approved, configured, tested and placed into production per agreed timeframe to complete an approved request.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	What is required before this service or service element can be ordered or completed? Approvals from the Commonwealth/Unisys PMO	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370058-A	Service Management Custom Report – Small	Per Report / 4 hours effort to complete
CCSU13370059-A	Service Management Custom Report – Medium	Per Report / 8 hours to complete
CCSU13370060-A	Service Management Custom Report - Large	Per Report / 20 hours to complete

ITSM Additional Licensing

Service Attribute	*Service Attribute Description*	
Service Name	Commonwealth ITSM User Licensing – Service Desk	
Detailed Description	Provide a named user or transfer of a user on a named license or a floating user license for use by the Commonwealth / Agency Service Desk users	
Service Customers / Users	Any participating Commonwealth agency or office Service Desk Management	
Service Prerequisites	What is required before this service or service element be ordered? 1) Training in Unisys Remedy ITSM Solution 2) Approval of the request by the Commonwealth / Unisys PMO	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370061-A	ITSM Licensing – End User Service Desk – Named User	Named License per month
CCSU13370062-A	ITSM Licensing – Floating User Service Desk – Floating users	Floating License per month for up to 10 users

Application Definition Mapping

Service Attribute	*Service Attribute Description*	
Service Name	Application Mapping Discovery Script - Setup	
Detailed Description	This Service will provide the necessary setup services to support calculating an availability infrastructure SLA that will support a new or modified Commonwealth / Agency application following transition. This service includes the mapping of CMDB items to the Application CI, configuring event monitoring, incident management and service level management applications to support an availability SLA for the specified Application.	
Orderable Unit	Per Number of Days to Complete the setup for small, medium and large application infrastructure environments.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370063-A	Application Definition Mapping – Initial Discovery Script - Small	Per Application Discovery Script / 4 hours
CCSU13370064-A	Application Definition Mapping – Initial Discovery Script - Medium	Per Application Discovery Script / 8 hours
CCSU13370065-A	Application Definition Mapping – Initial Discovery Script - Large	Per Application Discovery Script / 16 hours

Service Attribute	*Service Attribute Description*	
Service Name	Application Mapping Discovery Script Maintenance	
Detailed Description	This Service will provide the necessary support to maintain and monitor the Application Availability SLA monitoring environment including the mapping of CMDB items to the Application CI, configuration of event monitoring, incident management and service level management applications to support an availability SLA for the specified Application.	
Orderable Unit	Number of hours required to support the Application Availability SLA yearly depending upon whether the application infrastructure is small (8 hours), medium (16 hours) or large (32 hours). Charged monthly.	
Service Customers / Users	Any participating Commonwealth agency or office Application Owners	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370066-A	Application Definition Mapping – Discovery Script – Maintenance - Small	8 hours per year support
CCSU13370067-A	Application Definition Mapping – Discovery Script - Maintenance - Medium	16 hours per year support
CCSU13370068-A	Application Definition Mapping – Discovery Script - Maintenance - Large	32 hours per year support

Compute Services – Infrastructure Monitoring

Service Attribute	*Service Attribute Description*	
Service Name	Microsoft System Center 2012 (SCOM)	
Detailed Description	This service will provide SCOM monitoring of infrastructure supporting an application on a per server basis. This service will substitute for the default Nagios monitoring service that Unisys provides as a standard if the Commonwealth / Agency Application Owner prefers to have SCOM monitoring for a Windows/Linux infrastructure environment.	
Service Customers / Users	Any participating Commonwealth agency or office Application Owners	
Service Prerequisites	What is required before this service or service element be ordered? 1) SCOM Monitoring Server Capacity	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370069-A	Microsoft System Center 2012 (SCOM) – Standard	Per Server (virtual or physical)

Fully Managed Service

Windows / Linux

Service Attribute	*Service Attribute Description*
Service Name	Fully Managed Windows / Linux – Physical Server - Commission/Decommission Service Fee
Detailed Description	This fee includes the following: 1) Physical installation of the server 2) Installation of the operating system 3) Initial patching and security remediation 4) Setup of monitoring and CMDB CI entries 5) At decommissioning, wipe of any data from local drives 6) Unracking of server 7) For Unisys owned assets, disposal of all server and server related parts.
Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	1) Ordering of a physical or virtual fully managed Windows or Linux server 2) Ordering of managed only services 3) Ordering of Infrastructure as a Service server.
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog

Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370070-A	Fully Managed – Physical – Platinum – Comm/Decomm	Per Server
CCSU13370071-A	Fully Managed – Physical – Gold – Comm/Decomm	Per Server
CCSU13370072-A	Fully Managed – Physical – Silver – Comm/Decomm	Per Server
CCSU13370073-A	Fully Managed – Physical – Bronze – Comm/Decomm	Per Server
CCSU13370074-A	Fully Managed – Physical – Basic – Comm/Decomm	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	Fully Managed Windows / Linux – Virtual Server - Commission/Decommission Service Fee	
Detailed Description	This fee includes the following: 4) Physical installation of the server 5) Installation of the operating system 6) Initial patching and security remediation 7) Setup of monitoring and CMDB CI entries 8) At decommissioning, wipe of any data from local drives 9) Unracking of server 10) For Unisys owned assets, disposal of all server and server related parts.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) Ordering of a physical or virtual fully managed Windows or Linux server	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**

CCSU13370075-A	Fully Managed – Virtual – Platinum – Comm/Decomm	Per Server
CCSU13370076-A	Fully Managed – Virtual – Gold – Comm/Decomm	Per Server
CCSU13370077-A	Fully Managed – Virtual – Silver – Comm/Decomm	Per Server
CCSU13370078-A	Fully Managed – Virtual – Bronze – Comm/Decomm	Per Server
CCSU13370079-A	Fully Managed – Virtual – Basic – Comm/Decomm	Per Server

P-Series (AIX) Services

Service Attribute	*Service Attribute Description*	
Service Name	Platinum AIX Service Level Package	
Detailed Description	This package provides the additional hardware, software and services needed beyond the Resource Units to attain an availability of 99.999%.	
Service Customers / Users	Any participating Commonwealth agency or department	
Service Prerequisites	This service is only available after the workload is migrated to the new data center from the DPH and requires use of a second data center. For Platinum Tier Service Levels, there must be a minimum of three instances of the application, geographically dispersed and clustered or load balanced in such a manner that if one instance is taken offline, the end user sees no disruption or degradation of service. Must purchase a quantity of three of one of the following items: • AIX Config – 1 Fully Managed (1) - Platinum Tier • AIX Config – 2 Fully Managed (1) - Platinum Tier • AIX Config – 3 Fully Managed (1) - Platinum Tier • AIX Config – 4 Fully Managed (1) - Platinum Tier • AIX Config – 5 Fully Managed (1) - Platinum Tier The above Configs also have prerequisites that can be found in their Enterprise Services Catalog entry. Four-year commitment, invoiced monthly.

Storage and Backup Services

Service Attribute	*Service Attribute Description*	
Service Name	Archive Services: Archive storage that provides record-level content management and replication to DR	
Detailed Description	The service offers secure, reliable storage of data objects that satisfy the regulatory compliance requirements of SEC 17a-4, Sarbanes-Oxley, and HIPAA. The service provides long-term disk-based archive storage for data that is required to meet compliance requirements to provide content authentication, non-eraseability, and record-level content management. The service includes software costs for replication of content to an alternate Unisys-managed site and associated infrastructure at the alternate Unisys-managed site.	
Service Customers / Users	The Service is Available to Any participating Commonwealth agency or office.	
Service Prerequisites	What is required before this service or service element be ordered? 1) Selection of sufficient Network services to provide bandwidth for replication between sites. 2) Selection of sufficient Data Center resources to provide space and power for required infrastructure.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370083-A	Archive Services: Archive storage that provides record-level content management and replication to DR	Per GB of Protected Data

Service Attribute	*Service Attribute Description*
Service Name	EMC PowerPath Storage Load Balancing S/W for Physical Servers.
Detailed Description	For Fully-managed physical servers with a single O/S that are SAN-attached to EMC storage the service provides: **Automate failover and recovery** – Mitigates the threat of application disruptions from adapter and cable failures or user errors. Automates failover to alternate data paths in order to keep business processes online. Leverages intelligent, dynamic path testing to remove faulty paths and restore repaired paths to service without user intervention and without disrupting applications. **Optimize load balancing** – Helps eliminate I/O bottlenecks by intelligently optimizing data access across all available data paths. Manages I/O to goal that no path becomes overloaded while others have underutilized bandwidth. Leverages load-based path testing to confirm the viability of a data path for the workload assigned to it. **Standardize path management** – Provides standardization of storage path management for Linux, Microsoft Windows, and UNIX across evolving physical and virtual environments. Supports heterogeneous servers, operating systems, and storage including EMC and qualified non-EMC storage arrays.
Service Customers / Users	The Service is Available to Any participating Commonwealth agency or office.
Service Prerequisites	What is required before this service or service element be ordered? 1) Selection of sufficient server and SAN-attached storage to support server O/S and install of software.
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.

Provider Part Number(s)	Service Option Name	Orderable Unit / Restrictions per Unit
CCSU13370085-A	EMC PowerPath Storage Load Balancing S/W for Physical Servers.	Per CPU Per Server

Service Attribute	*Service Attribute Description*
Service Name	EMC PowerPath Storage Load Balancing S/W for Virtual Server hosts.
Detailed Description	For Fully-managed virtual host servers with multiple virtual servers that are SAN-attached to EMC storage the service provides: **Automate failover and recovery** – Mitigates the threat of application disruptions from adapter and cable failures or user errors. Automates failover to alternate data paths in order to keep business processes online. Leverages intelligent, dynamic path testing to remove faulty paths and restore repaired paths to service without user intervention and without disrupting applications. **Optimize load balancing** – Helps eliminate I/O bottlenecks by intelligently optimizing data access across all available data paths. Manages I/O to goal that no path becomes overloaded while others have underutilized bandwidth. Leverages load-based path testing to confirm the viability of a data path for the workload assigned to it. **Standardize path management** – Provides standardization of storage path management for Linux, Microsoft Windows, and UNIX across evolving physical and virtual environments. CCSU13370111-A	Unisys Mainframe (ClearPath Dorado) – PA Game DR System	Per Config

Infrastructure as a Service

Microsoft Cloud Compute Services

Service Attribute	*Service Attribute Description*	
Service Name	Microsoft SharePoint Online – Government Cloud	
Detailed Description	SharePoint Online delivers the powerful features of SharePoint without the associated overhead of managing the infrastructure. Microsoft SharePoint Online enables an organization to easily create and manage custom team-focused and project-focused sites for collaboration. In addition, it's possible to deploy an organization-wide intranet portal used to disseminate information and news across the organization.	
Service Customers / Users	*Any participating Commonwealth agency or office*	
Service Prerequisites	1) The SharePoint Administrator service is required based on the total number of SharePoint users.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSM13370113-A	SharePoint Online Plan 1 (Govt Cloud)	Per User Monthly Subscription
CCSM13370114-A	SharePoint Online Plan 2 (Govt Cloud)	Per User Monthly Subscription

Service Attribute	*Service Attribute Description*	
Service Name	Microsoft Office 365 – Government Cloud	
Detailed Description	Microsoft Office 365 delivers the power of cloud productivity to businesses of all sizes, helping save time, money, and free up valued resources. Office 365 combines the familiar Microsoft Office desktop suite with cloud-based versions of Microsoft's next-generation communications and collaboration services—including Microsoft Exchange Online, Microsoft SharePoint Online, Microsoft Office Web Apps, and Microsoft Lync Online—to help users be productive from virtually anywhere through the Internet.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	The Office 365 Administrator service is required based on the total number of SharePoint users.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSM13370115-A	Microsoft Office 365 Plan 1 (Govt Cloud)	Per User Monthly Subscription
CCSM13370116-A	Microsoft Office 365 Plan 3 (Govt Cloud)	Per User Monthly Subscription

Service Attribute	*Service Attribute Description*	
Service Name	Microsoft Project Server Online – Government Cloud	
Detailed Description	Microsoft Project Online is a flexible online solution for project portfolio management (PPM) and everyday work. Delivered through Office 365, Project Online enables organizations to get started, prioritize project portfolio investments and deliver the intended business value—from virtually anywhere on nearly any device.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) None	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**

CCSU13370170-A	Active Directory Support – Small	Per Forest / One Forest, Up to 2 Domains, up to 5 domain controllers, Up to 1,000 AD Objects, and Up to 2 sites
CCSU13370171-A	Active Directory Support – Medium	Per Forest / One Forest, Up to 3 Domains, up to 20 domain controllers, Up to 5,000 AD Objects, and Up to 3 sites
CCSU13370172-A	Active Directory Support – Large	Per Forest / One Forest, Up to 5 Domains, Up to 200 domain controllers, Up to 100,000 AD Objects, and Up to 5 sites
CCSU13370173-A	Active Directory Support – Very Large	Per Forest / One Forest, Up to 10 Domains, up to 500 domain controllers, up to 500,000 AD Objects, and Up to 10 sites

Service Attribute	*Service Attribute Description*	
Service Name	PKI Support	
Detailed Description	Provide support to administer Commonwealth PKI Certificate Authorities (CA). Support activities provided include: • Implementation and configuration • Certificate issuance and management • Template creation and Management • Level 2 for End user support	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370174-A	PKI Support – Small	Per PKI environment / 1 Issuing CA, up to 1000 certificates, and up to 2 templates
CCSU13370175-A	PKI Support – Medium	Per PKI environment / 2 Issuing CA, up to 10000 certificates, and up to 5 templates

CCSU13370176-A	PKI Support – Large	Per PKI environment / 3 Issuing CA, up to 10000 certificates, and up to 10 templates

Business Continuity and Disaster Recovery

Business Continuity - Planning Services

Service Attribute	*Service Attribute Description*	
Service Name	Development of a Data Center Disaster Recovery Plan	
Detailed Description	The objectives of this project are to begin the development the Data Center Disaster Recovery (DR) Plan. This Plan will document the steps needed to relocate to an alternate site and begin recovery the IT environment in the defined timeframe. A Plan Owner should be identified at the very start of this activity, who will then assume responsibility for the Plan as soon as it is completed enabling IBM to focus on skills transfer during the execution of this Statement of Work	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	None	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370177-A	Development of a Data Center Disaster Recovery Plan	Per Plan

Service Attribute	Service Attribute Description
Service Name	Business Impact Assessment Workshop
Detailed Description	IBM will provide Business Continuity and Resilience Services in the form of a Business Impact Analysis Workshop to assist Commonwealth of Pennsylvania in developing and documenting the Business requirements for disaster recovery. IBM working in conjunction with Commonwealth of Pennsylvania will define Recovery Time and Recovery Point objectives for critical business functions. The output of this Statement of Work provides the base business requirements for developing a Disaster Recovery Strategy and Disaster Recovery Plan.
Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	None
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.

Provider Part Number(s)	Service Option Name	Orderable Unit / Restrictions per Unit
CCSI13370178-A	Business Impact Assessment Workshop	Per Workshop

Service Attribute	*Service Attribute Description*	
Service Name	Resilient Strategy Development Workshop	
Detailed Description	The objectives of this project are to identify gaps, industry best practices and make recommendations for Commonwealth of Pennsylvania's Resilient Strategy Design for a disaster scenario resulting in the loss of physical data center and/or servers within the defined Recovery Time and Point Objectives for in-scope servers and data. IBM will develop up to one (1) Resilient Strategy Design based on a mutually agreed Data Center facility.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	None	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370179-A	Resilient Strategy Development Workshop	Per Workshop

Disaster Recovery - Testing

Service Attribute	*Service Attribute Description*	
Service Name	Labor for DR Tier 3 to Tier 6 DR Testing	
Detailed Description	The service provides the labor to complete an annual DR test for an application or portion of an application that has selected the disk-based restore provided as part of the Tier 3 through Tier 6 DR Services. The RFP stipulates 2 tests per year therefore 2 of these must be purchased for each application group.	
Service Customers / Users	The Service is Available to Any participating Commonwealth agency or office.	
Service Prerequisites	What is required before this service or service element be ordered? 1) The Unisys-managed data center has been provisioned with sufficient resources to complete a DR test at a site separate from Production. 2) The Unisys-managed Production Data Center holds the Fully –Managed assets that require the specified DR services. 3) The storage replication services have been provisioned and the Production and DR storage have been managed by Unisys for 30 days.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370180-A	Labor for DR Tier 3 to Tier 6 DR Testing	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	Labor for Tier 1 & Tier 2 DR Service Testing (Tape-based)	
Detailed Description	The service provides the labor to complete an annual DR test for an application or portion of an application that has selected the disk-based restore provided as part of the Tier 1 and Tier 2 DR Services. The RFP stipulates 2 tests per year therefore 2 of these must be purchased for each application group.	
Service Customers / Users	The Service is Available to Any participating Commonwealth agency or office.	
Service Prerequisites	What is required before this service or service element be ordered? 1) The Unisys-managed data center has been provisioned with sufficient resources to complete a DR test at a site separate from Production. 2) The Unisys-managed Production Data Center holds the Fully –Managed assets that require the specified DR services. 3) The backup to tape services in the Production Data Center has been managed by Unisys for 30 days.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370181-A	Labor for Tier 1 & Tier 2 DR Service Testing (Tape-based)	Per Server

Disaster Recovery – Storage and Backup

Service Attribute	*Service Attribute Description*	
Service Name	DR Config-1 Storage	
Detailed Description	The Storage matches the Config-1 Storage described for Production in the Schedule I, Volumetrics	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	What is required before this service or service element be ordered? 1) Selection of sufficient Data Center Facilities Services 2) Solution Request submittal	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370182-A	DR Config-1 Storage	Per GB

Service Attribute	*Service Attribute Description*	
Service Name	DR Config-2 Storage	
Detailed Description	The Storage matches the Config-2 Storage described for Production in the Schedule I, Volumetrics	
Service Customers / Users	The service is available to Any participating Commonwealth agency or office	
Service Prerequisites	What is required before this service or service element be ordered? 1) Selection of sufficient Data Center Facilities Services 2) Solution Request submittal	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
DR Config-2 Storage	DR Config-2 Storage	Per GB

Service Attribute	*Service Attribute Description*	
Service Name	DR Tape Library Resources for Tier1 DR RTO based on 100,000 GB	
Detailed Description	The Tier1 DR Services delivers to an RTO of 72 hrs using restoral of data from tape. This service provides the DR Tape Library capacity to meet that requirement during DR tests and in the unlikely event of an actual DR.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	What is required before this service or service element be ordered? 1) The Unisys-managed data center has been provisioned with sufficient resources to complete a DR test at a site separate from Production. 2) The Unisys-managed Production Data Center holds the Fully –Managed assets that require the specified DR services. 3) The storage replication services have been provisioned and the Production and DR storage have been managed by Unisys for 30 days.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370184-A	DR Tape Library Resources for Tier1 DR RTO based on 100,000 GB	Per GB of Protected Data

Service Attribute	*Service Attribute Description*	
Service Name	DR Tape Library Resources for Tier2 DR RTO based on 100,000 GB	
Detailed Description	The Tier2 DR Services delivers to an RTO of 48 hrs using restoral of data from tape. This service provides the DR Tape Library capacity to meet that requirement during DR tests and in the unlikely event of an actual DR. A greater number of tape drives are needed to process data restores in a shorter period of time.	
Service Customers / Users	The Service is Available to Any participating Commonwealth agency or office.	
Service Prerequisites	What is required before this service or service element be ordered? 1) The Unisys-managed data center has been provisioned with sufficient resources to complete a DR test at a site separate from Production. 2) The Unisys-managed Production Data Center holds the Fully –Managed assets that require the specified DR services. 3) The storage replication services have been provisioned and the Production and DR storage have been managed by Unisys for 30 days.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370185-A	DR Tape Library Resources for Tier2 DR RTO based on 100,000 GB	Per GB of Protected Data

Service Attribute	*Service Attribute Description*	
Service Name	Backup to Disk for 255,000 GBs of de-duplicated data	
Detailed Description	The Service provides hardware to allow backups to be written to an EMC Data Domain storage device. The storage written to the device is de-duplicated in order to provide the maximum use of the physical drives in the platform.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	What is required before this service or service element be ordered? 1) The service is available as a component of backup and/or disaster recovery service to servers that are Fully-Managed by Unisys. 2) The Commonwealth servers that use the service must be managed by the Unisys-managed backup infrastructure. 3) The Service can provide a primary target in Production for backups as well as a complementing DR instance so that Production backups are replicated to DR but in this case the Commonwealth must order each instance as well as sufficient network bandwidth for the replication.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370186-A	Backup to Disk for 255,000 GBs of de-duplicated data	Per GB of Protected Data

Service Attribute	*Service Attribute Description*	
Service Name	Mainframe Services: EMC RecoverPoint Data Replication for 27,000 GBs of VMAX10K Storage.	
Detailed Description	If the Commonwealth elects to provision the Unisys Mainframe with VMAX10K storage then it can use this means of replicating data from the Production location to the DR location.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	What is required before this service or service element be ordered? 1) The Commonwealth must provision the Unisys Mainframe with EMC's VMAX10K storage. 2) The Commonwealth must provision sufficient VMAX10K storage at the DR location to receive the data replicated from the Production VMAX10K	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370187-A	Mainframe Services: EMC RecoverPoint Data Replication for 27,000 GBs of VMAX10K Storage.	Per GB of Replicated Data

Service Attribute	*Service Attribute Description*	
Service Name	EMC RecoverPoint SnapShot & Replication for 32,256 GBs of Config2 Storage	
Detailed Description	The storage service adds snapshot and replication services for Config2 storage.	
Service Customers / Users	The Service is Available to Any participating Commonwealth agency or office.	
Service Prerequisites	What is required before this service or service element be ordered? 1) In the case of Snapshots only, the selection of sufficient Production Config2 Production storage allocated to a server as well as the selection of sufficient set-aside space for the accumulation of snapshots. 2) In the case of Snapshots and replication, the selection of sufficient Production Config2 storage and sufficient storage at the target location as well as the selection of sufficient set-aside space for the accumulation of snapshots at Production and, if desired, at the target location	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370188-A	EMC RecoverPoint SnapShot & Replication for 32,256 GBs of Config2 Storage	Per GB of Protected Data

Service Attribute	*Service Attribute Description*	
Service Name	EMC RecoverPoint SnapShot & Replication for 84,700 GBs of Config1 Storage	
Detailed Description	The storage service adds snapshot and replication services for Config1 storage.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	What is required before this service or service element be ordered? 1) In the case of Snapshots only, the selection of sufficient Production Config1 Production storage allocated to a server as well as the selection of sufficient set-aside space for the accumulation of snapshots. 2) In the case of Snapshots and replication, the selection of sufficient Production Config1 storage and sufficient storage at the target location as well as the selection of sufficient set-aside space for the accumulation of snapshots at Production and, if desired, at the target location	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370189-A	EMC RecoverPoint SnapShot & Replication for 84,700 GBs of Config1 Storage	Per GB of Replicated Data

Service Attribute	*Service Attribute Description*	
Service Name	Mainframe Services: EMC SRDF Data Replication for 50,000 GB of VMAX Storage	
Detailed Description	If the Commonwealth elects to provision the Unisys Mainframe with VMAX10K storage then it can use this means of replicating data from the Production location to the DR location.	
Service Customers / Users	The Service is Available to Any participating Commonwealth agency or office.	
Service Prerequisites	What is required before this service or service element be ordered? 1) The Commonwealth must provision the Unisys Mainframe with EMC's VMAX10K storage. 2) The Commonwealth must provision sufficient VMAX10K storage at the DR location to receive the data replicated from the Production VMAX10K	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370190-A	Mainframe Services: EMC SRDF Data Replication for 50,000 GB of VMAX Storage	Per GB of Replicated Data

Service Attribute	*Service Attribute Description*	
Service Name	Open Systems Services: EMC VPLEX Metro Replication for 140,000 GBs	
Detailed Description	This service provides a means of replicating data over limited distances in support of DR Tier5 & Tier6 DR Services.	
Service Customers / Users	The Service is Available to Any participating Commonwealth agency or office.	
Service Prerequisites	What is required before this service or service element be ordered? 1) The service requires both source and target servers and storage to be provisioned. 2) The service requires an initial feasibility review to analyze expected response times. 3) The network bandwidth required to support the needed data replication is provisioned separately.	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370192-A	Open Systems Services: EMC VPLEX Metro Replication for 140,000 GBs	Per GB of Replicated Data

Service Attribute	*Service Attribute Description*	
Service Name	SAN Switch Port, purchased in pairs, for SAN-attached Servers	
Detailed Description	This service is used to provide servers with access to Unisys-managed SAN storage infrastructure	
Service Customers / Users	The Service is Available to Any participating Commonwealth agency or office.	
Service Prerequisites	What is required before this service or service element be ordered? 1) The service is available to Fully-managed servers only.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370193-A	SAN Switch Port, purchased in pairs, for SAN-attached Servers	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	IBM Storwize V7000 Disaster Recovery System	
Detailed Description	This solution includes one storage subsystem which provides 118 TB via Raid 10/5 of useable space. This includes • IBM Storwize V7000 (Model 2076-124) • 177 – 900 GB 10k SAS disk • 15 – 300 GB 15k SAS disk • 8 – Fiber Optic Cable LC-LC • Two PDU power cords • Remote Mirroring license for 8 disk shelves • Includes four year hardware and software maintenance	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Access to affected systems and/or facilities. Disaster Recovery service Does not include ongoing storage management support; hardware, software and maintenance services only.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370564-A	IBM Storwize V7000 Disaster Recovery System	Per System

Service Attribute	*Service Attribute Description*	
Service Name	IBM XIV High Performance Disaster Recovery Tier	
Detailed Description	This solution includes one storage subsystem which provides 190 TB of useable space. This includes: • IBM XIV Gen 3 (2812-214) • 12 Module System with SSD • Unix/Linux/VMWare/Windows Host Attachment • 24 – Fiber Channel Cables • Remote Mirroring license • Includes four year hardware and software maintenance	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Access to affected systems and/or facilities. Disaster Recovery service Does not include ongoing storage management support; hardware, software and maintenance services only.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370565-A	IBM XIV High Performance Disaster Recovery Tier	Per System

Application Services

Application Performance Monitoring Services

Service Attribute	*Service Attribute Description*
Service Name	Application Performance Monitoring Setup Service
Detailed Description	This service will configure the following services for managing application performance and monitoring using the AppDynamics toolset in the production or test environment •□ Auto-discover and map application dependencies •□ Automatic code instrumentation •□ Self-learn application performance baselines •□ Auto-detect performance problems •□ Auto-detect and display transaction workflows •□ Auto-trigger diagnostic collection •□ Automation workflow for remediation •□ Custom executive dashboards “on the fly”
Orderable Unit	•□ Small Application (101- 250 IIS/JVM/PHP) •□ Medium Application (252 – 500 IIS/JVM/PHP) •□ Large Application (501- 1000 IIS/JVM/PHP)
Service Customers / Users	Any participating Commonwealth agency or office Application Owners
Service Prerequisites	What is required before this service or service element be ordered? 1)□Application must be supported on Unisys managed infrastructure
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services

	Catalog item using the above Service Name Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370194-A	Application Performance Monitoring Service - Setup – Small	Small Application (101- 250 IIS/JVM/PHP)
CCSU13370195-A	Application Performance Monitoring Service - Setup – Medium	Medium Application (251-500 IIS/JVM/PHP)
CCSU13370196-A	Application Performance Monitoring Service - Setup - Large	Large Application (501 – 1000 IIS/JVM/PHP)

Service Attribute	*Service Attribute Description*
Service Name	Application Performance Monitoring Ongoing Support Service
Detailed Description	This service will support the modification and ongoing execution of the following services for managing application performance and monitoring using the AppDynamics toolset •□ Auto-discover and map application dependencies •□ Automatic code instrumentation •□ Self-learn application performance baselines •□ Auto-detect performance problems •□ Auto-detect and display transaction workflows •□ Auto-trigger diagnostic collection •□ Automation workflow for remediation •□ Custom executive dashboards “on the fly”
Orderable Unit	•□ Small Application (101- 250 IIS/JVM/PHP) •□ Medium Application (252 – 500 IIS/JVM/PHP) •□ Large Application (501- 1000 IIS/JVM/PHP)
Service Customers / Users	*Any participating Commonwealth agency or office* Application Owners
Service Prerequisites	What is required before this service or service element be ordered? 1)□Application must be supported on Unisys managed infrastructure
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name Or To request this service, submit a Solution Request in the online

	Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370197-A	Application Performance Monitoring Service - Ongoing Support – Small	Small Application (101- 250 IIS/JVM/PHP)
CCSU13370198-A	Application Performance Monitoring Service - Ongoing Support – Medium	Medium Application (251-500 IIS/JVM/PHP)
CCSU13370199-A	Application Performance Monitoring Service - Ongoing Support - Large	Large Application (501 – 1000 IIS/JVM/PHP)

Application Capacity Management Services

Service Attribute	*Service Attribute Description*
Service Name	Application Capacity Management Setup Service
Detailed Description	This Service will provide capacity related analyses and recommendations using the capacity management, modeling and analytic capabilities of the BMC Capacity Optimization Toolset for a specific Commonwealth/Agency Application : • Forecast workload of each agency's application-based processor and memory usage using projected workload transaction and user volumes supplied by the Commonwealth. • Track application-based processor and memory usage and report the usage and trends to the Commonwealth. • Provide data storage capacity planning by estimating, measuring, and reporting on data storage used for supporting Commonwealth applications. • Utilize storage forecasts for each application provided by the Commonwealth to make periodic recommendations for upgrading or consolidating data storage capacity. • Support capacity planning for new application infrastructure focused on estimating, measuring, and reporting on network, server, and data storage usage over time for each application. • Capacity baselines will be established during testing of the application environment. Unisys will track application-based infrastructure usage. • Recommendations for upgrading existing infrastructure capacity.
Service Customers / Users	Any participating Commonwealth agency or office Application Owners
Service Prerequisites	What is required before this service or service element be ordered? Application must be supported on Unisys managed

	infrastructure	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370200-A	Application Capacity Management - Setup – Small	Per Application / up to 40 hours and up to 10 servers
CCSU13370201-A	Application Capacity Management - Setup – Medium	Per Application / up to 80 hours and up to 20 servers
CCSU13370202-A	Application Capacity Management – Setup - Large	Per Application / up to 120 hours and 21 – 30 servers

Service Attribute	*Service Attribute Description*
Service Name	Application Capacity Management Ongoing Maintenance Service
Detailed Description	This Service will provide ongoing support and capacity related analyses and recommendations using the capacity management, modeling and analytic capabilities of the BMC Capacity Optimization Toolset for a specific Commonwealth/Agency Application : • Forecast workload of each agency's application-based processor and memory usage using projected workload transaction and user volumes supplied by the Commonwealth. • Track application-based processor and memory usage and report the usage and trends to the Commonwealth. • Provide data storage capacity planning by estimating, measuring, and reporting on data storage used for supporting Commonwealth applications. • Utilize storage forecasts for each application provided by the Commonwealth to make periodic recommendations for upgrading or consolidating data storage capacity. • Support capacity planning for new application infrastructure focused on estimating, measuring, and reporting on network, server, and data storage usage over time for each application. • Capacity baselines will be established during testing of the application environment. Unisys will track application-based infrastructure usage. • Recommendations for upgrading existing infrastructure capacity. • Small Application (40 hours) (5 – 10 servers) • Medium Application (80 hours) (11- 20 servers) Large Application (120 hours) (21 – 30 servers)
Service Customers /	Any participating Commonwealth agency or office Application

Users	Owners	
Service Prerequisites	What is required before this service or service element be ordered? 1) Application must be supported on Unisys managed infrastructure 2) Application Capacity Management Setup Service for the specific Application is complete	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**

CCSU13370204-A	Application Capacity Management - Ongoing Support – Medium	Per Application / up to 80 hours and up to 20 servers
CCSU13370205-A	Application Capacity Management – Ongoing Support - Large	Per Application / up to 120 hours and 21 – 30 servers

Service Attribute	*Service Attribute Description*
Service Name	Application Capacity Management - Monitoring Tool License
Detailed Description	This Service will provide ongoing support and capacity related analyses and recommendations using the capacity management, modeling and analytic capabilities of the BMC Capacity Optimization Toolset for a specific Commonwealth/Agency Application : • Forecast workload of each agency's application-based processor and memory usage using projected workload transaction and user volumes supplied by the Commonwealth. • Track application-based processor and memory usage and report the usage and trends to the Commonwealth. • Provide data storage capacity planning by estimating, measuring, and reporting on data storage used for supporting Commonwealth applications. • Utilize storage forecasts for each application provided by the Commonwealth to make periodic recommendations for upgrading or consolidating data storage capacity. • Support capacity planning for new application infrastructure focused on estimating, measuring, and reporting on network, server, and data storage usage over time for each application. • Capacity baselines will be established during testing of the application environment. Unisys will track application-based infrastructure usage. • Recommendations for upgrading existing infrastructure capacity. • The tool license covers the server monitoring agent license. • Small Application (5 – 10 servers) • Medium Application (11- 20 servers) • Large Application (21 – 30 servers)

Service Customers / Users	Any participating Commonwealth agency or office Application Owners	
Service Prerequisites	What is required before this service or service element be ordered? 3) Application must be supported on Unisys managed infrastructure 4) Application Capacity Management Setup Service for the specific Application is complete	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370555-A	Application Capacity Management - Ongoing Support – Small	Per Application / Up to 10 servers
CCSU13370556-A	Application Capacity Management - Ongoing Support – Medium	Per Application / Up to 20 servers
CCSU13370557-A	Application Capacity Management – Ongoing Support - Large	Per Application / Up to 21 – 30 servers

Application Architecture Review

Service Attribute	*Service Attribute Description*	
Service Name	**Application Architecture Review**	
Detailed Description	Conduct in-depth review of application architecture, framework and design for robustness and extensibility that includes • Review Logical Architecture to gauge ability to fulfill application requirements. • Analyze Design and Coding Patterns for consistency, reusability and adaptability for desired business solution. • Review Component Design for explicit boundaries, loose coupling and standards conformance. • Analyze Application Integration and Cohesiveness to enable cross-module integration and reduce discrepancies	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth/Unisys PMO • Availability of supporting infrastructure and tools (software) solution to perform the assessment • Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370206-A	Application Architecture Review - Small	Per Assessment / Review 10 use cases, 5 class diagrams containing up to 10 classes each, 20 sequence diagrams, and architecture document not

		exceeding 100 pages
CCSD13370207-A	Application Architecture Review - Medium	Per Assessment /Review 30 use cases, 10 class diagrams containing up to 10 classes each, 40 sequence diagrams, and architecture document not exceeding 150 pages
CCSD13370208-A	Application Architecture Review – Large	Per Assessment / Review up to 50 use cases, 30 class diagrams containing up to 20 classes each, 60 sequence diagrams, and architecture document not exceeding 200 pages. Additionally, review complimentary product selection, integration pattern, scope of use (leveraging the investments), and product implementation architecture and design

Application Assessment Services

Service Attribute	*Service Attribute Description*	
Service Name	Application Performance Impact Assessment (follow-on for 5 applications)	
Detailed Description	Deep Dive Analysis is based on an average of five (5) individual user transactions or up to twenty five (25) total transactions; Application should be one of the applications work shopped or project change request would be followed to accommodate the additional application performance workshops.	
Service Customers / Users	Agencies who have participated in the APOC Assessment.	
Service Prerequisites	This is a follow-on effort to the APOC assessment. Can only be combined with this offering as a secondary output of that service.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370209-A	Application Performance Impact Assessment	Per Assessment

Service Attribute	*Service Attribute Description*	
Service Name	**Open System Database Performance Assessment**	
Detailed Description	The Open System Database Performance Assessment service provides agencies with a broad review and assessment of their current database operating solution. The assessment will include a broad spectrum of operational considerations such as: • Database Configuration Verification – An effort to analyze the database software was installed and configured in alignment with vendor leading practices • Infrastructure Topology Assessment – An effort to analyze the system topology configuration and capacity to identify performance tuning opportunities. • Historic Trending – An effort to review historic performance characteristics, business trends and usage patterns to help identify performance tuning opportunities. • SQL Query Analysis – Review of heavily exercised and/or complex queries that consume substantial system resources for performance tuning opportunities.	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth/Unisys PMO • Availability of supporting infrastructure and tools (software) solution to perform the assessment • Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**

CCSD13370210-A	Open System Database Performance Assessment - Small	Per Assessment (up to 100 database object)
CCSD13370211-A	Open System Database Performance Assessment - Medium	Per Assessment (Up to 500 database objects)
CCSD13370212-A	Open System Database Performance Assessment - Large	Per Assessment (up to 1,000 database objects)

Service Attribute	*Service Attribute Description*
Service Name	**Open System Configuration Management Assessment**
Detailed Description	The Open System Configuration Management (CM) Assessment service provides agencies with a broad review and assessment of their current configuration management solution. The assessment will analyze a full spectrum of operational considerations such as: • CM Infrastructure Management Process Assessment – An effort to review processes and practices that support the instantiation of a new machine, alterations to existing machines and the deployment of new application code to the machine. • CM Tools / Operational Assessment – An effort to analyze the infrastructure, tools and processes used to perform configuration management, including source code management, build/deployment management, IT Service Request management. • CM Incident/Problem Management Assessment – An effort to review processes and practices to determine alignment with ITIL incidents/problems management leading practices. Once complete, the assessment results document will highlight potential improvement opportunities to streamline the configuration management process, reduce risk and increase efficiency and repeatability.
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office
Service Prerequisites	• Approvals from the Commonwealth/Unisys PMO • Availability of supporting infrastructure and tools (software) solution to perform the assessment • Define assessment scope
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.

Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370213-A	Open System Configuration Management Assessment - Small	Per Assessment (single application)
CCSD13370214-A	Open System Configuration Management Assessment - Medium	Per Assessment (Multiple Application / Complex Architecture)
CCSD13370215-A	Open System Configuration Management Assessment - Large	Per Assessment (Enterprise Architecture)

Service Attribute	*Service Attribute Description*	
Service Name	**Mobile Wireframe Assessment**	
Detailed Description	The Mobile Wireframe Assessment service provides agencies with an assessment and review of mobile solution requirements to create a wireframe prototype. The assessment will analyze a full spectrum of operational considerations such as: Mobile Readiness Assessment – An assessment of current infrastructure, standards, policies, tools and software to determine readiness to support mobile development and production operations	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth/Unisys PMO • Availability of supporting infrastructure and tools (software) solution to perform the assessment • Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370216-A	Mobile Wireframe Assessment / - Small	Per Assessment (up to 10 pages)
CCSD13370217-A	Mobile Wireframe Assessment / - Medium	Per Assessment (up to 25 pages)
CCSD13370218-A	Mobile Wireframe Assessment / - Large	Per Assessment (up to 50 pages)

Service Attribute	*Service Attribute Description*	
Service Name	Application Management Innovation Workshop	
Detailed Description	Application Management Innovation Workshop helps the client identify opportunities on how social computing, cloud computing, big data, and mobile can be leveraged internally and externally within their environment and then prioritizes the opportunities based on key evaluation criteria.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	1) None	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370219-A	Application Innovation Workshop	Per Workshop (one day)

Service Attribute	*Service Attribute Description*	
Service Name	Application Modernization Assessment	
Detailed Description	The Application Modernization Assessment assists clients in assessing how to best leverage disruptive trends like social computing, cloud computing, big data, and mobile to improve business operations and customer experience and is targeted towards organizations with complex environments and/or multiple areas of interest.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	What is required before this service or service element be ordered? 1) Selection of another service (what service?) 2) Solution Request submittal 3) Etc.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370220-A	Application Modernization Assessment – 1 Week	Per Assessment (One Week)
CCSU13370221-A	Application Modernization Assessment – 4 Weeks	Per Assessment (4 Weeks)

Application Testing Services

Service Attribute	*Service Attribute Description*	
Service Name	**Test Assessment**	
Detailed Description	Conduct an assessment of existing Testing and Quality Assurance procedures. Identify areas of improvement in the testing and Quality Assurance processes Summarize the findings and recommendations Conduct up to 4 discovery sessions, review existing test management and quality assurance process and artifacts Review and synthesize reviewed project artifacts, session notes, processes and prior project results to produce findings and options. Guide project team members in identifying potential issues encountered in everyday test scenario execution as well as options to address issues. Review testing and quality assurance options and support the program to implement next steps.	
Service Customers / Users	Business, technology or security managers of *Any participating Commonwealth agency or office*	
Service Prerequisites	Availability of supporting infrastructure and tools (software) solution to perform the assessment Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**

CCSD13370222-A	Test Assessment	Per Assessment

Service Attribute	*Service Attribute Description*	
Service Name	**Test Estimation and Test Approach Planning**	
Detailed Description	Use of SEI and IEEE best practices for test estimation Creation of test approach with test strategy and test objective Create consolidated testing work plan Enterprise test management and Test Metrics Reporting Organize and conduct up to 4 workshop sessions to understand testing needs. Develop system test strategy and test approach for a .Net or Java application involving waterfall or agile development methods with up to 5 external agency interfaces Create an integration testing work plan in MS Project with up to 500 tasks outlining Commonwealth responsibilities and testing deliverables. Establish process and metrics for reporting testing progress and defects with daily, weekly and end of phase reporting frequency for up to 5 metric types.	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	Availability of supporting infrastructure and tools (software) solution to perform the assessment Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**

CCSD13370223-A	Test Estimation and test Approach Planning	• Per Assessment

Service Attribute	*Service Attribute Description*	
Service Name	**System Integration / Acceptance Testing and UAT Support**	
Detailed Description	Functional and non-functional system integration and acceptance test planning and execution User Acceptance Testing (UAT) coordination and support Testing scope management, scheduling, and resource planning. Each assessment supports a specific number of testing clarification sessions, screens, reports, interfaces and test scenarios as indicated below.	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	Availability of supporting infrastructure and tools (software) solution to perform the assessment Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370224-A	System Integration / Acceptance Testing and UAT Support – Small	• Per Request / Up to 3 testing clarification sessions, up to 10 screens, up to 2 reports, No interfaces, 40-50 test scenarios
CCSD13370225-A	System Integration / Acceptance Testing and UAT Support – Medium	• Per Request / Up to 5 testing clarification sessions, up to 20 screens, up to 5 reports, u to 2 interfaces, 50-100 test scenarios

CCSD13370226-A	System Integration / Acceptance Testing and UAT Support – Large	• Per Request / Up to 19 testing clarification sessions, up to 30 screens, up to 10 reports, 5 interfaces, 100-250 test scenarios

Service Attribute	*Service Attribute Description*	
Service Name	**Automated Regression Testing**	
Detailed Description	Regression Testing Planning Automated regression testing and repository management Each testing assessment supports a specific number of automation scripts for an entire application as indicated below	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	Availability of supporting infrastructure and tools (software) solution to perform the assessment Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370227-A	Automated Regression Testing – Small	• Per Request / Up to 20 automation test scripts for entire application
CCSD13370228-A	Automated Regression Testing – Medium	• Per Request / Up to 30 automation test scripts for entire application
CCSD13370229-A	Automated Regression Testing – Large	• Per Request / Up to 50 automation test scripts for entire application

Service Attribute	*Service Attribute Description*	
Service Name	**Test Data Management**	
Detailed Description	Management of test data including Test Data Automation PII Scrubbing Data Partitioning Each testing assessment supports a specific number of test data creation scripts for an entire application as indicated below Supported Platforms: QTP Microsoft Test Manager (MTM)	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	Availability of supporting infrastructure and tools (software) solution to perform the assessment Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370230-A	Test Data Management – Small	• Per Request / Up to 20 data creation scripts for entire application
CCSD13370231-A	Test Data Management – Medium	• Per Request / Up to 30 data creation scripts for entire

		application
CCSD13370232-A	Test Data Management – Large	• Per Request / Up to 50 data creation scripts for entire application

Service Attribute	*Service Attribute Description*	
Service Name	**ADA Compliance Testing**	
Detailed Description	Testing and verification of application compliance with Americans with Disabilities Act Each testing assessment supports a specific number of screens for ADA compliance testing as indicated below Supported Platforms: AccVerify JAWS	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	Availability of supporting infrastructure and tools (software) solution to perform the assessment Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370233-A	ADA Compliance Testing – Small	• Per Request / Up to 10 screens
CCSD13370234-A	ADA Compliance Testing – Medium	• Per Request / Up to 20 screens
CCSD13370235-A	ADA Compliance Testing – Large	• Per Request / Up to 30 screens

Load/Availability Testing

Service Attribute	*Service Attribute Description*	
Service Name	**Load Test Script Creation (Initial)**	
Detailed Description	The Load Testing Script Creation (Initial) service provides for the creation of a load testing scripts that allow agencies to mimic user interaction at identified production volumes. The intent is to exercise the application under load to analyze performance requirements and/or to identify performance tuning opportunities prior to the production release. The service provides the creation of: Load Test Scripts – A collection of scripts created from supplied processing requirements that will exercise the application under load. Script specification documents are a required input to detail process flow, user action, expected results, etc. Test data creation and set up is not included in this service. The output of the service is a collection of scripts, bundled into test scenarios that can be repeatedly executed for consistency verification and improvement quantification.	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	Approvals from the Commonwealth/Unisys PMO Availability of supporting infrastructure and tools (software) solution to perform the assessment Design Specifications (template to be provided)	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**

CCSD13370236-A	Load Test Script Creation (Initial) - Small	Per Script (up to 20 pages)
CCSD13370237-A	Load Test Script Creation (Initial) - Medium	Per Script (up to 50 pages)
CCSD13370238-A	Load Test Script Creation (Initial) - Large	Per Script (up to 100 pages)

Service Attribute	*Service Attribute Description*	
Service Name	**Load Test Script Maintenance**	
Detailed Description	The Load Testing Script Maintenance service builds from the Creation service to keep scripts aligned with changes made to the application. As functionality changes, alterations to the scripts to are required to maintain the ability to test the application under load. Input to this service will be updated script design specification documents. The service provides the creation of: Updated Load Test Scripts – Updated scripts originally created in the Load Test Script Creation service that aligns with application functionality changes.	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth/Unisys PMO • Availability of supporting infrastructure and tools (software) solution to perform the assessment • Updated / Added Script Design Specification	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370239-A	Load Test Script Maintenance - Small	Per Script (up to 20 pages)
CCSD13370240-A	Load Test Script Maintenance - Medium	Per Script (up to 50 pages)
CCSD13370241-A	Load Test Script Maintenance - Large	Per Script (up to 100 pages)

Service Attribute	*Service Attribute Description*	
Service Name	**Load Test Execution/Analysis**	
Detailed Description	This Service executes the load test scripts that have been previously prepared and performs analysis using the Silk Performer toolset. The results are provided as an output of the Load Test Execution/Analysis Service.	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth/Unisys PMO • Availability of supporting infrastructure and tools (software) solution to perform the assessment • Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370242-A	Load Test Execution/Analysis - Small	Per Test (up to 25 scripts)
CCSD13370243-A	Load Test Execution/Analysis - Medium	Per Test (up to 50 scripts)
CCSD13370244-A	Load Test Execution/Analysis - Large	Per Test (up to 100 scripts)

Service Attribute	*Service Attribute Description*	
Service Name	**Synthetic Transaction Modeling**	
Detailed Description		
Orderable Unit	• Simple/Small Transaction (up to 5 pages) • Medium Size / Complexity Transaction (up to 10 pages) • Complex/Large Transaction (up to 15 pages)	
Service Customers / Users	Business, technology or security managers of agency or enterprise	
Service Prerequisites	• Approvals from the Commonwealth/Unisys PMO • Availability of supporting infrastructure and tools (software) solution to perform the assessment • Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370245-A	Synthetic Transaction Modeling - Small	Per Model (up to 5 pages)
CCSD13370246-A	Synthetic Transaction Modeling - Medium	Per Model (up to 10 pages)
CCSD13370247-A	Synthetic Transaction Modeling - Large	Per Model (up to 15 pages)

Application Migration Services

Service Attribute	*Service Attribute Description*	
Service Name	**Enterprise Application Transition Strategy**	
Detailed Description	Develop a strategy to transition enterprise application infrastructure and applications for an agency to managed data center	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	Approvals from the Commonwealth/Unisys PMO Availability of supporting infrastructure and tools (software) solution to perform the assessment Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370248-A	Enterprise Application Transition Strategy - Small	Per Assessment (one agency comprising of one business application having up to three environments, development, testing and production that are supported by up to 12 servers)
CCSD13370249-A	Enterprise Application Transition Strategy - Medium	Per Assessment (Develop transition strategy for one agency comprising of up to 2 business applications having up to three environments each, development, testing and production that are supported by up to 24 servers)

CCSD13370250-A	Enterprise Application Transition Strategy - Large	Per Assessment(one agency comprising of up to 4 business applications having up to three environments each, development, testing and production that are supported by up to 48 servers)
CCSD13370251-A	Enterprise Application Transition Strategy – Very Large	Per Assessment (one agency comprising of up to 6 business applications having up to three environments each, development, testing and production that are supported by up to 60 servers)

Service Attribute	*Service Attribute Description*	
Service Name	**Application Migration Plan**	
Detailed Description	Develop a plan for agency applications to migrate to a Unisys Managed Data Center	
Service Customers / Users	Business, technology or security managers of Any participating Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth/Unisys PMO • Availability of supporting infrastructure and tools (software) solution to perform the assessment • Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370252-A	Application Migration Plan - Small	Per Assessment (up to one application that need to be migrated. This includes up to three application environments, development, testing and production that are supported by up to 12 servers)
CCSD13370253-A	Application Migration Plan - Medium	Per Assessment (up to two applications that need to be migrated. This includes up to three environments per application, development, testing and production that are supported by up to 24 servers)
CCSD13370254-A	Application Migration Plan -	Per Assessment (up to four applications that need to be

	Large	migrated. This includes up to three environments per application, development, testing and production that are supported by up to 48 server)

Middleware Application Services

Middleware Application Services - AIX

Service Attribute	*Service Attribute Description*
Service Name	WebSphere Build p-Series Standard (1 server)
Detailed Description	Identify performance and availability requirements Perform hardware selection; solicit physical build from client Baseline current environment and utilization (e.g., CPU, memory) Create high-level design using requirements in Assess phase and baseline build documentation Develop a project plan with milestones, dependencies and resource allocations Plan, track, document, and coordinate activities for the project Create data base or WAS-specific test plans and develop acceptance criteria Request Storage allocations per client defined requirements Work with client to confirm power up and burn-in of Server Install and configure AIX v6.x on 1 LPAR per server Install and configure Bundle Middleware Package Configure AIX and Bundle Middleware per customer build requirements Test hardware and software according to documented test plan Validate acceptance criteria have been met Turn-over system to customer and obtain sign-off Build from base level hardware with no OS pre-installed, physical servers are pre-installed in racks with all hardware installed, base OS, I/O, and HA configuration only (no applications), with base images and configuration standards supplied by customer.

Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Software and/or hardware to complete service Access to affected systems and/or facilities.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370255-A	WebSphere Build p-Series Standard	Per Build

Service Attribute	*Service Attribute Description*
Service Name	WebSphere Build p-Series Complex (2 servers)
Detailed Description	Identify performance and availability requirements Perform hardware selection; solicit physical build from client Baseline current environment and utilization (e.g., CPU, memory) Create high-level design using requirements in Assess phase and baseline build documentation Develop a project plan with milestones, dependencies and resource allocations Plan, track, document, and coordinate activities for the project Create data base or WAS-specific test plans and develop acceptance criteria Request Storage allocations per client defined requirements Work with client to confirm power up and burn-in of Server Install and configure AIX v6.x on 1 LPAR per server Install and configure Bundle Middleware Package Configure AIX and Bundle Middleware per customer build requirements Test hardware and software according to documented test plan Validate acceptance criteria have been met Turn-over system to customer and obtain sign-off Build from base level hardware with no OS pre-installed, physical servers are pre-installed in racks with all hardware installed, base OS, I/O, and HA configuration only (no applications), with base images and configuration standards supplied by customer.
Service Customers / Users	Any participating Commonwealth agency or office.

Service Prerequisites	Software and/or hardware to complete service Access to affected systems and/or facilities.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370256-A	WebSphere Build p-Series Complex	Per Build

Service Attribute	*Service Attribute Description*
Service Name	WebSphere Upgrade p-Series Standard (1 server)
Detailed Description	Identify performance and availability profile Collect Performance Baseline Create high-level design using requirements in Assess phase and baseline build documentation Develop a project plan with milestones, dependencies and resource allocations Plan, track, document, and coordinate activities for the project Create application-specific test plans and develop acceptance criteria Request new hardware requirements based upon performance requirements Install and configure current version of target Bundle on 1 LPAR per server Test software according to document test plan Validate acceptance criteria have been met Turn-over system to customer and obtain sign-off This is Upgrade of WebSphere Application Server only - 1 version level upgrade only, OS will be at a version which support the upgraded WAS, base images and configuration standards to be supplied by client. Storage and SAN Fabric are client or other Bundle responsibility, with remote delivery for services is primary alternative, with on-site when necessary.
Service Customers / Users	Any participating Commonwealth agency or office.
Service Prerequisites	Software and/or hardware to complete service Access to affected systems and/or facilities.

Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.

Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370257-A	WebSphere Upgrade p-Series Standard	Per Upgrade

Service Attribute	*Service Attribute Description*
Service Name	WebSphere Upgrade p-Series Complex (2 servers)
Detailed Description	Identify performance and availability profile Collect Performance Baseline Create high-level design using requirements in Assess phase and baseline build documentation Develop a project plan with milestones, dependencies and resource allocations Plan, track, document, and coordinate activities for the project Create application-specific test plans and develop acceptance criteria Request new hardware requirements based upon performance requirements Install and configure current version of target Bundle on 1 LPAR per server Test software according to document test plan Validate acceptance criteria have been met Turn-over system to customer and obtain sign-off This is Upgrade of WebSphere Application Server only - 1 version level upgrade only, OS will be at a version which support the upgraded WAS, base images and configuration standards to be supplied by client. Storage and SAN Fabric are client or other Bundle responsibility, with remote delivery for services is primary alternative, with on-site when necessary.
Service Customers / Users	Any participating Commonwealth agency or office.

Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.

Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370258-A	WebSphere Upgrade p-Series Complex	Per Upgrade

Service Attribute	*Service Attribute Description*	
Service Name	DataPower Quick Start Services	
Detailed Description	Provide DataPower architectural review and design analysis, installation and configuration of appliance, guidance on monitoring techniques, and provide service function design and build. Includes base services setup of 5 Small services.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	Software and/or hardware to complete service Access to affected systems and/or facilities.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370259-A	DataPower Quick Start Services	Per Quick Start

Service Attribute	*Service Attribute Description*	
Service Name	p-Series Support for WebSphere App Server (10 Instances)	
Detailed Description	This services bundle is to provide support for WebSphere App Server Instances on System p. This is support for 1 to 10 instances of the application server. 1 FTE in the bundle for one month. 12-month commitment;	
Service Customers / Users	Any participating agency/department.	
Service Prerequisites	None	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370260-A	p-Series Support for WebSphere App Server (10 Instances)	Per Request / Up to 10 WebSphere instances

Service Attribute	*Service Attribute Description*	
Service Name	p-Series Support for WebSphere App Server (25 Instances)	
Detailed Description	This services bundle is to provide support for WebSphere App Server Instances on System p. This is support for 11 to 25 instances of the application server. 2 FTEs in the bundle for one month.	
Service Customers / Users	Any participating agency/department.	
Service Prerequisites	12-month commitment;	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370261-A	p-Series Support for WebSphere App Server (25 Instances)	Per Request / Up to 25 WebSphere instances

Service Attribute	*Service Attribute Description*	
Service Name	p-Series Support for WebSphere App Server (40 Instances)	
Detailed Description	This services bundle is to provide support for WebSphere App Server Instances on System p. This is support for 26 to 40 instances of the application server. 3 FTEs in the bundle for one month.	
Service Customers / Users	Any participating agency/department.	
Service Prerequisites	12-month commitment;	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370262-A	p-Series Support for WebSphere App Server (40 Instances)	Per request / Up to 40 Websphere Instance

Service Attribute	*Service Attribute Description*	
Service Name	p-Series Support for WebSphere MQ Queue Managers (40 Instances)	
Detailed Description	This services bundle is to provide support for WebSphere MQ Queue Managers on System p. This is support for 1 to 40 instances of the Queue Manager. 1 FTE in the bundle for one month.	
Service Customers / Users	Any participating agency/department.	
Service Prerequisites	12-month commitment;	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370263-A	p-Series Support for WebSphere MQ Queue Managers (40 Instances)	Per request / Up to 40 Websphere Instance

Service Attribute	*Service Attribute Description*	
Service Name	p-Series Support for WebSphere MQ Queue Managers (80 Instances)	
Detailed Description	This services bundle is to provide support for WebSphere MQ Queue Managers on System p. This is support for 41 to 80 instances of the Queue Manager. 2 FTEs in the bundle for one month.	
Service Customers / Users	Any participating agency/department.	
Service Prerequisites	12-month commitment;	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370264-A	p-Series Support for WebSphere MQ Queue Managers (80 Instances)	Per Request / Up to 80 Websphere instances

Service Attribute	*Service Attribute Description*	
Service Name	p-Series Support for WebSphere MQ Queue Managers (120 Instances)	
Detailed Description	This services bundle is to provide support for WebSphere MQ Queue Managers on System p. This is support for 81 to 120 instances of the Queue Manager. 3 FTEs in the bundle for one month.	
Service Customers / Users	Any participating agency/department.	
Service Prerequisites	12-month commitment;	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370265-A	p-Series Support for WebSphere MQ Queue Managers (120 Instances)	Per Request / Up to 120 Websphere instances

Middleware Application Services – z-Series

Service Attribute	*Service Attribute Description*
Service Name	WebSphere Build z-Series Standard (1 subsystem without data sharing or clustering)
Detailed Description	Identify performance and availability profile Collect Performance Baseline Create high-level design using requirements in Assess phase and baseline build documentation Develop a project plan with milestones, dependencies and resource allocations Plan, track, document, and coordinate activities for the project Create application-specific test plans and develop acceptance criteria Request new hardware requirements based upon performance requirements Install and configure current version of target Bundle on 1 LPAR per server Test software according to document test plan Validate acceptance criteria have been met Turn-over system to customer and obtain sign-off This is build of a WebSphere Application Server. Base images and configuration standards to be supplied by client. Remote delivery for services is primary alternative, with on-site when necessary.
Service Customers / Users	Any participating Commonwealth agency or office.
Service Prerequisites	Software and/or hardware to complete service Access to affected systems and/or facilities.

Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370266-A	WebSphere Build z-Series Standard	Per Build

Service Attribute	*Service Attribute Description*
Service Name	WebSphere Build z-Series Complex (2 subsystems with data sharing and clustering across multiple CECs)
Detailed Description	Identify performance and availability profile Collect Performance Baseline Create high-level design using requirements in Assess phase and baseline build documentation Develop a project plan with milestones, dependencies and resource allocations Plan, track, document, and coordinate activities for the project Create application-specific test plans and develop acceptance criteria Request new hardware requirements based upon performance requirements Install and configure current version of target Bundle on 1 LPAR per server Test software according to document test plan Validate acceptance criteria have been met Turn-over system to customer and obtain sign-off This is build of a WebSphere Application Server. Base images and configuration standards to be supplied by client. Remote delivery for services is primary alternative, with on-site when necessary.
Service Customers / Users	Any participating Commonwealth agency or office.
Service Prerequisites	Software and/or hardware to complete service Access to affected systems and/or facilities.
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services

	Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370267-A	WebSphere Build z-Series Complex	Per Build

Service Attribute	*Service Attribute Description*
Service Name	WebSphere Upgrade z-Series Standard (1 subsystem without data sharing or clustering)
Detailed Description	Identify performance and availability profile Collect Performance Baseline Create high-level design using requirements in Assess phase and baseline build documentation Develop a project plan with milestones, dependencies and resource allocations Plan, track, document, and coordinate activities for the project Create application-specific test plans and develop acceptance criteria Request new hardware requirements based upon performance requirements Install and configure current version of target Bundle on 1 LPAR per server Test software according to document test plan Validate acceptance criteria have been met Turn-over system to customer and obtain sign-off This is upgrade of a single version of WebSphere Application Server. Base OS is at level required for upgrade of WAS. Base images and configuration standards to be supplied by client. Remote delivery for services is primary alternative, with on-site when necessary
Service Customers / Users	Any participating Commonwealth agency or office.
Service Prerequisites	Software and/or hardware to complete service Access to affected systems and/or facilities.

Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.

Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370268-A	WebSphere Upgrade z-Series Standard	Per Upgrade

Service Attribute	*Service Attribute Description*
Service Name	WebSphere Upgrade z-Series Complex (2 subsystems with data sharing and clustering across multiple CECs)
Detailed Description	Identify performance and availability profile Collect Performance Baseline Create high-level design using requirements in Assess phase and baseline build documentation Develop a project plan with milestones, dependencies and resource allocations Plan, track, document, and coordinate activities for the project Create application-specific test plans and develop acceptance criteria Request new hardware requirements based upon performance requirements Install and configure current version of target Bundle on 1 LPAR per server Test software according to document test plan Validate acceptance criteria have been met Turn-over system to customer and obtain sign-off This is upgrade of a single version of WebSphere Application Server. Provider Part Number(s)	Service Option Name	Orderable Unit / Restrictions per Unit
CCSI13370269-A	WebSphere Upgrade z-Series Complex	Per Upgrade

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Support for WebSphere App Server (10 Instances)	
Detailed Description	This services bundle is to provide support for WebSphere App Server Instances on System z. This is support for 1 to 10 instances of the application server. 1 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12-month commitment;	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370272-A	z-Series Support for WebSphere App Server (10 Instances)	Per Request / Up to 10 instances

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Support for WebSphere App Server (25 Instances)	
Detailed Description	This services bundle is to provide support for WebSphere App Server Instances on System z. This is support for 11 to 25 instances of the application server. 2 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12-month commitment	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370273-A	z-Series Support for WebSphere App Server (25 Instances)	Per unit as set forth above

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Support for WebSphere App Server (40 Instances)	
Detailed Description	This services bundle is to provide support for WebSphere App Server Instances on System z. This is support for 26 to 40 instances of the application server. 3 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12-month commitment	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370274-A	z-Series Support for WebSphere App Server (40 Instances)	Per unit as set forth above

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Support for WebSphere MQ Queue Managers (40 Queue Managers)	
Detailed Description	This services bundle is to provide support for WebSphere MQ Queue Managers on System z. This is support for 1 to 40 instances of the Queue Manager. 1 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12-month commitment;	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370275-A	z-Series Support for WebSphere MQ Queue Managers (40 Queue Managers)	Per unit as set forth above

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Support for WebSphere MQ Queue Managers (80 Queue Managers)	
Detailed Description	This services bundle is to provide support for WebSphere MQ Queue Managers on System z. This is support for 41 to 80 instances of the Queue Manager. 2 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12-month commitment;	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370276-A	z-Series Support for WebSphere MQ Queue Managers (80 Queue Managers)	Per unit as set forth above

Service Attribute	*Service Attribute Description*	
Service Name	z-Series Support for WebSphere MQ Queue Managers (120 Queue Managers)	
Detailed Description	This services bundle is to provide support for WebSphere MQ Queue Managers on System z. This is support for 81 to 120 instances of the Queue Manager. 3 FTE in the bundle for one month.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	12-month commitment;	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370277-A	z-Series Support for WebSphere MQ Queue Managers (120 Queue Managers)	Per unit as set forth above

User Experience (UX) Design

Service Attribute	*Service Attribute Description*	
Service Name	**User Experience Strategy**	
Detailed Description	• Facilitate user experience (UX) workshops • Define personas and user stories • Define success measurement • Develop UX Implementation Roadmap • Define Solution Business Case(s) • Each strategy service supports a specific number work workshops and user stories. The Large workshop also includes the Success Measurement, Implementation Roadmap and Solution Business Case deliverables.	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of supporting infrastructure and tools (software) solution to perform the assessment • Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370278-A	User Experience Strategy - Small	Per Request / Up to 2 workshops, up to 5 user stories
CCSD13370279-A	User Experience Strategy - Medium	Per Request / Up to 5 workshops, up to 10 user stories

CCSD13370280-A	User Experience Strategy - Large	Per Request / Up to 5 workshops, up to 10 user stories, success measurement, implementation roadmap, solution business case

Service Attribute	*Service Attribute Description*	
Service Name	**User Experience Design**	
Detailed Description	• End User Research/Observation/Analysis • End User Usability Testing • Design Option Definition • Style Guide Design • Low Fidelity Sketches • High Fidelity Mock-ups • Interactive Prototype • Each Design service supports a specific number of user research sessions, design options, and screens Each service also includes low or high fidelity sketches, mock-ups, style guides and prototypes.	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of supporting infrastructure and tools (software) solution to perform the assessment • Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370281-A	User Experience Design - Small	Per Request / Up to 2 user research sessions, 1 design option, up to 10 screens, low fidelity sketches.

CCSD13370282-A	User Experience Design - Medium	Per Request / Up to 2 user research sessions, 2 design options, up to 15 screens, low fidelity sketches, high fidelity mock-ups, style guide
CCSD13370283-A	User Experience Design - Large	Per Request / up to 5 user research sessions, 1 usability test, 3 design options, up to 25 screens, low fidelity sketches, high fidelity sketches, style guide, interactive prototype

Service Attribute	*Service Attribute Description*	
Service Name	**User Experience Prototype Development**	
Detailed Description	• Develop User Experience Artifacts • Images • Button Styles • "Response Web" CSS • Configurable "skins" • HTML structure and implementation patterns • Each prototype develop service supports a specific number of screens.	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of supporting infrastructure and tools (software) solution to perform the assessment • Define assessment scope	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370284-A	User Experience Prototype Development - Small	Per Request / Up to 10 screens
CCSD13370285-A	User Experience Prototype Development - Medium	Per Request / Up to 15 screens
CCSD13370286-A	User Experience Prototype	Per Request / Up to 25 screens

	Development - Large	

Data Quality Management (DQM) Analysis & Strategy

Service Attribute	*Service Attribute Description*	
Service Name	**Data Quality Management (DQM) – Analysis and Strategy**	
Detailed Description	Identify causes and develop strategies for overcoming inaccurate, incomplete and inconsistent data in enterprise systems. • Define Data Quality Requirements: Identify data components and its impact on business policies. Evaluate and categorize data errors in terms of data quality. • Profile, analyze, and assess Data Quality using data profiling tools and techniques. • Define Data Quality Metrics and Business Rules based on standard conformance and compliance templates • Evaluate and Design Data Quality SLA's and Procedures to measure and monitor compliance with defined data quality rules and SLA's	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office

Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
What Provider Part Numbers can be used to order this service?	Application and Infrastructure Mapping with Virtualization and Consolidation Plan	Per Request

Data Center Facility Services

Service Attribute	*Service Attribute Description*
Service Name	Security Caging – EDC
Detailed Description	This security caging provides a secure space sufficient to hold between 2 and 14 standard racks. The space is constructed of wire mesh panels with sliding entries. The cage sides will extend to the roof or will be topped; in addition, the cage will extend down through the raised floor to the concrete below providing a fully segregated space.
Service Customers / Users	Any participating Commonwealth agency or office
Service Prerequisites	The selection of this service requires the selection of other equipment or services to be placed within the cage including but not limited to fully managed servers, managed-only servers, or colocation services. Secure access control is not included and the type must be selected from the Catalog of Services. Video camera monitoring of the cage, its entrance or interior is optional and may be selected from the Catalog of Services.
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog

Provider Part Number(s)	Service Option Name	Orderable Unit / Restrictions per Unit
CCSU13370501-A	EDC Security Cage – Small	1 cage - 8 feet x 9 feet; 1 door; space is sufficient for 2 standard racks or cabinets; availability dependent upon space
CCSU13370502-A	EDC Security Cage – Medium	1 cage - 10 feet x 9 feet; 1 door; space is sufficient for 3 standard racks or cabinets; dependent upon available space
CCSU13370503-A	EDC Security Cage – Large	1 cage - 18 feet x 9 feet, 1 door; space is sufficient for 7 standard racks or cabinets; dependent upon available space
CCSU13370504-A	EDC Security Cage – Extra Large	1 cage - 18 feet x 15 feet; 2 doors; space is sufficient for 14 standard racks or cabinets in 2 rows; dependent upon available space

Service Attribute	*Service Attribute Description*	
Service Name	Security Caging – [redacted]	
Detailed Description	This security caging provides a secure space sufficient to hold between 2 and 14 standard racks. The space is constructed of wire mesh panels with sliding entries. The cage sides will extend to the roof or will be topped; in addition, the cage will extend down through the raised floor to the concrete below providing a fully segregated space.	
Service Customers / Users	Any	
Service Prerequisites	The selection of this service requires the selection of other equipment or services to be placed within the cage including but not limited to fully managed servers, managed-only servers, or colocation services. Secure access control is not included and the type must be selected from the Catalog of Services. Video camera monitoring of the cage, its entrance or interior is optional and may be selected from the Catalog of Services.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370314-A	[redacted] Security Cage – Small	1 cage - 8 feet x 9 feet; 1 door; space is sufficient for 2 standard racks or cabinets; availability dependent upon space

CCSU13370315-A	[redacted] Security Cage – Medium	1 cage - 10 feet x 9 feet; 1 door; space is sufficient for 3 standard racks or cabinets; dependent upon available space
CCSU13370316-A	[redacted] Security Cage – Large	1 cage - 18 feet x 9 feet, 1 door; space is sufficient for 7 standard racks or cabinets; dependent upon available space
CCSU13370317-A	[redacted] Security Cage – Extra Large	1 cage - 18 feet x 15 feet; 2 doors; space is sufficient for 14 standard racks or cabinets in 2 rows; dependent upon available space

Service Attribute	*Service Attribute Description*	
Service Name	Security Caging – [redacted]	
Detailed Description	This security caging provides a secure space sufficient to hold between 2 and 14 standard racks of up to 84" height. The space is constructed of wire mesh panels with sliding entries. The cage sides will be topped; in addition, the cage will extend down through the raised floor to the concrete below providing a fully segregated space.	
Service Customers / Users	Any

Service Attribute	*Service Attribute Description*	
Service Name	Enclosed Network Security Conduit	
Detailed Description	An enclosed network security conduit provides a physically secure path from one secure area to another for network cabling requiring physical segregation.	
Service Customers / Users	Any.	
Service Prerequisites	This service must be requested with another service that provides or includes network connectivity such as a fully-managed server or a co-location cabinet.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370322-A	4” Steel Security Conduit	Per foot; must be ordered for one of the in scope data centers.

Service Attribute	*Service Attribute Description*	
Service Name	Enclosed Security Cable Tray	
Detailed Description	An enclosed security cable tray provides a physically secure path from one secure area to another for cabling requiring physical segregation.	
Service Customers / Users	Any.	
Service Prerequisites	This service must be requested with another service that provides or includes network connectivity; typically requested with a security cage.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370323-A	Enclosed Security Cable Tray	Per foot; must be ordered for one of the in scope data centers.

Service Attribute	*Service Attribute Description*	
Service Name	Security Camera	
Detailed Description	A security camera placed as requested within the datacenters for the video monitoring of an entrance, cabinet, or area within the datacenter.	
Service Customers / Users	Any.	
Service Prerequisites	None.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370324-A	Security Camera	Per camera; time to install depends upon the capacity within the current video monitoring system

Service Attribute	*Service Attribute Description*	
Service Name	Access Control Panel	
Detailed Description	An access control panel for controlled access through doors such as those on security cages	
Service Customers / Users	Any.	
Service Prerequisites	None.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370325-A	Access Control Panel	Per panel; time to install depends upon the capacity within the existing access control system

Service Attribute	*Service Attribute Description*	
Service Name	Security Cabinet	
Detailed Description	A secure cabinet of standard footprint (2’ x 3’) including lockable front and rear doors.	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	None.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog

CCSU13370326-A	Security Cabinet – Standard, Full	Per cabinet

Data Center Relocation Services

Service Attribute	*Service Attribute Description*	
Service Name	Lift and Ship of Servers	
Detailed Description	This servers includes the following services: 1) Unracking of the server 2) Packing the new server in preparation of shipment. 3) Shipment of the server to new location 4) Unpacking of the server 5) Cabling of the server in the new location 6) Racking the server in the new location.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Not Applicable	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370327-A	Lift and Ship of Servers	Per Server

Service Attribute	*Service Attribute Description*	
Service Name	Data Center Relocation Services	
Detailed Description	Provide assessment and discovery services, move day planning and implementation for a lift and shift relocation for the entire enterprise data center. The complexity of a full data center build, move, relocate and maintaining operations is often poorly estimated by many enterprises during this critical activity. IBM has a great deal of experience in making the move as seamless as possible to provide continued operation	
Service Customers / Users	Any participating Commonwealth agency or office.	
Service Prerequisites	None	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370328-A	Data Center Relocation Services Plan	Per Plan

Service Attribute	*Service Attribute Description*	
Service Name	Transition Tools: EMC RecoverPoint Solution for migrations for 10,000 GB of SAN-attached Storage	
Detailed Description	This service is offered to the Commonwealth to aid in data migration and mitigate against application outages in cases where highly critical applications require near continuous availability.	
Service Customers / Users	The Service is Available to Any participating Commonwealth agency or office.	
Service Prerequisites	What is required before this service or service element be ordered? 1) The service may require a scheduled change outage window to complete a temporary break in data flow and attach the infrastructure. A second outage may be required to remove the infrastructure following migration.	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370329-A	Transition Tools: EMC RecoverPoint Solution for migrations for 10,000 GB of SAN-attached Storage	Per Package

Network and Security Services

IPV6 Services

Service Attribute	*Service Attribute Description*	
Service Name	IPV6 Strategy	
Detailed Description	Three phase approach to implementing IPV6 on the CoPA network. Phase 1 will be full network and application analysis of current IPv4 implementation and readiness of applications and LAN/WAN to support IPv6; Phase 2 will be a detailed plan to cut over both applications and LAN/WAN to IPv6; Phase 3 will be the cutover itself.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	1) What is required before this service or service element be ordered? Service will not be offered until all transition/transformation activities are completed.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSP13370330-A	IPV6 Strategy	Per Engagement

LAN Network Services

Service Attribute	*Service Attribute Description*	
Service Name	LAN Switch Installation for new Managed Only Racks	
Detailed Description	This service provides the installation and initial configuration of a network switches in a new rack with Managed Only or Co-Location equipment requiring network connectivity.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370331-A	LAN Switch Installation for new Managed Racks	Per Switch

Virtual Private Network Services

Service Attribute	*Service Attribute Description*	
Service Name	Virtual Private Network – Business Partner - Planning	
Detailed Description	Develop the design of the Virtual Private Network site to site connection for a Commonwealth Business Partner to enable controlled access to an application or service between the Agency's data center applications and the Business Partner.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370332-A	VPN – Business Partner - Planning	Per Request

Service Attribute	*Service Attribute Description*	
Service Name	Virtual Private Network – Business Partner - Implementation	
Detailed Description	Implement the Virtual Private Network site to site connection for a Commonwealth Business Partner to enable controlled access to an application or service between the Agency's data center applications and the Business Partner.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370333-A	VPN – Business Partner - Implementation	Per Request

Service Attribute	*Service Attribute Description*	
Service Name	Virtual Private Network – Business Partner - Modification	
Detailed Description	Modify an existing Virtual Private Network site to site connection for a Commonwealth Business Partner to enable controlled access to an application or service between the Agency's data center applications and the Business Partner.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	What is required before this service or service element be ordered? 1) Selection of another service (what service?) 2) Solution Request submittal 3) Etc.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370334-A	VPN – Business Partner - Modification	Per Request

Service Attribute	*Service Attribute Description*	
Service Name	Virtual Private Network – Business Partner - Decommission	
Detailed Description	Remove an existing Virtual Private Network site to site connection for a Commonwealth Business Partner to enable controlled access to an application or service between the Agency's data center applications and the Business Partner	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	If Business Partner access is still required after the removal of the VPN site to site tunnel, an alternative connection must be in place prior to the removal to limit the impact to the application's users.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370335-A	VPN – Business Partner – Decommission	Per Request

Service Attribute	*Service Attribute Description*	
Service Name	***Virtual Private Network – Commonwealth Agency - Planning***	
Detailed Description	Develop the design of a Virtual Private Network site to site connection between a Commonwealth Agency or Office and a Unisys team managed data center with Agency or Office hosted applications.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	What is required before this service or service element be ordered? 1) Selection of another service (what service?) 2) Solution Request submittal 3) Etc.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog

Network Load Balancing Services

Service Attribute	*Service Attribute Description*	
Service Name	Hardware Network Load Balancer – Design and Implement	
Detailed Description	Design and Implement application services on a Hardware Network Load Balancer	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370340-A	Hardware Network Load Balancer – Design & Implement – Small	Per Request / Up to 2 servers and 1 Content Service
CCSU13370341-A	Hardware Network Load Balancer – Design & Implement – Medium	Per Request / Up to 5 servers and 2 Content Services
CCSU13370342-A	Hardware Network Load Balancer – Design & Implement - Large	Per Request / Up to 10 servers and 5 Content Services

Service Attribute	*Service Attribute Description*	
Service Name	Hardware Network Load Balancer - Modify	
Detailed Description	Modify application services on a Hardware Network Load Balancer	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Application Service on Hardware Load Balancer implemented by the Design and Implement Service	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370343-A	Hardware Network Load Balancer – Modify – Small	Per Request / Up to 2 servers and 1 Content Service
CCSU13370344-A	Hardware Network Load Balancer – Modify – Medium	Per Request / Up to 5 servers and 2 Content Services
CCSU13370345-A	Hardware Network Load Balancer – Modify - Large	Per Request / Up to 10 servers and 5 Content Services

Service Attribute	*Service Attribute Description*	
Service Name	SSL Offloading on Network Load Balancer – Design and Implement	
Detailed Description	Design and Implement SSL Offloading services on a Hardware Network Load Balancer	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370346-A	SSL Offloading on Network Load Balancer – Design and Implement	Per Request / 1 URL for 1 Application

Service Attribute	*Service Attribute Description*	
Service Name	SSL Offloading on Network Load Balancer - Modify	
Detailed Description	Modify SSL Offloading services on a Hardware Network Load Balancer	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	SSL Offload for Application Service on Hardware Load Balancer implemented by the Design and Implement Service	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370349-A	SSL Offloading on Network Load Balancer – Modify	Per Request / 1 URL for 1 Application

Service Attribute	*Service Attribute Description*	
Service Name	Multi-site Global Network Load Balancer – Design and Implement	
Detailed Description	Design and Implement a Multi-Site Global Load Balancer service between two data centers	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370352-A	Multi-site Global Network Load Balancer – Design – Small	Per Request / Up to 2 servers and 1 content service across 2 sites.
CCSU13370353-A	Multi-site Global Network Load Balancer – Design – Medium	Per Request / Up to 5 servers and 2 content service across 2 sites.
CCSU13370354-A	Multi-site Global Network Load Balancer – Design - Large	Per Request / Up to 10 servers and 5 content service across 2 sites.

Service Attribute	*Service Attribute Description*	
Service Name	Multi-site Global Network Load Balancer - Modify	
Detailed Description	Short write up on what the Catalog item will do	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Global Load Balancing for Application Service on Hardware Load Balancer implemented by the Design and Implement Service	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370355-A	Multi-site Global Network Load Balancer – Modify – Small	Per Request / Up to 2 servers and 1 content service across 2 sites.
CCSU13370356-A	Multi-site Global Network Load Balancer – Modify – Medium	Per Request / Up to 5 servers and 2 content service across 2 sites.
CCSU13370357-A	Multi-site Global Network Load Balancer – Modify - Large	Per Request / Up to 10 servers and 5 content service across 2 sites.

Reverse Proxy Services

Service Attribute	*Service Attribute Description*	
Service Name	Reverse Proxy Platform– Design and Implement	
Detailed Description	Design and Implement a Reverse Proxy to support Application services. This service covers the design and implementation of the Proxy platform.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Per Application to be supported, the Reverse Proxy – Application Service – Design and Implement is required.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370358-A	Reverse Proxy – Design & Implement – Proxy Platform – Small	Per Request / up to 100 concurrent users, and 40 KBPS
CCSU13370359-A	Reverse Proxy – Design & Implement – Medium	Per Request /up to 200 concurrent users, and 60 KBPS
CCSU13370360-A	Reverse Proxy – Design & Implement - Large	Per Request / up to 500 concurrent users, and 80 KBPS

Service Attribute	*Service Attribute Description*	
Service Name	Reverse Proxy – Application Service - Design and Implement	
Detailed Description	Design and Implement a Reverse Proxy to support Application services. This service covers the design and implementation of the Application service on the proxy.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Reverse Proxy Platform– Design and Implement supporting the number of concurrent users.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370361-A	Reverse Proxy – Design & Implement – Application Service – Small	Per Request / 1 Application, 1 URL, up to 100 concurrent users, and 40 KBPS
CCSU13370362-A	Reverse Proxy – Design & Implement – Application Service – Medium	Per Request / 1 Application, 1 URL, up to 200 concurrent users, and 60 KBPS
CCSU13370363-A	Reverse Proxy – Design & Implement – Application Service – Large	Per Request / 1 Application, 1 URL, up to 500 concurrent users, and 80 KBPS

Service Attribute	*Service Attribute Description*	
Service Name	Reverse Proxy – Application Service - Modify	
Detailed Description	Modify a Reverse Proxy to support Application services. This service covers the modification of the Application service on the proxy.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Existing Reverse Proxy Application Service implemented by the Reverse Proxy – Application Service – Design and Implement service.	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name. Or To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370364-A	Reverse Proxy – Modify – Application Service – Small	Per Request / 1 Application, 1 URL, up to 100 concurrent users, and 40 KBPS
CCSU13370365-A	Reverse Proxy – Modify – Application Service – Medium	Per Request / 1 Application, 1 URL, up to 200 concurrent users, and 60 KBPS
CCSU13370366-A	Reverse Proxy – Modify – Application Service – Large	Per Request / 1 Application, 1 URL, up to 500 concurrent users, and 80 KBPS

Stealth Security Services

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Starter Plan Service	
Detailed Description	This service will deploy the Stealth Solution in your infrastructure to be used to explore and validate the selected use case. Documentation of the use case testing and a summary of findings and recommendations will be provided.	
Service Customers / Users	Any participating Commonwealth agency or office requiring data in motion encryption	
Service Prerequisites		
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370367-A	Stealth Starter Plan Service – 2 weeks	Per Request / 2 Week Project

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Secure Virtual Terminal Starter Plan Service Add-On	
Detailed Description	This service is an add-on module to the Stealth PoC to add Stealth Solution for Virtual Terminal to the PoC. This service adds an additional 2 weeks to the POC to provide for the design and creation of the USB images.	
Service Customers / Users	Any participating Commonwealth agency or office requiring data in motion encryption	
Service Prerequisites	Stealth Starter Plan Service	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370368-A	Stealth SSVT Starter Plan Add-On Service – 2 weeks	Per Request / 2 Week Project

Service Attribute	*Service Attribute Description*	
Service Name	Steal Discovery Service	
Detailed Description	The Unisys Stealth Solution Discovery Service is a facilitated, participant-driven activity focused on introducing you to the Unisys Stealth Solution and identifying Stealth use cases that best meet your business requirements. The discovery service will produce a high level architecture diagram that represents a suggested use for Stealth in the client environment.	
Service Customers / Users	Any participating Commonwealth agency or office requiring data in motion encryption	
Service Prerequisites	None	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370369-A	Stealth Discovery Service – 2 Weeks	Per Request / 2 Week Project

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Design Service	
Detailed Description	The Unisys Stealth Solution Design Service draws on the infrastructure and requirements information gathered as part of the preceding Stealth service engagements and provides a technical plan for the implementation of Stealth as per the use cases identified by you.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Stealth Discovery Service -2 Weeks	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370370-A	Stealth Design Service – 2 weeks	Per Request / 2 week Project

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Deployment Service	
Detailed Description	The Unisys Stealth Solution Deployment Service is a follow-on service to the Unisys Stealth Solution Design Service. The purpose of this service is to install and configure the Unisys Stealth Solution infrastructure in your network and render your environment 'Ready for Use'.	
Service Customers / Users	Any participating Commonwealth agency or office requiring data in motion encryption	
Service Prerequisites	Stealth Design Service – 2 Weeks	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370371-A	Stealth Deployment Service – 2 Weeks	Per Request / 2 week Project

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Network Appliance	
Detailed Description	Stealth appliances use military-grade technology and best practices to render end-users, servers and other IT assets undetectable on any available network. Additionally, cryptographic virtualization separates and secures users, functions and entire organizations into Communities-of-Interest, undetectable from each other and external malicious activities. Entry-Level end-point data protection appliance Specification: 3.1GHz Single Processor, 300Mb/Sec Mid-Level end-point data protection appliance Specification: 3.1GHz Single Processor, 800Mb/Sec Large-Scale end-point data protection appliance Specification: 2.9GHz Single Processor, 1Gb/sec	
Service Customers / Users	Any participating Commonwealth agency or office requiring data in motion encryption	
Service Prerequisites	Stealth Deployment Service – 2 Weeks Stealth Network Appliance – Annual Maintenance Stealth Client Licenses, or Stealth Server Licenses	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370372-A	Stealth Network Appliance (1000 Licenses, 300 Mbps)	Per Appliance
CCSU13370373-A	Stealth Network Appliance (1000 Licenses, 800 Mbps)	Per Appliance

CCSU13370374-A	Stealth Network Appliance (RPS, 1 Gbps)Stealth Deployment Service	Per Appliance

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Network Appliance – Annual Maintenance	
Detailed Description	Stealth appliances use military-grade technology and best practices to render end-users, servers and other IT assets undetectable on any available network. Additionally, cryptographic virtualization separates and secures users, functions and entire organizations into Communities-of-Interest, undetectable from each other and external malicious activities. Entry-Level end-point data protection appliance Specification: 3.1GHz Single Processor, 300Mb/Sec Mid-Level end-point data protection appliance Specification: 3.1GHz Single Processor, 800Mb/Sec Large-Scale end-point data protection appliance Specification: 2.9GHz Single Processor, 1Gb/sec The Annual Maintenance service provides the manufacturers ongoing software support contract.	
Service Customers / Users	Any participating Commonwealth agency or office requiring data in motion encryption	
Service Prerequisites	Stealth Deployment Service – 2 Weeks	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370526-A	Stealth Network Appliance (1000 Licenses, 300 Mbps) – Annual Maintenance	Per Appliance
CCSU13370527-A	Stealth Network Appliance (1000 Licenses, 800 Mbps) – Annual Maintenance	Per Appliance

CCSU13370528-A	Stealth Network Appliance (RPS, 1 Gbps)– Annual Maintenance	Per Appliance

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Client License	
Detailed Description	Stealth Concurrent Usage Licenses protecting a client endpoint such as a laptop or PC	
Service Customers / Users	Any participating Commonwealth agency or office requiring data in motion encryption	
Service Prerequisites	Stealth Network Appliance Stealth Client License – Annual Maintenance	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370375-A	Stealth Client License (1-24)	Per License / 1-24 licenses
CCSU13370376-A	Stealth Client License (25-49)	Per License / 25-49 licenses
CCSU13370377-A	Stealth Client License (50-99)	Per License / 50-99 licenses
CCSU13370378-A	Stealth Client License (100-249)	Per License / 100-249 licenses
CCSU13370379-A	Stealth Client License (250-499)	Per License / 250-499 licenses
CCSU13370380-A	Stealth Client License (500-999)	Per License / 500-999 licenses
CCSU13370381-A	Stealth Client License (1000+)	Per License / 1000+ licenses

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Client License – Annual Maintenance	
Detailed Description	Stealth Concurrent Usage Licenses protecting a client endpoint such as a laptop or PC The Annual Maintenance service provides the manufacturers ongoing software support contract.	
Service Customers / Users	Any participating Commonwealth agency or office requiring data in motion encryption	
Service Prerequisites	Stealth Network Appliance	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370529-A	Stealth Client License (1-24) – Annual Maintenance	Per License / 1-24 licenses
CCSU13370530-A	Stealth Client License (25-49) – Annual Maintenance– Annual Maintenance	Per License / 25-49 licenses
CCSU13370531-A	Stealth Client License (50-99) – Annual Maintenance	Per License / 50-99 licenses
CCSU13370532-A	Stealth Client License (100-249) – Annual Maintenance	Per License / 100-249 licenses
CCSU13370533-A	Stealth Client License (250-499) – Annual Maintenance	Per License / 250-499 licenses
CCSU13370534-A	Stealth Client License (500-999) – Annual Maintenance	Per License / 500-999 licenses

CCSU13370535-A	Stealth Client License (1000+)– Annual Maintenance	Per License / 1000+ licenses

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Client Expansion License	
Detailed Description	Stealth add-on licenses after initial installation protecting a client endpoint such as a laptop or PC.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Stealth Network Appliance Stealth Client Licenses Stealth Client Expansion Licenses – Annual Maintenance	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370382-A	Stealth Client Expansion License (1-24)	Per License / 1-24 licenses
CCSU13370383-A	Stealth Client Expansion License (25-49)	Per License / 25-49 licenses
CCSU13370384-A	Stealth Client Expansion License (50-99)	Per License / 50-99 licenses
CCSU13370385-A	Stealth Client Expansion License (100-249)	Per License / 100-249 licenses
CCSU13370386-A	Stealth Client Expansion License (250-499)	Per License / 250-499 licenses
CCSU13370387-A	Stealth Client Expansion License (500-999)	Per License / 500-999 licenses

CCSU13370388-A	Stealth Client Expansion License (1000+)	Per License / 1000+ licenses

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Client Expansion License – Annual Maintenance	
Detailed Description	Stealth add-on licenses after initial installation protecting a client endpoint such as a laptop or PC. The Annual Maintenance service provides the manufacturers ongoing software support contract.	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Stealth Network Appliance	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Authorization Service License	
Detailed Description	Data protection authorization interface service License	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Stealth Network Appliance Stealth client and/or server licenses	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370401-A	Stealth Authorization Service Stand Alone License	Per Service

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Authorization Service License	
Detailed Description	Data protection authorization interface service License. Interfaces with AD/LDAP authorization scheme	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Stealth Network Appliance Stealth client and/or server licenses	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370402-A	Stealth Authorization Service with AD/LDAP License	Per Service

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Authorization Service License	
Detailed Description	Data protection authorization interface service License. Interfaces with a RADIUS (Remote Authentication Dial-In User Service) authorization scheme	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Stealth Network Appliance Stealth client and/or server licenses	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370403-A	Stealth Authorization Service with RADIUS License	Per Service

Service Attribute	*Service Attribute Description*	
Service Name	Stealth Secure Virtual Terminal Boot Device	
Detailed Description	Customized Stealth Secure USB devices delivers Stealth software media to provide a data protection solution designed to provide an uncompromised internet business session through the use of a hardened, highly minimized operating system, a locked down browser and communications tunnel cloaked to those who are not pre-identified as part of the "secure community."	
Service Customers / Users	Any participating Commonwealth agency or office	
Service Prerequisites	Completion of the Stealth Design Service	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370404-A	Stealth Secure Virtual Terminal 4GB Windows Boot Device	Per Device

Security Services

Security Vulnerability Assessment

Service Attribute	*Service Attribute Description*	
Service Name	**Security Vulnerability Assessment – Infrastructure**	
Detailed Description	Identify potential security risks on the IT infrastructure using automated vulnerability scanning tools and manual assimilation. Use automated vulnerability scanning tools to identify potential security risks within the IT infrastructure	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of non-production environment identical to the production environment or in case the assessment is done using the production environment an appropriate fail over plan should be established • Define scope of the assessment and availability of vulnerability testing tools	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370405-A	Vulnerability Assessment – Infrastructure - Small	Per Assessment (Up to 3 Class C Networks with up to 60 hosts)
CCSD13370406-A	Vulnerability Assessment – Infrastructure– Medium	Per Assessment (Up to 5 Class C Networks with up to 125 hosts)
CCSD13370407-A	Vulnerability Assessment –	Per Assessment (Up to 10 Class

	Infrastructure– Large	C with up to 275)
CCSD13370408-A	Vulnerability Assessment – Infrastructure – Very Large	Per Assessment (Up to 1 Class B network with 500 hosts)

Service Attribute	*Service Attribute Description*
Service Name	**Security Vulnerability Assessment –** **Web/mobile application**
Detailed Description	Identify potential security risks on the web application, using automated vulnerability scanning tools and manual assimilation. Use automated vulnerability scanning tools to identify potential security risks within the applications (web/mobile).
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office
Service Prerequisites	• Availability of non-production environment identical to the production environment or in case the assessment is done using the production environment an appropriate fail over plan should be established • Define scope of the assessment and availability of vulnerability testing tools
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.

Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370409-A	Vulnerability Assessment – Web/Mobile Application - Small	Per Assessment (35 Custom Web Application Pages)
CCSD13370410-A	Vulnerability Assessment – Web/Mobile Application – Medium	Per Assessment (70 Custom Web Application Pages)
CCSD13370411-A	Vulnerability Assessment – Web/Mobile Application – Large	Per Assessment (100 Custom Web Application Pages)

CCSD13370412-A	Vulnerability Assessment – Web/Mobile Application – Very Large	Per Assessment (175 Custom Web Application Pages)

Service Attribute	*Service Attribute Description*	
Service Name	**Security Vulnerability Assessment – Database**	
Detailed Description	**Database assessment:** Perform a controlled vulnerability assessment on the target database infrastructure to identify potential security vulnerabilities that may lead to unauthorized information leakage or even lead to comprise of the database system. Supported database assessments: Oracle, Microsoft SQL Server, IBM DB2, MySQL, Lotus Domino and Sybase.	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of non-production environment identical to the production environment or in case the assessment is done using the production environment an appropriate fail over plan should be established • Define scope of the assessment and availability of vulnerability testing tools	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370413-A	Vulnerability Assessment – Database - Small	Per Assessment (3 database server running up to 5 instances or Oracle SIDs
CCSD13370414-A	Vulnerability Assessment – Database – Medium	Per Assessment (5 database servers running up to 10 instances or Oracle SIDs

CCSD13370415-A	Vulnerability Assessment – Database– Large	Per Assessment (10 database servers running up to 15 instances or Oracle SIDs
CCSD13370416-A	Vulnerability Assessment – Database – Very Large	Per Assessment (20 database servers running up to 30 instances or Oracle SIDs

Service Attribute	*Service Attribute Description*	
Service Name	Security Vulnerability assessment – Wireless infrastructure	
Detailed Description	Wireless assessment: Identify security vulnerabilities in the configuration or implementation of the target wireless LAN infrastructure. Perform controlled discovery of wireless access nodes, high level security analysis of the configuration, and assess the overall capability of the Wireless LAN infrastructure through the following tasks: □□ Wireless network profile □□ Wireless configuration and security	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• □ Availability of non-production environment identical to the production environment or in case the assessment is done using the production environment an appropriate fail over plan should be established • □ Define scope of the assessment and availability of vulnerability testing tools	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370417-A	Vulnerability Assessment – Wireless Infrastructure - Small	Per Assessment (up to 2 locations with a total of 25 total wireless access points

CCSD13370418-A	Vulnerability Assessment – Wireless Infrastructure – Medium	Per Assessment (two3cations with a total of 50 total wireless access points
CCSD13370419-A	Vulnerability Assessment – Wireless Infrastructure – Large	Per Assessment (4 locations with a total of 75 wireless access points)

Service Attribute	*Service Attribute Description*	
Service Name	**Vulnerability Assessment - Security Code Review**	
Detailed Description	Use static code review tools to perform security code review for identification of potential insecure coding practices within the custom web application source code. Supported custom web application technologies: Microsoft .NET framework, JAVA, Adobe Flash, JavaScript and AJAX	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of non-production environment identical to the production environment or in case the assessment is done using the production environment an appropriate fail over plan should be established • Define scope of the assessment and availability of vulnerability testing tools	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370420-A	Security Code Review - Small	Per Assessment (up to 500,000 lines of one web application custom source code. Perform manual verification on up to 15 vulnerabilities (up to four instances per vulnerability assimilated)
CCSD13370421-A	Security Code Review – Medium	Per Assessment (up to one million lines of one web application custom source code. Perform manual verification on up to 20 vulnerabilities (up to

		six instances per vulnerability assimilated)
CCSD13370422-A	Security Code Review – Large	Per Assessment (up to two million lines of one web application custom source code. Perform manual verification on up to 25 vulnerabilities (up to eight instances per vulnerability assimilated))
CCSD13370423-A	Security Code Review – Very Large	Per Assessment (up to 3.5 million lines of one web application custom source code. Perform manual verification on up to 35 vulnerabilities (up to 10 instances per vulnerability assimilated)

Security Risk Management

Service Attribute	*Service Attribute Description*
Service Name	**Security risk assessment**
Detailed Description	Conduct a security assessment of the agency's IT infrastructure security process and controls to identify gaps with relevant security guidelines and potential mitigation controls: •□ Commonwealth information security policy and standards •□ Internal Revenue Service publication 1075 •□ Health Information Portability and Accountability Act (HIPAA) •□ Criminal Justice Information Services (CJIS) •□ Pennsylvania Criminal History Records Information Act (CHRIA) •□ Payment Card Industry (PCI) •□ Family Educational Rights Protection Act (FERPA) •□ Social Security Administration (SSA) •□ Centers for Medicare and Medicaid Services (CMS) •□ National Institute of Standards and Technology (NIST) SP800-53 •□ ISO 27001:2005 •□ Other controls as agreed upon during scope discussions.
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office
Service Prerequisites	•□ Approvals from the Commonwealth Trusted Agent/Unisys PMO •□ Define scope of the assessment and availability of security risk assessment templates & tools

Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370424-A	Security Risk Assessment - Small	Per Assessment (An Agency or Office with up to 99 employees & 1 Security Guidelines)
CCSD13370425-A	Security Risk Assessment – Medium	Per Assessment (An Agency or Office with up to 999 employees & 2 Security Guidelines)
CCSD13370426-A	Security Risk Assessment – Large	Per Assessment (An Agency or Office with up to 9,999 employees & 5 Security Guidelines)
CCSD13370427-A	Security Risk Assessment – Very Large	Per Assessment (An Agency or Office with 10,000+ employees & 10 Security Guidelines)

Service Attribute	Service Attribute Description	
Service Name	eGRC Platform – Install and Initial Setup	
Detailed Description	□□ Install eGRC solution suite along with supporting software (MS Silverlight and web server). □□ Enable database connectivity and setup standard user access (up to five (5) users. □□ Technology platforms: RSA Archer, IBM Open Pages, CA eGRC	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370428-A	eGRC Solution – Install and Initial setup	• □ Per eGRC Implementation / One eGRC installation and standard initial configuration

Service Attribute	Service Attribute Description	
Service Name	eGRC Solution – Design and Configure	
Detailed Description	• Design and configure eGRC solution modules such as Risk Management, Policy Management and Enterprise Management (using RSA Archer). This activity include analysis of the current environment, correlating business and system requirements, design and configuration of eGRC solution. In addition we configure standard user access (up to five users) • Technology platforms: RSA Archer, IBM Open Pages, CA eGRC	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370429-A	eGRC Solution – Design and Configure – Small	• Per Request / Up to one solution module
CCSD13370430-A	eGRC Solution – Design and Configure - Medium	• Per Request / Up to two solution modules
CCSD13370431-A	eGRC Solution – Design and Configure – Large	• Per Request / Up to four solution modules
CCSD13370432-A	eGRC Solution – Design and Configure – Very Large	• Per Request / Up to six solution modules

Service Attribute	Service Attribute Description	
Service Name	eGRC Solution – Develop Risk Assessment	
Detailed Description	• Work with the Commonwealth stakeholders to develop and establish one risk assessment questionnaire template based on regulatory requirements. This template allows the stakeholders to perform periodic risk assessments across the management, operational, and technology areas of the enterprise or IT infrastructure. • Technology platforms: RSA Archer, IBM Open Pages, CA eGRC	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites		
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370433-A	eGRC Solution – Develop risk assessment templates - Small	• Per Request / 1 risk assessment template with up to 50 questions
CCSD13370434-A	eGRC Solution – Develop risk assessment templates – Medium	• Per Request / 1 risk assessment template with up to 125 questions
CCSD13370435-A	eGRC Solution – Develop risk assessment templates – Large	• Per Request / 2 risk assessment templates with a total of 200 questions
CCSD13370436-A	eGRC – Develop risk assessment templates – Very Large	• Per Request / 2 risk assessment templates with a total of 300 questions

Security Configuration Review

Service Attribute	*Service Attribute Description*
Service Name	**Security Configuration Review**
Detailed Description	• Perform a review of the IT system's security configuration to identify potential vulnerabilities using leading industry practices such as IRS 1075 SCSEMs, NIST, SANS and Center for Internet Security (CIS). • Security configuration review of standard operating system platforms (instance) on up to three information systems: o Microsoft Windows (2000, XP, 2003, 2008,7 and 8) o UNIX Flavors of HP-UX, AIX, SCO and Tru64 o Linux flavors – Red Hat and SUSE o HP OpenVMS o Oracle Solaris o Other Security configuration review of three standard database solution instance – Oracle, Microsoft SQL Server, MySQL or IBM DB2. Security configuration review of three web server technology instance – Microsoft IIS, Apache Jakarta, Apache Tomcat and IBM WebSphere • Security configuration review of two boundary defense solution instance such as firewall, intrusion prevention system, antivirus, VPN and switch/router. • Security configuration review of one mainframe operating system instance – IBM zOS and UNISYS. • Security configuration review of three virtual infrastructure instance (VMWare ESX). • Security configuration review of one standard ERP solution – SAP, PeopleSoft and Oracle Applications.

Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	Scope of the assessment and availability of security configuration review tools	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370437-A	Security Configuration Review (Standard OS Platform - up to 3 information Systems	Per Request
CCSD13370438-A	Security Configuration Review (3 standard database instances)	Per Request
CCSD13370439-A	Security Configuration Review (3 web server instances)	Per Request
CCSD13370440-A	Security Configuration Review (2 boundary defense devices)	Per Request
CCSD13370441-A	Security Configuration Review (One Mainframe OS Instance)	Per Request
CCSD13370442-A	Security Configuration Review (up to 3 Virtual infrastructure instances)	Per Request
CCSD13370443-A	Security Configuration Review (One standard ERP solution)	Per Request

Cyber Threat Intelligence (CTI) Analysis

Service Attribute	*Service Attribute Description*	
Service Name	**CTI - Diagnostic**	
Detailed Description	Analyze security event logs to identify those potential internal hosts that may be compromised and are attempting to communicate with malicious internet hosts. The analysis will include detection of potential internal devices to determine presence of rogue devices or devices exhibiting potential stealth-like characteristics	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of system audit logs to perform the assessment • Define scope of the assessment and availability of system audit log analysis tools	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370444-A	CTI-Diagnostic - Small	Per Assessment (1 of TB of audit logs and rogue device detection for up to 1,000 devices)
CCSD13370445-A	CTI-Diagnostic – Medium	Per Assessment (2 of TB of audit logs and rogue device detection for up to 2,000 devices)
CCSD13370446-A	CTI-Diagnostic – Large	Per Assessment (3 of TB of audit logs and rogue device detection for up to 3,500

		devices)
CCSD13370447-A	CTI-Diagnostic – Very Large	Per Assessment (4 of TB of audit logs and rogue device detection for up to 5,000 devices)

Service Attribute	*Service Attribute Description*	
Service Name	**Suspicious Program Diagnostic**	
Detailed Description	Identify potentially unwanted programs, malicious files, and unknown binaries on agency workstations and desktops	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of system audit logs to perform the assessment • Define scope of the assessment and availability of system audit log analysis tools	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370448-A	Suspicious Program Diagnostic - Small	Per Assessment (up to 25 standard configuration for Servers, workstations, or desktops)
CCSD13370449-A	Suspicious Program Diagnostic – Medium	Per Assessment (up to 100 standard configuration for Servers, workstations, or desktops)
CCSD13370450-A	Suspicious Program Diagnostic – Large	Per Assessment (up to 250 standard configuration for Servers, workstations, or desktops)
CCSD13370451-A	Suspicious Program Diagnostic – Very Large	Per Assessment (up to 1,000 standard configuration for Servers, workstations, or

		desktops)

Service Attribute	*Service Attribute Description*	
Service Name	**Remote Access Compromise Analysis**	
Detailed Description	Remote access logs are analyzed against current cyber intelligence data to expose compromised devices logging into the organization's network.	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of system audit logs to perform the assessment • Define scope of the assessment and availability of system audit log analysis tools	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370452-A	Remote Access Compromise Analysis - Small	Per Assessment (1 TB of Remote Access Audit Logs)
CCSD13370453-A	Remote Access Compromise Analysis – Medium	Per Assessment (2 TB of Remote Access Audit Logs)
CCSD13370454-A	Remote Access Compromise Analysis – Large	Per Assessment (3 TB of Remote Access Audit Logs)
CCSD13370455-A	Remote Access Compromise Analysis – Very Large	Per Assessment (4 TB of Remote Access Audit Logs)

Service Attribute	*Service Attribute Description*	
Service Name	**Insider Threat Detection Diagnostic**	
Detailed Description	An assessment of the organization's insider threat detection capability including review of existing logs that can reveal current or past insider threats. The review will also analyze recent incidents and recommend a roadmap for automating the capability	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of system audit logs to perform the assessment • Define scope of the assessment and availability of system audit log analysis tools	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370456-A	Insider Threat Detection Diagnostic - Small	Per Assessment (Agency or Office with up to 99 employees, up to 250 GB of Audit Logs, and up to 3 Interviews)
CCSD13370457-A	Insider Threat Detection Diagnostic – Medium	Per Assessment (Agency or Office with up to 999 employees, up to 500 GB of Audit Logs, and up to 5 Interviews)
CCSD13370458-A	Insider Threat Detection Diagnostic – Large	Per Assessment (Agency or Office with up to 9,999 employees, up to 1 TB of Audit Logs, and up to 10 Interviews)

CCSD13370459-A	Insider Threat Detection Diagnostic – Very Large	Per Assessment (Agency or Office with up to 10,000+ employees, up to 2 TB of Audit Logs, and up to 3 Interviews)

Service Attribute	*Service Attribute Description*	
Service Name	**Enterprise Fraud Program Assessment**	
Detailed Description	Review the agency fraud program to determine if the appropriate skill sets, processes, organization integration, and technologies are in place to detect/manage potential emerging fraud issues. This assessment includes a review of the agency's internet application transaction and web server logs to identify potential fraudulent transactions	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of system audit logs to perform the assessment • Define scope of the assessment and availability of system audit log analysis tools	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370460-A	Enterprise Fraud Program Assessment - Small	Per Assessment (Agency or Office with up 99 employees, 250 GB of Audit Logs, and up to 3 Fraud Detection Rule Sets)
CCSD13370461-A	Enterprise Fraud Program Assessment – Medium	Per Assessment (Agency or Office with up 999 employees, 500 GB of Audit Logs, and up to 5 Fraud Detection Rule Sets)
CCSD13370462-A	Enterprise Fraud Program Assessment – Large	Per Assessment (Agency or Office with up 9,999 employees, 1 TB of Audit Logs, and up to 5 Fraud

		Detection Rule Sets)
CCSD13370463-A	Enterprise Fraud Program Assessment – Very Large	Per Assessment (Agency or Office with up 10,000+ employees, 2 TB of Audit Logs, and up to 5 Fraud Detection Rule Sets)

Data Prevention

Service Attribute	*Service Attribute Description*	
Service Name	**Data Loss Prevention (DLP) – Network monitoring**	
Detailed Description	Establish a high level DLP governance model in addition to monitoring and reporting metrics. Design, implement and configure a DLP data-in-motion (network) solution to help detect/prevent inadvertent data loss by monitoring the network traffic.	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth Trusted Agent/Unisys PMO • Availability of supporting network infrastructure, DLP hardware and software solution to perform the implementation • Define design and implementation scope of the DLP solution	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370464-A	Data Loss Prevention - Network Monitoring - Small	Per Request (1 Egress Point, and 5 Small, and 1 Complex DLP Policies)
CCSD13370465-A	Data Loss Prevention - Network Monitoring – Medium	Per Request (2 Egress Points, 7 Small, and 2 Complex DLP Policies)
CCSD13370466-A	Data Loss Prevention - Network	Per Request (3 Egress Points, 9

	Monitoring – Large	Small, and 3 Complex DLP Policies)
CCSD13370467-A	Data Loss Prevention - Network Monitoring – Very Large	Per Request (4 Egress Points, 12 Small, and 5 Complex DLP Policies)

Service Attribute	*Service Attribute Description*
Service Name	**Data Loss Prevention (DLP) – Endpoint protection**
Detailed Description	Establish a high level DLP governance model in addition to monitoring and reporting metrics. Design, implement and configure a DLP data-in-use (endpoint) solution to help detect/prevent inadvertent data loss by monitoring activity at the endpoint (e.g. laptop, desktop).
Orderable Unit	Small (Very small agency): Design, Implement and configure the DLP solution for up to 150 IT infrastructure endpoints. Configure up to five Small and one complex DLP policies Medium (Small agency): Design, Implement and configure the DLP solution for up to 1,250 IT infrastructure endpoints. Configure up to seven Small and three complex DLP policies Large (Mid-size agency): Design, Implement and configure the DLP solution for up to 11,000 IT infrastructure endpoints. Configure up to nine Small and three complex DLP policies Very Large (Large agency): Design, Implement and configure the DLP solution for up to 25,000 IT infrastructure endpoints. Configure up to 12 Small and five complex DLP policies
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office
Service Prerequisites	• Approvals from the Commonwealth Trusted Agent/Unisys PMO • Availability of supporting network infrastructure, DLP hardware and software solution to perform the implementation • Define design and implementation scope of the DLP solution
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.

Provider Part Number(s)	Service Option Name	Orderable Unit / Restrictions per Unit
CCSD13370468-A	Data Loss Prevention - Endpoint Protection - Small	Per Request (up to 150 IT infrastructure endpoints, 5 Small, and 1 Complex DLP Policies)
CCSD13370469-A	Data Loss Prevention - Endpoint Protection – Medium	Per Request (up to 1,250 IT infrastructure endpoints, 7 Small, and 3 Complex DLP Policies)
CCSD13370470-A	Data Loss Prevention - Endpoint Protection – Large	Per Request (up to 11,000 IT infrastructure endpoints, 9 Small, and 3 Complex DLP Policies)
CCSD13370471-A	Data Loss Prevention - Endpoint Protection – Very Large	Per Request (25,000 IT infrastructure endpoints, and 12 Small, and 5 Complex DLP Policies)

Service Attribute	*Service Attribute Description*	
Service Name	**Data breach diagnostic**	
Detailed Description	Support the Commonwealth to identify the IT infrastructure impacted by the data breach. Perform a forensic analysis and system audit log review of the impacted IT infrastructure to help determine: • How the system(s) were compromised, allowing the data breach to occur • The internal scope of the breach; i.e. How many other systems may have been involved, and may require further investigation/remediation to remove further threat of data loss. • The potential number of Personally Identifiable Information (PII) records affected by the breach	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth Trusted Agent/Unisys PMO • Availability of system audit logs, supporting network infrastructure, and software	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370472-A	Data Breach Diagnostics - Small	Per Assessment (Up to 3 Systems, 120 GB of File Storage, and 100 GB of uncompressed text Audit Logs)
CCSD13370473-A	Data Breach Diagnostics –	Per Request (Up to 10

	Medium	Systems, 120 GB of File Storage, and 500 GB of uncompressed text Audit Logs)
CCSD13370474-A	Data Breach Diagnostics – Large	Per Request (Up to 50 Systems, 120 GB of File Storage, and 2 TB of uncompressed text Audit Logs)

Mobile Security

Service Attribute	*Service Attribute Description*	
Service Name	**Mobile Device Management (MDM) – Design and implement**	
Detailed Description	Implementation of mobile security technology through a staged approach (e.g., test/pilot/production), to include technology configuration based on identified requirements and use cases, unit testing, user acceptance testing, post-deployment support.	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth Trusted Agent/Unisys PMO • Availability of supporting infrastructure and software solution to perform the design and implementation • Define design and implementation scope	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370475-A	Mobile Device Management (MDM) - Design and Implement - Small	• Per Request (up to 100 managed devices)
CCSD13370476-A	Mobile Device Management (MDM) - Design and Implement – Medium	Per Request (up to 250 managed devices)
CCSD13370477-A	Mobile Device Management (MDM) - Design and Implement – Large	Per Request (up to 1,000 managed devices)

CCSD13370478-A	Mobile Device Management (MDM) - Design and Implement – Very Large	Per Request (up to 2,000 managed devices)

Service Attribute	*Service Attribute Description*	
Service Name	**Mobile Security Strategy and Roadmap**	
Detailed Description	Design and deploy a requirements driven mobile security strategy and architecture that takes into account the mobile ecosystem, its inter-dependencies, the various organizational risks, the underlying mobile security objectives/approach and strategic choices.	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth Trusted Agent/Unisys PMO • Define assessment scope	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370479-A	Mobile Security Strategy and Roadmap - Small	• Per Request (up to 100 managed devices)
CCSD13370480-A	Mobile Security Strategy and Roadmap – Medium	Per Request (up to 250 managed devices)
CCSD13370481-A	Mobile Security Strategy and Roadmap – Large	Per Request (up to 1,000 managed devices)
CCSD13370482-A	Mobile Security Strategy and Roadmap – Very Large	Per Request (up to 2,000 managed devices)

Security Awareness Training

Service Attribute	*Service Attribute Description*	
Service Name	**Security Training Assessment**	
Detailed Description	Conduct a training assessment of the Commonwealth/Agency's existing training curriculum to identify gaps relevant to security protocols. The assessment includes: •□ Understanding existing security awareness •□ Identifying existing training curriculum and training history •□ Documenting knowledge gaps for each Agency •□ Identifying training requirements to mitigate knowledge gaps	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	•□ Approvals from the Commonwealth Trusted Agent/Unisys PMO •□ Define assessment scope	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370483-A	Security Training Assessment - Small	Per Request (Agency or Office with up to 999 employees)
CCSD13370484-A	Security Training Assessment - Medium	Per Request (Agency or Office with up to 9,999 employees)
CCSD13370485-A	Security Training Assessment - Large	Per Request (Agency or Office with up to 10,000+ employees)

Service Attribute	*Service Attribute Description*	
Service Name	**Security training (design and delivery)**	
Detailed Description	• Develop specialized security training materials that describe the Commonwealth/agency's information security program & the individual's responsibility to protect Commonwealth data • Develop and provide a tailored security-related education & awareness workshops	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth Trusted Agent/Unisys PMO • Define security awareness training scope and number of users to be trained	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370486-A	Security Training - Design and Delivery -	• Per Request (Training Presentation Deliverable and one training session (Up to 4 Hours))

Identity & Access Management (IAM) Service

Service Attribute	*Service Attribute Description*
Service Name	**Access Management – Design and Implementation Service**
Detailed Description	Design and implement □□ Application access policies □□ User authentication □□ Single sign on, single logout if multiple applications are required to be configured □□ Identity provider □□ Service provider □□ Federation access policies Major technology platforms □□ CA SiteMinder/Federation □□ IBM Security Access Manager □□ IBM Tivoli Federated Identity Manager and Oracle Access Manager Small: Access Management solution design and implementation for standard applications based on web servers such as IIS or Apache platforms, with up to 50 role based access policies and/or an identity federated solution integration with a service provider/one identity provider Medium: Access Management solution design and implementation for the medium complex applications based on applications servers such as IBM WebSphere and WebLogic; with up to 100 role based access policies and Single Sign-On (SSO) Integration (or) IAM federated solution integration for up to two service providers/one identity provider □□ Large: Access Management solution design and implementation for complex applications such as SAP, Oracle EBS, SharePoint or large custom applications with up to 100 role based access policies and SSO integration (or) a federated solution integration for up to five service providers/one identity provider
Service Customers /	Business, technology or security managers of any participating

Users	Commonwealth agency or office	
Service Prerequisites	• Approvals from the Commonwealth Trusted Agent/Unisys PMO • Availability of appropriate IAM solutions and processes	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370487-A	Access Management - Design and Implement - Small	• Per Request / Design and implementation for standard applications based on web servers such as IIS or Apache platforms, with up to 50 role based access policies and/or an identity federated solution integration with a service provider/one identity provider
CCSD13370488-A	Access Management - Design and Implement - Medium	Per Request / Design and implementation for the medium complex applications based on applications servers such as IBM WebSphere and WebLogic; with up to 100 role based access policies and Single Sign-On (SSO) Integration (or) IAM federated solution integration for up to two service providers/one identity provider
CCSD13370489-A	Access Management - Design and Implement - Large	Per Request / Design and implementation for complex applications such as SAP, Oracle EBS, SharePoint or large

		custom applications with up to 100 role based access policies and SSO integration (or) a federated solution integration for up to five service providers/one identity provider

Service Attribute	*Service Attribute Description*
Service Name	**Identity Provisioning and Management – Design and Implementation Service**
Detailed Description	Design and implement □ Identity provisioning and de-provisioning processes with default adapters □ Password management processes □ Delegated user administration model □ Setup entitlement repository and access certification campaign Major technology platforms □ CA GovernanceMinder and Identity Manager □ Aveksa Role Manager □ SailPoint Governance Platform and Compliance Manager □ IBM Security Identity Manager and □ Oracle Identity Manager Small: Implement provisioning solution for one user repository based on LDAP, Databases using out of the box provisioning connector, up to three single step approval workflows, and up to five provisioning policies. Medium: Implement provisioning solution for two user repositories based on Unix, LDAP, Databases using out of the box provisioning connector, up to three single step and multi-step approval workflows, and up to ten provisioning policies. Large: Implement provisioning for one complex system/application with up to 5 modules e.g. SAP, and Oracle ERP; up to three single step and multi-step approval workflows, and up to ten provisioning policies.
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office
Service Prerequisites	• □ Availability of appropriate IAM solutions and processes

Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSD13370490-A	Identity Provisioning and Management - Design and Implement - Small	Per Request / Standard: Implement provisioning solution for one user repository based on LDAP, Databases using out of the box provisioning connector, up to three single step approval workflows, and up to five provisioning policies.
CCSD13370491-A	Identity Provisioning and Management - Design and Implement - Medium	Per Request / Implement provisioning solution for two user repositories based on Unix, LDAP, Databases using out of the box provisioning connector, up to three single step and multi-step approval workflows, and up to ten provisioning policies.
CCSD13370492-A	Identity Provisioning and Management - Design and Implement - Large	Per Request / Implement provisioning for one complex system/application with up to 5 modules e.g. SAP, and Oracle ERP; up to three single step and multi-step approval workflows, and up to ten provisioning policies.

Service Attribute	*Service Attribute Description*	
Service Name	**Identity Governance and Management – Design and Implementation Service**	
Detailed Description	Use existing user provisioning process on the support platforms (described below) to setup entitlement repository and access certification campaign Major technology platforms CA GovernanceMinder and Identity Manager Aveksa Role Manager SailPoint Governance Platform and Compliance Manager IBM Security Identity Manager and Oracle Identity Manager	
Service Customers / Users	Business, technology or security managers of any participating Commonwealth agency or office	
Service Prerequisites	• Availability of appropriate IAM solutions and processes	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
	Identity Entitlement Provisioning and Management - Design and Implement - Small	Per Request (Provide entitlements and access certification for up to 2 applications)
	Identity Entitlement Provisioning and Management - Design and Implement - Medium	Per Request (Provide entitlements and access certification for up to 5 applications)
	Identity Entitlement Provisioning and Management - Design and Implement - Large	Per Request (Provide entitlements and access certification for up to 10

		applications)

Third Party Software

Service Attribute	*Service Attribute Description*	
Service Name	Unisys Mainframe – Software License Transfer	
Detailed Description	As part of the installation of a replacement Unisys Mainframe, software must be transferred. The following Server Options provide transfer fee support for the indicated Exhibit B.4 software.	
Service Customers / Users	Commonwealth Agencies with Unisys Mainframe	
Service Prerequisites	New Unisys Mainframe Installation or technology replacement	
Request the Service	To request this service, submit a Solution Request in the online Enterprise Services Catalog	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSU13370496-A	Unisys Mainframe – Software Transfer License – KMSYS	Per Request / Active Licenses on Unisys Mainframe
CCSU13370497-A	Unisys Mainframe – Software Transfer License – SMA OpCon	Per Request / Active Licenses on Unisys Mainframe
CCSU13370498-A	Unisys Mainframe – Software Transfer License – Sightline	Per Request / Active Licenses on Unisys Mainframe

Strategy Workshop Services

Service Attribute	*Service Attribute Description*	
Service Name	Cloud Transformation Workshop for Single Tower	
Detailed Description	This project focuses on the analysis of a single tower and its IT practices reviewing the current state, assessing gaps, making recommendations in the form of a roadmap where changes to the current state can provide quantifiable value. The workshop will diagnose, and prioritize the highest value actions that could be taken to improve the tower's overall quality and ROI. The typical workshop is a four week assessment for two consultants, and the four week workshop would focus on the single technology tower, and generate a generic engagement roadmap. Schedule would be contingent upon availability of all data at the start of the workshop.	
Service Customers / Users	Any affected agency/department.	
Service Prerequisites	None	
Request the Service	To request this service, submit a Service Request and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370499-A	Cloud Transformation Workshop for Single Tower	Per Workshop

Service Attribute	*Service Attribute Description*	
Service Name	Cloud Transformation Workshop	
Detailed Description	This project focuses on the analysis of datacenter workloads and IT practices and their effects on the economics of Cloud computing. This Cloud Transformation Workshop is a six weeks assessment for two consultants. The six week workshop would review up to 20 workloads on less than 125 servers and be contingent upon availability of all data at the start of the workshop.	
Service Customers / Users	Any affected agency/department.	
Service Prerequisites	None	
Request the Service	To request this service, submit a Service Request in the online Enterprise Services Catalog and select the Enterprise Services Catalog item using the above Service Name.	
Provider Part Number(s)	**Service Option Name**	**Orderable Unit / Restrictions per Unit**
CCSI13370500-A	Cloud Transformation Workshop	Per Workshop

Data Center Computing Services

Schedule D

Transition Milestones

Milestones include the completion of all tasks, deliverables and interim milestones associated with such Milestone as set forth in the Transition Plan. The Earn Back period is thirty (30) calendar days from the Transition Milestone Due Date and applies to those Milestones indicated with "Y" in the Earn Back column. The Acceptance Criteria for each Milestone includes criteria described in Schedule F and Schedule K of the contract.

Note: If a Milestone is dependent on another Milestone and the first Milestone is missed, the subsequent Milestones remain in effect. An example is: if M-3 is missed, M-5 is still enforced.

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
M-1	Key Staffing	30 calendar days from Contract Effective Date	• Key Personnel team completed per Schedule G • Staffing plan approved • Detailed project organizational chart approved • Resumes for each key personnel listed on the team submitted • Staff contingency plan approved	$50,000 One-time	N	• Commonwealth review and approval
M-2	Contract Management Plan	45 calendar days from Contract Effective Date	• Delivery and acceptance of the following Deliverables from Schedule K: o D-11.01	$50,000 One-time	Y	• Commonwealth review and approval
M-3	Staffing	90 calendar days from Contract Effective Date	• Employee on-boarding completed o Identify positions that have been filled and are ready to work • Descriptions of Offeror's policies and training processes submitted and approved • Staff Tools fulfillment completed o Office Systems (PCs, printers, software) installed and operational – letter provided and approved	$150,000 One-time	Y	• Commonwealth review and approval

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
M-4	Datacenter Architecture Plan and Roadmap	90 calendar days from Contract Effective Date	• Delivery and acceptance of the following Deliverables from Schedule K: o D-01.01 o D-01.02 (Initial Deliverable Approval) o D-01.03 (Initial Deliverable Approval) o D-01.04 (Initial Deliverable Approval) o D-01.05 (Initial Deliverable Approval) o D-01.07 o D-03.01 o D-03.04 o D-03.08 o D-04.01 o D-04.05	$150,000 One-time	Y	• Commonwealth review and approval
M-5	Data Gathering	120 calendar days from Contract Effective Date	• Completion of Data Gathering o All data gathering checklists completed, validated, reviewed and approved • Delivery and acceptance of the following Deliverables from Schedule K: o D-10.01 • Completion, submittal and acceptance of data gathering report on B2B interface to Commonwealth's ITSM system that includes interfaces for the following:	$250,000 One-time	N	• Commonwealth review and approval

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
			o Incident Management o Change Management o Problem Management o Known Errors o Request Management o Invoicing Process			
M-6	Detailed Transition Plan	180 calendar days from Contract Effective Date	• Completion and acceptance of the Detailed Transition Plan using Schedule M – Detailed Transition Plan • Delivery and acceptance of the following Deliverables from Schedule K: o D-05.01 o D-05.04 o D-05.10 • The Detailed Transition plan must contain: o An **overall (master) plan** which includes but is not limited to: ▪ Transition governance plan ▪ Transition risk and mitigation plan ▪ Due diligence timeline ▪ Configuration / testing verification ▪ Operational readiness o A **plan by Data Center** which includes but is not limited to: ▪ Transition governance plan ▪ Transition risk and mitigation plan	$150,000 One-time	N	• Commonwealth review and approval

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
			▪ Due diligence timeline ▪ Configuration / testing verification ▪ Operational readiness o A **plan by Agency** which includes but is not limited to: ▪ Transition governance plan ▪ Transition risk and mitigation plan ▪ Due diligence timeline ▪ Configuration / testing verification ▪ Operational readiness o A **plan by Application** which includes but is not limited to: ▪ Transition governance plan ▪ Transition risk and mitigation plan ▪ Due diligence timeline ▪ Configuration / testing verification ▪ Operational readiness			
M-7	Commonwealth Compute Process Manual (CCPM)	120 calendar days from Contract Effective Date	• Delivery and acceptance of the following Deliverables from Schedule K: o D-02.01 o D-02.04 o D-02.09 o D-02.15 o D-02.17 o D-02.18 o D-02.23	$75,000 One-time	Y	• Commonwealth review and approval

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
			o D-02.26 o D-02.29 o D-02.32 o D-02.37 o D-02.42 o D-02.47 o D-02.52 o D-02.57 o D-02.62 o D-02.67 o D-02.70 o D-02.75 o D-02.81 • Completion and Acceptance of final CCPM as listed within Schedule L of this contract. This includes but is not limited to: o Incident (including Security) o Problem o Change o Order/Request o Billing o Service Level			
M-8	Network Connectivity	120 calendar days from Contract Effective Date	• Completion and Acceptance of the Network Connectivity to the Commonwealth	$250,000 One-time	N	• Commonwealth review, testing and approval
M-9	Security	180 calendar days from	• Completion and acceptance of security architecture, solution, policies and	$250,000 One-time	N	• Commonwealth review and approval

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
		Contract Effective Date	procedures which included but is not limited to: o Delivery and acceptance of the following Deliverables from Schedule K: ▪ D-07.01 ▪ D-07.06 ▪ D-01.03 (Initial Deliverable Approval) ▪ D-09.01 ▪ D-09.02 o Implement security management plan o Implement security and firewall plan o Policies and procedures are in place for physical security o Policies and procedures are in place for data and network security o Policies and procedures are in place for personnel security, such as annual background checks o Security assessment is conducted to provide data safety and confidentiality			
M-10	ITSM System Integration	180 calendar days from Contract Effective Date	• Completion and Acceptance of Integration between Commonwealth's ITSM system and Offeror's ITSM System including but is not limited to: o Incident connectivity has been tested and incidents created and updated on either side flow back and forth between systems	$150,000 One-time	Y	• Commonwealth review and approval

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
			o Problem connectivity has been tested and problems created and updated on either side flow back and forth between systems o Change requests connectivity has been tested and requests created and updated on either side flow back and forth between systems o Configuration items in both system CMDBs are reconciled o Test Invoices have been processed through the ITSM system to the Commonwealth's AP system o Reporting from Offeror's ITSM system is available to Commonwealth			
M-11	Financial Management	180 calendar days from Contract Effective Date	• Completion and acceptance of billing process and form of invoice approved • Schedule K Deliverable D-02.01 completed • Process implemented, tested and accepted providing an enterprise bill providing the details required by the Commonwealth	$75,000 One-time	Y	• Commonwealth review and approval
M-12	Operational Readiness	240 calendar days from Contract Effective Date	• Completion and acceptance of an Operational Readiness Report indicating Offeror is "Ready" to transition the Commonwealth's Applications and Services to other Datacenters. This report must include but is not limited to the following:	$150,000 One-time	N	• Commonwealth review and approval

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
			o Delivery and acceptance of the following Deliverables from Schedule K: ▪ D-01.01 ▪ D-01.02 ▪ D-01.03 ▪ D-01.04 ▪ D-01.05 ▪ D-01.06 ▪ D-01.07 o Transition Project Office established and fully staffed o Program plan and architecture developed and approved by the Commonwealth o Processes and Tools implemented to support the transition change control, schedule, quality, communications, risk and issue management o Datacenter environment configured , tested and acceptance			
M-13	SSAE 16 Audit of EDC	12 months from Contract Effective Date	• Completion and Acceptance of SSAE 16 audit of the Commonwealth's EDC • Schedule K Deliverable D-08.02	$100,000 One-time	Y	• Commonwealth review and approval
M-14 (A)	DPH Transition Completed	18 months from Contract Effective Date	• Completion and acceptance of ALL applications transitioned from the DPH to new Datacenters which includes but is not limited to the following for each application:	$2,500,000 per month or partial month for six (6) months	N	• Commonwealth review and approval of work product plus assisting in data gathering, planning, ordering, implementing,

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
			o High availability, backup and DR are operational for identified systems. o CCPM specific details for application are available in KMP. o Operations dashboards to report immediately on status and alerts for transitioned applications. o Service Level agreements are identified and supporting metrics in place. o System operational for scheduling and tracking of ticket-based tasks and incidents. o System is available to begin data collection to produce configuration, monitoring and management status reports. o Systems with DR plans have an updated DR plan and test scheduled. o Operational support assumed and workloads migrated. • High-Speed direct link to current DPH location is disconnected. • Signoff that all Services provided by DPH have been successfully transitioned			testing and accepting the transition of the applications
M-14 (B)	DPH Transition Completed	24 months from Contract Effective	• Completion and acceptance of ALL applications transitioned from the DPH to new Datacenters which includes but is not limited to:	$5,000,000 per month or partial month	N	• Commonwealth review and approval of work product plus assisting in data gathering, planning,

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
		Date	o High availability, backup and DR are operational for identified systems. o CCPM contains specific details for apps transitioned are available in KMP. o Operations dashboards are in place to report immediately on status and alerts for transitioned apps. o Service Level agreements have been identified and supporting metrics in place. o System is operational for scheduling and tracking of ticket-based tasks and incidents. o System available to begin data collection in order to produce configuration, monitoring and management status reports. o Systems with DR plans have a replacement plan and test scheduled. o Operational support has been assumed and workloads migrated. o High-Speed direct link to current DPH location is disconnected. o Signoff that all Services provided by DPH have been successfully transitioned			ordering, implementing, testing and accepting the transition of the applications
M-15	EDC Operational Transition Completed	12/31/2014	• Completion and acceptance of operational control and support of the EDC which includes but is not limited to the following:	$100,000 per month or partial month	N	• Commonwealth review and approval of work product plus assisting in data gathering, planning,

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
			o Schedule K deliverable D-01 o Schedule K deliverable D-08.01 o Schedule K deliverable D-08.06 o Verification CMDB of record with Offeror's configuration info includes EDC assets and CI's o Service catalogs, processes, and procedures are transitioned o Multi environments/instances are available for identified systems o High availability, backup and DR are operational for identified system o CCPM specific details for applications are available in KMP. o Operations dashboards are in place to report immediately on status and alerts for apps o Service Level agreements have been identified and supporting metrics in place o System is operational for scheduling and tracking of ticket-based tasks and incidents o System is available to begin data collection in order to produce configuration, monitoring and management status reports o Transition orders completed and accepted by the Commonwealth			ordering, implementing, testing and accepting the transition of the applications
M-16	Department of Labor and Industry Datacenter	30 months from Contract	• Completion and acceptance of ALL applications transitioned from the DLI Datacenter to new Datacenters which	$5,000,000 One-time	N	• Commonwealth review and approval of work product plus assisting in data

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
	Transition Completed	Effective Date	includes but is not limited to the following: o Service catalogs, processes and procedures fully established, documented and approved o Multi environments and instances are fully functional for transitioned systems o High availability, backup and DR are operational for transitioned systems o CCPM contains specific details for apps transitioned are available in KMP o Operations dashboards are in place to report immediately on status and alerts for transitioned apps o Service Level agreements have been identified and supporting metrics in place o System is operational for scheduling and tracking of ticket-based tasks and incidents o System available to begin data collection in order to produce configuration, monitoring and management status reports o Transition orders completed and accepted by the Commonwealth			gathering, planning, ordering, implementing, testing and accepting the transition of the applications
M-17	Department of Revenue Datacenter Transition	30 months from Contract	• Completion and acceptance of ALL applications transitioned from the DOR Datacenter to new Datacenters which	$5,000,000 One-time	N	• Commonwealth review and approval of work product plus assisting in data

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
	Completed	Effective Date	includes but is not limited to the following: o Service catalogs, processes and procedures fully established, documented and approved o Multi environments and instances are fully functional for transitioned systems o High availability, backup and DR are operational for transitioned systems o CCPM contains specific details for applications transitioned are available in KMP o Operations dashboards are in place to report immediately on status and alerts for transitioned apps o Service Level agreements have been identified and supporting metrics in place o System is operational for scheduling and tracking of ticket-based tasks and incidents o System available to begin data collection in order to produce configuration, monitoring and management status reports o Transition orders completed and accepted by the Commonwealth			gathering, planning, ordering, implementing, testing and accepting the transition of the applications
M-18	Pennsylvania State Police Datacenter Transition	30 months from Contract	• Completion and acceptance of ALL applications transitioned from the PSP Datacenter to new Datacenters which	$5,000,000 One-time	N	• Commonwealth review and approval of work product plus assisting in data

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
	Completed	Effective Date	includes but is not limited to the following: o Service catalogs, processes and procedures fully established, documented and approved o Multi environments and instances are fully functional for transitioned systems o High availability, backup and DR are operational for transitioned systems o CCPM contains specific details for applications transitioned are available in KMP o Operations dashboards are in place to report immediately on status and alerts for transitioned apps o Service Level agreements have been identified and supporting metrics in place o System is operational for scheduling and tracking of ticket-based tasks and incidents o System available to begin data collection in order to produce configuration, monitoring and management status reports o Transition orders completed and accepted by the Commonwealth			gathering, planning, ordering, implementing, testing and accepting the transition of the applications
M-19	Department of Public Welfare Datacenter	30 months from Contract	• Completion and acceptance of ALL applications transitioned from the DPW Datacenter to new Datacenters which	$5,000,000 One-time	N	• Commonwealth review and approval of work product plus assisting in data

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
	Transition Completed	Effective Date	includes but is not limited to the following: o Service catalogs, processes and procedures fully established, documented and approved o Multi environments and instances are fully functional for transitioned systems o High availability, backup and DR are operational for transitioned systems o CCPM contains specific details for apps transitioned are available in KMP o Operations dashboards are in place to report immediately on status and alerts for transitioned apps o Service Level agreements have been identified and supporting metrics in place o System is operational for scheduling and tracking of ticket-based tasks and incidents o System available to begin data collection in order to produce configuration, monitoring and management status reports o Transition orders completed and accepted by the Commonwealth			gathering, planning, ordering, implementing, testing and accepting the transition of the applications

Milestone Number	Transition Milestone	Milestone Due Date	Acceptance Criteria	Milestone Credit	Earn Back	Dependency on Commonwealth
M-20	Department of Health Datacenter Transition Completed	30 months from Contract Effective Date	• Completion and acceptance of ALL applications transitioned from the DOH Datacenter to new Datacenters which includes but is not limited to the following: o Service catalogs, processes and procedures fully established, documented and approved o Multi environments and instances are fully functional for transitioned systems o High availability, backup and DR are operational for transitioned systems o CCPM contains specific details for apps transitioned are available in KMP o Operations dashboards are in place to report immediately on status and alerts for transitioned apps o Service Level agreements have been identified and supporting metrics in place o System is operational for scheduling and tracking of ticket-based tasks and incidents o System available to begin data collection in order to produce configuration, monitoring and management status reports o Transition orders completed and accepted by the Commonwealth	$5,000,000 One-time	N	• Commonwealth review and approval of work product plus assisting in data gathering, planning, ordering, implementing, testing and accepting the transition of the applications

UNISYS RESPONSE:

Transition milestones, including their timing, are documented in the Detailed Task Plan found in **Attachment 9 to Section 3.0 – Schedule M: Detailed Transition Plan.**

Schedule E

Offeror Datacenter Locations

This page intentionally left blank.

[The Offeror will list the address of proposed Datacenter locations that will host the Commonwealth's applications and data].

UNISYS RESPONSE:

Unisys [redacted]

- On the campus of [redacted]
- [redacted]
- Key data points:
  - Tier 3 equivalent facilities infrastructure with 2N+2 backup
  - Approximately [redacted] direct miles and [redacted] road miles between Harrisburg, Pennsylvania and [redacted]
  - Physical building security controls include 24x7 staffed guard stations and perimeter/interior video monitoring.
  - The Unisys area includes [redacted] square feet area supporting an active and protected electrical load up to 2.7 megawatts with a floor power density of 200 watts per square foot.
  - Floor space and power can be expanded.
  - Other [redacted] tenants occupy other buildings/vaults in this [redacted] building complex. Unisys occupies a private, secure, and fully isolated campus module.
  - The facility is accessible only by prior reservation or security clearance externally to the campus and through the facility's access-controlled passage ways via the security station and security doorways internally. Internal access without prior security clearance requires a security guard escort at all times
  - Availability report (on following page)

Month	Power	Cooling
Apr-12	100	100
May-12	100	100
Jun-12	100	100
Jul-12	100	100
Aug-12	100	100
Sep-12	100	100
Oct-12	100	100
Nov-12	100	100
Dec-12	100	100

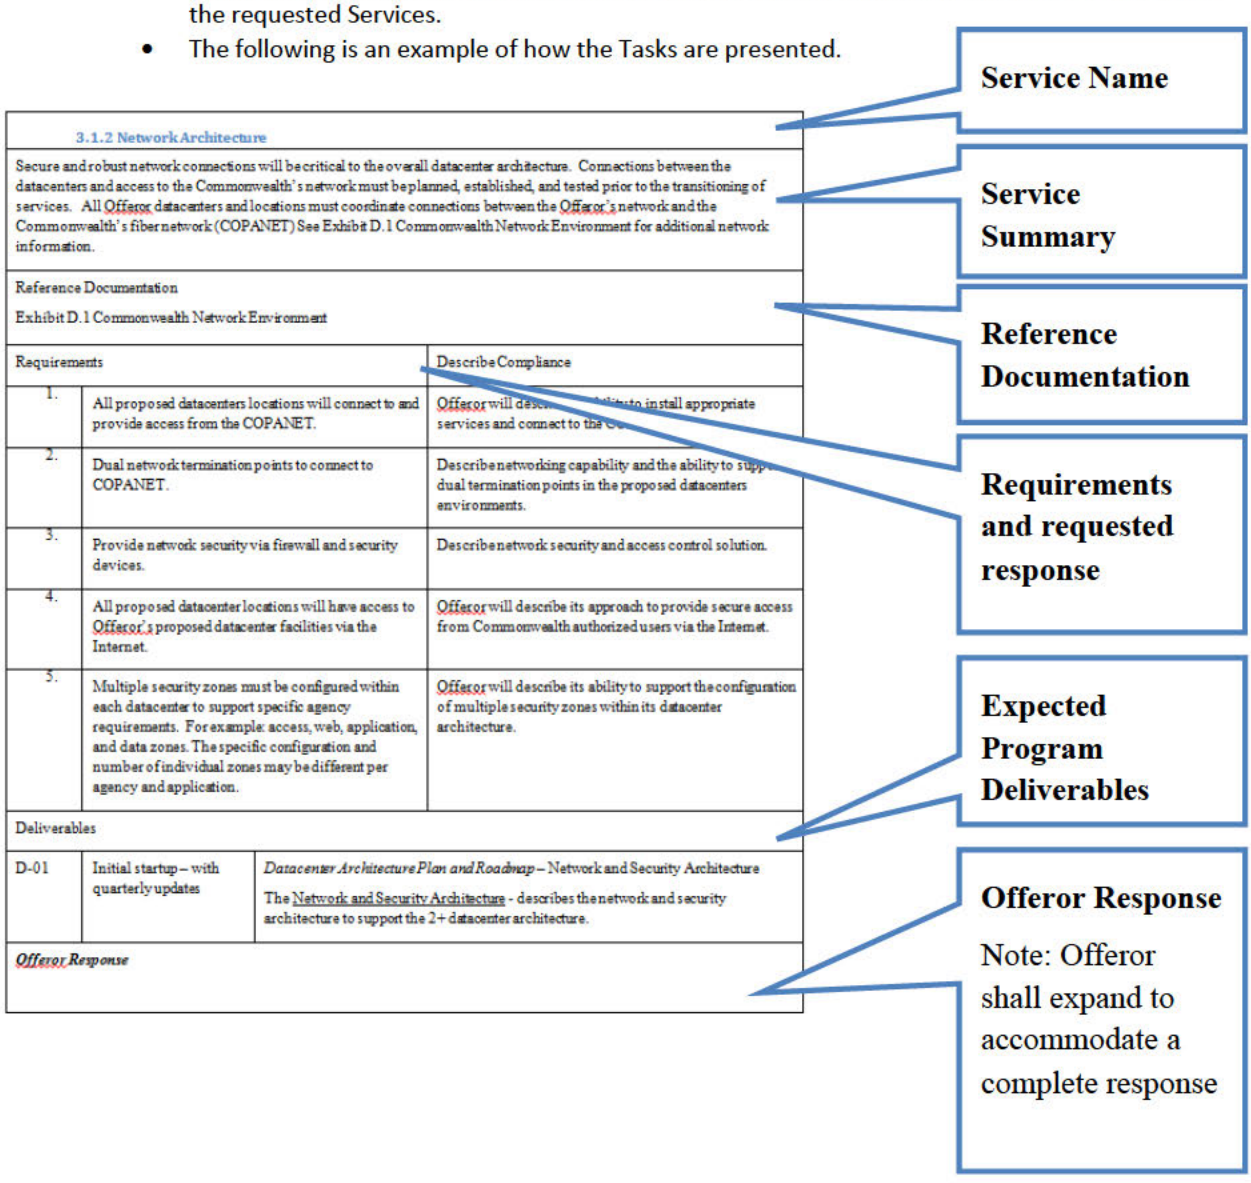
1 Offeror Guidelines

This Schedule contains the primary scope of Services required to support the Commonwealth's Enterprise Datacenter Services program. The Offeror must respond to the requirements contained in this Schedule according to the instructions provided below.

1.1 Offeror Instructions

- The Offeror's response to the RFP must reflect and comply with the information contained in this Schedule and any Referenced Schedules and Exhibits.
- The Offeror must provide responses to the section 3 Tasks. After reviewing each of the service requirement tables, the Offeror should provide its response. Responses must address the stated requirements as well the additional information on Offeror's approach and how it would deliver the requested Services.
- The following is an example of how the Tasks are presented.



3.1.2 Network Architecture		
Secure and robust network connections will be critical to the overall datacenter architecture. Connections between the datacenters and access to the Commonwealth's network must be planned, established, and tested prior to the transitioning of services. All Offeror datacenters and locations must coordinate connections between the Offeror's network and the Commonwealth's fiber network (COPANET) See Exhibit D.1 Commonwealth Network Environment for additional network information.		
Reference Documentation Exhibit D.1 Commonwealth Network Environment		
Requirements		Describe Compliance
1.	All proposed datacenters locations will connect to and provide access from the COPANET.	Offeror will desc… ability to install appropriate services and connect to the C…
2.	Dual network termination points to connect to COPANET.	Describe networking capability and the ability to supp… dual termination points in the proposed datacenters environments.
3.	Provide network security via firewall and security devices.	Describe network security and access control solution.
4.	All proposed datacenter locations will have access to Offeror's proposed datacenter facilities via the Internet.	Offeror will describe its approach to provide secure access from Commonwealth authorized users via the Internet.
5.	Multiple security zones must be configured within each datacenter to support specific agency requirements. For example: access, web, application, and data zones. The specific configuration and number of individual zones may be different per agency and application.	Offeror will describe its ability to support the configuration of multiple security zones within its datacenter architecture.
Deliverables		
D-01	Initial startup – with quarterly updates	*Datacenter Architecture Plan and Roadmap* – Network and Security Architecture The Network and Security Architecture - describes the network and security architecture to support the 2+ datacenter architecture.
Offeror Response		

2 Program Objectives and Summary Solution Requirements

2.1 Program Objectives

The Commonwealth is seeking to implement a new datacenter service model that will provide various infrastructures/computing platforms to service the needs of the Commonwealth in a secure and flexible manner. This initiative will realize the following objectives:

- Provide a reliable, flexible, secure, and robust IT infrastructure to support the transformation of the Commonwealth into an information-focused organization.
- Provide a multiple datacenter architecture utilizing the Offeror's proposed datacenter assets that will support the current and future capacity and service level demands.
- Include primary support for the Commonwealth's Enterprise Datacenter ([redacted] operations and its computing assets including but not limited to datacenter facilities operations and infrastructure support (see **Exhibits D.1 through D.7** [redacted] Exhibits for description of the facility, servers, storage and tape equipment).
- Leverage Offeror's established processes and tools necessary to ensure consistent and predictable pricing to facilitate accurate and timely budget projections.
- Provide engineering support that will anticipate changes in business and technical requirements and make recommendations for staying current with industry best practices.
- Ensure that the Offeror's datacenters adhere to the Commonwealth's contractual, regulatory, and policy compliance requirements for security, architecture, and systems development life cycle (SDLC) standards.
- Establish a tiered service/capability to support high-availability hosting, backup, and disaster recovery (DR) Services to maintain continuity of government operations.
- Provide multiple environments and instances to support the enterprise application portfolio. For example; Development, Integration, System / User Acceptance Test (SAT/UAT), Training, load Testing, Pre-Production and Production.
- Continue to consolidate Commonwealth datacenters to achieve cost savings, energy consumption reductions, optimal space utilization, and improvements in IT asset utilization in accordance with the government-wide datacenter consolidation initiative currently underway.

Currently, Commonwealth datacenter resources are decentralized, owned and operated under multiple datacenter service catalogs, processes and procedures. At times, this presents the Commonwealth with barriers to establishing interoperability between datacenters, implementing standard processes and procedures for datacenter oversight, and ensuring compliance with the same standards for datacenter operations. To resolve these issues, the Commonwealth intends, under this single procurement vehicle, to contract with a service provider that currently owns,

maintains and operates a group of geographically dispersed world-class datacenters (meeting or exceeding Tier 3 standards) located in the continental United States.

To satisfy the Commonwealth diverse datacenter requirements, the Offeror must be capable of providing the necessary infrastructure for the following critical purposes:

- Provide production, development and hosting of new and legacy business applications and databases that run on mainframes (IBM and Unisys), mid-ranges and distributed platforms
- Support options for high-availability, backup/recovery, and multiple levels of DR Services in support of the Commonwealth.

The Offeror's datacenter architecture must consist of multiple geographically dispersed datacenters, referred below as a 2+ (two-plus) architecture. The Offeror must utilize the [redacted] as one of its datacenters and propose a minimum of one additional datacenter to meet the 2+ architecture requirement. It is the Offeror's option to utilize the [redacted] as one of its primary datacenters within its proposed solution. It is the Commonwealth's requirement that the Offeror datacenters will have the ability to provide multiple levels of DR Services in the event of a disaster, which must also include an option to support high availability (HA) application infrastructures.

The Offeror is responsible for ensuring successful delivery of IT infrastructure Services, providing the Commonwealth with visibility into (performance, capacity, security, SLA's etc.), as well as, working in partnership with the Commonwealth as required to ensure seamless operations. In turn, the Commonwealth's role will be to provide oversight to ensure that the Offeror is delivering agreed-upon Services and that the business requirements are clearly communicated and satisfied, and provide timely feedback on contractor performance. Commonwealth agencies, OA/OIT and the Offeror will work together on IT planning, including service and capacity planning, strategic and tactical planning, and IT resource and budget planning. The Commonwealth believes that this combination of industry knowledge, government oversight, and collaboration will result in successful partnership between the private sector and the Commonwealth.

The datacenter approach must provide a computing infrastructure that delivers reliable, effective and technologically current Services seamlessly to the Commonwealth in a cost-effective manner. The cost for those Services must remain less than the cost the Commonwealth would have incurred for providing the same infrastructure itself. Applications hosted in the Offeror's datacenters must meet Quality of Service (QoS) requirements as determined by the Commonwealth agency application owners. The Commonwealth will avoid capital expenditure by acquiring Services through Capacity on Demand. The Commonwealth agencies will consume resources as a service and pay only for those resources that it uses. The Commonwealth and Offeror must engage in proactive oversight of datacenter operations. The Commonwealth requires visibility into the Offeror's management practices and effective monitoring channels that include the following:

- Program and project progress reports that track milestones, deliverables, risks, and financial data.
- Commonwealth Computing Procedures Manual (CCPM) that provides up-to-date detailed description of all processes and procedures used to support the computing needs of the Commonwealth via the Offeror's Knowledge/Service Management Portal (KMP). The CCPM must contain specific sections dedicated to the operational procedures for each Commonwealth datacenter customer.
- Scheduling and tracking of ticket-based tasks and incidents.
- Operations dashboards with status and alerts based on real-time and historic data collected by instruments, agents, scanners, and logs that monitor the hosted applications, batch operations, network, security, and service performance measures.
- Other configuration, monitoring and management status reports as needed.
- Recommendations and offerings by the Offeror for improved processes and procedures for delivery of Services that are based on a program of continuous quality and process improvement as implemented by the Offeror.

2.2 Service Level Agreements

The Commonwealth has proposed a baseline set of Service Levels which the Offeror is required to consider when developing its proposed solution. The Offeror is expected to provide multiple service tiers and associated service levels within each service offered. The Offeror is also required to have or implement a quality and process improvement program that focuses not on just meeting minimum requirements but on meeting or exceeding the target requirements.

2.3 Target Solution Requirements Overview

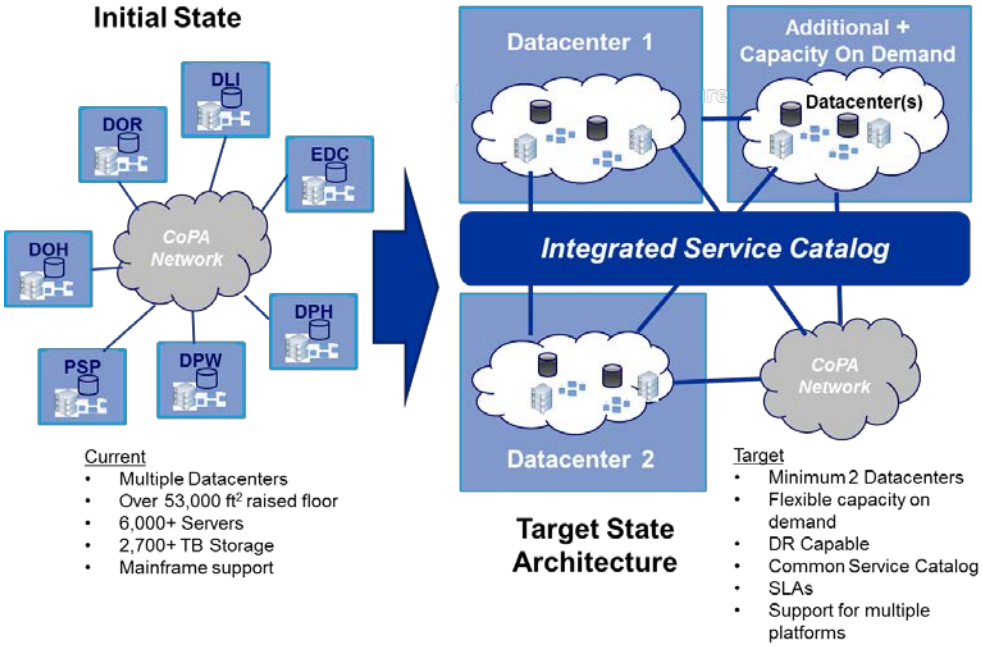
A key outcome of the Commonwealth datacenter strategy is to transition from the current individually managed datacenters with different levels of service to enterprise level datacenter architecture with a common set of basic Services combined with available specialized Services dependent upon specific customer requirements. To facilitate this request for Services, the Commonwealth has structured the solution requirements into three areas, as follows:

- Transition Services;
- Target Datacenter 2+ Architecture (includes operations support for the Commonwealth's [redacted] and
- Common Services Portfolio

2.3.1 Target Datacenter 2+ Architecture

The target architecture must leverage a minimum of two geographically separated datacenters located in the continental United States that would allow for enhanced disaster recovery capabilities as well as leverage excess capacity (virtual capacity on demand). The Commonwealth requires that the architecture include operations support for the [redacted] The Offeror must explain how it can leverage additional capacity from other datacenter resources within its provider network to satisfy the needs of the Commonwealth. The architecture will

include support for multiple computing platforms including but not limited to x86 (physical and virtual), midrange, mainframes, and storage systems. All of the Commonwealth computing workloads must be transitioned from the current state to the new target state architecture.



The 2+ datacenter architecture must include secure redundant network connections to the Commonwealth's network and the Internet. Offeror network connections must terminate at different end points within the Commonwealth's network. The Offeror is expected to implement a multi DR solution to limit the impact of any disruptive event at any datacenter location. This requirement is targeted for all systems that are currently covered by a DR solution. The solution must also have the capability to support future disaster recovery requirements by providing tiered DR capability within its datacenters.

Each datacenter must have the ability to support multiple security and network zones to support specific agency requirements. For example: access, web, application, and data zones. The specific configuration and number of individual zones may be different per agency and application.

To support the potential of future demand and Services beyond the capacity of the two datacenters, the Offeror must explain how it can leverage additional capacity from other datacenter resources within its provider network.

2.3.2 IP conversion strategy

The Offeror shall provide an IPv6 strategy which includes an enterprise migration plan to take the Commonwealth from the IPv4 address format to the IPv6 format.

The Offeror shall provide an infrastructure and equipment that supports IPv6 andIPv4, except were limited due to the requirement that the Initial transition approach of the Commonwealth's

mainframe and SAP environments must be as close to the Commonwealth's current configuration as possible. As technology refreshes replace this equipment, the infrastructure and equipment shall support IPv6 andIPv4

2.3.3 Common Services Portfolio

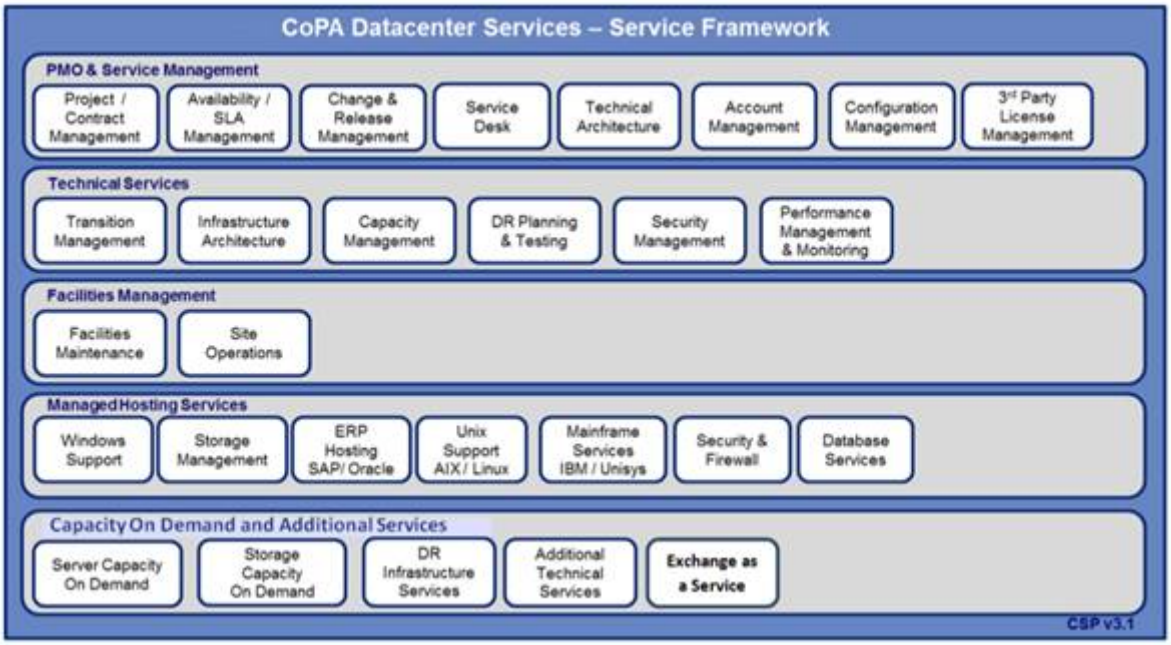
Based on the review of current and future requirements as well as industry offered Services; the following five (5) Key Services Areas will be used as a framework for the new datacenter common portfolio of Services.

Key Service Area Framework

	Key Service Area	Service Overview
1	Program Management Office (PMO) & Service Management	Provides for overall project management and operational service management (e.g. PMO, Account, Availability, Service Level Agreement (SLA))
2	Technical Services	Technical support services resources (e.g. Transition Management, Infrastructure Architecture, Capacity Planning)
3	Facilities Management	Facility operational support services (e.g. Facility Management, Operations Support)
4	Managed Hosting Services	Managed hosting/platform services for existing and future applications (e.g. Windows, Unix, SAP Hosting, Mainframe)
5	Capacity on Demand and Additional Services	Provides for additional capacity on demand offerings to support disaster recovery or increased demand for server and storage infrastructure (e.g. Cloud-centric offerings, Infrastructure as a Service (IaaS), Platform as a Service (PaaS)). Also access to additional skilled technology resources if required.

The Offeror is required to provide a complete set of Services within these service areas. The anticipated target Services are presented below and the requirements are further detailed in the Task section that follows.

Expanded Services Framework



2.3.4 Data Protection

The Offerors solution shall provide security of Commonwealth data. Offerors shall describe how they will ensure that all data (at rest and in transit) is kept secure and confidential. If Offerors proposed solution involves data residing or routing outside the continental United States; the Offeror shall disclose this in their proposal and describe how the data will be kept secure, confidential, and meet the security requirements as described in this RFP.

Offeror shall provide data protection Services including Data Loss Prevention (DLP) and Database Firewall (DBFW) Services to identify, monitor and protect sensitive and confidential Citizen Personal Identifiable Information (PII) in use, data in transit, and data at rest through deep content inspection and analysis of information exchange both at data storage locations and administrative/access endpoints.

Reference Documentation

Requirements		Describe Compliance
1.	DLP • Discover confidential data wherever it is stored, inventory sensitive data, and automatically manage data cleanup. • Monitor confidential data usage and provide enterprise visibility. • Enforce security policies to proactively secure data and prevent confidential data from leaving Commonwealth systems. • Manage policies across the enterprise, remediate and report on incidents, and detect content from centralized management platform.	Offeror must describe their approach to discover, manage, monitor, and enforce security for confidential data to meet Data Loss Prevention requirements.
2.	DBFW • Alert or block database attacks and abnormal access requests, in real time to protect against database attacks including SQL injection, Buffer overflow, Denial of Service. • Detect and patch database software vulnerabilities • Provide both agent based and network based database activity monitoring. • Audit all access to sensitive data by privileged and application users, and enforce corporate policies on data usage • Provide centralized management and advanced analytics • Discover new databases and database objects in scope for security and compliance projects and automatically apply appropriate protection and audit policies	Offeror must describe their approach to alert, detect, audit, monitor, manage, and discover attacks to meet Database Firewall requirements.
Deliverables		
Deliverables are defined in **Schedule K – Key Program Deliverables**		

Offeror Response

Introduction

"The wealth of personally identifiable information (PII) and sensitive business data makes states attractive targets for cybercriminals and hacktivists." – 2012 Deloitte-NASCIO cybersecurity study.

The Unisys team understands the importance that the Commonwealth places on safeguarding the privacy of and confidentiality of the Personally Identifiable Information (PII) entrusted by the Commonwealth's residents. Using our experience providing security and privacy services for over 12 years, the Unisys team will help the Commonwealth establish a data protection program that addresses evolving cyber threats.

State Government agencies hold a comprehensive repository of citizen PII, medical, and financial data. When such data is lost, it can spur citizen outrage, mistrust and attract media attention. Today's increasingly connected State Government IT infrastructure is under constant threat of unauthorized access or disclosure of sensitive data and attacks originating from cyber-criminal groups and hackers. This is evident from the recent data breach incidents in the State of South Carolina and in the State of Utah.

The dynamic evolution of the cybersecurity regulatory reforms, introduction of Health Information Exchanges (HIE) and Health Insurance Exchanges (HIX), and the use of electronic citizen data for online transactions presents significant pressure on the Commonwealth to address the ever-mounting security and privacy challenges. Further compounding this environment is the urgent need to address cyber security in order to mitigate the threat of disruption to the Commonwealth's operations and services. Citizen and business partner data, critical cyber infrastructure, and even national security can be compromised by deliberate attacks, cyber-wrongdoing, inadvertent security lapses, fraud and new vulnerabilities.

The Unisys team uses its time-tested **privacy and data protection methodology** to help the Commonwealth adopt an enterprise data protection program that robustly secures and keeps Commonwealth data confidential. Our solution uses both Data Loss Prevention (DLP) and Database Firewall (DBFW) to appropriately identify, monitor and protect sensitive and confidential citizen PII in use, data in transit, and data at rest at the data storage server locations and data center egress points. Our solution does not involve data residing or routing outside the continental United States. The Unisys team's solution focuses on both the technological solution and the "people and process" to support and interface with the technology solution, as illustrated in **Figure 2.3.4-1**:

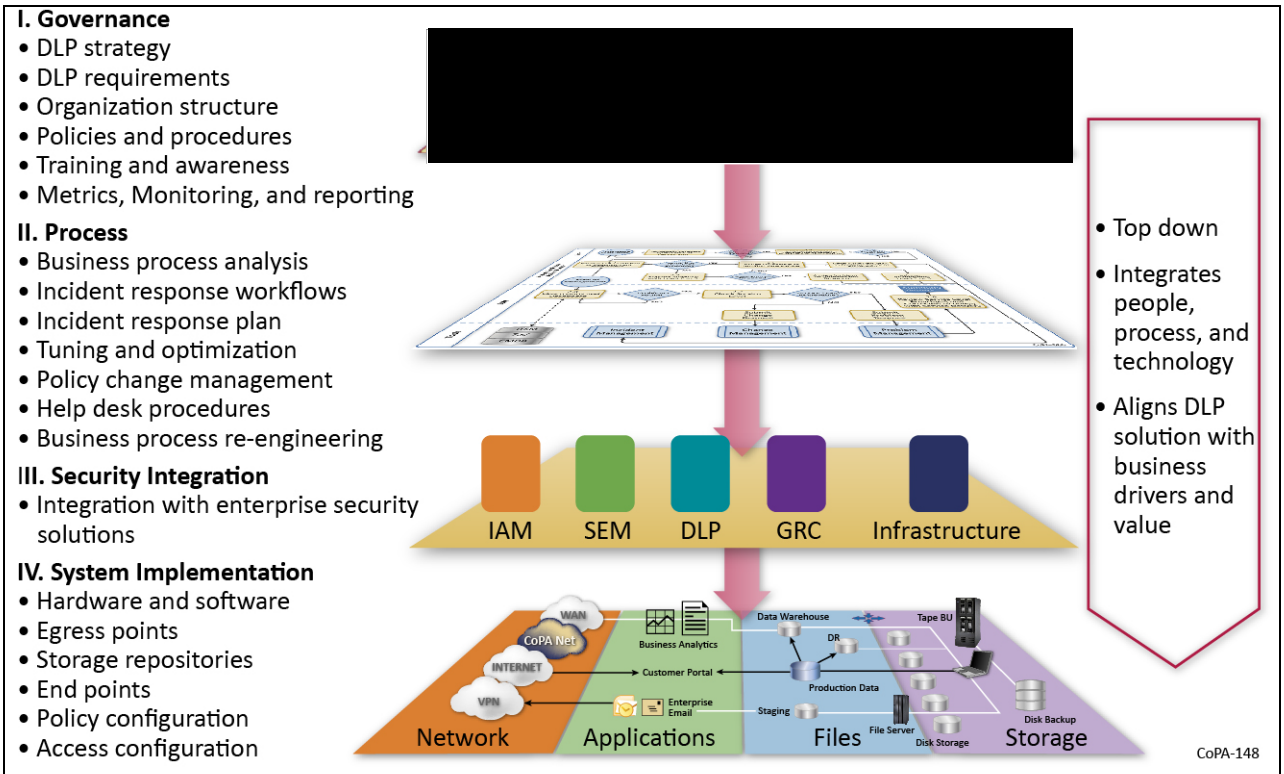


Figure 2.3.4-1. The Unisys Team's Holistic DLP Approach

Our Approach

The Unisys team has tailored its data protection methodology to meet the Commonwealth's data protection needs of preventing inappropriate storage, use, sharing, and transfer of confidential information through the design and implementation of data loss prevention and Web Application and Database firewall solutions. In the following sections, we have outlined our approach to designing a target architecture and outlining hardware and software requirements, developing an implementation plan for incremental roll-out, and implementing data at rest, data in motion, and data in use components including configuration, installation, and administration of DLP and DB firewalls.

1 DLP

1A Discover confidential data wherever it is stored, inventory sensitive data, and automatically manage data cleanup.

The first step in our DLP implementation process is **Scope and Plan**. The Unisys Team works with the Commonwealth and data center stakeholders to define the DLP requirements including business and technical requirements, sensitive data definition and network and storage details for databases. The Team also identifies the data server storage and the solution hosting environment. Then the team identifies the data center network infrastructure end points and egress points that handle confidential data.

Next, the second step in our process, **Discover and Classify Data**, begins. This step occurs during the transition phase of the contract. Confidential data is discovered during transition as part of the development of the initial security plan. We perform data discovery and data

classification assessment to indicate level of sensitivity of Commonwealth's PII and identify presence of PII data at rest. This step includes the following activities – Data classification and Data discovery, as detailed below:

- ***Activity 1 – Data Classification:*** We conduct and facilitate five workshops with the Commonwealth stakeholders to define a data classification standard for the Commonwealth's Personally Identifiable Information (PII), based on sensitivity of PII. For example, some of the categories include:
  - Special handling PII (that contains SSN, driver license number, FEIN, and Medicare ID)
  - Protected Health Information
  - Individual information
  - Sensitive PII (such as racial/ethnic origin, religious/philosophical beliefs, Trade-union membership and criminal convictions).
- ***Activity 2 – Data Discovery:*** We perform an assessment using the Symantec Data Loss Prevention (DLP) solution's data discovery tool on the Commonwealth selected data center IT infrastructure consisting of servers and databases to identify the PII data at rest. We perform the following tasks as part of this activity:
  - Document the results of the data discovery assessment in the IT asset inventory (inventory of sensitive data)
  - Use the data center security risk framework to identify appropriate data encryption requirements to appropriately protect the PII data and meet the relevant regulations, policies and standards.

The third step in our DLP Implementation Process is **Assess Data Loss Threats**. In this step, we identify the high risk infrastructure within the COPA network. We work with the Commonwealth and data center stakeholders to identify the IT infrastructure, locations, and business units that present the most risk to the Commonwealth (handling PII). We use the initial security plan/security management plan to identify the regulatory requirements, technical, operational, and other requirements for data protection solution functionality and processes to mitigate the risks identified.

The next step in our Process is **Define Data Protection Governance.** We collaborate with the Commonwealth and data center stakeholders to develop a governance model that will define required roles, responsibilities, and processes necessary to manage the data protection program effectively through its life cycle. The governance model will include:

- Identification of high risk infrastructure
- Personnel roles and responsibilities
- Solution configuration and maintenance
- Reporting and alerting procedures
- Training and awareness plan
- Key metrics for monitoring and reporting, and automatic data cleanup and data retention requirements.

1B Monitor confidential data usage and provide enterprise visibility.

The next step in our Process is **Design DLP Solution and Assess Infrastructure Readiness.** The Unisys team works with key Commonwealth stakeholder and the Unisys information security manager to assess infrastructure readiness for the rollout of the data protection program. This activity involves:

- Reviewing the data storage inventory of Citizen PII
- Identifying the critical infrastructure to support pilot rollout and identify readiness to support enterprise rollout
- Prioritizing data protection solution implementation within the Commonwealth defined data center migration groups
- Designing the network DLP solution on data center egress points in the Commonwealth's Enterprise Data Center environments
- Identifying the critical data storage server locations that requires periodic data at rest monitoring using the data discovery solution
- Identifying network DLP policies to monitor confidential data usage and provide enterprise visibility.

Once the appropriate DLP policies have been defined, they are implemented in the next two steps. Enterprise visibility is provided through the Security Incident and Event Monitoring (SIEM) tool during the Monitoring and Maintenance phase of the DLP Implementation Process.

1C Enforce security policies to proactively secure data and prevent confidential data from leaving Commonwealth systems.

In step 6, **Configure and Deploy pilot DLP solution**, Unisys works with the Commonwealth key stakeholders and the Unisys information security manager to establish and operationalize a pilot implementation plan for configuration and implementation of Symantec network DLP solution on one egress point. We implement five standard (out-of-the-box) network DLP policies selected by the Commonwealth as part of the pilot implementation. Once the pilot has run successfully, Step 7, **Configure and Deploy Enterprise DLP solution,** rolls out the DLP to the Commonwealth Enterprise. The Unisys team again works with the Commonwealth stakeholders and the Unisys information security manager to install and configure Symantec network DLP solution (using standard out-of-the-box policies) on the data center egress points, selected by the Commonwealth. These policies represent the security policies that are enforced by the DLP solution to proactively secure data and prevent confidential data from leaving Commonwealth systems.

1D Manage policies across the enterprise, remediate and report on incidents, and detect content from centralized management platform.

The 8th and last step of the DLP Implementation Process is a phase. During the **Maintain and Monitor** phase, Unisys staff maintains and monitors the operation of the DLP solution on an ongoing basis, including configuring the solution on additional egress points and managing and updating network DLP policies as necessary for the Enterprise. Unisys uses the DLP to prevent inappropriate storage, use, sharing, and transfer of confidential information. The DLP appliance outputs data to the SIEM tool for data correlation and centralized reporting. The SIEM, a centralized management platform, allows Unisys security staff to detect, report, and remediate data loss incidents.

1E Offeror must describe their approach to discover, manage, monitor, and enforce security for confidential data to meet Data Loss Prevention requirements.

The Unisys Team approach to discover, manage, monitor, and enforce security for confidential data to meet Data Loss Prevention requirements is detailed above in response to requirements 1.A – 1.D.

2 DBFW

2.A Alert or block database attacks and abnormal access requests, in real time to protect against database attacks including SQL injection, Buffer overflow, Denial of Service.

The Database Firewall (DBFW) Implementation Process is very similar to the DLP Implementation process. The first step in our Database Firewall (DBFW) Implementation Process is **Scope and Plan.** As in the DLP Implementation Process, the Unisys team works with the Commonwealth stakeholders and the designated information security manager to define the DBFW requirements, including business and technical requirements, sensitive data definition and network and storage details for databases. We identify the data server storage and solution hosting environment. The team also identifies the data center network infrastructure end points and egress points that handle confidential data.

The second step in our Database Firewall (DBFW) Implementation Process is **Design DBFW solution**. In this step, the Unisys team works with the Commonwealth stakeholders to identify the database instances that require the periodic/continuous monitoring using the DBFW solution including automatic detection of new databases within that instance. We identify and define the standard (out of the box) and complex DBFW policies to help alert or block database attacks and abnormal access requests and help protect against database attacks such as SQL injection, buffer overflow and denial of service. Next, our team identifies the critical infrastructure to support a pilot rollout of the DBFW solution and identifies readiness to support enterprise rollout. We define a pilot implementation plan to configure and implement the DBFW solution on three critical database instances. We also define an enterprise rollout plan to configure and implement DBFW solution implementation on the data center standard Oracle, Microsoft SQL Server, MySQL and IBM DB2 databases (selected by the Commonwealth).

In the next step, **Implement and Configure**, the Unisys team installs, configures and tests the data protection solution (using standard out-of-the-box policies) as part of the pilot and then the enterprise implementation to support DBFW solution on databases selected by the Commonwealth.

The last step, **Monitor and Maintain**, is the phase where Unisys staff maintains and monitors the operation of the DBFW solution on an ongoing basis, including configuring the solution on additional critical database instances and updating DBFW policies as necessary. Unisys uses the DBFW solution to alert and block database attacks and abnormal access requests. The DBFW solution outputs data to the SIEM tool for data correlation and centralized reporting.

Features of our solution:

- Continuous audit of all access to sensitive data by privileged and application users
- Alert on abnormal access requests and database attacks, in real time

- Accelerated incident response and forensic investigation through centralized management and advanced analytics
- Audit reports produced to demonstrate compliance with regulatory requirements.
- Databases and objects in scope for Compliance and Security Projects identified

2.B Detect and patch database software vulnerabilities.

The Unisys security team uses the DBFW solution to configure and enable standard database vulnerability detection rules/policies. These database vulnerability signatures are based on the vendor provided knowledge base that will be kept up-to-date by the Unisys security team.

Identifying and blocking potential database vulnerability exploit attempt: Using the updated database vulnerability signatures, the DBFW solution rules/policies identify and block potential exploit attempts. This helps in preventing potential exploitation of recently released database vulnerability signatures.

Patch management: In addition to the above described approach to use the DBFW to block potential database vulnerability exploits, we will notify the Commonwealth Chief Information Security Officer and the system owner and work with them to identify a patch for the impacted database system. The team will work will the Commonwealth to develop a mitigation plan and using the existing data center change management process, the database software will be patched to address the vulnerability (after the patch is provided by the database vendor and tested in a lower environment). As necessary, the Unisys security team will develop custom rules to prevent these vulnerabilities from reoccurring.

2.C Provide both agent based and network based database activity monitoring.

The Unisys team's DBFW solution provides both agent based and network based database activity monitoring. Our solution uniquely enables us to optimize our database activity monitoring implementation by combining agent-based monitoring and network activity monitoring. The database agents can be configured for monitoring local privileged activity exclusively, or for monitoring all database activity. This hybrid architecture provides the ability to perform comprehensive database auditing. The Unisys team works with the Commonwealth for the following scenarios:

- ***Privileged activity monitoring***: the database appliance monitors network activity and the agent is configured to monitor only local, privileged activity. This configuration provides complete coverage of all paths to the databases with minimal impact on the database server.
- ***Full agent-based monitoring***: the agent is configured to monitor database activity regardless of its source (network and local, privileged activity).This configuration is typically used when an appliance cannot be deployed in front of the database.

2.D Audit all access to sensitive data by privileged and application users, and enforce corporate policies on data usage.

The DBFW solution monitors and maintains an audit log of database operations (protected by the DBFW solution). We will use the following approach to help audit access to Commonwealth data and maintain a data usage policy:

- ***Data classification***: As part of the initial security plan described in the Security Transition section 3.3.2.2, the Unisys team will discover and classify PII data on Commonwealth agency systems. Once identified and tagged based on PII sensitivity, we will work with the Commonwealth to establish DBFW rules/policies for Commonwealth prioritized PII sensitivity types.
- ***Data access patterns***: The Unisys team uses the DBFW solution's standard out-of-the-box functionality to identify user access patterns to data. This helps establish a baseline of user activity for database operations including: Data Manipulation Language (DML), Data Definition Language (DDL) and Data Control Language (DCL) and usage of stored procedures.
- ***Detect potential data access violations***: The Unisys team uses the above described DBFW solution's standard out-of-the-box-functionality to configure and enable appropriate rules/policies to help detect potential data access violations to Commonwealth PII. In addition, the DBFW rules can help detect users performing unauthorized requests to the database and help disabling those users' access to the database.
- ***Reporting***: The Unisys team uses the DBFW solution's standard out-of-the-box functionality along with integration with SIEM solution to generate periodic reports to help monitor and review user access to data. In addition, we submit these reports as part of our monthly firewall logs to the Commonwealth.

2.E Provide centralized management and advanced analytics.

The DBFW solution monitors and maintains an audit log of the allowable database operations (those defined as allowable by the DBFW solution). Using the DBFW solution's standard, out-of-the-box DBFW solution capability, we are able to identify the following key parameters for a database operation:

- User performing the action
- Timestamp
- Database table accessed
- Database query/operation executed

Additionally, the DBFW audit logs will be integrated with the data center's SIEM solution. Using the standard out-of-the-box DBFW capability and SIEM solution, Unisys staff use data correlation techniques to perform analytics for discovering and responding to potential attacks against Commonwealth databases. This approach will help the Commonwealth to accelerate incident response and forensic investigation procedures.

2.F Discover new databases and database objects in scope for security and compliance projects and automatically apply appropriate protection and audit policies.

The Unisys team will use the DBFW solution along with the DLP solution's data discovery capability to discover identify new databases and database objects. We will work with the Commonwealth to identify the appropriate regulatory compliance requirements and the appropriate DBFW solution rules/policies for the newly identified databases and the database objects. The DBFW solution's identified standard out-of-the-box rules/policies will enable us to maintain the appropriate database protection measures.

2.G Offeror must describe their approach to alert, detect, audit, monitor, manage, and discover attacks to meet Database Firewall requirements.

The Unisys Team approach to alert, detect, audit, monitor, manage, and discover attacks to meet Database Firewall requirements is detailed above in response to requirements 2.A – 2.F.

Additional Solutions to Protect Data-in-Motion and Data-at-Rest

The Commonwealth also has access to the Unisys Stealth Solution and Data-at-Rest protection through the Enterprise Services Catalog.

The Unisys Stealth Solution™ renders users, data, and infrastructure undetectable to cyber criminals. Built to meet requirements of the U.S. Department of Defense to secure sensitive information, Unisys Stealth achieved the National Security Agency's National Information Assurance Partnership Common Criteria EAL-4+ certification; protecting data-in-motion across any network regardless if it is private or public.

Benefits of Unisys Stealth Solution include:

- Renders data, users, and sensitive data center dark to the outside world
- Securely protects the user, network, and data center
- Unprecedented security without an expensive reconfiguring of the network

Unisys also offers additional protection for stored data using encryption keys that are managed through a centralized key management process.

Benefits of Encrypting Data-at-Rest include:

- Minimizing the risk of loss or breach of sensitive information
- Encrypting sensitive stored data helps facilitate compliance with regulatory standards such as HIPAA.

Unisys Team Experience

The Unisys team's history demonstrates our commitment to providing our clients with leading security and privacy solutions. Our partner Deloitte's Security and Privacy Services practice, which consists of over 1,000 professionals in the United States, has been assisting clients with data protection strategy, and solution implementations, including technology integration (e.g., DLP, SIEM, IAM, Cyber Threat Intelligence, etc.) for many years.

Client	Project Description
Microsoft Corporation	Background: Microsoft is the worldwide leader in software, services and solutions that help people and businesses realize their full potential. Objectives: The Unisys team's objectives included: • Implementing a solution that meets the Payment Card Industry (PCI) data protection requirements • Identifying and protecting Microsoft's Intellectual Property data that includes source code, strategic plans, operational information

	• Performing a data discovery on 30,000 file shares, 12 terabytes of data and more than 120,000 SharePoint sites. Solution: The Unisys team's data protection solution leveraged the RSA DLP End Point to automatically provision and grid scan target systems. Benefits: The benefits obtained by Microsoft include • Highly scalable solution allowing rapid scanning • Better understanding of the location of high impact business information • Highly accurate results requiring far less manual intervention.
Accor North America	Background: Operator of 1,400+ hotel properties in U.S., Canada, and Mexico Objectives: The scope of work required The Unisys team to implement a data protection mechanism that that meets the Payment Card Industry (PCI) Data Security Standard on the several of the client's applications that processes PCI information. Solution: The Unisys team data protection solution implementation included: • Encryption of data at the point of capture to protect it at-rest and in-flight • Usage of RSA Key Manager and Application Security Manager to add encryption capabilities to core applications (Web and phone reservation systems, hotel point-of-sale) and manage encryption keys Benefits: The Unisys team's tailored approach helped the client rapidly implement encryption of customer data at the earliest point possible, in addition to securely managing the encryption keys. The RSA Key Manager architecture was designed to operate even when network connectivity is disrupted.

Benefits to the Commonwealth

Our consistent performance as a leader in security and privacy is a differentiator for us and of clear value for the Commonwealth. The Unisys team provides advisory and implementation services that focus on solving client needs from a business perspective. We bring a number of important attributes to this initiative:

- A Leading Security & Privacy Practice. Our national **Center for Security & Privacy Solutions** (Center) focuses on methodology development, thought leadership, subject matter specialists, leading-edge tools, and continuous monitoring of changing laws and regulations.
- Experienced team. The proposed team members have significant experience related to privacy, information security, and technology integration with the tools and processes related to data protection including Data Loss Prevention and Database Firewall.
- Broad industry experience. We possess deep knowledge of the state government sector and have worked successfully with the many state governments to help improve their security posture.

Our proven data protection methodologies, extensive experience in the federal and state government sectors, and seasoned security experts will result in an improved security posture for CoPA.

2.3.4 Transition Services

Transition to the new baseline datacenter architecture and common Services portfolio must be carefully planned and executed. The Offeror is required to provide a proven methodology and plan to establish the target environment and then conduct an orderly transition of existing infrastructure and Services to the new environment.

The Offeror must transition Services from the incumbent contractor where there is an incumbent contractor, as well as, transitioning Services located at the Commonwealth managed datacenters. The Offeror must identify critical success factors and risk mitigation strategies, and describe how it will coordinate and manage other Commonwealth contractor related activities impacting the Offeror's plan. The Offeror must provide an estimate of any required Commonwealth resources, including the skills needed and the duration required for each of the resources required in order for the Offeror to implement its solution. The Commonwealth expects to provide limited resources.

The Offeror must thoroughly plan, evaluate and propose comprehensive and realistic activities and timeframes for accomplishment of transition activities given identified parameters within the Commonwealth's requirements as described in Schedule K - Key Program Deliverables and Schedule D - Transition Milestones.

3 Tasks

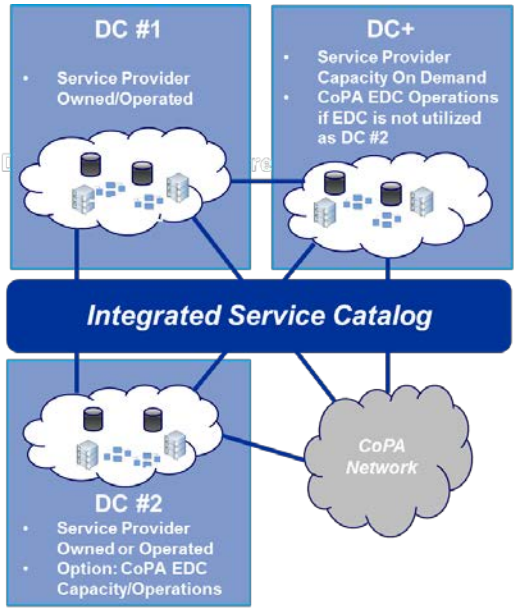
The Commonwealth has provided detailed information on the current environment for computing (mainframe, mid-range, x86, etc.), data storage, data backup (tape and other) and other datacenter related equipment in the referenced Exhibits. The Offeror shall utilize this information as the baseline requirement (in terms of Services, quantities and bandwidth) for developing its proposal.

3.1 Establish Datacenter Architecture

The Offeror must provide a multi-datacenter, multi-platform solution that will support the migration of all of the Commonwealth's current workloads. In order to support future Services, the Offeror must develop a proposal which will lead the Commonwealth into the future, and be able to address all current and future datacenter requirements. The Offeror must propose cost-effective, efficient, and forward-looking technologies for integrating Services and incorporate these technologies into its proposal. The Offeror must also address how it will allow for service updates and new technology offerings. The Offeror must describe how it will perform sizing exercises for different infrastructure to ensure the Commonwealth is getting a minimum of "like for like" or increased computing capabilities.

Baseline Architecture

In an effort to simplify the administration of IT assets, reduce IT costs, improve the provisioning of IT Services, and, in general improve the quality of IT Operations, the Commonwealth has established a preferred datacenter baseline target state architecture.



Baseline Datacenter Architecture

- Minimum 2 Datacenters
- Manage the CoPA EDC within architecture
- Flexible capacity on demand
- Redundant Secure Network Links between Datacenters and CoPA Network
- DR Capable
- Common Service Catalog
- SLAs
- Support for multiple platforms

The datacenter baseline target state architecture is based on a shared Services model in which a minimum of two geographically-separate datacenters (includes operations support for the [redacted] provide a wide range of common IT Services to the Commonwealth. While not necessarily mirror images of each other, each datacenter must be capable of supporting critical Commonwealth processing in the event the other datacenter goes offline (as, for example, in the event of a datacenter disaster). To address the need for additional capacity and new Services over time the Offeror may propose additional capacity beyond the two datacenters with secure connections to other Offeror capacity.

Initially, this target datacenter combination would host the Commonwealth's existing collection of shared information systems and currently outsourced Services. Over a prescribed period of time, the new datacenter architecture must support the transition of additional IT workloads presently being processed at a variety of datacenters owned and operated by Commonwealth agencies, thus permitting these datacenters to be decommissioned.

3.1.1 Multi Datacenter Environment (2+ Architecture)

The Offeror must provide a multi datacenter environment. All datacenters will be managed and maintained by the Offeror, including the Commonwealth's EDC and may be either a standalone facility, or integrated into existing qualified facilities. The multi datacenter environment is to facilitate high availability, capacity on demand, and the recovery of applications and Services that are deemed critical to the Commonwealth. The multi datacenter requirement is to provide a minimum of two datacenters. The Offeror may propose additional capacity and Services utilizing additional facilities beyond the two required datacenters.

Reference Documentation

Schedule E – Datacenter Locations

Exhibit A - Commonwealth Network Environment

Exhibit(s) D.1 through D.15 – Enterprise Datacenter (EDC) Exhibits

Requirements		Describe Compliance
•	The Offeror's datacenter architecture must consist of multiple geographically disbursed datacenters. Any datacenters being used in a back-up function must be at least 50 miles apart from the associated primary location for the service.	Offeror must describe the process of establishing a multi datacenter environment, including facility management, resource sharing, operational coordination, and inter-datacenter communications. Provide proposed datacenter architecture and locations. Using **Schedule E – Datacenter locations**, the Offeror must list the address of all proposed Datacenter locations that will host the Commonwealth's applications and data.
•	Tier III equivalent datacenter facilities proposed by the Offeror must have had consistent availability of 99.99% in the past six months as of December 31, 2011.	Offeror must provide current availability reports of its proposed datacenter(s) with its submittal.
•	The EDC assets will be managed and maintained by the Offeror. The current maintenance contract for the EDC servers is scheduled to expire on June 30, 2014.	Offeror must describe its approach to transition operations and management of the EDC infrastructure from the Commonwealth to the Offeror's support Services and how it intend to address the server maintenance expiration issue.

•	Each datacenters will have the capability to provide DR for the other, for identified critical applications.	Offeror must describe the process of providing DR for critical applications from one datacenter to the other. Also, describe additional DR Services if included in the overall proposed offering.
•	Datacenter sustainability.	Offeror must describe its methods of achieving datacenter sustainability, such as realizing a low Power Usage Effectiveness (PUE) ratio.
•	Robust physical security, including biometric access control, video surveillance, and routine security officer patrols.	Offeror must describe its security methods and techniques that will be used to protect Commonwealth computing assets and ensure compliance with Commonwealth security requirements.
•	In a datacenter environment that hosts both Commonwealth and non-Commonwealth clients, segregation of Commonwealth data, and computing resources from other clients' data and computing resources. The Offeror is required to provide system and data segregation between different agency application environments. Note: The Offeror may not use the EDC to provide services to Non-Commonwealth clients. The Commonwealth may permit the Offeror to provide services to COSTARS members if written permission is granted by the Commonwealth.	Offeror must describe its approach to provide Services in the event a datacenter will be shared with a non-Commonwealth client, describe how segregation of resources will be achieved and maintained. Offeror must describe how systems and data segregation can be maintained between different agency application infrastructure environments.
•	Elastic datacenter infrastructures to accommodate variable workloads.	Offeror must describe its computing and networking capabilities that will accommodate the growth or contraction of workloads.

•	24/7/365 staffing.	Offeror must describe the staffing model used to provide 24/7/365 staffing. Operations staff, technical support staff, security staff, and management. Offeror must address how it plan to manage security/background checks, monitoring and reporting on employees and how it will coordinate those requirements with Criminal Justice agencies.
•	Common work and meeting space.	Offeror must describe its capabilities to accommodate meeting and workspace for Commonwealth and Offeror IT staff and management.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Unisys data center architecture has been designed with the benefit of prior knowledge and awareness of the Commonwealth's IT environment and operation. Consideration of locations for multiple data centers has been actively pursued for over 18 months with study of sites inside and outside the Commonwealth.

Options were considered for available space and power, proximity to Harrisburg and each other and for each of the key infrastructure characteristics of security, scalability, flexibility, availability, and reliability.

Few sites met the several clip levels we set for each factor for the analysis of possible facilities that could ultimately be harnessed with the Commonwealth's [redacted] to meet the requirements we anticipated and ultimately see in the RFP.

In the end, Unisys selected two facilities from 18+ sites considered – facilities in [redacted] In addition, the Unisys team is maintaining its relationship with [redacted] as a site to provide mainframe DR services on a subscription basis, if the Commonwealth elects to continue the current mainframe DR approach (see **Figure 3.1.1-1** below).

Figure 3.1.1-1 – Proposed Commonwealth Data Center Locations

Unisys data center architecture provides flexibility, availability, reliability, and resiliency and provides locations allowing for the right placement of Commonwealth IT equipment. Our data centers are interconnected and operated as a unified whole. Unisys manages its facilities including the [redacted] as a single integrated unit. Unisys provides the data center resources that matches the best solution to the Commonwealth's IT requirements. Moreover, our architecture provides Commonwealth-focused data center operational coordination with a common management team and integrated process supported by common service management architecture across the environment.

For addresses, descriptions and additional documentation on proposed data centers, please refer to Schedule E "Datacenter Locations".

1 Multi Datacenter Architecture

1A The Offeror's datacenter architecture must consist of multiple geographically disbursed datacenters. Any datacenters being used in a back-up function must be at least 50 miles apart from the associated primary location for the service.

Unisys data center architecture provides flexibility, availability, reliability and resiliency and provides locations allowing for the right placement of Commonwealth IT equipment. Our data centers are interconnected and operated as a unified whole, and Unisys manages its facilities including the Commonwealth's [redacted] as a single integrated unit. To accomplish our intent, Unisys considered more than 18 sites and selected facilities in [redacted] to join with the Commonwealth's [redacted]. The IBM Data Center in [redacted] will continue to be available as an IBM Mainframe DR option. Each of the facilities has been considered for its location relative to Harrisburg, and each other with no facility within 50 miles of another allowing any site to maintain a suitable distance as a DR location for any other.

Each of the Unisys facilities maintains availability above 99.99% along with an engineering posture equivalent to Uptime Institute's Tier III.

1B Offeror must describe the process of establishing a multi datacenter environment, including facility management, resource sharing, operational coordination, and inter-datacenter communications. Provide proposed datacenter architecture and locations.

The facility locations have been selected with the following criteria:

- Deliberate engineering and construction that, if formally assessed, would find the facility equivalent to Uptime Institute's Tier 3 rating.
- Significant security treatments and a safety posture meeting the requirements of the Unisys delivery model for the Commonwealth's IT systems.
- Predictable and ready availability of sufficient and reasonably priced electric utility for the anticipated IT load.
- Present availability of high-speed and high-capacity networking to mitigate potential latency issues between sites, the [redacted] Commonwealth users and COPANET.
- Reasonable accessibility to Unisys service delivery teams and Commonwealth staff.
- Present capability of assuming either of or both production and recovery site operations.
- Immediate flexibility sufficient to permit growing or shrinking Commonwealth workloads.
- Capable of operating with the other Unisys data centers as a member of an interconnected and unified whole.

Engineering and Construction

Each facility was selected with an ability to meet and exploit the environment extremes common to their location. Steel and concrete construction was required along with interior floor loading characteristics that permit the variety of the Commonwealth's IT equipment.

Security and Safety

Each facility has both physical and logical security in place and ready to deploy down to the rack level if requested. Perimeter security is maintained by camera and an active physical security presence. All facilities include guard-controlled access to interior spaces. In each case, guard-controlled access to segregated data hall areas can be incorporated upon request.

Security systems whether access control, monitoring, or alarming are incorporated into the Unisys operational model permitting event correlation, logging and management alerting at all appropriate levels in the Unisys delivery team. These facility security systems are integrated with the service management ITSM systems allowing a facility component to the ITIL-aligned processes employed for the Commonwealth.

Access control systems include access to and within the facilities in all data centers. Access control is through a combination of keycard, keypad and biometric devices. In addition, access control systems including keypad and biometric authentication capabilities are available for the raised floor on areas segregated from portions of the Commonwealth's service area. The Commonwealth can request these services including security caging, security cabinets, and cabinet or cage-level monitoring (camera or access) down to the rack level from the Enterprise Services Catalog. For more information on security see Section 3.1.2, "Network and Security Architecture".

Electric Power

Each facility has been selected for its ability to provide continuous, efficient, cost-effective power. The Unisys team facilities provide between 2N+1 to 2N+2 redundancy. In addition, we have selected facilities with the capacity to grow to and beyond an estimate of the full requirement that the Commonwealth IT estate may have. The considerations include a review of the ability of local utilities to deliver electricity and the cost to meet and grow with the Commonwealth's use of each location.

High-Speed Networking

Unisys data center architecture includes a robust interconnection architecture to minimize network effects of data center separation and provide the ability for Commonwealth applications to connect where required. Access to a variety of network providers has also been incorporated into the evaluation of sites for the Commonwealth. Unisys prerequisites include the presence of multiple high-bandwidth, high capacity providers able to deliver to the site. Preference was given to sites with those providers whose existing infrastructure passed by if not into the location to minimize time to procure new and future service.

Unisys has selected and built carrier-neutral data center facilities, offering a variety of telecommunications carriers to choose from and a broad range of network solutions to satisfy connectivity requirements. The facilities boast numerous dark fiber providers, as well as lit fiber service providers as well.

For greater detail on networking between and within the Unisys sites see Section 3.1.2, "Network and Security Architecture".

Accessibility

The locations Unisys has selected were selected, in part, for their accessibility to both the Unisys and Commonwealth staff. Their proximity to Unisys locations or the Commonwealth reduces the cost and time for any required access to IT spaces or equipment. In particular, locations have been selected that are within driving distance of, close to a major airport or both.

Mission Flexibility

The diversity of the Commonwealth's IT estate set a criteria in Unisys selection for a space capable of addressing the entire range of power, cooling, and floor loading variations demonstrated from our experience with the Commonwealth and laid out in the RFP's exhibits. Further, the selections were made based on the ability of the space to grow with Commonwealth requirements without a heavy cost of preparing for that possibility in advance. Each site was evaluated with no set preference for a role as DR or production allowing the architecture to maintain flexibility. Examples of considerations given include the ability of the site to provide for a possible need for extra high density layouts, water-cooled equipment, and exceptional floor loading. Each site addresses those circumstances and holds the potential solution available to the architecture team needing to deploy them.

Unisys facilities are purpose-built for mission critical systems and applications. Data floor features like high power density, high cooling density, and ease of scalability enable customers to deploy a variety of IT environments in our data center facilities. High density production

environments, storage networks, and development environments are all easily supported within our facilities due to our ability to accommodate high rack power consumption and quickly add connectivity and power when requested. Customizable office space, fit up space, and testing space also gives the flexibility required to accomplish a variety of missions inside the Unisys data center facilities.

Scalability

Like mission flexibility, the selection of a site by the Unisys team, incorporated a concern for growth in the scale of the operation as well as scope for IT environment diversity. In particular, scalability has been addressed both in the facilities themselves and in their operations.

Scalable facilities of many types including pod and module architectures were considered. These choices, while extraordinarily flexible challenge many of the security requirements unique to the Commonwealth. Moreover, such facilities do not meet the requirement to have been operating for 6 months by December 31, 2012. Consequently, these options have been set back as deep options for future consideration.

The choices were then made between operating facilities with standing ready to meet such a need. Both [redacted] have this characteristic in two forms – active ready white space waiting for IT equipment and space, with and without grid but without the more significant electrical and mechanical subsystems representing major capital cost and therefore upward pressure on the ultimate cost of the Unisys bid.

Operationally, the Unisys solution incorporates a single, common space management team reporting to the Unisys account team. This single team has a holistic view that includes the [redacted] in the deployment of equipment to the sites during transition and migrations, and after. Unisys manages these facilities including the Commonwealth's [redacted] as a single integrated whole.

One of [redacted] major differentiators is the patented critical infrastructure that enables the facility to easily and massively scale without impacting customers. For the Commonwealth, this means that you do not have to worry about increasing a co-location footprint or committed power consumption – [redacted] infrastructure was designed from inception to scale without impacting customers IT systems or their reliability. The infrastructure delivery team is especially responsive to cross connect requests and electrical circuit requests.

1C Using Schedule E – Datacenter locations, the Offeror must list the address of all proposed Datacenter locations that will host the Commonwealth's applications and data.

The facilities' locations along with some key facts for each are provided in Schedule E.

2 Datacenter Availability

2.A Tier III equivalent datacenter facilities proposed by the Offeror must have had consistent availability of 99.99% in the past six months as of December 31, 2011.

Unisys data center facilities meet or exceed the Uptime Institute Tier III standard for concurrently maintainable data center site and infrastructure. The overall facility UPS topology

is a distributed redundant configuration. Unisys [redacted] uses a patented maintenance bypass isolation feature. This feature enables our [redacted] facilities to exceed Uptime Tier 4 standards for data centers to be concurrently maintainable or fault tolerant with a simultaneous utility outage. This innovative level of critical infrastructure redundancy has been termed 2N+2: two completely separate power paths from the power utility to the customer rack (2N) and all of the critical components in those two independent power paths have (at least) two extras for backup (N+2).

In addition, each of these facilities meet the requirement as amended in notes ("Addendum 16 Master Questions and Answers", page 29, item shown for Addendum 4 – Round 1, Part 2, #30) from the Commonwealth for a facility in operation with an availability at or above 99.99% in the six months prior to December 31, 2012. Documentation to support this requirement for each site is available upon request. Such documentation shows that Unisys facilities exceed the requirement.

2.B Offeror must provide current availability reports of its proposed datacenter(s) with its submittal.

Availability reports are included in Schedule E for [redacted]

3 EDC Assets and Transition

3.A The EDC assets will be managed and maintained by the Offeror. The current maintenance contract for the EDC servers is scheduled to expire on June 30, 2014.

3.B Offeror must describe its approach to transition operations and management of the EDC infrastructure from the Commonwealth to the Offeror's support Services and how it intend to address the server maintenance expiration issue.

Unisys evaluation of the Commonwealth facilities includes a detailed review of the infrastructure currently installed in the [redacted] This evaluation incorporates a wall-to-wall inventory to locate and identify all equipment along with a review of the maintenance status.

Upon completion, Unisys intends to recommend and consult with the Commonwealth on the options that can be pursued. These options are provided in the Technology Refresh plan and include:

- Provision of maintenance services for the equipment,
- Conversion of an asset to Unisys new Fully-Managed service,
- Commonwealth acquisition of new equipment that can be used with Unisys Managed-Only services and that is current for maintenance and warranty purposes.

Equipment that remains aged beyond warranty, support and maintenance will not be able to be serviced with any SLA coverage.

For more details on the Technology Refresh plan and approach refer to Schedule F, Section 3.2.1.5.1 "Technology Refresh".

For greater detail on the transition of the [redacted] management to Unisys please refer to Schedule

F, Section 3.3 "Transition Services" and Schedule M "Transition Plan".

4 DR Services

4.A Each datacenters will have the capability to provide DR for the other, for identified critical applications.

Unisys data center architecture provides an operational model that supports a strategic intent of maturing the Commonwealth's disaster recovery posture. Unisys selection of sites was from its team's portfolio of sites and beyond. The selection criteria included criteria based on the Commonwealth's IT Strategic Plan published in late 2011 for operational characteristics that are required in facilities supporting the Commonwealth. The evaluation of sites over the last 18+ months has always included a mutual DR characteristic. With the selected sites, Unisys has sites with Unisys [redacted] that can backup each other. Each has similar facilities infrastructure designed to provide a site ready to operate for the other where applications require.

Examples where this is the case appear throughout the solution such as the placement of the production Unisys mainframe in Unisys [redacted] with a DR peer in Unisys [redacted] In fact, where [redacted] was once a cold and warm DR site, now those application environments are in the [redacted] sites.

In addition, Unisys is able to adjust and widen its DR approach where cost or design dictate. An example is the incorporation of the existing use of the [redacted] facility into the data center fabric as a continuing cold site option for the IBM mainframes.

While these stand as options, Unisys decisions on how production and DR systems are deployed are not assumed. Agency use, including the use of the [redacted] as a participant in the architecture, will be a result of collaboration between the Unisys team and the agency in determining the best deployment for the best cost that meets an application's operating needs.

For example, the Department of Labor and Industry's application DR solutions may be migrated to the data centers in a number of ways, all of which Unisys will call on DLI for review and approval. In this case, specifically, the Unisys migration team along with its architecture, facility and space management team will work to gain DLI's insight and counsel to collaborate on the best solution for DLI.

For more information and greater detail on the Unisys disaster recovery services please see Schedule F, Sections 3.2.1.5.2 "IT Service Continuity Architecture", 3.2.2.4 "DR Planning and Testing" and 3.2.5.3 "DR Infrastructure on Demand".

4.B Offeror must describe the process of providing DR for critical applications from one datacenter to the other.

DR solutions for the Commonwealth's critical applications are available in most forms of DR in use today including cold-site subscription services. Unisys team has the unique advantage of being able to provide the range of services from Unisys operational DR support services to IBM's subscription services.

The Commonwealth's DR needs are met through the selection from the Enterprise Services Catalog with equipment designated for DR use and noting that placement is in support of an application's infrastructure. Identification of that system will then allow Unisys Space Planning to provide the options for the DR environment to the Commonwealth. Where a greater degree of consultation and collaboration is required, either Unisys or the Commonwealth may engage the other in a deeper review of the available options or discussion on how additional options may be provided.

In general, DR is provided by placing IT systems in the same facility for high availability, in another facility for continuous operation, or both for continuous availability. The Commonwealth may engage the Unisys team on the actual mechanisms for failover but these are considered specific to the application and the architectural responsibility of the application owner. Major elements of DR service exist and reside within the data center services including dual diverse network connections between each sites, along with backup/recovery services and data replication. These may be requested from the Enterprise Services Catalog.

For more information and greater detail on the Unisys disaster recovery services please see Schedule F, Sections 3.2.1.5.2 "IT Service Continuity Architecture", 3.2.2.4 "DR Planning and Testing" and 3.2.5.3 "DR Infrastructure on Demand".

4.C Also, describe additional DR Services if included in the overall proposed offering.

DR solutions for the Commonwealth's critical applications are available in most forms of DR in use today including cold-site subscription services of IBM Business Continuity and Recovery Services at [redacted]. The Unisys team has the uncommon advantage of being able to provide the range of services from Unisys operational DR support services to IBM's subscription services. The Unisys proposal includes this last optionally for the current mainframe environment. Similar services, while not in the Enterprise Services Catalog, are available by request. DR architectures that require site schemes beyond the sites provided are possible within the family of Unisys and IBM data centers. A service request can start the process with consulting or a request from the Enterprise Services Catalog.

5 Datacenter sustainability

5.A Offeror must describe its methods of achieving datacenter sustainability, such as realizing a low Power Usage Effectiveness (PUE) ratio.

Unisys data center architecture is uniquely sensitive to the environment. [redacted] has one of the lowest design PUEs in the data center industry. This industry-leading energy efficiency is achieved through innovative cooling system design using proven methods. The mechanical cooling plant utilizes air-cooled chillers, which keep water usage low due to its closed loop system. The air-cooled chillers also have an economization mode that is used when operating parameters are met to conserve energy usage by bypassing (securing) the refrigeration cycle and allowing the chiller to act as a carburetor does on a car.

In addition, [redacted] computer room air handler units are 100% outside air economization capable, a cooling mode which is utilized about 60% of the year, a big driver in low PUE. The cooling system in its entirely is completely automated, ensuring that the most energy efficient cooling method is employed to cool the data center and closely match cooling required with

cooling delivered.

The facility is designed to U.S. Green Building Council LEED Gold requirements and is designed to earn the EPA ENERGY STAR rating. Unisys [redacted] was the first multi-tenant colocation data center to earn the EPA ENERGY STAR, leading the industry to improve data center energy efficiency.

[redacted] uses integrated and sustainable design elements such as a 30-inch raised floor that maintains superior air flow around servers to maximize cooling efficiency. Unisys also maintains a glycol air conditioning system that is greater than 40 percent more efficient than those typically found at data centers. This system also uses "free cooling" when the outside temperature is below 50 degrees Fahrenheit, saving 8 percent of power consumption and cost. Other energy-saving equipment includes computer designed fluorescent lighting, central humidification systems, better cable management, and lower emitting emergency generators.

Matching air conditioning with power usage saves electric costs in the Commonwealth area in [redacted] This green operational procedure has served as a model for other Unisys data centers.

6 Physical Security

6.A Robust physical security, including biometric access control, video surveillance, and routine security officer patrols.

Offeror must describe its security methods and techniques that will be used to protect Commonwealth computing assets and ensure compliance with Commonwealth security requirements.

The Unisys data centers' architecture incorporates the latest in physical and operational security approaches.

[redacted] has deployed a centralized, electronic access control system that provides alarm monitoring points on all personnel and equipment doors, as well as intrusion detection throughout the facility. Photo ID badges with unique personal identification numbers, as well as biometric iris scanners, provide multiple levels of electronic access control, and also provide individual accountability throughout the facility. The site's security systems control physical and electronic access to the building, the data center floor, and each client's caged area or module. 3-factor identification is required to access the data floor. A fourth layer is required to access a client cage or module.

Each client's equipment within [redacted] data center is housed in a vault that is exclusively dedicated to the Commonwealth. Access is restricted to authorized personnel only with that list maintained via [redacted] online security portal. All data center visitors must pass through multiple security zones delineated by mantraps with card readers and keypads for personal identification numbers, as well as biometric iris scanners (each with a unique access list tied to each security device) to access any of the customer spaces.

Physical facility security includes a building-within-a-building design, ensuring there is no direct access to the data floor from the external walls of the facility. Over 150 steel and concrete bollards surround the [redacted] facility in front of parking and the main entrance. All other back-of-house Mechanical Electrical Physical (MEP) infrastructure and the shipping & receiving area is surrounded by steel fencing and secured with entrance gates and a guardhouse.

Cameras are located at every entrance, every mantrap, every data pod, the entire roof area, the back-of-house MEP area, and all parking lots. All cameras are PTZ CCTV, digitally recorded, monitored by security staff 24x7 (and the Network Operations Center for backup and situational awareness) and all footage is maintained for at least 90 days.

[redacted] is safe, secure, and protected from disruption or intrusion. All critical procedures, equipment, and software systems have a backup, an acceptable alternative, or a proven workaround solution for use in component or system failure. [redacted] also complies fully with industry guidelines for safety, fire protection, uninterruptible power supply, and security requirements. Each year, our facility is required to pass a SSAE-16 audit for its overall operations. Multiple SSAE-16 audits that are tailored for specific clients are also performed. [redacted] has ISO 27001 certification like the other Unisys data centers and Managed Services Centers around the globe.

[redacted] maintain similar security postures and have their facility alerts forwarded to the Unisys Commonwealth event management system for immediate notification of incidents to Unisys account managers, and where required, Commonwealth personnel.

7 System and Data Segregation

7.A "In a datacenter environment that hosts both Commonwealth and non-Commonwealth clients, segregation of Commonwealth data, and computing resources from other clients' data and computing resources.

Offeror must describe its approach to provide Services in the event a datacenter will be shared with a non-Commonwealth client, describe how segregation of resources will be achieved and maintained."

Unisys data center architecture provides for secure physical and logical separation from any adjacent facility or campus occupants, including an ability to provide similar segregation within the Commonwealth's IT services area. The Commonwealth's IT environment is secure physically and logically from other potential occupants of the facilities supporting it.

At the [redacted] facility, the Commonwealth environment will occupy an entire "data center vault" at the facility and have its own secure entrance and facility infrastructure. No other facility customers from the other data center vaults are able to access the Unisys Commonwealth data center vault. Additionally, within the vault, 12 ft. tall cage mesh partitions can be used to separate different environments and systems as required.

At [redacted] the Commonwealth of Pennsylvania environment takes a dedicated "data center area", Area F, and has its own security access controls and power and cooling infrastructure. No other Unisys customers are deployed to this area. In addition, the Commonwealth may select to install security caging with "slab-to-slab" steel wire-mesh fencing using the cages listed within the Enterprise Services Catalog or to a custom size via a service request.

7.B "The Offeror is required to provide system and data segregation between different agency application environments.

Offeror must describe how systems and data segregation can be maintained between different agency application infrastructure environments."

Note: The Offeror may not use the [redacted] to provide services to Non-Commonwealth clients. The Commonwealth may permit the Offeror to provide services to COSTARS members if written permission is granted by the Commonwealth.

Unisys data center architecture provides optional physical and logical segregation within the Commonwealth's physical and logical data center spaces. Within the Commonwealth colocation space, cage mesh partitions can be optionally used to separate different agency environments and systems as required. The Unisys infrastructure service delivery team will work with the Commonwealth to determine exact requirements for caged partitions within the already physically and logically separate Commonwealth/Unisys "data center vault."

In anticipation of this requirement Unisys has included a number of standard cages in the Enterprise Services Catalog that can be deployed within the sites. Security cages in small (8'x9'), medium (10'x19'), large (18'x9') and extra-large (18'x15') sizes are provided via the Enterprise Services Catalog for each location as space is available within each facility to combine with fully-managed, managed-only or co-location services options.

Additionally, there will be logical separation of agency data via [redacted] firewalls may be provided. For greater detail on logical security within the Unisys sites see Section 3.1.2, "Network and Security Architecture".

8 Elastic datacenter infrastructures to accommodate variable workloads

8.A Offeror must describe its computing and networking capabilities that will accommodate the growth or contraction of workloads.

Unisys datacenter architecture is designed to flex with the Commonwealth's need for growth or reduction in data center hosted services.

Unisys data center facilities are purpose-built for mission critical systems and applications. Data floor features like high power density, high cooling density, and ease of scalability enable customers to deploy a variety of IT environments in our data center facilities. High density production environments, storage networks, and development environments are all easily supported within our facilities due to our ability to accommodate high rack power consumption and quickly add connectivity and power when requested. Customizable office space, fit up space, and testing space also gives the flexibility required to accomplish a variety of missions inside the Unisys [redacted] data center facility.

One of Unisys [redacted] major differentiators is the patented critical infrastructure that enables easy and massive scaling of the facilities without impacting customers. For customers, this means that they don't have to worry about increasing their colocation footprint or their committed power consumption – Unisys [redacted] infrastructure was designed from inception to scale without impacting customers' IT systems or their reliability. The infrastructure delivery team is incredibly responsive to cross connect requests and electrical circuit requests.

9 "24/7/365 staffing."

9.A Offeror must describe the staffing model used to provide 24/7/365 staffing. Operations staff, technical support staff, security staff, and management.

Unisys data center staffing provides a single point of responsibility, contact, and management for all data center management supporting the common data center operational model. The Unisys security team is onsite 24x7. The security lobbies are staffed 24x7 by our security team. Training includes periodic training sessions as well as drill-type evolutions for the security staff.

Unisys provides dedicated network/security support staff at its facilities 24x7x365, coupled with automated tools that provide real time notification of suspected security intrusion events. Unisys Security Operations Center (SOC) is comprised of security support staff and a suite of automated tools that provide comprehensive 24x7x365 monitoring, alerting, and response to security events. Personnel follow specific instructions to mitigate issues according to the Security Incident Procedure (SIP) policy.

The Unisys Service Desk (Level 1) monitors the network/security team's response for security related incidents and escalates as appropriate. The Service Desk helps to provide that the Unisys network/security team responds even during off hours depending upon the SLA requirements for incident priority response. (See Section 3.2.4.6 for more on security.)

9.B Offeror must address how it plan to manage security/background checks, monitoring and reporting on employees and how it will coordinate those requirements with Criminal Justice agencies.

A criminal (misdemeanor and felony charges) background check that goes back 7 years is completed upon an offer of employment. The background check also encompasses national watch lists, education verification, and address verification. Each report is reviewed independently by HR personnel. Upon successful completion of the background check, we do a non-DOT instant 7 panel drug screen. The drug screen must be verified by HR personnel before the employee begins work at a Unisys team facility when they are working on or in the Commonwealth service areas.

Unisys is accustomed to completing Commonwealth specific background checks in accordance with the Commonwealth ITB. We will perform fingerprint background checks on all personnel required to do so per the CJIS policy and will execute Management Control Agreement (MCA) with PA State Police. As part of our ISO27001 certification, we perform an annual 3rd party/subcontractor review as well.

All employees and subcontractors providing data center services are subject to background checks and form signatures and completion of annual security training. Those that do not require physical access to the facility are subject to a one-time Department of Corrections (DOC) check and are not issued a badge. Per the Commonwealth policy on contractors, each user is also subject to an annual Pennsylvania Access to Criminal History (PATCH) background check.

Onsite data center employees and contractors are subject to an annual DOC background check, form signatures and a one-time PA State Police (PSP) fingerprint check.

See Section 5, "Personnel" for greater detail on these and related staffing items.

10 Common work and meeting space

10.A Offeror must describe its capabilities to accommodate meeting and workspace for Commonwealth and Offeror IT staff and management.

Unisys facilities provide meeting and work space for Unisys or Commonwealth staff needing access to Unisys Commonwealth service areas.

Unisys data centers are built for compliance, security, and space for IT servers to work. They are also designed with meeting and collaboration space for IT managers and data center professionals. In addition to the data center space, our facilities offer dedicated customer lounges with gourmet coffee and soft drinks, entertainment centers, dedicated customer conference rooms, IT workstations, and comfortable seating areas. Unisys facilities also offer highly customizable private office space which can be used as a NOC, testing and fit-up space, or traditional office space.

Unisys Harrisburg offices include spaces commensurate to the regular cadence of meetings for small and medium size groups including regular executive meeting space for confidential or sensitive discussions with the Commonwealth. In addition, Unisys has retained access privileges to Harrisburg University meeting and conference areas for large groups or when meetings have a need for significant multi-media and video technology content.

The Unisys team can make meeting space available in many of its facilities including the corporate meeting and training facilities in Blue Bell, PA, the [redacted], among many others. The Commonwealth is encouraged to contact the Unisys Agency Account Managers with any inquiry for available locations and possible costs that may be incurred.

Unisys Team Experience:

The Unisys Team manages over 400 of its own facilities world-wide. For a close example, Unisys currently operates and maintains the Commonwealth's Data PowerHouse. During our management tenure the facility has seen major facility refresh and upgrades on key data center infrastructure components including the power and cooling systems.

The team also manages far more than its own facilities and is engaged at customer facilities world-wide. By example, Unisys manages the two facilities established for the State of Texas Department of Information Resources in Austin and San Angelo, Texas. Our services for Texas have included the actual construction as well as the operation of the Austin facility, as well as recent upgrade planning. Services for both sites include the engineering, support and maintenance of the structure, power, cooling, fire suppression and security aspects of the facilities.

Mission critical data centers are often within the team's remit including those for major banks, transportation and logistics companies, telecommunications providers and manufacturers.

Benefits to the Commonwealth

The Commonwealth can benefit from the Unisys team in active management of its facilities as well as the direct benefit of using the team's own facilities. The Unisys team is in the business of keeping IT operating and that includes paying attention to the actual foundations for secure, reliable and available facilities to house IT environments. It is an expertise that the team has and must cultivate to keep the best and latest skill and technology in play for the

support of IT environments whether it is the latest in key system efficiencies leading to cost improvement or the recent opportunities in improving the engineering solutions that define our data centers.

3.1.2 Network and Security Architecture

Secure and robust network connections are critical to the overall data center architecture. Connections between the data centers and access to the Commonwealth's network must be planned, established, and tested prior to the transitioning of Services. All Offeror data centers and locations must coordinate connections between the Offeror's network and the Commonwealth's fiber network (COPANET).

Reference Documentation

Exhibit A - Commonwealth Network Environment

Exhibit P – Enterprise Internet Bandwidth Utilization

	Requirements	Describe Compliance
1.	All proposed datacenter locations will connect to and provide access from COPANET.	Offeror must describe its approach to connect to COPANET.
2.	Dual network termination points to connect to COPANET.	Offeror must describe its networking capability and the ability to support dual termination points in the proposed datacenters environments.
3.	Provide network security via firewall and security devices.	Offeror must describe its network security and access control solution.
4.	All proposed Offeror's datacenter facilities will have secure Internet access capabilities. Internet access must provide virus and intrusion protection systems with reporting capabilities.	Offeror must describe its approach to providing secure access from Commonwealth authorized users via the Internet. The Offeror must describe its approach to providing virus and intrusion protection and reporting.

5.	Multiple security zones must be configured within each datacenter to support specific agency requirements. For example: access, web, application, and data zones. The specific configuration and number of individual zones may be different per agency and application.	Offeror must describe its ability to support the configuration of multiple security zones within its datacenter architecture.
6.	Secure connections are required for traffic that may traverse between Datacenters and between Datacenters and Commonwealth. Encryption shall be a minimum of 128-bit and must be FIPS 140-2 certified to meet Criminal Justice Information Services (CJIS) requirements. (Refer to Pennsylvania State Police (PSP) Summary of CJIS Requirements and CJIS Security Policy.)	Offeror must describe its ability to provide secure network connectivity that meets the standards outlined in the requirement.
7.	Remote access to datacenters supporting CJIS systems must meet minimum security requirements identified in CJIS Security Policy. These requirements include but are not limited to identifying remote user's identity, IP address and connection must be FIPS 140-2 certified with a minimum of 128-bit encryption.	Offeror must describe its ability to comply with the security policies described in this requirement,

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction:

Unisys has designed a state of the art network and security solution that takes into consideration the current Commonwealth network and has laid out an architecture that is designed to support the Commonwealth well into the future. The highly experienced Unisys network and security team will review the network and security architecture outlined below with the Commonwealth agencies during transition to verify that requirements are agreed upon and accepted. In addition, the network and security team will implement the approved

architecture and maintain it through the Unisys standard ITSM processes.

Because the current Unisys network and security team understands the internal policies and procedures of the Commonwealth, Unisys strongly believes we are the lowest risk option to implement the new network design described in detail in the following sections. This detailed understanding of the existing Commonwealth's policies and current network design also verifies that the Unisys team will be able to deliver the solution in the least amount of time while meeting or exceeding all transition delivery milestones.

1 COPANET

1.A All proposed datacenter locations will connect to and provide access from COPANET.

Offeror must describe its approach to connect to COPANET.

As **Figure 3.1.2-1** below illustrates, the Unisys Team will be meeting the current COPANET connectivity requirements by connecting locally at [redacted] via 10 Gb Ethernet and via 2 x 1 Gb Ethernet connections to an alternate COPANET location from another data center. Should direct connectivity to the Verizon PIP network be required, Unisys can terminate Commonwealth provided PIP circuits on Unisys owned and managed equipment at the Unisys Data Centers.

In addition to the [redacted] two new data centers will be utilized – Unisys [redacted] and Unisys [redacted] In [redacted] a new connection to the existing COPANET node will be built using two 10 Gb fiber connections within the Commonwealth Technology Center [redacted]. Since the distance to connect [redacted] to COPANET is so short, these connections do not require a WAN circuit to be installed, thus saving cost. The [redacted] connectivity is shown on the far left diagram of **Figure 3.1.2-1** below:

[redacted]

Figure 3.1.2-1 – COPANET Connectivity

In the middle and far right side of the **Figure 3.1.2-1** above, COPANET connections to Unisys [redacted] and Unisys [redacted] are shown. Based on predicted future usage, both the Unisys [redacted] and Unisys [redacted] Data Centers will be connected to COPANET via 1 Gb circuits. To prevent a single point of failure in the connection to COPANET, the COPANET circuits from Unisys [redacted] and Unisys [redacted] will terminate in a different physical facility than the connection from the [redacted] The locations being considered to terminate these two Data Center circuits are 555 Walnut St. in Harrisburg and 400 North St. in Harrisburg, PA.

It should be noted that the circled numbers "9" and "10" in **Figure 3.1.2-1** indicate which logical circuit numbers were assigned to the various circuits being proposed for the Commonwealth, which will be explained in more detail in the next section. The point-to-point circuits 9 and 10 above will terminate on [redacted] routers in Unisys [redacted] and Unisys [redacted] on the COPANET side the circuits will terminate on existing [redacted] switch line cards, which currently form the edge connection point into COPANET.

In the [redacted] the two 10 Gb fiber connections will terminate directly on the new [redacted] core switches, while the other end of the connection will also terminate on existing [redacted] switch line cards. Unisys will be providing the necessary equipment to terminate these 10 Gb connections. The Commonwealth will be required to provide ports or line card availability on the COPANET nodes (PEs). Any additional PE equipment (line cards or SFPs) would be provided by Unisys.

2 Dual network termination points to connect to COPANET

2.A Offeror must describe its networking capability and the ability to support dual termination points in the proposed datacenters environments.

The new Commonwealth network's proposed design will have the following characteristics:

- The use of the current [redacted] Data Center;
- A Unisys [redacted] Data Center;
- A Unisys [redacted] Data Center;
- An [redacted], if the Commonwealth elects to continue with the current IBM mainframe DR approach (using existing the existing Verizon PIP connectivity);
- Diverse connectivity into existing COPANET nodes from the [redacted] Unisys [redacted] and Unisys [redacted] (described in detail in the previous section);
- Internet access for Unisys employees and Unisys 3rd parties will be provided at Unisys [redacted] and Unisys [redacted] to support Unisys management and tools traffic;
- The Unisys network design addresses both bandwidth and latency concerns;
- The Unisys network design includes both circuit and data center redundancy.

Figure 3.1.2-2 below shows an overview of the 10 new circuits that will be put in place to support the network design. The numbers are grouped together by color, with numbers 1-6 (yellow) used for high-speed backbone data center connectivity, 7-8 (green) for Unisys Internet tools connectivity, and 9-10 (purple) for COPANET connectivity:

Figure 3.1.2-2 – WAN Overview

At the heart of the new design is a high speed, fully redundant, low latency wide area network (WAN). This new backbone WAN will connect the [redacted] Unisys [redacted] and Unisys [redacted] sites together using two separate 10 Gb redundant paths between each site. Using standard [redacted] WAN load balancing across the links (per-destination load balancing), up to 20 Gb of bandwidth will be available between any of the 2 sites.

Figure 3.1.2-3 is a diagram that breaks out the 6 circuits that will be installed in support of this new backbone WAN network. The Unisys Team is confident this WAN design is the appropriate network solution to support the data transformation needs of the Commonwealth, given the amount of data that will likely need to traverse the network from the existing Commonwealth Data Centers to the new Unisys Data Centers. After the data center transition and transformation phases of the project are completed, a bandwidth analysis will be done to evaluate the circuit bandwidth. It is anticipated that less bandwidth will be needed in the steady state environment than during the transition and transformation stages.

Figure 3.1.2-3 – Data Center Connectivity

As shown in the **Figure 3.1.2-3** above, the fiber acquired from the telecommunication provider(s) will terminate directly on [redacted] core switches, allowing the deployment of [redacted] technology across all the three sites. Using [redacted] a Layer 2 multipath network will be built without the Spanning Tree Protocol (STP) being deployed. This new network design is particularly suitable for large virtualization deployments, private clouds, and high-performance computing environments. When deployed across multiple [redacted] chassis, [redacted] creates a flat data center switching fabric with:

- High switching capacity
- High cross-sectional bandwidth
- Low predictable latency

To address specific latency concerns regarding physical distance between the data centers, point-to-point telecommunication circuits will be deployed. Based on the fact that it takes approximately 1 millisecond (ms) for light to travel 100 miles, Unisys is estimating that round trip latency between any two of the three sites should be less than 30ms. The reason the latency is not less than 30ms is because additional latency (i.e., non-distance related) is added by the physical telecommunication equipment at either end of the circuit. Point-to-point circuits offer the lowest latency versus traditional network "cloud" or "star" topologies, as the distance the light needs to travel is considerably less.

In addition to Fabric Path (mentioned above) for steady state operations among the three data centers, the new Commonwealth network will be utilizing [redacted] technology during the transition in situations where the same IP subnets need to be maintained. Unisys experience is that IP addresses often need to be maintained either permanently or temporarily because of the number of servers being moved (servers in the same IP subnet cannot all be moved or relocated at the same time) or the hard coding of IP addresses in applications not allowing new IP addresses to be assigned. In either case, [redacted] on the [redacted] and [redacted] platforms is a technology that significantly

simplifies extending Layer 2 networks across distributed data centers without getting into complicated and unreliable tunneling technologies that were used in the past.

Unisys successfully utilized [redacted] technology recently on a similarly sized project when moving a large data center between states and where no IP readdressing was allowed by our customer. In that project it was necessary to maintain the same Layer 2 subnet across geographically large distances (high latency environment) and [redacted] performed as designed. When all the servers were migrated successfully, [redacted] was turned off.

[redacted]

As **Figure 3.1.2-4** above shows, [redacted] provides the Commonwealth with the ability to deploy virtual computing resources and clusters across geographically distributed data centers, delivering:

- Transparent workload mobility
- Business resiliency
- Superior computing resource efficiencies

Figure 3.1.2-5 – LAN Overview

At the [redacted] Unisys [redacted] and Unisys [redacted] locations, a completely new [redacted] LAN network will be built for the Commonwealth using state of the art [redacted] devices at the core, distribution, and access layers. Servers will have the ability to be connected to the network in either 10 Gb, 1 Gb, or 100 Mb configurations, with the network itself supporting high availability redundant uplinks, as shown in **Figure 3.1.2-5** above.

At the [redacted] the new [redacted] LAN will also connect to the existing [redacted] core network. By connecting the new [redacted] equipment in the [redacted] to the existing [redacted] equipment the Commonwealth will leverage the benefits of using existing infrastructure to reduce costs, as well as introducing new technology to significantly update the network with the latest equipment. The new [redacted] network for all three data centers will include 168 10Gb network ports and 1152 1Gb network ports.

Figure 3.1.2-6 below shows a more detailed LAN design for the three data centers.

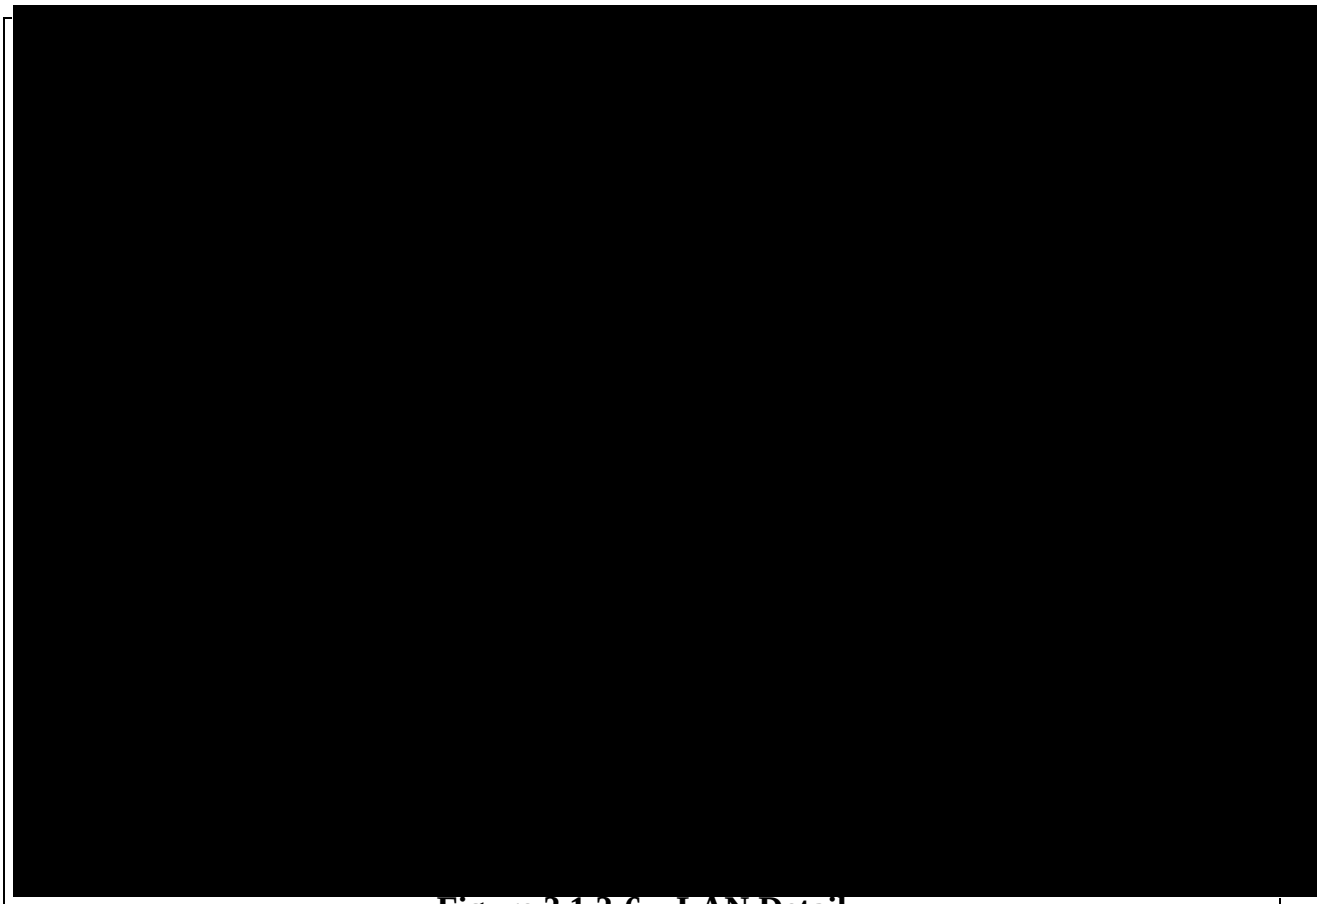


Figure 3.1.2-6 – LAN Detail

3 Network Security and Access Control

3.A Provide network security via firewall and security devices.

Offeror must describe its network security and access control solution.

[redacted] series firewall devices will be used as the enterprise class firewall at the [redacted] Unisys [redacted] and Unisys [redacted] In order to consolidate firewall and IPS functions, these [redacted] firewalls will also have built-in IPS sensors. All security products will send security alerts directly to the [redacted] product. The full capabilities of the firewalls and access control solution are described in more detail in the following sections.

4 Secure Internet access

4.A All proposed Offeror's datacenter facilities will have secure Internet access capabilities.

Offeror must describe its approach to providing secure access from Commonwealth authorized users via the Internet.

The [redacted] VPN client will allow secure Internet access capabilities for Unisys employees and Unisys 3rd parties. The Internet bandwidth Unisys is installing at Unisys [redacted] and Unisys [redacted] will be used for Unisys specific Internet facing management tools, such as [redacted] Unisys understands that the current Internet facing Commonwealth servers that are running today are going over Verizon managed circuits and that this solution will remain unchanged.

The current Verizon management and support of the Commonwealth's VPN firewalls will also remain unchanged.

Internet access of 300 Mb will be provided at both Unisys [redacted] and Unisys [redacted] as shown in **Figure 3.1.2-7** below. These circuits can be upgraded to 1 Gb on short notice, if necessary.

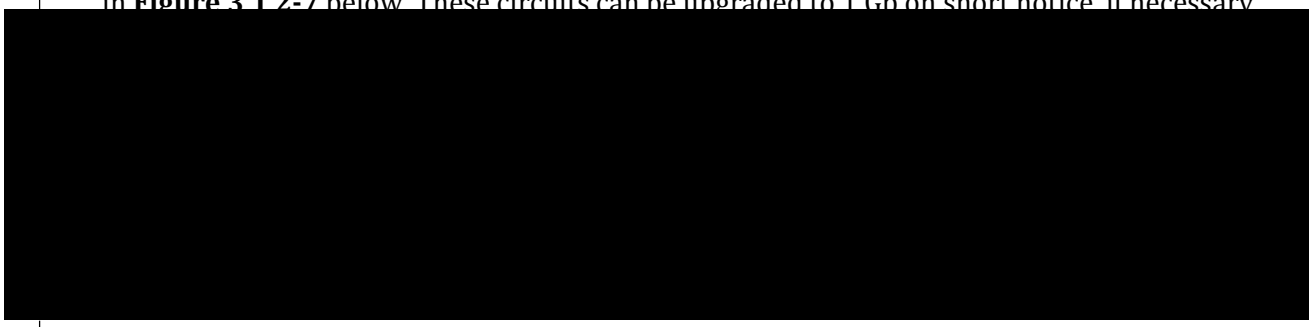

Figure 3.1.2-7 – Internet Connectivity

4.B Internet access must provide virus and intrusion protection systems with reporting capabilities.

The Offeror must describe its approach to providing virus and intrusion protection and reporting.

Our server virus protection offers comprehensive defense against complex attacks for both physical and virtual environments. It combines essential security technologies in a high performance agent with a single management console.

Below is a list of some standard virus protection report types:

- **Application and Device Control.** Events where some type of behavior was blocked
- **Audit.** Information about the policies that clients and locations use
- **Compliance.** Compliance status of your network
- **Computer Status.** Operational status of the computers in your network
- **Network Threat Protection.** Information about intrusion prevention
- **Risk.** Information on risk events on your management server and their clients
- **Scan.** Antivirus and antispyware scan activity
- **Systems.** Information on even times, types, sites, domains, servers, and severity levels

[redacted] firewalls will provide firewalling and IPS within the same appliances, enforcing and alerting on both firewall and IPS policy. Alerting, reporting, and logging will be provided by the [redacted]) and [redacted] products. For intrusion protection reports, all information will be pulled from the [redacted] tool, including proactive alerting from the [redacted] tool. The [redacted] provides both a pre-packaged reporting function and a customized reporting function. The reports can be easily scheduled and automatically sent in various graphical formats for review.

5 Security Zones

5.A Multiple security zones must be configured within each datacenter to support specific agency

requirements. For example: access, web, application, and data zones. The specific configuration and number of individual zones may be different per agency and application.

Offeror must describe its ability to support the configuration of multiple security zones within its datacenter architecture.

The Commonwealth network will be protected through a combination of network and security devices from several "best in class" vendors. The firewall vendor will be [redacted] Networks. The [redacted] devices will consist of a combination of devices. Protecting the [redacted] Unisys [redacted] and Unisys [redacted] will be [redacted] enterprise class [redacted] firewalls; protecting the front end Internet connections will be another set of [redacted] firewalls. The enterprise [redacted] [redacted] firewalls will also have built in IPS sensors.

The [redacted] [redacted] box is designed around the concept of multiple security zones. The [redacted] device supports various types of security zones, with the understanding that different agencies may have different requirements. From a Unisys perspective, security zones represent virtual sections of the network, segmented into logical areas. Security zones can be assigned to a physical interface or to a virtual system. When assigned to a virtual system, multiple zones can share a single physical interface.

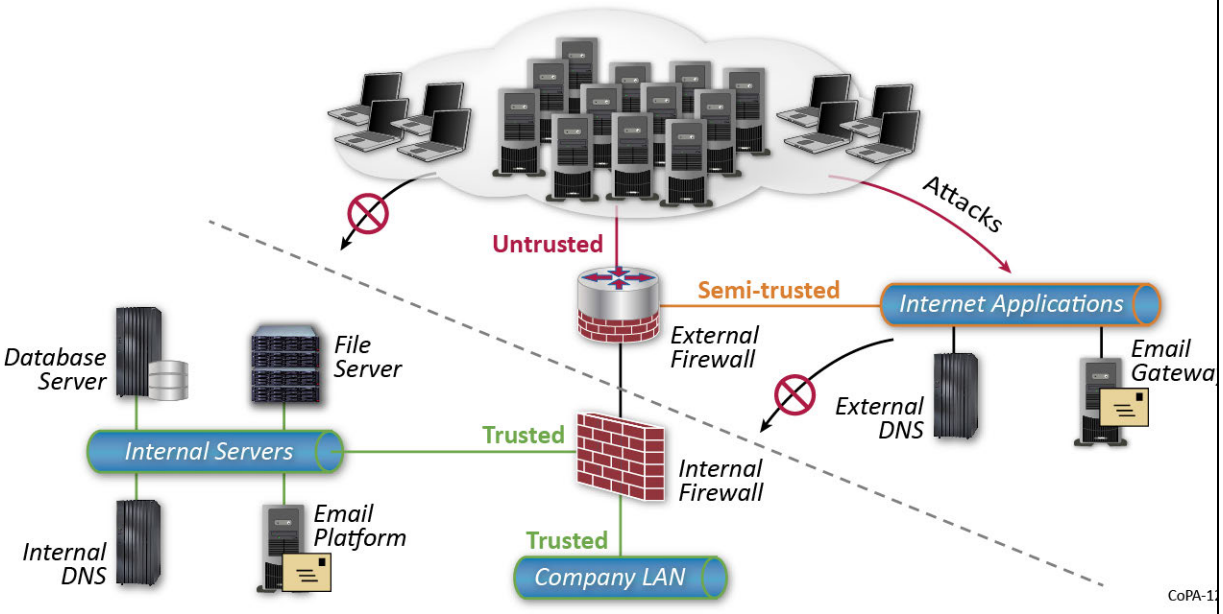

Figure 3.1.2-8 – Security Zones

Following the 4-Zone network architecture presented above in **Figure 3.1.2-8**, [redacted] Networks offers comprehensive, flexible, and robust security solutions that are ideally tailored for the requirements of the Commonwealth's new data centers. Unisys understands the Commonwealth's need for agencies and applications to be separated with firewalls and the [redacted] enterprise solution best meets this need.

[redacted] offers an unparalleled combination of features addressing these fundamental requirements:

- **Scale:** [redacted] solutions offer the processing scalability required to combat today's sophisticated threats. With the [redacted] Networks® [redacted] Series Services Gateways, [redacted]

offers firewalls that scale, both in terms of throughput and in the number of concurrent sessions, so they can accommodate the intensive security and bandwidth requirements of the next-generation data center.

- **Fabric architecture support:** [redacted] provides switches for fabric architectures, and is leading the way in delivering cohesive security integration in these environments. The [redacted] Series product line is designed to work with the scalable [redacted] fabric, ensuring optimal flexibility, scalability, and security in these emerging environments.
- **Visibility:** [redacted] security solutions can incorporate the required context, in real time, to provide effective, continuous policy enforcement. With AppSecure, [redacted] provides a deep understanding and visibility into application behaviors and weaknesses to prevent application-borne threats that are otherwise difficult to detect, let alone stop. In addition, [redacted] Networks Unified Access Control allows organizations to integrate user identities into their security policies. [redacted] also offers hypervisor integration that enables security teams to incorporate visibility into virtualized components in their security mechanisms.
- **Intelligent enforcement:** Finally, [redacted] offers solutions that can be deployed both on physical devices and in the hypervisor, enabling policy management and enforcement across the entire next-generation data center. As result, organizations realize stronger overall security, and security teams can implement faster configuration changes and reduce the errors that can create security exposures.

6 Secure Network Connectivity

6.A Secure connections are required for traffic that may traverse between Datacenters and between Datacenters and Commonwealth.

The requirement for secure connections is addressed through the use of dedicated point-to-point private connections with appropriate access and routing controls. On a case by case basis, Unisys has the capability to encrypt selected traffic between the data centers using the FIPS compliant [redacted] firewalls and offers the Unisys Stealth product as an Enterprise Services Catalog item. All Commonwealth agency to agency traffic may be encrypted, as required, using the [redacted] Firewalls with 128 bit encryption or higher.

6.B Encryption shall be a minimum of 128-bit and must be FIPS 140-2 certified to meet Criminal Justice Information Services (CJIS) requirements. (Refer to Pennsylvania State Police (PSP) Summary of CJIS Requirements and CJIS Security Policy.)

Offeror must describe its ability to provide secure network connectivity that meets the standards outlined in the requirement.

Unisys will coordinate with the Commonwealth as part of transition in determining the necessary encryption requirements. Where encryption is required, a solution will be provided that meets FIPS 140-2 and CJIS requirements. FIPS compliant [redacted] firewalls are capable of 128 bit encryption or higher, in cases where the above compliance is necessary Unisys is proposing that the Stealth product be available as an Enterprise Services Catalog item to meet regulatory requirements. Where necessary, Unisys will provide tunnel/VPN termination points for all traffic coming in over the Internet. The tunnels will be able to support 128 bit encryption or higher, where required. These tunnels will terminate on the [redacted] equipment. Between the [redacted] Firewalls and the Stealth product, Unisys will be able to meet all known Commonwealth regulatory requirements.

7 Remote Access

7.A Remote access to datacenters supporting CJIS systems must meet minimum security requirements identified in CJIS Security Policy. These requirements include but are not limited to identifying remote user's identity, IP address and connection must be FIPS 140-2 certified with a minimum of 128-bit encryption.

Offeror must describe its ability to comply with the security policies described in this requirement.

All remote access provided to in-scope CJIS systems will meet FIPS 140-2 certification and provide user identification and tracking, coupled with two-factor authentication. The [redacted] Firewalls and VPN termination equipment will be used as the termination point in the 3 data centers for all secure connections coming into the data centers from individual agencies. The SecureAuth VM Appliance will be used as the two-factor authentication method.

Unisys Team Experience

The Unisys team of network design engineers has been supporting the Commonwealth's network and security operations for several years at the DPH and the [redacted] This team, which includes the talents and Commonwealth experience of top-notch engineers, has a thorough understanding of the architectural design, details, and the interworking of COPANET and the processes associated with supporting Commonwealth business partners.

This team performed the initial transition of the agencies supported in the DPH from an architecture that consisted of isolated work group network switching configurations by agency, to the current enterprise level shared infrastructure core switching configuration that exists today. Our network design engineers are accustomed to supporting complex and secure enterprise network environments.

Unisys will provide to the Commonwealth a network management solution based on ITIL principals and delivered using proven processes that are part of the Unisys ITSM framework, integrated with cross-functional services delivered via the BMC Remedy tool suite.

The network design engineers will troubleshoot any faults using a suite of state-of-the-art management tools described in the previous sections. While performing fault isolation activities, Unisys will interface closely with the Commonwealth's telecommunication service representative, as necessary, to identify potential problems and initiate troubleshooting activities.

Changes to the Commonwealth's network, including network upgrades, will be accomplished using the standard ITSM change control process.

As part of the fault isolation process, Unisys works to resolve the problem in a timely manner in accordance with applicable SLAs. If the problem is the result of a software or configuration problem, the network design engineer will initiate the fix remotely; if the problem is the result of a hardware component failure, Unisys will engage the hardware vendor directly for a replacement part, if necessary. Some common network components will be held as spares in an on-site depot. Once the problem is resolved, Unisys will test the component to verify that the device is fully functioning.

In addition, Unisys has recently moved a large data center for the American Red Cross using the [redacted] technology to make sure that servers could remain on the same subnet with no IP

address changes. Unisys supports many other large networks for federal government and state agencies.

Benefits to the Commonwealth

The network management team's network design engineers deliver the following services to the Commonwealth:

- Configuration and management of enterprise core switching environments;
- Configuration and administration of network load balancing configurations;
- Hosting and operational support services for security products and firewalls located at the Commonwealth data centers;
- Network security configuration installations that protect the equipment and applications in the data centers from the 7 most common hacker attacks: Spoofing, Sniffing, Mapping, Hijacking, Trojans, DoS and DDoS, and Social engineering;
- Mainstream security hardware and software installation and maintenance utilizing current industry best practices sufficient to protect the enterprise class data center environments with a significant volume of sensitive class data;
- High availability enterprise data center networks administration and maintenance in support of contractual SLAs at all in-scope Commonwealth data centers;
- Fault notification, tracking, troubleshooting, isolation, and resolution;
- Full configuration management of covered network elements;
- Storage and backup of configuration files necessary to "roll-back" to a previously known state;
- Inventory reports detailing the managed elements and internal components;
- Ongoing performance analysis;
- Alert notifications and recommendations when network elements exceed mutually agreed performance thresholds;
- Periodic network reviews providing analysis and recommendations on identified network and security issues;
- Fully integrated service options, including infrastructure maintenance and help desk services;
- Audit and system logs of changes to the network showing date and specific types of changes.

3.1.3 Datacenter Architecture and Technology

The Offeror must evaluate the Commonwealth computing infrastructure(s) and develop and implement an IT architecture that will support all current systems and applications, utilizing existing and/or underutilized technologies where appropriate, to provide a high level of quality computing Services to the Commonwealth, in a cost effective manner. An overall review of all Commonwealth computing Services is required, as the requirement is to consolidate all Commonwealth based computing Services into the Offeror's data center architecture. This architecture design is to include the current DR programs and structure and will be implemented along with the production and testing environments.

The Offeror must provide a multi-platform solution that will support the migration of all of the Commonwealth's current workloads. The Offeror must address in its design how it will create a target environment that will minimize application latency concerns.

The Offeror must also develop a proposed infrastructure environment, which will lead the Commonwealth into the future, and be able to address all current and future data center requirements.

Requirements		Describe Compliance
1.	Develop the architecture and define the technology that will be used in the target datacenter environment to support the Commonwealth computing systems.	Offeror must describe the overall architecture and technologies that will be required to run the computing requirements for the Commonwealth.
2.	Provide all technical system support and reporting including: • Multi-Platform Systems Support • Multi-Tiered Storage Management • Network Management • Security Management • Capacity planning • Performance analysis and tuning • Technology Refresh/Life Cycle Management • Annual Audits and Certifications	Offeror must describe overall strategy to provide these Services for each component of its supporting architecture.
3.	Provide a storage management approach which meets the Commonwealth's needs. The storage management approach shall include, but not be limited to, the following: • **Basic** – based on Pay-As-You-Go allocation model with no upfront resource allocation and resources are reserved on demand per workload. (shared, multitenant) • **Committed** – based on Allocation Pool allocation model which gives a minimal initial commitment of resources plus the ability to burst above that minimum if additional capacity is needed – usually a percentage of resources reserved for agency with over-allocation. (shared, multitenant) • **Dedicated** – based on Reservation Pool allocation model – 100% of resources are reservation–guaranteed.	Offeror must describe overall strategy to provide these Services for storage management.

	(dedicated, single tenant)	
4.	Provide real-time monitoring and monthly reporting of system availability, performance, utilization, and efficiency.	Offeror must describe its overall strategy to provide real-time scheduled system performance, operations, monitoring and capacity reporting for the entire datacenter architecture. Offeror must describe its strategy to support or provide real-time system and/or application monitoring
5.	Disaster Recovery - Design a tiered DR solution to ensure that applications and associated hardware that currently have an active DR plan will continue to have offsite Services available in the event of a primary system outage. The tiered DR solution must include an option to support high availability (HA) architectures. Include tiered DR solution in the overall datacenter architecture design.	Offeror must describe its tiered approach to supporting the Disaster Recovery needs of the Commonwealth.
6.	Configuration Item Reconciliation The Offeror must perform an initial asset review of the targeted inventory for all datacenter configuration items (CI) that will be managed. The Offeror must reconcile and validate that appropriate relationships exist for all datacenter configuration information in the Configuration Management Database (CMDB) system. Offeror must ensure that CIs are properly mapped in order to support the established Service Level Agreements (SLAs). The Offeror will be required to provide an automated interface between its CMDB and the Commonwealth's CMDB.	Offeror must describe its approach to gathering this configuration information.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Unisys Team has evaluated the exhibits and schedules and used the evaluation as a basis for the solution. Unlike other vendors Unisys is distinctively poised to re-use, as appropriate, current Unisys owned and managed assets and can transition these from the existing data centers to new data centers. During Data Gathering and Transition Planning, Unisys will work with the Commonwealth to develop a consolidation plan to transition all Commonwealth based computing Services on an application by application basis to the Unisys provided data centers and the Unisys-managed infrastructure. We look forward to reviewing the flexible DR architecture and the production and testing environments included in the solution. For instance, the Commonwealth could consider reducing DR costs by allowing Test environments to be leveraged to become part of Production in the very unlikely event of an actual Data Center disaster.

The Unisys solution team has crafted a multi-platform solution across the towers of Windows and Linux server, AIX server, IBM Mainframe, IBM iSeries, Unisys Mainframe, Network, Storage and Monitoring that supports the migration of all specified workloads. The Unisys solution uses the IBM Flex chassis/blade technology to provide hardware that supports both physical and virtual Wintel and Linux environments as well as the AIX environment. The Unisys network solution, in particular, provides diverse network connections of sufficient bandwidth to anticipate network demands for Commonwealth applications.

The Unisys solution team has also proposed tools in the Enterprise Services Catalog that will help the Commonwealth to identify instances where application interfaces are highly dependent on close proximity. The identification of these interdependencies is critical during transition when Unisys will take care to bundle tightly coupled applications into coherent move groups. This transition planning leads to the creation of separate move groups and, by nature, these groups are internally more tolerant of longer latency.

The Unisys solution provides the Commonwealth a very flexible infrastructure environment that is highly modular, addresses the current data center requirements, and is highly flexible in anticipation of future data center needs. For instance, in the Server, Network, and Storage infrastructures the architects have taken a chassis/frame and capacity architecture approach. The Unisys solution team will be able to incorporate advances in both the blades and chassis as the Commonwealth requires additional capacity. In effect, this allows a rolling refresh as capacity increases and is coupled with a technology refresh following standard lifecycle management. The Storage and Network infrastructures follow a similar refresh path both at the next chassis/frame purchase and at the close of the lifecycle for equipment purchased during the early stages of the contract.

1 Datacenter Architecture and Technology

1.A Develop the architecture and define the technology that will be used in the target datacenter

environment to support the Commonwealth computing systems.

Offeror must describe the overall architecture and technologies that will be required to run the computing requirements for the Commonwealth.

The Unisys solution relies on the IBM [redacted] technology for both physical and virtual Wintel and Linux environments as well as the AIX environment. Detailed descriptions of this architecture are provided in Schedule F, Section 3.2.4.1 "Windows Support" and Schedule F, Section 3.2.4.4 "UNIX Support – AIX/Linux Approach".

The Unisys solution includes both [redacted] storage technologies. The unique partnership between Unisys and IBM provides the Commonwealth with a competitive bidding process within the Commonwealth's managed services. Another vendor might propose a single-vendor's monolithic storage frame to meet all of Commonwealth's requirements. Unfortunately this limits the Commonwealth's access to competitive pricing as technologies evolve with lower price points. Detailed descriptions of this architecture are provided in Schedule F, Section 3.2.4.2 "Storage Management".

The Network solution based on [redacted] and [redacted] technologies is detailed in Schedule F, Section 3.1.2 "Network and Security Architecture".

The Unisys Team proposes a [redacted] Mainframe. The processor will have four General Purpose (GP) processors, one z Integrated Information Processor (zIIP) and 6 Integrated Facility for Linux (IFL) processors tightly integrated with IBM storage, tape libraries, and IBM tools to provide the maximum utilization of the powerful compute platform, as described in detail in Schedule F, Section 3.2.4.5.2 "IBM Mainframe Services".

The Unisys mainframe team meets the requirements of the Commonwealth with a new mainframe platform and continued support for the steady reliable services provided in the current contract. The solution includes new Dorado and Libra mainframe environments for production, development and Disaster Recovery. These are offered via the Enterprise Services Catalog. These have been architected to match the characteristics and MIPS requirements as detailed in the Exhibits and descriptions in Schedule F, Section 3.2.4.5.1 "Unisys Mainframe Services"

2 Technical Support and Reporting

2.A Offeror must describe overall strategy to provide these Services for each component of its supporting architecture.

The Unisys strategy for providing these services is presented in organizational detail in Schedule F, Section 3.2.2.2 "Infrastructure Architecture" which presents the IT Service Management (ITSM) layer and the Infrastructure Architecture services that are monitored by the ITSM layer.

Critical to this interaction between the ITSM monitoring and the Infrastructure Architecture services are the tight binding of the ITSM Nagios collectors and the management utilities and tools provided by the vendors of the compute components for servers, storage, network, and mainframes.

As described in detail in Schedule F, Section 3.2.3.2 "Site Operations", the ITSM Nagios Collectors are the ITSM's eyes and ears on the services compute components and tools. The

ITSM "brain" is the [redacted] which provides, among other services:

- Analytics-based intelligence to maximize visibility and control of the Commonwealth's Utility computer model
- Proactive detection of initial issues coupled with Commonwealth-approved runbook automations to resolve incidents.

Provide all technical system support and reporting for Multi-Platform Systems Support

The Unisys Team provides technical support for a wide variety of compute services platforms including Windows, Linux, AIX, Mainframe, and Storage. By using the integrated service management platforms described in section Schedule F, Section 3.2.3.2 "Site Operations" and the multiple tiers of support described in each of the technology solutions in Schedule F, Section 3.2.4 "Managed Hosting Services" and Schedule F, Section 3.2.5 "Capacity on Demand Services", the Commonwealth gains the flexibility of meeting the individual needs for each application's compute infrastructure's deployment while also maintaining the common view of through the Services Portal and ITSM platform.

The reporting for services is provided through the Services Portal's online operational dashboard which is described as part of the Service Management solution in Schedule F, Section 3.2.3.2 "Site Operations".

2.B.3 Provide all technical system support and reporting for Network Management

The Unisys solution brings the Commonwealth's network infrastructure and network management up to the high standards and latest technology that Unisys currently maintains for its newest customers who invested in network technology refreshes as part of their migration into the Unisys-managed data centers.

In order to quickly analyze problems on the network or to isolate problems specific to an application, a distributed sniffer system will be deployed using NetScout. F5 load balancers will be deployed at the new data centers to load balance application traffic.

Unisys provides event management solutions to help provide network connectivity and consistent system response times. Unisys utilizes automated system management tool(s) to provide real- time monitoring and notification of server availability and response times including the stop and start times of servers to support SLA availability measurements. The following tools are the major toolsets to support network and system event management and monitoring.

[redacted]

For a complete understanding of how this subset of Event Management Tools supports enterprise Event Management please refer to Schedule F, Section 3.2.3.2 “Site Operations”.

2.B.4 Provide all technical system support and reporting for Security Management

As with the Network Management described above the Unisys solution brings the Commonwealth security management up to the latest technology and the standard by which Unisys manages its latest customers.

[redacted] firewalls will be deployed at the three data centers. The [redacted] platform is designed around the concept of multiple security zones. The [redacted] device supports various types of security zones, with the understanding that different agencies may have different requirements. From a Unisys perspective, security zones represent virtual sections of the network, segmented into logical areas. Security zones can be assigned to a physical interface or to a virtual system. When assigned to a virtual system, multiple zones can share a single physical interface. The [redacted] devices also utilize built-in IDS sensors.

Through the Enterprise Services Catalog, the Commonwealth also has access to the Unisys Stealth Solution.

The Unisys [redacted] renders users, data, and infrastructure undetectable to cyber criminals. Built to meet requirements for securing sensitive information for the U.S. Department of Defense, Unisys Stealth achieved the National Security Agency’s National Information Assurance Partnership Common Criteria EAL-4+ certification protecting data-in-motion across any network regardless if it is private or public.

Benefits of Unisys [redacted]

- Render data, users, and your data center dark to the outside world
- Securely protect the user, network, and data center
- Unprecedented security without an expensive reconfiguring of the network

2.B.5 Provide all technical system support and reporting for Capacity planning

Unisys provides the Commonwealth/Agencies with a comprehensive integrated IT Service

Management (ITSM) Architecture to run the computing requirements for the Commonwealth. The proposed ITSM Architecture will provide an effective and efficient operational platform to support the Commonwealth/Agencies application infrastructure for the following IT Service Management Processes:

- Event Management
  - Provide infrastructure monitoring for all server, storage and network platforms from a Single Pane of Glass (SPOG) using the [redacted] platform.
  - Leverage existing infrastructure monitoring tools and investments (e.g., [redacted]
- Incident, Problem, Change, Asset Configuration, Release, Service Level Management, Service Request Management, and Knowledge Management will all be implemented using the [redacted] Platform.
- Configuration Management (CMDB) in [redacted] applications using [redacted]
- Availability and Performance Management are supported by the centralized [redacted] Platform with availability and performance monitors (such as IBM System Resource Manager (SRM)) feeding this centralized platform.
- Capacity Management [redacted] to support enterprise capacity management and reporting across all server, mainframe, network and storage devices supporting Commonwealth/Agency applications
- Server and Network Administration using [redacted] for provisioning servers in the cloud environment, patching, software distribution, and compliance for network and server environments.
- Financial Management and Billing will be implemented using the [redacted] tool. It will be integrated with provisioned and requested services from [redacted] and other project sources to present a consolidated billing to the Commonwealth/Agencies.
- Service Validation and Testing (Load Testing – Silk Performer)
- Enterprise Services Catalog /Service Request Management will be implemented using [redacted]
- Reporting will be supported in the Real-time Dashboard, the [redacted]
- Enterprise batch scheduling and management platform is provided with [redacted] to support the Commonwealth/Agencies goal of one enterprise batch management platform while supporting existing batch management platforms [redacted]
- Database Management (optional service)
- Application Management (optional service) – [redacted]

2.B.6 Provide all technical system support and reporting for Performance analysis and tuning

As described in the above item 2.B.5, the Unisys solution relies on the integration of the [redacted] tool set within ITSM to manage Performance analysis. Unisys provides the

technical support required for the required tuning based on the performance analysis. The [redacted] performance tools are integrated through [redacted]. In **Figure 3.1.3-1** below, the [redacted] appears to the [redacted] infrastructure as if the [redacted] is a "Regional/Client Infrastructure".

[redacted]

2.B.7 Provide all technical system support and reporting for Technology Refresh/Life Cycle Management

As part of the overall architecture support, the Commonwealth's environment will be reviewed on a quarterly basis to identify technology, services or components which require replacement to maintain the Commonwealth's business needs and associated service levels. The review will include the following activities. The overall technology refresh plan will be documented in Key Deliverable D-03. This plan will be used for all Unisys supported environments.

Overall life cycle management is performed using the Technology Refresh Plan activities as described in Schedule F, Section.3.2.1.5.1 "Technology Refresh".

2.B.8 Provide all technical system support and reporting for Annual Audits and Certifications

The Unisys team manages regular audits through the Security Management office as described in Schedule F, Section 3.2.2.5 "Security Management". Within this organization the Audit and Regulatory Compliance function has accountability for Unisys Team compliance with Commonwealth IT policies and directives as well as federal and Commonwealth laws, regulations and policies, including the Criminal History Record Information Act (CHRIA), Health

Insurance Portability and Accountability Act (HIPAA), Criminal Justice Information Services (CJIS) regulations, the United States Social Security Administration (SSA)regulations, IRS (Internal Revenue Service) Publications, Commonwealth ITBs and the Payment Card Industry (PCI) standards. This function works with each agency to understand and verify compliance with laws, regulations, and policies as it pertain to each individual agency. The responsibility for conducting contractually required audits or arranging for participation in agency audits falls under this function.

Over the last twelve years the Unisys team has integrated these processes and oversights with the Commonwealth's oversight management. The integration of audits, oversight and remediation has protected the Commonwealth form the type of security breaches such as those that occurred at the State of South Carolina Department of Revenue (2012) and more recently at the State of Washington Office of the Courts.

The Unisys team manages Unisys-provided data centers to SSAE-16 annual audits and adjustments to remain in compliance and correct audit findings.

3 Storage Management

3.A Provide a storage management approach which meets the Commonwealth's needs. The storage management approach shall include, but not be limited to, the following:

Offeror must describe overall strategy to provide these Services for storage management.

Unisys proposes a modular approach to storage provisioning rather than deploying a large monolithic frame infrastructure. The focus on provisioning to smaller-sized frames allows the Unisys team to distribute storage systems across the "Basic", "Committed", and "Dedicated" service types that the Commonwealth seeks. By distributing these services across various frames the Unisys team can evolve an application from a "Basic" service on a shared multi-tenant frame to a "Dedicated" single-tenant frame without incurring the high overhead that would be required through the use of larger monolithic frames.

The Unisys Team recognizes that a fundamental application management requirement indicated by the Commonwealth is the ability to move data seamlessly between multiple data center locations to reduce risk and provide service resiliency. The Unisys strategy to provide these storage services provides multiple levels of storage replication services through the Enterprise Services Catalog. This allows the Commonwealth to select the tool that provides the right levels of replication to match the criticality of applications.

Detailed descriptions on the tools offered to the Commonwealth via the Enterprise Services Catalog are provided in Schedule F, Section 3.2.4.2 "Storage Management".

3.A.1 Basic – based on Pay-As-You-Go allocation model with no upfront resource allocation and resources are reserved on demand per workload. (shared, multitenant)

3.A.2 Committed – based on Allocation Pool allocation model which gives a minimal initial commitment of resources plus the ability to burst above that minimum if additional capacity is needed – usually a percentage of resources reserved for agency with over-allocation. (shared, multitenant)

3.A.3 Dedicated – based on Reservation Pool allocation model – 100% of resources are reservation–

guaranteed. (dedicated, single tenant)

The Commonwealth seeks a utility-based approach that allows maximum price flexibility in the Unisys-provided utility, Storage as a Service model. Within the capacities and tiers specified in the Schedule I Volumetrics tab Unisys is able to provide all of three of the requested service types: "Basic", "Committed" (i.e. Basic with bursting), and "Dedicated". Unisys proposes to meet the "Dedicated" single tenant service by providing dedicated physical hard drives so that these provide dedicated performance characteristics. If the Commonwealth seeks dedicated storage frame assets within the Storage as a Service infrastructure then Unisys proposes to discuss the basis for the reservation pool, including tenancy duration commitments as part of Data Gathering and Transition activities.

Unisys has provided a solution that projects reliance upon multiple [redacted] for Open Systems storage rather than adding this capacity to a few centralized Mainframe-class storage frames such as the [redacted] product lines. This provides the Commonwealth with a fine granularity of storage frames. Therefore Unisys anticipates that depending upon the capacity required for dedicated frames, the current solution has sufficient flexibility to accommodate dedicated storage capacity that is already included in the Schedule I "Volumetrics" capacity requests.

Unisys will integrate its ITSM Incident Management system with the Storage Management dashboards such the [redacted]

The integration of the [redacted] tools sets with the Unisys ITSM solution allows Unisys to set threshold bands and prioritize alerts to create appropriate incident tickets before preliminary indicators develop into actual service incidents or interruptions.

The tools also provide the Unisys Storage team with sufficient details to manage LUN status and investigate LUNS which have become "orphaned" and could be re-assigned to the allocation pool.

4 Real-time System and/or application monitoring and reporting

4.A Provide real-time monitoring and monthly reporting of system availability, performance, utilization, and efficiency.

Offeror must describe its overall strategy to provide real-time scheduled system performance, operations, monitoring and capacity reporting for the entire datacenter architecture.

Offeror must describe its strategy to support or provide real-time system and/or application monitoring

Unisys will utilize the [redacted] platform to monitor and manage availability and performance management across all the infrastructure supporting Commonwealth Agency applications (see **Figure 3.1.3-2**). It will be utilized to proactively manage and optimize application performance by avoiding costly outages, solving issues before service levels are impacted, accelerating mean-time-to-repair (MTTR), and extending mean-time-between-failure (MTBF). It reduces customer impact through predictive analytics and drives preventative automation across a single Proactive Operations platform.

[redacted]

The source performance monitors providing performance data include the following tools:

[redacted]

[redacted] automatically discovers and learns the behavior and performance trends for each of the monitored application service components (CI's); identifying normal and abnormal behavior. Unlike threshold-based monitoring systems, the analytics engine only generates events when there is significantly abnormal behavior. Based on these learned trends, the Commonwealth realizes significant reductions in the number of false events generated by reactive, threshold-based performance monitoring approaches. With fewer, more intelligent events. Unisys will support the Commonwealth by pinpointing and prioritizing the most critical business performance issues.

[redacted] applies real-time predictive root cause analytics to continuously sift through events and abnormalities collected from the application and infrastructure components that support the Commonwealth applications and business services, identifying a prioritized set of the most likely problem causes. The solution applies predictive correlation and filtering techniques that leverage real-time service relationships in the [redacted] and configuration changes collected from [redacted] (or any other change source), along with additional detailed diagnostic data. This information provides continuous visibility into problems as they develop; allowing Unisys support personnel to diagnose intermittent performance issues on-demand without requiring the effort to reproduce a problem. These tools allow Unisys technical support staff to remediate problems quickly and efficiently.

The monthly reporting of system availability, performance, utilization, and efficiency are provided through automation that the Unisys team routinely builds around the solution's ITSM infrastructure described in detail above.

5 Disaster Recovery

5.A Design a tiered DR solution to ensure that applications and associated hardware that currently have an active DR plan will continue to have offsite Services available in the event of a primary system outage.

The transition activity includes a review with the Unisys IT Risk Manager of offsite services currently in use and evaluating these in conjunction with the Enterprise Services Catalog offerings to provide current and long-term coverage for these assets.

5.B The tiered DR solution must include an option to support high availability (HA) architectures. Include tiered DR solution in the overall datacenter architecture design.

Offeror must describe its tiered approach to supporting the Disaster Recovery needs of the Commonwealth.

The Enterprise Services Catalog offerings for Disaster Recovery Service will appear alongside the offerings for production servers so that Agency staff ordering new production gear can specify the criticality of the applications being supported as well as the DR services required.

Alternately after a regular DRP review with the IT Risk Manager or at any time, an authorized Agency staff member may elect to use the Enterprise Services Catalog to augment existing

Production infrastructure with DR infrastructure to fill out gaps in the Agency's DRP.

The DR solution includes not only the same components available in the Production environment but also a rich diversity of DR Tiers allowing the Commonwealth to build sufficient high availability through the Disaster Recovery offering to match the Production equivalent for any application.

During planned Data Gathering workshops the Unisys team will present ways to reduce the Commonwealth's daily spend on Disaster Recovery services. It might not be prudent to assume that a perfect DR service is exactly equivalent to the Production services, as this represents a very high ongoing insurance premium against an event that is extremely unlikely to occur. Unisys currently supports customers in Unisys-provided DR sites who, for instance, provision the DR center at only 75% the compute capacity of what is provided in Production. In support of this cost savings Unisys is able to negotiate to an acceptable delivery schedule, invoked only after a disaster occurred, to bring the DR to full compute capacity. The customer realizes a 25% annual savings by taking on a relatively low risk

The Unisys solution includes these Tiered DR Services:

- Tier 1: Recovery from Tape Backup.
- Tier 2: Accelerated Recovery Tape Backup.
- Tier 3: Recovery from Backups replicated to DR via the [redacted] infrastructure.
- Tier 4: Recovery through asynchronous data replication for Open Systems SAN storage removing the need for Data Recovery.
- Tier 5: Data and O/S level replication for Virtual Windows/Linux instances removing the need for Data Recovery.
- Tier 6: With Agency approval the Tier5 offering can be configured to provide an automatic failover.

Following the review of existing Agency DRPs Unisys may propose alternate Tiers to meet any gaps discovered between broad Agency requirements and the Tiers above.

6 Configuration Item Reconciliation

6.A The Offeror must perform an initial asset review of the targeted inventory for all datacenter configuration items (CI) that will be managed.

The Unisys transition team will complete this initial asset review of the existing Commonwealth CMDB. This review includes interviews with Commonwealth and Agency application owners so that the review is inclusive of the matrix of applications that rely on common components in the CI.

6.B The Offeror must reconcile and validate that appropriate relationships exist for all datacenter configuration information in the Configuration Management Database (CMDB) system.

Offeror must describe its approach to gathering this configuration information.

Unisys will develop a Configuration Management Plan during transition that includes all Configuration Item's (CI's) , attributes and relationships that will be discovered, tracked, stored and maintained in the [redacted] and managed through the Change Management

Processes and procedures. The [redacted] toolset will be utilized across all targeted architecture infrastructure platforms to discovery and populate the [redacted] and the indicated relationships. During transition for each agency and data center – the Unisys Configuration Management Team working with the Unisys and Commonwealth/Agency transition teams will transition the identified, discovered and cleansed and reconciled CI's into the Unisys [redacted] to be managed going forward under Change Management Processes.

The Unisys Configuration Manager and support team will follow detailed processes and procedures to reconcile the information before populating the Unisys [redacted]. The Commonwealth/Agencies will be involved in processes and procedures during transition and ongoing to review and accept changes in configuration data that is stored in the [redacted]

Unisys will provide an automated interface between its CMDB and the Commonwealth's CMDB on a near real time electronic basis. This will be accomplished by utilizing the [redacted] to synchronize CMDB information as well as other ITSM information between the Unisys instance of [redacted] and the Commonwealth's instance of Remedy.

For a complete understanding of the Configuration process and supporting tools please refer to Schedule F, Section 3.2.1.7 "Configuration Management".

6.C Offeror must ensure that CIs are properly mapped in order to support the established Service Level Agreements (SLAs).

The Unisys solution complies with the Commonwealth's SLAs on this point.

6.D The Offeror will be required to provide an automated interface between its CMDB and the Commonwealth's CMDB.

As described above in item 6.A, the Unisys solution meets the Commonwealth's requirement to provide an automated interface between the Unisys and the Commonwealth CMDBs.

Unisys Team Experience

The Unisys Team has clients where we provide Data Center Architecture and Technology services such as American Red Cross, California State University, and the City of Minneapolis to name a few. The details of these clients can be found in Section 4.0, "Prior Experience".

The Unisys Team dedicated to the Commonwealth already uses most of the tools and processes described above. The proposed solution introduces new tools that are currently deployed and managed by the Unisys team for other customers. Thus the learning curve for the new tools has already been addressed by resident experts available to the Unisys/Commonwealth team.

Benefits to the Commonwealth

As the Commonwealth is well-aware, the Pennsylvania-based Unisys team dedicated to the Commonwealth's strategic and operations goals has established a well-honed governance process for providing the Commonwealth with forward-looking architecture proposals to

continuously update the Commonwealth's infrastructure. This process helped propel the Commonwealth to a contract extension with Unisys in 2008 that not only saved the Commonwealth hundreds of millions of dollars but resulted in a significant infrastructure refresh. The Unisys/Commonwealth Infrastructure Architecture governance process, jointly developed over prior years, has resulted in reliable and predictable services throughout transformation activities.

An example of these proven architecture services includes the project in 2008 to develop the high-capacity network to allow State Troopers to electronically transmit mug shots and better communicate with other agencies. Under the 18-month contract, Unisys upgraded the CLEAN system to allow state troopers to connect directly with other state, local and federal law enforcement officials. Unisys provided a high-bandwidth, high-availability network that included new features, such as the ability to transmit directly to troopers' cars. The new system replaced a Law Enforcement Message Switch with a new system based on an open architecture, accessible to Microsoft Windows-based users, as well as to users of the existing system.

3.2 Enable Common Service Portfolio

The Commonwealth currently bases its service management practices on the Information Technology Infrastructure Library (ITIL) v3, a worldwide recognized best-practice framework for the management and delivery of IT Services throughout their full life cycle. Accordingly, the Commonwealth requires that the Offeror's service management practices be based on the ITIL v3 framework and guidance. The Datacenter Architecture, which conforms to a service-oriented structure, is prescribed by the Commonwealth common service framework. The common service framework is comprised of 27 discrete IT Services divided into five (5) categories of service:

- **PMO & Service Management** – This category of service defines the overall datacenter management structure, including interactions with the Commonwealth and business partners.
- **Technical Services** – This category of service defines the datacenter architecture, and prescribes standards for datacenter continuity and security. This level also defines the workload transition process, for when Commonwealth Agencies migrate applications to the new datacenter computing Services model.
- **Facilities Management** – This category of service defines day-to-day datacenter operations and maintenance.
- **Managed Hosting Services** – This category of service defines a set of Commonwealth enterprise datacenter managed Services, each designed to accommodate the specific needs of the Commonwealth.
- **Capacity On Demand and Additional Services** – This category of service defines a set of infrastructure as a service (IaaS) offerings, each designed to provide just-in-time resources to the Commonwealth.

3.2.1 Program & Service Management

3.2.1.1 PMO & Contract Management

The PMO & Contract Management service is responsible for the overall program, projects, and contract elements, and will maintain an active working relationship with the Commonwealth project team. Offeror must assign an executive management team that will drive the processes to complete the due diligence required to make informed decisions and Services offerings that will meet the needs and requests of the Commonwealth. This executive team will also provide ongoing direction and leadership supporting the contract and designated Services, for the duration of the Contract.

The Offeror is required to provide and maintain operational, technical, and management staff contacts so that it is clear to the Commonwealth whom is the most direct contact for each operational area.

Reference Documentation

Schedule H - CCPM Commonwealth Computing Procedures Manual

Requirements		**Describe Compliance**
1.	Establish and maintain a program and project management framework, throughout the term of the contract.	Offeror must describe its proposed program and project management framework that will be used to support this contract.
2.	Establish and maintain a protocol for project estimation: ▪ Scope ▪ Hardware / Software ▪ Manpower to develop, test and implement ▪ All other resources required	Offeror must describe a project estimation protocol suitable for Commonwealth data-center migration projects.

3.	Collaboration meetings, technical exchanges, and forums – Through established procedures and meetings address in good faith all issues, needs, technical exchanges and forums with the Commonwealth team. Provide the technical knowledge, and knowledgeable staff, to effectively support and guide the Commonwealth's technology needs.	Offeror must describe how it will accomplish this.
4.	Translate the Datacenter contract requirements into measurable service level objectives, and codify those requirements by creating a set of service level agreements.	Offeror must provide examples of actual datacenter service level agreements, appropriately redacted to preserve client anonymity.
5.	Establish interim contract management procedures during the transition of datacenter Services. All interim contract management procedures must be negotiated in good faith and approved by both parties.	Offeror must describe an interim procedure to monitor and manage service delivery (conforming to Commonwealth policies and procedures) including but not limited to the following; Problem Management, Change Management, Service Level monitoring and reporting, physical and logical security, project management, etc. while the service is transitioned from the Commonwealth to the Offeror.
6.	Establish and maintain a process for change management for the Datacenter contract as requested or required. The final process developed must be coordinated with the Commonwealth contract compliance group and mutually agreed to by both parties.	Offeror must describe its proposed contract change management process.

7.	Subcontractor Relationship Management - Establish and enforce standards for ensuring subcontractor performance. The Offeror is responsible for all Services provided by subcontractors.	Offeror must describe its subcontractor relationship management process.
8.	Offeror must have experience in managing and supporting Managed Service Solutions for Datacenter Infrastructure Services.	Offeror must document its qualifications within its proposal.
9.	Offeror must have the capability to provide mainframe (IBM & Unisys) Services to support the current and future needs of the Commonwealth.	Offeror must document its qualifications within its proposal.
10.	Offeror must have experience managing and supporting SAP/Oracle ERP environments.	Offeror must document its qualifications within its proposal.
11.	Offeror must be an established firm which has provided hosted datacenter Services for a period exceeding three years	Offeror must document its qualifications within its proposal.
12.	Offeror must currently operate at least 3 Datacenters. Each of those datacenters have to have been operational for at least one (1) year and have a minimum five (5) clients hosted at each.	Offeror must document its qualifications within its proposal.

13.	Offeror must have experience handling comprehensive on-site operations and maintenance of Datacenter Physical Infrastructure Services. The Services must have been provided for a continuous period of at least one year during the last three years ending 2011. The Services may not have been terminated before completion of the relevant contract.	Offeror must document its qualifications within its proposal.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The PMO serves as a central point of management for the overall program. Through the PMO, Unisys will manage continuous cross-organizational collaboration to achieve strategic business goals for the Commonwealth. The PMO organization serves to:

- Provide centralized and coordinated management of all initiatives and projects undertaken to support the data center compute services contract.
- Work in conjunction with Commonwealth leadership to establish a program governance structure.
- Focus on the coordinated planning, prioritization and execution of projects and subprojects that are tied to the Commonwealth's overall business objectives.
- Conduct activity ranging from providing supporting functions such as development of standardized policies and procedures to the direct management responsibility for achieving business objectives through day-to-day service delivery.
- Act as an integral stakeholder and key decision-maker along with the Commonwealth during the initiation stage of each project/initiative.
- Coordinate effective use of resources and capacity management across all projects and contract activities.
- Provide central point of communication management across projects and throughout agencies.
- Enforce the use of best practices, process standards and project methodology.

The Program Management Office is led by the Engagement Executive, [redacted] All

executives responsible for the seven aspects of the program report directly to Ann.

Figure 3.2.1.1-1 depicts the seven organizations with their basic functions, noting key personnel in red.

Figure 3.2.1.1-1. Seven Organizations Staffing Requirements

Support for the Commonwealth far exceeds the boundaries of the team defined above and detailed further within Section 5. Unisys executives are committed to the success of the Commonwealth all the way up to our Chief Executive Officer, [redacted] who serves as the Executive Sponsor of the Commonwealth of Pennsylvania. [redacted] reports directly to [redacted] Regional Vice President who has served the Commonwealth for the past 29 years building long-lasting executive relationships through 5 administrations. The Unisys Executive Leadership Committee discussed in the front of section 5.0 provides far-reaching support for the Harrisburg, PA based team throughout Unisys and partner leadership.

The **Program Management Office** is an integral part of the current program and has been enhanced over the current DPH PMO to manage the complexities of a much larger and very different DCCS program. This team is responsible for the governance and execution of the overall program, projects, and contract elements, and provides ongoing direction and leadership supporting the contract and designated services for the duration of the contract.

As shown in **Figure 3.2.1.1-2**, the PMO also has supporting staff responsible for the three major functions of Financial Management, Contract Management, and Vendor and Subcontractor Management. The PMO support team functions are further maturing under the new contract. Through the enhanced Financial Management function, this office provides accurate and cost-effective stewardship of IT assets and resources providing a truly transparent analysis of the Commonwealth spending on services. Other enhancements include dedicated focus on subcontractor accountability for performance of services throughout the contract term along with management of third-party software licensing and all maintenance agreements for hardware and software.

Figure 3.2.1.1-2. Project Office Support Team Duties and Staffing Requirements

1. ***Establish and maintain a program and project management framework, throughout the term of the contract. Offeror must describe its proposed program and project management framework that will be used to support this contract.***

The Unisys Team's strategy incorporates a comprehensive approach to transitioning and managing data centers. This proven methodology has been used in more than 187 public sector and commercial outsourcing engagements. In addition to internally consolidating 58 worldwide data centers into one, the Team has had proven success with large outsourcing clients such as United HealthCare, General Services Administration, PECO Energy, BASF, the State of Michigan, IRS, and Kodak.

Working with Unisys on the Data PowerHouse project provides the Commonwealth with years of experience and dedication to Commonwealth business, and will also eliminate the need for ramp up, training, and relationship building required for a new vendor. Leveraging the existing team enables us to provide stable service delivery going forward, and will facilitate the continuation of service improvement efforts already underway ensuring that Commonwealth business does not skip a beat. The Unisys Team has made an investment to certify all staff supporting the Commonwealth in ITIL V3 Foundations and our Service Management Platform is

based on ITIL V3. This depth of process and work ethic brings a strong base of repeatable, consistent development and operations support across the enterprise.

Incumbency Transition through steady-state operations is a key component of our work plan. As the incumbent vendor, Unisys will continue to provide outstanding service to the Commonwealth's mission-critical application infrastructure hosted in the Data PowerHouse, and provide staff augmentation to the operations in the Enterprise Data Center until each location is fully transitioned to the new model. Our incumbency provides us the unique ability to seed the transition and migration teams with knowledgeable resources that understand the Commonwealth infrastructure. This knowledge considerably reduces ramp-up time to train the staff on basic infrastructure support and the priorities and nuances of each agency. It is during this time that we will accelerate our focus on reforming our organizational structure and work processes to meet the changing requirements of the new model.

It is during Month 1 of transition that we will begin to bring key personnel on board to establish our PMO under the new contract starting with the Engagement Executive, [redacted], our Transition Executive, [redacted], the second Transition Manager, [redacted], and Senior Enterprise Infrastructure Architect, [redacted]. Positions currently held by [redacted] and [redacted] will be backfilled on the Data PowerHouse contract. This team will lead all aspects of the transition efforts. We will also bring on the Service Excellence Officer; [redacted] to build our Service Excellence Office that will initially reform workflows of existing ITIL aligned processes to meet the needs of the new model.

Unisys establishes clear delineation of project and program boundaries, and well-articulated outputs. Proper planning enables the program manager to define start and end dates that are based on detailed requirements and accurate cost and resource estimates. A well-defined scope and change control process has been adopted to manage these types of program variations. This includes resource planning and defining roles and responsibilities in advance.

Unisys will establish a framework that utilizes a PMI based methodology. The Unisys Global Project Management Practice (PMP) is an industry best practice approach that employs process, people, and technology to deliver projects on time and within budget. All Unisys project managers have access to the support and training of the Global Project Management Practice and are required to achieve PMI certification. This creates standard skill sets and consistent project delivery. Objectives of the practice include cost optimization (focus on estimating accuracy and cost management), continuous improvement (knowledge sharing, artifact reuse, lessons learned), and governance (tracking metrics, reviews, alignment with account management and client).

All projects managed for and on behalf of the Commonwealth will be delivered using a standard form and method traversing the following phases: Initiating, Planning, Executing, Monitoring and Controlling, Closing. Project collateral will be consistent, supportive, timely, and of a high quality. Communication plans and cadence will be agreed upon with the Commonwealth for each individual project. Unisys has demonstrated its commitment to rigorous project management methodology by delivering multiple parallel projects to the Commonwealth and will continue to do so. The project management approach is best described by the following:

Unisys Solution Delivery Framework (SDF)SM

Unisys has standardized the best project management practices, tested and proven by our experience, into our project management methodology named Solution Delivery FrameworkSM. This provides a formal, yet flexible, approach to formulating, implementing, and maintaining

information systems as driven by the business needs of our clients.

The SDF was developed to assist Unisys delivery teams in providing value-added services to clients, including strategic direction setting, organizational change, and the planning, design, and implementation of information systems. Our methodology, based on Project Management Institute (PMI) standards, is a combination of methods, techniques, and tools used by Unisys to deliver system solutions.

An essential aspect of the SDF is the application of quality management techniques requiring the use of processes, procedures, and guidelines to support the assurance of quality throughout the engagement. Quality assurance reviews are conducted at major checkpoint.

The Framework assists Unisys professionals in planning and managing resources to meet the client's business and technical requirements, on time and within budget.

The primary objective of the SDF is to provide the methods, techniques, and tools to manage one or more related projects, and the scope and flexibility of the SDF addresses small to large, complex engagements. Our four guiding principles are:

- Clear goals are essential for successful projects.
- Adherence to formal and constantly improving best practice processes will provide that all solutions and deliverable products meet their stated requirements.
- Planning and scheduling of all tasks and resources and subsequent monitoring, control, and reporting are essential to solution delivery.
- Agreement on deliverables and definition of an effective change management process are essential to achieving the project's goals.

Our framework provides best practices, templates and guidelines for all project phases from the initial proposal through project closeout.

2. Establish and maintain a protocol for project estimation:

Scope

Hardware / Software

Manpower to develop, test and implement

All other resources required

Offeror must describe a project estimation protocol suitable for Commonwealth data- center migration projects.

Estimating methods used by Unisys are tailored to the specific project. These methods are used to identify project scope, right-size hardware and software configurations, estimate manpower and other resource requirements to develop, test and ultimately implement the project.

The method used for most definitive estimates is to fully define and understand the scope, develop a Work Breakdown Structure (WBS) that encompasses all deliverables for the project, decompose the deliverables to sufficient depth to be able to estimate the components as tasks. Quantify the work breakdowns structure within the boundaries set by project scope. Then apply costing to each element of the work breakdown structure which is summed to a total cost.

As the WBS is formed, we develop extensive documentation for review (to obtain consistent pricing).

Early estimates may employ various means of cost modeling. The basic characteristics of effective estimating include: clear identification of task, broad participation in preparing estimates, availability of valid data, standardized structure for the estimate, provision for program uncertainties, recognition of inflation, recognition of excluded costs, independent review of estimates, and revision of estimates for significant program changes.

During the costing process, we follow a set of best practices that provide repeatable methods that result in high-quality cost estimates that are comprehensive and accurate and that can be easily and clearly traced, replicated, and updated.

The Unisys Team has 30 plus years of experience specific to Commonwealth projects and data center migrations. We take the approach noted above and apply the benefit of subject matter expertise that our Commonwealth experience provides. We employ a detailed estimating technique that generates estimates at the lowest level of detail and builds the summary estimates by rolling up the details. Applying the Delphi Technique of estimation, Unisys leverages corporate subject matter experts (SMEs) to develop estimates for a pre-determined set of tasks or project. A description of the work involved is provided to the SMEs before the exercise begins. The SMEs develop their estimates independently, discuss differences and assumptions, and then go through one or more revision cycles to reach a consensus.

3. Collaboration meetings, technical exchanges, and forums – Through established procedures and meetings address in good faith all issues, needs, technical exchanges and forums with the Commonwealth team. Provide the technical knowledge, and knowledgeable staff, to effectively support and guide the Commonwealth's technology needs. Offeror must describe how it will accomplish this.

Unisys understands the need for meetings to effectively and efficiently communicate important information to program stakeholders as part of a good governance model. However, management meetings are but one component of that communication and governance model.

There will be a three tier meeting structure that will provide visibility at all levels within our respective organizations.

1. *Tier 1 – Executive Governance and Steering Committees*
   The objective of these meetings is to focus on the strategy and goals of the engagement. This will serve to better align the IT initiatives with the business goals of the Commonwealth. These meetings will develop and review strategy for the engagement. It is a forum for sharing insights on application of industry best practices. These meetings should be held monthly early in the contract and quarterly as steady state operations are achieved.

2. *Tier 2 – Program Management*
   Program management meetings focus on operational performance. The objectives of these meetings are to manage performance and effectiveness, manage SLAs and communications, and provide a platform for continuous improvement. These meetings should occur weekly in the transition phase, and monthly as operations reach steady state.

3. *Tier 3 – Service Delivery Management Teams*
   These meetings are meant to handle day-to-day issues. They focus on daily operations, escalation management, 3rd party management and handoffs, and end-to-end incident management. These meetings would occur daily during transition and weekly after steady state is achieved.

All meetings require controlled agendas to verify that they are taking place per their agreed upon frequency and the meetings are productive for all parties. All points for improvement can be added to the CSIIP library to be jointly addressed by Unisys and the Commonwealth.

Examples of subject matter addressed through the meetings held at various levels include the following:

- **Transition and Transformation Plan Tracking** -- Gather status and metrics from Transition and Transformation activities, assess status and risk, identify issues and risks, design and implement mitigation for risks and corrective actions for issues, track to closure at subsequent meetings
- **Contractor Performance Reviews.** Gather status and metrics from Service level activities, Gather status and metrics from Transition, assess status and risk, identify issues and risks, design and implement mitigation for risks and corrective actions for issues, track to closure at subsequent meetings
- **Technical Exchange/Forums.** Will be planned and facilitated by the Enterprise Architecture team with agendas structured to address emerging technologies and their impact on Commonwealth Agency business. These forums promote collaboration and information sharing among agencies in a learning environment that provides structured vendor sessions and access to industry leaders with expertise on relevant technologies. Agendas will be jointly developed with input from the Unisys Team and the Commonwealth Agencies
- **Dispute Management.** Gather the facts, distill facts to relevant information, develop possible solutions, negotiate potential solutions with the disputing organizations, find common ground or acceptable compromise, implement solutions, track for recurring problems until situation is closed
- **Issues/Risk Database.** Track the progress and usefulness of the deployed Services, track the availability of unused services, track status and risk for services, track status and risk for projects. Produce reports for review and comment at meetings, gather information and assignments from meetings, confirm the staff responsible for the issue or risk is aware of guidance from leadership, record status from staff working the issue or risk.
- **Acquisition Planning.** Coordinate and conduct planning sessions to address the enterprise impacts for new hardware of software acquisitions, service deployments, and projects. Document findings in issues/risks database; confirm the staff responsible for the issue or risk is aware of guidance from leadership; record status from staff working the issue or risk.

Unisys will provide the technical knowledge, and knowledgeable staff, to effectively support and guide the Commonwealth's technology needs. An Agency Infrastructure Architect that reports to the Senior Enterprise Architect will be assigned to each agency and directly aligned to the Agency Account Manager to support this need.

4. Translate the Datacenter contract requirements into measurable service level objectives, and codify those requirements by creating a set of service level agreements. Offeror must provide examples of actual datacenter service level agreements, appropriately redacted to preserve client anonymity.

Unisys will work with the Commonwealth to establish Service Level Agreements based on the service levels noted in the Commonwealth's Schedule J.3. The Unisys Team has been managing to Service Level Agreements (SLA) with the Commonwealth on the DPH contract. In 2012, Unisys managed to 427 Commonwealth SLAs monthly, performing at a 99.9% achievement rate. These SLAs included the following:

- System Availability
  - High Availability – 99.9%
  - Non-HA Enterprise Class and Partitions – 99.8%
  - Non-HA Commodity – 99.5%
- Online Transaction Processing Systems availability
- Production Batch Completion On Time

In addition, Unisys has provided the following types of SLAs for other customers:

- Incident Management Response and Resolution
- Timely Incident Root Cause Analysis Reporting
- Backup Management
- Data Restore Timeliness and Accuracy
- Timely Response to Service Requests
- Timely Response to Change Requests
- SAN Availability
- Facility Environmental Controls
- Disaster Recovery Restore Time

The SLA table in **Figure 3.2.1.1-3** below shows actual Service Level Agreements for a redacted Unisys customer.

SLA Description	Required Achievement
Severity Level 1 Incident Acknowledgement Time	95% Response w/in 30 Minutes
Severity Level 2 Incident Acknowledgement Time	95% Response w/in 60 Minutes
Severity Level 3 Incident Acknowledgement Time	95% Response w/in 4 Hours
Severity Level 4 Incident Acknowledgement Time	95% Response w/in 8 Hours
Severity Level 1 Incident Resolution Time	95% Resolve w/in 4 Hours
Severity Level 2 Incident Resolution Time	95% Resolve w/in 6 Hours
Severity Level 3 Incident Resolution Time	95% Resolve w/in 1 Business Day
Severity Level 4 Incident Resolution Time	95% Resolve w/in 5 Business Days
Data Center Server Data Backups	98% On Time Completion
Data Center Server Data Restores	98% On Time Completion

System Change Success	98% Successful System Changes
Platinum Server Pool Availability	99.9% Aggregate Availability
Gold Server Pool Availability	99.5% Aggregate Availability
Silver Server Pool Availability	99.0% Aggregate Availability
Bronze Server Pool Availability	98.0% Aggregate Availability

Figure 3.2.1.1-3: Unisys Redacted Customer SLA Table

Please refer to Schedule J.3 for detail regarding how Unisys will translate and codify the SLA requirements.

5A. Establish interim contract management procedures during the transition of datacenter Services. All interim contract management procedures must be negotiated in good faith and approved by both parties.

Our Team's outsourcing expertise and our operational experience gained from our longstanding partnership with the Commonwealth Agencies will help to make the transition least disruptive to the Commonwealth's end users. Unisys will leverage the current contract management procedures as interim procedures during the transition period with minor modifications that provide the ability to make contractual changes for new service offerings such as on-demand services and the flexibility to make the switch from the fixed-price nature of the current contract to a consumption-based pricing model. These procedures are already approved and familiar to the Commonwealth and as the incumbent, puts Unisys in a good position to minimize any procedural changes.

Ultimately, contractual changes and Commonwealth invoicing will be facilitated using the Enterprise Services Catalog on the Services Portal. The Enterprise Services Catalog contains all data center compute services that can be purchased through the contract. The tool leveraged also provides the capability to track agency spending and automatically chargeback appropriately through the monthly invoicing process. The transition to this tool will involve collaboration with the Office of Administration and agency leadership to establish workflows aligned to change management process governance, and in accordance with agency approval limits, and to establish services to be included in the catalog.

In the interim, we will continue to use a paper based Change Order process. The high-level process in **Figure 3.2.1.1-4** below illustrates the process flow from the point that need is identified by an agency through solution implementation. The change order process is one step in that process.

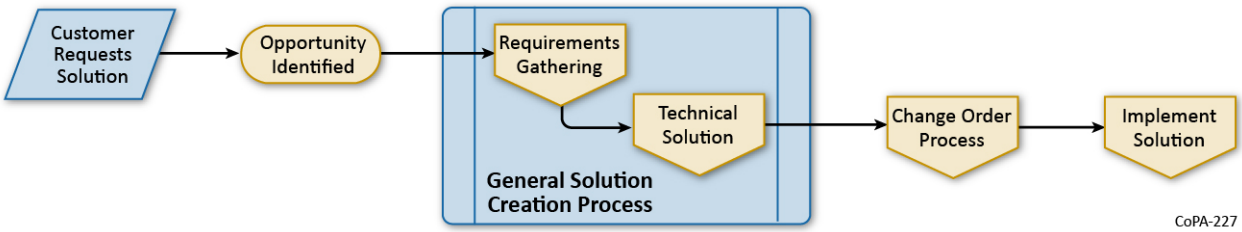

Figure 3.2.1.1-4: High Level Interim Contract Change Management Process

The Unisys Team will work with the Commonwealth to establish interim contract change management procedures. Minimally, the interim process will include the following steps:

1. The agency notifies the Unisys Agency Account Manager that it has a need for data center compute services.

2. The requesting agency, the Unisys Agency Account Manager (AAM) and the Agency Infrastructure Architect (AIA) will engage in requirements gathering.

3. The Unisys Contract Management team will create a paper based request for services form in a format agreed by the Commonwealth. The Contract Manager will document requirements provided by the AAM and AIA and send the form to the agency for approval of requirements.

4. Upon approval of requirements, the Unisys Agency Infrastructure Architect will develop and document the solution.

5. The Unisys Contract Manager will document the solution on the request for service form and provide the form to the agency leader with approval authority, and to the Office of Administration.

6. Receiving approval from the agency and the Office of Administration indicates the project and solution have been approved and can move forward to a change order.

7. The Change Order is a contractually binding document that serves as a means to modify Unisys scope on the data center compute services contract. Upon approval of a request for service, the change order document will be drafted in a format agreed by the Commonwealth.

8. The change order document will be completed to reflect any change in contractual scope and provided to the Contract Compliance team within the Office of Administration.

9. When the change order is approved by Unisys and Office of Administration authorized leadership, Unisys will implement the change to contract scope.

The paper-based change order process will also be leveraged as a means to document hardware and software additions and deletions as well as Service Level Agreements required based on the selected services. The paper-based process will be used in the interim until the Enterprise Services Catalog on the Services Portal and ITSM modules are fully operational. Services used by an agency will be documented by the Financial Management team who will manually track the services pending the availability of a fully operational Enterprise Services Catalog. This will enable agencies to take advantage of the consumption based model, which enables them to use services as needed and discontinue services when they are no longer needed. The information tracked by the Financial Management team confirms that the Commonwealth is only charged for services used. This process will be automated within the Enterprise Services Catalog post transition.

5B. Offeror must describe an interim procedure to monitor and manage service delivery (conforming to Commonwealth policies and procedures) including but not limited to the following; Problem

Management, Change Management, Service Level monitoring and reporting, physical and logical security, project management, etc. while the service is transitioned from the Commonwealth to the Offeror.

During the transition period, the Service Excellence Office which manages program quality will review existing service delivery processes used on the DPH contract. Those processes will be optimized and workflows adjusted to meet the needs of the new contract. Unisys will implement the ITIL compliant procedures for service delivery that will be used for the duration of the contract using workflows in the ITSM system.

Prior to the availability of the automated workflows and business to business connectivity to the Commonwealth's ITSM system, we will utilize the ITSM system in use on the DPH contract to record Problem Management, Change Management, Service Level Monitoring, Project Management, and all other service delivery data. Since that system is not connected to the Commonwealth's ITSM system, Commonwealth users can call the Unisys Service Desk to request services, changes and to report incidents. The Service Desk will then record the information into the Remedy system.

Existing Unisys DPH procedures will be followed in the interim for physical and logical security while these procedures are being drafted for the new contract. Security procedures will be drafted as part of the overall Security Plan key deliverable.

6A. Establish and maintain a process for change management for the Datacenter contract as requested or required. The final process developed must be coordinated with the Commonwealth contract compliance group and mutually agreed to by both parties. Offeror must describe its proposed contract change management process.

The process of Change Management is similar in nature to the interim process previously discussed in that an agency requests changes, requirements and solutions are created, and approvals are obtained, but the main difference is that a large portion of this process will be automated.

Contractual changes and Commonwealth invoicing will be facilitated using the Enterprise Services Catalog on the Services Portal. The Enterprise Services Catalog contains all data center compute services that can be purchased through the contract. The tool leveraged also provides the capability to track agency spending and automatically chargeback appropriately through the monthly invoicing process. The workflows in the Enterprise Services Catalog will be aligned to change management process governance, and in accordance with agency approval limitations.

The high-level process in **Figure 3.2.1.1-5** below illustrates the process flow from the point that need is identified by an agency through service implementation.

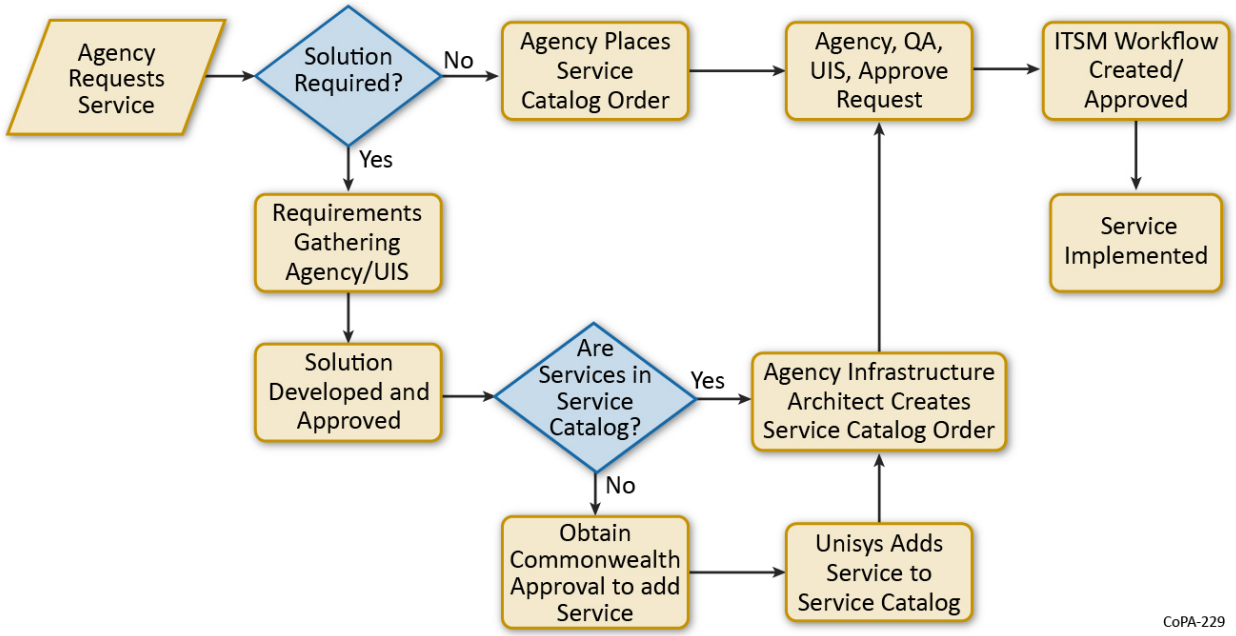

Figure 3.2.1.1-5 High Level Contract Change Management Process

During transition, the Unisys Team will work with the Commonwealth to establish long-term contract change management procedures. Our suggested approach is outlined in Figure 3.2.1.1-5 above. There are many types of change requests that will be executed using this process.

This discussion will address processing of a simple change first followed by the steps required to process a complex change. A simple change is defined as a request for a service or services for which an agency requires no assistance with the solution, and the services are defined in the Enterprise Services Catalog. A complex change is initiated when the complexity of the services needed requires Unisys architect assistance with developing a solution, and/or the services are not currently defined in the Enterprise Services Catalog.

Simple Change Process

1. The agency identifies services needed and places an order from the Enterprise Services Catalog located on the Services Portal. This process is similar to Internet shopping in that agencies can browse all of the services offered, select them for purchase, and place the order.

2. The order will automatically be routed to agency approvers, Unisys approvers, and Office of Administration approvers.

3. Once the order is approved by all parties, automated workflows will be initiated in the ITSM system. The automated workflows open change and service requests that are either automatically provisioned with runbooks or assigned to teams that will implement the new service. Upon approval of the request and ITSM, the services will be implemented.

Agencies also have the capability to use the same process to remove services that they no longer need.

Complex Change Process

1. The agency identifies a need for additional services and places a request for solution from the Enterprise Services Catalog. In this case one or both of the following are true:
   - Addition of the services requires a technology solution to be developed
   - The services needed do not exist in the Enterprise Services Catalog
2. The requesting agency, the Unisys Agency Account Manager (AAM) and the Agency Infrastructure Architect (AIA) will engage in requirements gathering. Requirements will be formally documented by Unisys and approved by the Commonwealth agency to confirm understanding of both parties.
3. Once requirements are approved, the Unisys AIA will develop a solution that will be formally reviewed with the agency. The agency will have the opportunity to recommend changes prior to solution approval.
4. When the solution is approved, the AIA will validate that all services needed are provided in the Enterprise Services Catalog. If there are services needed that are not in the Enterprise Services Catalog, Unisys will approach the Commonwealth to obtain approval to add services to the Enterprise Services Catalog.
5. At the point that all services are available to be ordered in the Enterprise Services Catalog, the AIA creates an order in the Enterprise Services Catalog.
6. The order will automatically be routed to agency approvers, Unisys approvers, and Office of Administration approvers.
7. Once the order is approved by all parties, automated workflows will be initiated in the ITSM system. The automated workflows open change and service requests that are automatically provisioned or are assigned to teams that will implement the new service. Upon approval of the request and ITSM workflows, the services will be implemented.

ITSM workflows will include ensuring that all post-implementation activities are completed at the appropriate time including tasks such as updating operational documentation and the Commonwealth Computing Procedures Manual, updating hardware and software asset information in the CMDB, and updating Service Level Management documentation to include new SLAs.

7. Subcontractor Relationship Management - Establish and enforce standards for ensuring subcontractor performance. The Offeror is responsible for all Services provided by subcontractors. Offeror must describe its subcontractor relationship management process.

Contracts with subcontractors will include all terms and conditions from the Commonwealth contract that are applicable to that subcontractor. There is a PMO Subcontractor Manager assigned to monitor contract compliance and work changes with all subcontractors as may be affected by prime contract change orders/contract changes. Subcontractors are held to the same level of performance as expected of Unisys employees. Our proposed list of subcontractor partners is included in Schedule L of our proposal.

All subcontractors will be governed by the Unisys Supply Management organization including contract terms, services scope, quality, and payments. As part of our subcontractor management process, the Unisys PMO Subcontractor Manager will monitor and measure performance of our subcontractors to verify that services provided are meeting the contract requirements. All quality and non-compliance issues will be managed by Unisys. The Subcontractor Manager will meet with each subcontractor on a monthly or quarterly basis to review status of program activity, the subcontractor's performance, upcoming requirements, pertinent change, incident and problem activity, and identification and remediation of potential performance issues.

Should it be necessary to replace a subcontractor providing service, Unisys will notify the Commonwealth of Pennsylvania with specific plans and a schedule for the subcontractor change. This notification will include a request for Commonwealth approval for the recommended replacement firm who will meet or exceed the qualification of the replaced subcontractor.

Our proposed list of subcontractor partners is included in Schedule L of our proposal and more details on their qualifications in Section 4.1, with past performance highlights in Section 4.5. Section F.3.2.1.1.3 Subcontractor Management provides more detail on Subcontractor Management.

8. Offeror must have experience in managing and supporting Managed Service Solutions for Datacenter Infrastructure Services. Offeror must document its qualifications within its proposal.

The Unisys Team possesses the ability to deliver cost-efficient, high quality, and state-of-the art IT outsourcing services including Managed Services Solutions for Data Center Infrastructure Services. Unisys has implemented global sourcing capabilities not just in the United States, but also in Eastern Europe, China, India, South America, and New Zealand.

Unisys has made strategic investments in system infrastructure, processes, tools, training, and people to build our global delivery model. **Figure 3.2.1.1-6** represents some of our corporate domestic, near shore, and offshore resource strengths in the areas of data center footprints.

[redacted]

Figure 3.2.1.1-6 Global Services Footprint

For worldwide volumes, global reach, and market position for services delivered similar to the Commonwealth of Pennsylvania, please see **Figure 3.2.1.1-7**.

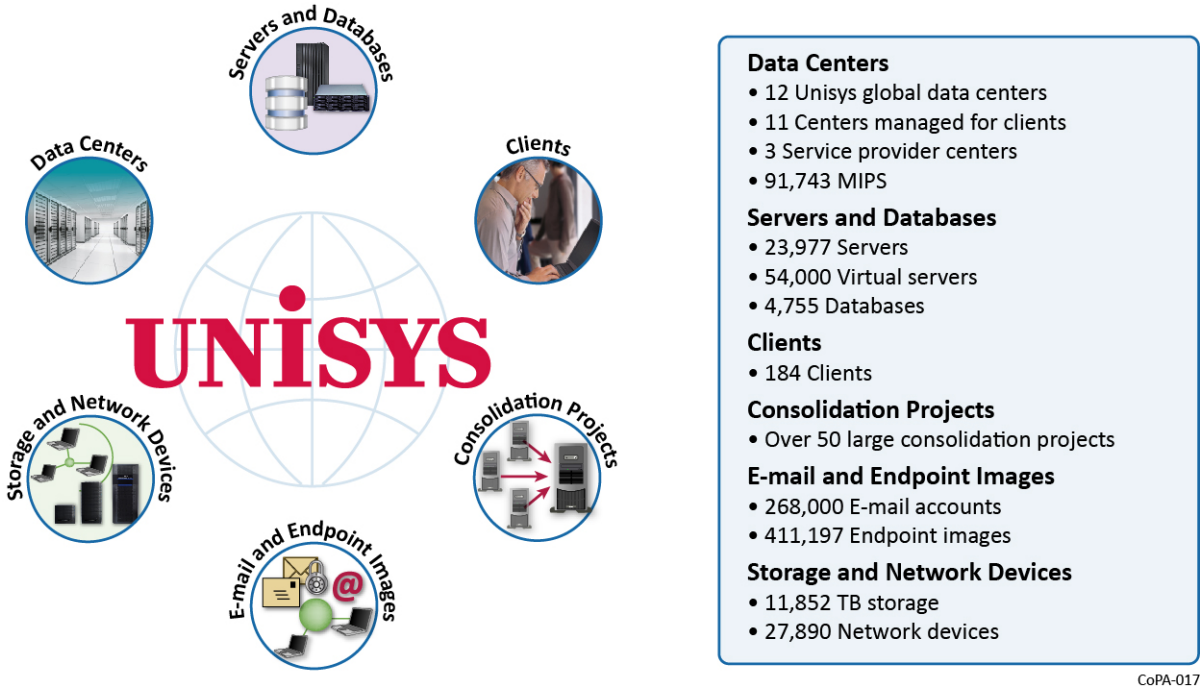

Figure 3.2.1.1-7 Global Services and Worldwide Volumes

Unisys has been managing the Commonwealth Data PowerHouse (DPH) Datacenter since 1999, having successfully transitioned seventeen (17) agencies within a twelve month period. Similar to the Commonwealth's [redacted] model of the new contract, IBM manages the Georgia Technology Authority's consolidated data center. It is a Tier 4 facility housing Midrange and Mainframe equipment and services.

In the United States, Unisys hosts 19 clients in the [redacted] and 9 clients in the [redacted]. The [redacted] acts as the disaster recovery facility for a number of our customers hosted in the [redacted].

9. Offeror must have the capability to provide mainframe (IBM & Unisys) Services to support the current and future needs of the Commonwealth. Offeror must document its qualifications within its proposal.

Unisys and IBM are uniquely qualified in that we would be supporting our own equipment. We have been supporting this equipment for the Commonwealth for nearly 60 years, including the 13 years for the Data PowerHouse.

The reference detail for IBM and Unisys mainframe support client references listed below are documented in Section 4.5 of the proposal.

1. The Internal Revenue Service (IRS): Unisys and IBM mainframes
2. Commonwealth of Pennsylvania: Unisys and IBM mainframes
3. Defense Information Systems (DISA): Unisys mainframes
4. State of Georgia: IBM mainframes
5. State of Washington: IBM mainframes

10. Offeror must have experience managing and supporting SAP/Oracle ERP environments. Offeror must document its qualifications within its proposal.

Unisys currently supports ERP environments for the Commonwealth's Integrated Enterprise System, the PA Liquor Control Board, and the Department of Revenue. As a result of the implementations of these Commonwealth SAP and Oracle ERP systems, Unisys is in the exclusive position of having gone through an actual transition, working closely with Commonwealth experts to build and improve their systems. Experience specific to the Commonwealth that was gained during these implementations is invaluable to future expansions and upgrades to these systems.

The reference detail for SAP support client references listed below are documented Section 4.5 of the proposal.

SAP Systems

1. Commonwealth – IES SAP General Accounting System
2. Commonwealth – DOR SAP Integrated Tax System
3. World Leading Brewery Company - SAP HCM ECC 6.0

The reference detail for Oracle ERP support client references listed below are documented Section 4.5 of the proposal.

Oracle Systems

1. Commonwealth - PLCB Oracle Enterprise
2. California State University – Unified University Management System
3. United Kingdom Ministry of Justice

11. Offeror must be an established firm which has provided hosted datacenter Services for a period exceeding three years. Offeror must document its qualifications within its proposal.

The 140-year history of Unisys is one of reliable, technically excellent, tenacious people helping businesses and governments protect their assets and apply information technology to achieve new levels of competitiveness and success. IBM with its rich 102-year history of innovations has significantly contributed to "making the world work better."

Unisys and IBM are established leaders in providing hosted data center services for many years. In fact, Unisys built the industry's first data center in 1946. For the past thirteen (13) years, Unisys and IBM have been successfully managing the on-site operations and maintenance of the Commonwealth's Data PowerHouse, as well as many other data centers as noted in 8A above.

12. Offeror must currently operate at least 3 Datacenters. Each of those datacenters have to have been operational for at least one (1) year and have a minimum five (5) clients hosted at each. Offeror must document its qualifications within its proposal.

Unisys currently operates 26 data centers, 12 of its own data center facilities, 11 client facilities, and 3 service provider facilities, all of which have been established for a minimum of one year. Unisys has at least three facilities, each with a minimum of 5 clients hosted. Our experience also includes managing the Commonwealth's Willow Oak data center since 1999.

13. Offeror must have experience handling comprehensive on-site operations and maintenance of Datacenter Physical Infrastructure Services. The Services must have been provided for a continuous period of at least one year during the last three years ending 2011. The Services may not have been terminated before completion of the relevant contract. Offeror must document its qualifications within its proposal.

Unisys subcontracts its data center facilities physical infrastructure management services to Jones Lang LaSalle (JLL). As the world's largest facilities management company, we entrust JLL with management of our data center physical infrastructure supporting our systems infrastructure that hosts the most mission-critical applications for our customers. JLL employs the best practices they have honed while managing critical environments and one-of-a-kind facilities on five continents. JLL has been managing Unisys Data Center facilities for over three years.

JLL also provides Facilities Engineering analysis support to provide infrastructure upgrade and capital investment requirements, end-of-service life assessments, Uptime Institute tier level

compliance currency, Infrastructure Change Management planning and oversight, and a host of additional technical support functions to provide ongoing, top notch facility performance.

Unisys currently provides data center facilities physical infrastructure management services in partnership with JLL in the Commonwealth's Willow Oak data center. For more details on Unisys facilities management, please reference Section F 3.2.3.1 Facilities Management.

Services have been provided for a continuous period of at least one year during the last three years ending 2011 from the Unisys facilities. The Services were not terminated before completion of any contract.

Unisys Team Experience

Unisys and our subcontractor IBM have been working with the Commonwealth supporting mainframe systems for many years, and have been managing the Commonwealth Data PowerHouse Data Center for more than 13 years. We are uniquely qualified as a result of the experience gained on the Commonwealth systems and business environments. Even more importantly, we have developed long term relationships and trust with Commonwealth staff. We do not provide a "one size fits all" solution, but work in partnership with each agency on their specific needs and requirements.

In addition, because we manage other data centers, we can leverage a broad base of expertise and staff as situations warrant. Throughout our response to this section, Unisys has cited numerous past experience citations including the ability to support managed data center services across a broad customer base, and a list of current customers that have agreed to provide references for us in the areas of ERP and Mainframe support services.

Benefits to the Commonwealth

We already have many of the Commonwealth process requirements in place, having developed them with the Commonwealth's specific needs and requirements in mind and with their input and participation. Therefore, interim procedures can be quickly implemented with minor adjustments to current procedures, reducing learning curves and duplication of effort. In choosing Unisys to continue data center services, transition risk and knowledge transfer is drastically reduced.

3.2.1.1.1 Financial Management

The Offeror must provide financial management for Services to provide accurate and cost effective stewardship of IT assets and resources. Financial management will be used to plan, control, and recover costs expended in providing the Services. Overall, the goal of financial management is to offer a truly transparent analysis of the Commonwealth spending on Services. In many cases, this analysis of efficiency will be used to create intelligent, metric-based cost-reduction strategies.

Clear and transparent invoicing, both for the Commonwealth and for individual agencies, will be required to insure integrity and accountability of all invoices. It is expected that invoicing may vary somewhat on a monthly basis whenever Services are either increased or decreased.

The Offeror is expected to work with the Commonwealth to identify major investments as part of the budgetary planning process. The Commonwealth will review strategic and tactical objectives as indicated in the planning process to measure impact on its budget(s).

A significant percentage of the Commonwealth's funding comes from federal sources. Offeror's must be able to provide detailed service information necessary to obtain the uninterrupted flow of federal funds.

On a monthly basis, the Offeror must present the Commonwealth with a single enterprise invoice and multiple agency invoices for chargeback purposes. The agency's invoices must include sufficient detail to validate and accurately allocate charges to funding sources based on actual usage.

The Offeror is required to capture and provide information related to monthly volumes of work, counts, and utilization of specific infrastructure areas. The Offeror and the Commonwealth will develop a set of detailed, equitable and repeatable chargeback procedures for each provided Service based on either actual monthly utilization or allocation methods depending on which is most appropriate. The chargeback procedures will include the ability to map to discrete programs and funding sources identified by agencies with this requirement.

The Offeror must integrate its Financial Management tool with the Commonwealth's Enterprise ITSM system which currently is BMC Remedy Billing module and processes; which may change during the term of the resulting contract. The Offeror must leverage any current chargeback procedures and implementation configuration to accelerate the implementation of the new system. The Offeror must expand the chargeback system to capture all related computing related charges associated with the Datacenter project.

Reference Documentation

N/A

Requirements		Describe Compliance
1.	Provide a uniform rate structure which charges the same rates for the same/similar Services.	Offeror must provide detailed descriptions on the type of Services included in its overall solution. Cost information must not be provided in the technical submittal.
2.	Monthly invoicing for Services will be provided to the Commonwealth. Invoicing will identify Services rendered, pricing, and agency specific service usage. Transparency in billing will identify service cost per agency. The Commonwealth does not have a common system for charge backs. Some current services are not charged back, and some are done manually. The selected Offeror must connect to the Commonwealth's ITSM system. The Commonwealth does not require a full charge back system. The agency invoices should provide billing detail so the agency has full transparency into the services it consumed. Billing details shall include all services procured by agency general ledger (GL) code. A service may be allocated across multiple GL codes. Identify method for adjusting agency level billing due to failing to meet SLAs.	Offeror must describe its process or policies that will address this requirement. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

3.	Flexible pricing will be applied when Services are either increased or decreased.	Offeror must describe its process or policies that will address the flexible pricing requirements. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.
4.	Interim Financial Management Procedures will be required as the Commonwealth transitions its current architecture to the Offeror's Services.	Offeror must describe its approach and procedure(s) for providing invoices, invoice verification and charge back to datacenter customers including but not limited to the following; service components, asset management, asset transfer, forecasting, etc.
5.	During the term of the Contract, provide cost effective approaches and suggestions to improve Services while maintaining or lowering the cost for Services. For example as the industry costs for server and storage capacity are reduced over time, it is expected that there will be a continual cost reduction in like Services within this contract.	Offeror must describe its process or policies that will address this requirement. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.
6.	Integrate Financial Management with other service management processes, especially with SLA, Capacity and Configuration Management.	Offeror must describe how it will accomplish this.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Through the **Financial Management** function, the PMO provides accurate and cost-effective stewardship of IT assets and resources. They plan, control, and recover costs expended in providing the services offering a truly transparent analysis of the Commonwealth spending on services. Areas of responsibility under Financial Management include:

- **Budgetary Planning**: the budgetary planning function works with the Commonwealth to identify major investments as part of the budgetary planning process.
- **Invoicing**: the invoicing function provides clear and transparent invoicing, both for the Commonwealth and for individual agencies, and provides integrity and accountability of all invoices.
- **Financial Analysis**: the financial analysis function is responsible for the analysis of efficiency that will be used to create intelligent, metric based cost reduction strategies.
- **Chargeback**: the chargeback function provides the accurate capture and provision of information related to monthly volumes of work, counts, and utilization of specific infrastructure areas to provide the necessary transparency.

1A. Provide a uniform rate structure which charges the same rates for the same/similar Services.

Unisys will implement an Enterprise Services Catalog based upon the Service Tiers, Hardware Configurations and Operating Systems found in Schedule I– Offeror Pricing Forms. Utilizing this Enterprise Services Catalog, Unisys will establish standard configurations at a standard price, from which the Commonwealth can order incremental capacity across the hardware platforms within the enterprise. In developing the Enterprise Services Catalog pricing, a work breakdown structure was utilized that provided congruency between similar services.

1B. Offeror must provide detailed descriptions on the type of Services included in its overall solution. Cost information must not be provided in the technical submittal.

A complete list of our detailed descriptions of the type of services included in our offering can be found in Schedule C - Services Catalog. The detailed description of the services is provided throughout Schedule F – Statement of Work. Corresponding rates can be found in Schedule I – Offeror Pricing Forms. These rates will be used consistently to charge for services ordered by the Commonwealth agencies.

2A. Monthly invoicing for Services will be provided to the Commonwealth. Invoicing will identify Services rendered, pricing, and agency specific service usage. Transparency in billing will identify service cost per agency. The Commonwealth does not have a common system for charge backs. Some current services are not charged back, and some are done manually. The selected Offeror must connect to the Commonwealth's ITSM system.

The Commonwealth does not require a full charge back system. The agency invoices should provide billing detail so the agency has full transparency into the services it consumed. Billing details shall include all services procured by agency general ledger (GL) code. A service may be allocated across multiple GL codes.

Unisys has a good understanding and experience with the timing and processes associated with Commonwealth invoicing at the agency level. We will leverage the financial management component within Enterprise Services Catalog as part of the Services Catalog ordering system to pull monthly data by agency for specific services ordered during that billing month. The invoicing will be configured to provide various funding streams and GL codes as identified by each agency during implementation.

Each invoice item will provide the following information:

- Agency name
- Service Name
- Service Identifier (i.e. Product number)
- Unit Price
- Quantity
- GL Account Number (7 digits)
- Department Number (4 alphanumeric characters)
- Reporting Level(4 digits)
- Sub-account number (4 digits)
- SAP Fund number (10 digits)
- Cost Center number (10 Digits)
- Percent Allocation (percentage)

(The percent allocation is used if an invoice item is paid across differing Cost Centers.)

The Unisys ITSM system will have connectivity to the Commonwealth's ITSM system.

Identify method for adjusting agency level billing due to failing to meet SLAs.

The total amount of Service-Level Credits that Unisys will be obligated to pay to the Commonwealth, with respect to Service-Level Defaults occurring each month, will be credited on the invoice that contains charges for the month during which the Service-Level Default(s) giving rise to such credit(s) occurred. For example, the amount of Service-Level Credits payable with respect to Service-Level Defaults occurring in August shall be set forth in the invoice for the August Monthly Invoice Amount issued in September.

If Unisys fails to meet the "Earnback Minimum" objective, Service Level Credits will be calculated and applied on the next Billing Cycle.

2B. Offeror must describe its process or policies that will address this requirement. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

Any SLA credits that are immediately due to the Commonwealth for that month will be applied against the invoice amount. Unisys and the Commonwealth will establish a process that formally documents SLA violations and their potential for future invoice credit. All violations will be tracked until closure is reached; meaning that either a credit was triggered and invoiced to the Commonwealth or the penalty was earned back by Unisys.

Draft invoices will be generated and presented to the Commonwealth in advance of the invoice due date. Upon approval by the Commonwealth, the actual invoice will be generated and submitted to the Commonwealth per mutually agreed procedures.

On the IBM State of Georgia engagement, chargeback at the agency level is facilitated through the [redacted]. This tool automates the creation of agency level invoices. On this engagement, Service Level Agreements and credits are a part of the

governance structure. Credits are calculated and provided at the agency level.

3A. Flexible pricing will be applied when Services are either increased or decreased.

Based on components ordered from the Enterprise Services Catalog by each individual agency, total invoice amounts for the month will be computed by multiplying the units ordered by the rate from the Catalog of Services Rate Card. In managing the provision of Resource Units (RU), Unisys will maintain the flexibility to respond to changes in the Commonwealth's demand for services, particularly where agencies experience significant variations in demand.

Billable Resource Unit usage is measured on a monthly basis to determine an agency's requested utilization of such Resource Units. Starting on the Effective Date and monthly thereafter, Subcontractor will measure, track and report usage of Resource Units. Unisys method for measuring, tracking and reporting RUs will be reviewed with the Commonwealth prior to full implementation. The automated system used by Unisys to perform this responsibility will be configured to track and record all user entries, reports, modifications, and all other actions taken in relation to the billing source data. Unisys will be responsible for recording all payments due, and for reflecting these amounts in each Monthly Invoice, effective the month following completion and approval by the Commonwealth.

3B. Offeror must describe its process or policies that will address the flexible pricing requirements. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

The flexible pricing invoice process is described above. This approach has been used with data center services for the State of Texas, American Red Cross, California State University, City of Minneapolis, and data storage for the IRS.

4A. Interim Financial Management Procedures will be required as the Commonwealth transitions its current architecture to the Offeror's Services.

While the Enterprise Services Catalog is being developed and customized to meet all Commonwealth objectives and awaiting Commonwealth approval, Unisys will provide interim manual invoices that will be in an excel format similar to the current DPH invoices. The invoices will include adequate descriptive information, i.e. agency, description of charge, amount, and any required Commonwealth accounting distributions in order to be processed thru the Commonwealth's Financial Management system.

4B. Offeror must describe its approach and procedure(s) for providing invoices, invoice verification and charge back to datacenter customers including but not limited to the following; service components, asset management, asset transfer, forecasting, etc.

Unisys is in the unique position of being able to transition the current contract invoicing seamlessly into the invoicing of the new contract. Prior to the implementation of the Enterprise Services Catalog system and its workflow that will ultimately automate invoice generation, Unisys will continue to leverage manual processes to create invoices. Service components, asset management and transfer, and forecasting functions will be managed and tracked by the Service Excellence Office utilizing the Unisys ITSM system.

Unisys will work with the Commonwealth to define Services Catalog workflows to facilitate the online ordering and approval of the addition and removal of data center compute services. Following a test plan developed in conjunction with the Commonwealth, a complete monthly invoice will be generated in a test mode prior to live billing, utilizing test data so that the

complete process can be tested. This will be submitted to the Commonwealth, resulting in the full spectrum of billing data being confirmed prior to going live. Invoices will provide the level of detail from the Enterprise Services Catalog items.

5A. During the term of the Contract, provide cost effective approaches and suggestions to improve Services while maintaining or lowering the cost for Services. For example as the industry costs for server and storage capacity are reduced over time, it is expected that there will be a continual cost reduction in like Services within this contract.

Unisys will work with the Commonwealth to provide cost effective approaches and suggestions to improve services that may result in lower costs of services for the Commonwealth. Through the structure of this contract, there are opportunities for the Commonwealth to save costs using capacity on-demand resources designed for agencies to pay only for resources consumed. This is one opportunity where an agency can save on resources that are required on a short-term basis negating the need for extensive investments in hardware and software licensing to support a relatively short-term project.

Our Enterprise Services Catalog pricing depicted for each year of the contract takes into account reductions in the cost of technology based on standard industry lifecycles. We have anticipated that, in many cases, the price of technology will decline over time. In those cases, the rate card or Enterprise Services Catalog pricing has been adjusted to reflect the change.

In section 3.2.1.1.6 Continuous Service Improvement, more detail is provided regarding the Unisys Continuous Service Improvement and Innovation Program. The offerings of this program include identification, tracking and completion of initiatives designed to result in continuous improvement in the Commonwealth environment. This improvement can take many forms, including innovations that may result in cost savings to the Commonwealth.

5B. Offeror must describe its process or policies that will address this requirement. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

The process is described above. Unisys has provided various cost savings opportunities to the Commonwealth as the result of technological advancements through network upgrades, leveraging virtual server environments, providing upgraded mainframes at no additional cost, and leveraging enterprise storage solutions. In addition, as the Commonwealth faced extreme financial challenges over the years, Unisys has worked with the Commonwealth in a true partnership to identify ways to meet those challenges in a manner that saved the Commonwealth money without compromising services. This was evidenced in the contract extensions in 2002 and 2008.

6A. Integrate Financial Management with other service management processes, especially with SLA, Capacity and Configuration Management. Offeror must describe how it will accomplish this.

Support of the environment is accomplished via toolsets that Unisys will deploy for this contract including:

- [redacted]ent
- [redacted])
- [redacted]
- Extensive monitoring toolsets

Unisys will provide a Financial Management Process to support the Commonwealth with integration to many ITSM processes including:

- Enterprise Services Catalog
- Service Level Management
- Change
- Release
- Capacity
- Asset
- Configuration

The integration of the Financial Management Process with the ITIL processes listed above will be accomplished through the integration of process and technology. The Enterprise Services Catalog is managed from a centralized platform for all services and infrastructure that Unisys will provide to the Commonwealth. The Enterprise Services Catalog is maintained with all services, service levels, and billing data to provide transparency to the Commonwealth users using the Enterprise Services Catalog. The Enterprise Services Catalog process is integrated with the Unisys ITIL processes for Change Management, Capacity Management, Service Level Management, Capacity Management and Configuration Management ([redacted]).

Changes approved and deployed to the Enterprise Services Catalog also require changes within the supporting processes including:

- **Service Level Management.** Implementing or updating SLA's for new or updated Enterprise Services Catalog items
- **Release & Deployment.** Updating the workflow for provisioning new or updated Enterprise Services Catalog items
- **Capacity.** Establishing the tracking and forecasting usage and capacity for new or updated infrastructure services
- **Configuration Management.** Implementing new or updated CI's and attributes in the CMDB for new or updated Enterprise Services Catalog items
- **Financial Management.** Updating any billing codes, resource units, prices, integrations in order to bill the Commonwealth correctly

The [redacted] is instrumental to automating the integration of Enterprise Services Catalog and Financial Billing and Management Applications with all the various supporting processes. The Enterprise Services Catalog and Billing Applications are integrated in the [redacted], and includes the following components:

- **iCollaborate is a web-based front end that functions as the entry point into the Enterprise Services Catalog.** iCollaborate performs all authentication, authorization and role adjudication functionality based on integration with the Commonwealth's Active Directory service.

  iCollaborate contains the financial management and billing application which is tightly

integrated with the [redacted] Catalog and [redacted] and [redacted] to integrate all the necessary invoicing and financial management information. [redacted] Financial Billing integrates various sources of billing related data from the Enterprise Services Catalog, project service requests, provisioned infrastructure and Remedy CMDB information to prepare a consolidated invoice for the Commonwealth.

- **iRequest is the Enterprise Services Catalog component. For** the Commonwealth, the Enterprise Services Catalog will allow the user to specify what type of infrastructure service is required, what size is needed, and the support tier for the item being ordered.
- **iDeliver is a complete workflow automation engine.** The iDeliver component interfaces via API directly to the [redacted] for Server Automation, and [redacted]. The iDeliver component will coordinate all change and request management processes, and where automated server provisioning is supported, drive the build of the server environment. The PMG software suite also includes data for billing as well as online reporting for utilization, provisioning and de-provisioning.

Unisys Team Experience

Unisys has been working with the Commonwealth with financial management services as required by the current Data PowerHouse contract for more than 13 years. In addition, through other data center contracts, we have developed a variety of processes and financial models from which to leverage for the Commonwealth. A number of Unisys existing customers including California State University, the City of Minneapolis and the State of Texas have benefited from the ability to leverage flexible services that can be purchased via standard rate card unit pricing and used for the term required thus avoiding the need for capital investments to secure computing resources to meet short-term needs.

Benefits to the Commonwealth

We already have many of the Commonwealth process requirements in place, having developed them with the Commonwealth's input and participation. Therefore, existing procedures with slight modifications can be deployed as interim procedures, reducing learning curves and duplication of effort. The Unisys Team also has an in-depth understanding of the agency structure and the need for agency project level reporting and the importance of separate invoicing. Additionally, we have a proven track record of leveraging emerging technology to reduce overall cost to the Commonwealth and ultimately citizens of Pennsylvania.

3.2.1.1.2 Governance & Policy Compliance

Major IT decisions related to this Contract will be reviewed and approved according to the Commonwealth's governance policy. These decisions are critical to the success of the Commonwealth. IT governance addresses compliance initiatives, and satisfies the need for greater accountability for decision-making.

Reference Documentation

Schedule B - Governance

	Requirements	Describe Compliance
1.	Major IT decisions will be made under the guidance of the Commonwealth governance organization.	Offeror must describe its overall compliance policy and enforcement measures. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.
2.	Design and architecture decisions will be made with a high level of integrity and advance the interests of the Commonwealth. All designs must be approved by the Commonwealth.	Offeror must describe the overall design and architecture methodology. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.
3.	All policies and procedures will be executed in a consistent manner to ensure the Services are completed as planned and consistent with specifications. Audits will be conducted on a yearly basis to verify and report on compliance with policies and procedures.	Offeror must describe its compliance and audit policy and enforcement measures. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The IT infrastructure architecture being proposed provides a foundation for the applications which support the Commonwealth's business activities. By establishing an ongoing IT governance function, the Commonwealth will be able to maintain an alignment between the infrastructure architecture, provided services, business needs, application requirements, and compliance initiatives. The IT governance process shown in **Figure 3.2.1.1.2-1** below is supported by our enterprise architecture team and will interact with both the account's overall governance process and service delivery. More details about the overall process and governance structure can be found in section 3.2.1.5 Technical Architecture.

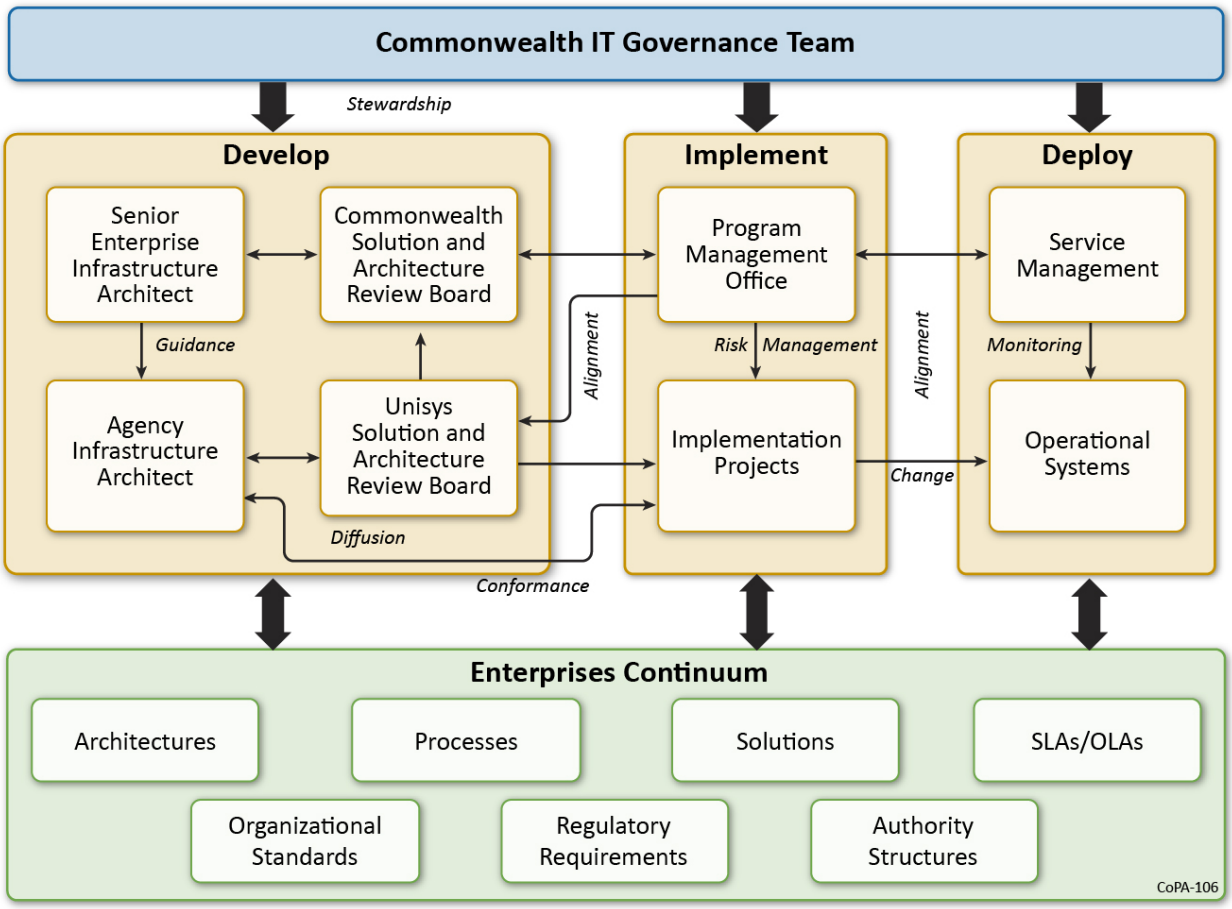

Figure 3.2.1.1.2-1 Unisys IT Governance Process for the Commonwealth

1. Major IT decisions will be made under the guidance of the Commonwealth governance organization. Offeror must describe its overall compliance policy and enforcement measures. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

The Commonwealth will be a key participant in major IT decisions for the infrastructure architecture and associated services supporting the Commonwealth's environment. The Unisys Team will use the IT governance activities to receive the Commonwealth's guidance and approval for requested solutions and major IT decisions. The Unisys Enterprise Architect team,

will establish a Solution and Architecture review process and organization which will be aligned to work with the Commonwealth's IT Governance team to review each solution and major IT decision prior to the implementation of each solution. The Senior Enterprise Infrastructure Architect will also work with the Program Manager and the Engagement Executive to communicate major IT decisions which have an impact to the overall account and may require review and approval by the Commonwealth's Contract Governance team.

2. ***Design and architecture decisions will be made with a high level of integrity and advance the interests of the Commonwealth. All designs must be approved by the Commonwealth. Offeror must describe the overall design and architecture methodology. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.***

Unisys will develop solutions and provide architectures with a focus on quality to support the Commonwealth and its business needs. The architecture of the services provided by the Unisys team will be documented within the Key Deliverables D-01 (Datacenter Architecture Plan and Roadmap), D-03 (Technology Architecture and Refresh Approach), and D-04 (IT Service Continuity Architecture and Plan). Each of these documents will be reviewed within the Solution and Architecture Review Boards as part of Transition and when architecture changes are developed. Please see **Figure 3.2.1.1.2-2** below. To maintain the consistency and quality of the Commonwealth's requested services, each solution will be developed using a common set of activities which cover the solution development lifecycle up to the Agency's approval. This lifecycle includes the following activities.

- Receive Request
- Gather Requirements
- Review and receive Commonwealth approval for requirements
- Review current services against requirements
- Develop solution
- Review and approve solution within Unisys Solution and Architecture Review Board. The Unisys Solution and Architecture Review Board will be comprised of the Senior Enterprise Infrastructure Architect, Agency Infrastructure Architects, Chief Information Security Officer and technical support leads.
- Review and approve solution with Commonwealth Solution and Architecture Review Board. The Commonwealth Solution and Architecture Review Board should be comprised of the Unisys Enterprise Architect team, Unisys technical support leads (as needed), Commonwealth IT Governance participants, and Agency representatives (as needed).

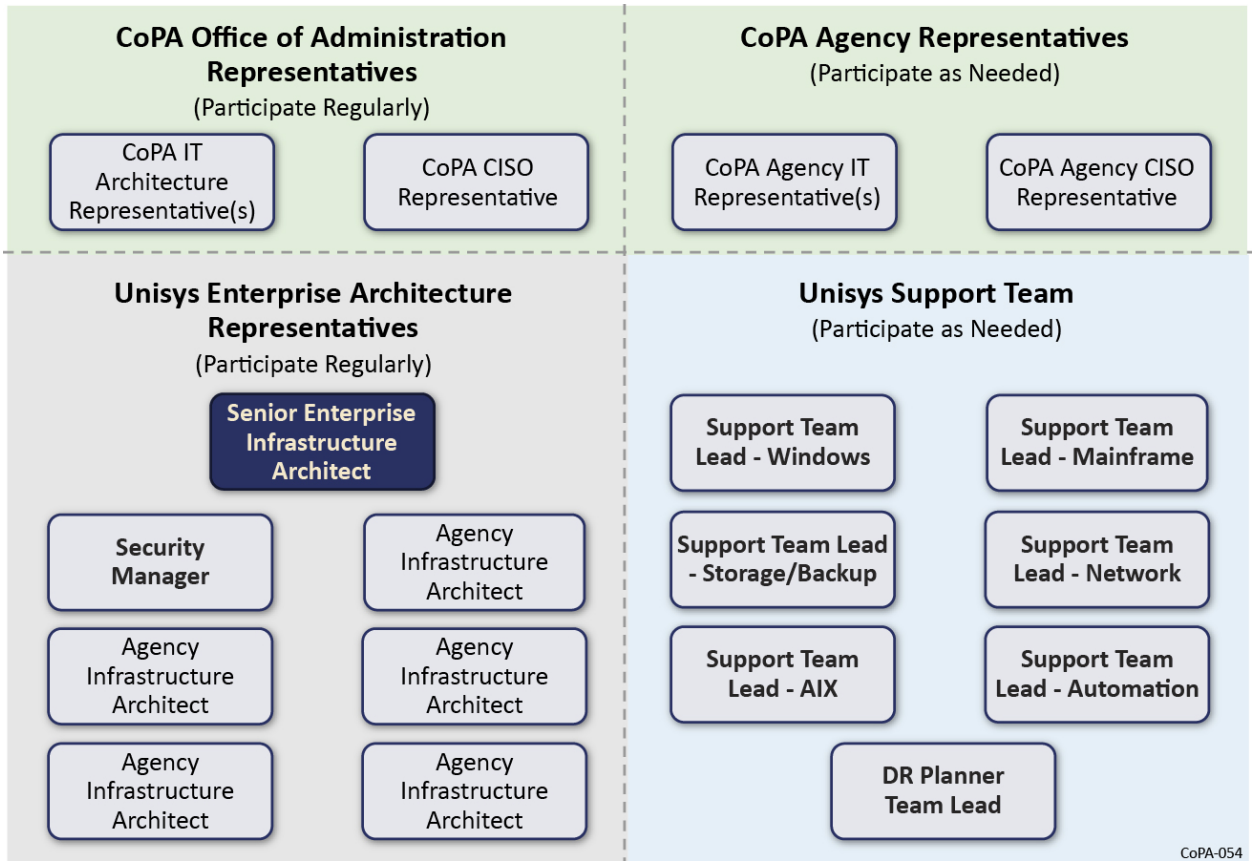

Figure 3.2.1.1.2-2 Unisys Enterprise Architecture Team for the Commonwealth

- Review and approve solution with Commonwealth Agency requestors
- Transfer to Project Implementation team.

With the American Red Cross account, the Unisys team develops solutions based on the requestor's requirements and reviews each solution in detail with the Red Cross' review board before the projects are approved for implementation.

3. All policies and procedures will be executed in a consistent manner to ensure the Services are completed as planned and consistent with specifications. Audits will be conducted on a yearly basis to verify and report on compliance with policies and procedures. Offeror must describe its compliance and audit policy and enforcement measures. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

Procedures used to provide data center compute services will be documented within the Commonwealth Computing Procedures Manual (CCPM). All members of the Unisys team will be trained to perform their duties in compliance with procedures outlined in the CCPM. Unisys will conduct annual SSAE 16 audits at its data center locations to audit our organization's compliance to processes and procedures. The scope of this audit also encompasses work completed by our subcontractors.

On the DPH contract, Unisys conducts a SSAE 16 SOC2 audit on an annual basis that serves to audit all operational policies and procedures. This audit is performed by KPMG who performs a

thorough review of processes and work products of Unisys and its subcontractor's compliance.

Unisys Team Experience

Unisys has more than 13 years of developing consistent policies and procedures specific to and in partnership with the Commonwealth of Pennsylvania through the Data PowerHouse. As part of the services provided currently to the Commonwealth, each solution is developed by collecting requirements from the Agency's technical team in participation with the Unisys account managers and appropriate solution representatives. The solution is designed based on consistent technical standards and reviewed with the requesting Agency's representatives throughout the development. Each solution is reviewed and approved by the Agency to confirm it will support the Agency's needs before the project is implemented.

With the American Red Cross account, the Unisys team develops solutions based on the requestor's requirements and reviews each solution in detail with the Red Cross' review board before the projects are approved for implementation. As the American Red Cross is an FDA regulated account, each solution includes the additional documentation to support the quality requirements.

Benefits to the Commonwealth

Unisys has familiarity with the Commonwealth's processes and procedures that no other vendor has. Transition time will be more seamless, reducing costs for Commonwealth staff in lost time and resources.

3.2.1.1.3 Subcontractor Management

The Offeror may provide some of its Services and offerings via subcontractors. The Offeror must be the prime provider of Commonwealth Services, and is responsible to contract with subcontractors, manage its subcontractors, and for Offeror's performance and the performance of its subcontractors throughout the term of the Contract.

Reference Documentation

N/A

	Requirements	Describe Compliance
1.	Obtain, manage, and be responsible for all Services or offerings provided by subcontractors. Subcontractors may change over the course of this contract. Offeror is required to notify the Commonwealth of the new subcontractor(s) and assure the Commonwealth that there will not be a conflict of interest, and that the new subcontractor meets or exceeds the qualifications of the replaced subcontractor. The Commonwealth must approve all subcontractors.	Offeror must describe / list all subcontractors that it will be utilize for this project. Describe process or policies that will address this requirement. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.
2.	CJIS Security Policy requires fingerprint based background checks and executing a Management Control Agreement (MCA) and Security Addendum with the Pennsylvania State Police (additional information is provided in the PSP exhibit material).	Offeror must describe its process or policies that will address this requirement.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Unisys will utilize subcontractors who have expertise above and beyond what Unisys could provide on our own. We understand the importance of managing subcontractors, as their performance is essential to our ability to meet our contractual requirements to the Commonwealth This also gives us the opportunity to support Small Diverse Businesses who might not otherwise have such opportunities, and provide them with the opportunity for mentoring with experienced corporate leaders. All subcontracts will be managed per the terms of the prime contract and will be held to the high performance standards Unisys requires of itself.

1A. Obtain, manage, and be responsible for all Services or offerings provided by subcontractors subcontractors may change over the course of this contract. Offeror is required to notify the Commonwealth of the new subcontractor(s) and assure the Commonwealth that there will not be a conflict of interest, and that the new subcontractor meets or exceeds the qualifications of the replaced subcontractor. The Commonwealth must approve all subcontractors. Offeror must describe / list all subcontractors that it will be utilize for this project. Describe process or policies that will address this requirement. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

Unisys will be delivering managed services to the Commonwealth as the prime contractor and will be responsible for all services and offerings provided by subcontractors. Our proposed list of subcontractor partners is included in Schedule L of our proposal.

All subcontractors will be governed by the Unisys Supply Management organization including contract terms, services scope, quality, and payments. As part of our subcontractor management process, the Unisys Program Management Office will monitor and measure performance of our subcontractors to verify that services provided are meeting the contract requirements. All quality and non-compliance issues will be managed by Unisys.

Subcontractors are governed by the Unisys PMO Subcontract Manager who will meet with each subcontractor to review status of program activity, the subcontractor's performance, upcoming requirements, pertinent change, incident and problem activity, and identification and remediation of potential performance issues.

Should it be necessary to replace a subcontractor providing service, Unisys will notify the Commonwealth of Pennsylvania with specific plans and a schedule for the subcontractor change. This notification will include a request for Commonwealth approval for the recommended replacement firm who will meet or exceed the qualification of the replaced subcontractor.

Unisys has relevant experience providing services to the Commonwealth on the Data PowerHouse project. In this project, Unisys has proven the effectiveness of strong partnerships with several subcontractors providing data center computing services including IBM, American Personnel Management Corporation and Innovative Business Concepts. We have significantly expanded our partnerships for the new data center compute services contract that features key partners IBM and Deloitte with augmentation by a team of 10 Small Diverse Businesses that bring various complementary services to the Unisys Team. Our proposed list of subcontractor partners is included in Schedule L of our proposal and more details on their qualifications in Section 4.1, with past performance highlights in Section 4.5.

2A. CJIS Security Policy requires fingerprint based background checks and executing a Management

Control Agreement (MCA) and Security Addendum with the Pennsylvania State Police (additional information is provided in the PSP exhibit material).

2B. Offeror must describe its process or policies that will address this requirement.

Unisys is accustomed to completing Commonwealth specific background checks in accordance with the Commonwealth ITB. We will perform fingerprint background checks on all personnel required to do so per the CJIS policy and will execute the MCA and Security Addendum with the PA State Police. As part of our ISO27001 certification, we perform an annual 3rd party/subcontractor review as well.

All employees and subcontractors providing data center services either remote or onsite are subject to background checks and form signatures as well as annual security training. Those that do not require physical access to the facility are subject to a one-time Department of Corrections (DOC) check and are not issued a badge. Per the Commonwealth policy on contractors, each remote user is also subject to an annual Pennsylvania Access to Criminal History (PATCH) background check.

Onsite Data Center employees and contractors are subject to an annual DOC background check, form signatures and a one-time PA State Police (PSP) fingerprint check. They are also required to have their picture taken for a Unisys employee or contractor badge and are required to take the annual security training.

Unisys Team Experience

Unisys has long-term established relationships with most of our selected team. The IBM subcontractor relationship on the DPH contract has truly proven the value of a "powerhouse" team that provides the strongest technology skill sets in the platforms developed by our respective companies. We are also very familiar with Commonwealth background check procedures and have followed them in support of Commonwealth contracts.

Benefits to the Commonwealth

As a result of our experience with these subcontractors and subcontracting in general, transition time and knowledge transfer will be minimized. There will not be relationship growing pains with the Unisys team that other teams may experience ensuring focus on the success of the Commonwealth's transition.

3.2.1.1.4 Business Partners Management

The Commonwealth has business partners such as banks and insurance companies that require connections to its hosted systems and applications. The Offeror must coordinate with the Commonwealth to support any Commonwealth – Business Partner agreements that require a committed connection to its hosted systems.

Reference Documentation

N/A

	Requirements	Describe Compliance
1.	The Offeror must provide coordination and support of Commonwealth – Business Partner agreements that require connections and Services to the Offeror's datacenter Services to ensure that any committed connections and service levels are maintained.	Offeror must describe its process or policies that will address this requirement.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Unisys is committed to working with all Commonwealth Business Partners to affect efficient processes and successful service delivery. Our network team has worked diligently in the past to provide connectivity required by the Commonwealth in all aspects of the Data PowerHouse service delivery. We anticipate this to continue as the scope expands under this proposal.

1A. The Offeror must provide coordination and support of Commonwealth – Business Partner agreements that require connections and Services to the Offeror's datacenter Services to ensure that any committed connections and service levels are maintained.

1B. Offeror must describe its process or policies that will address this requirement.

The Commonwealth's requirements for Business Partner connections to hosted systems and applications in the Offeror's data center will be supported by the proposed solution. Unisys will work closely with the Commonwealth to coordinate and support the implementation of the connections of Commonwealth Business Partners to the data center services.

The transition planning process will include the assessment and detailed planning for support of the specific network and security requirements of each Commonwealth Business Partner. Additional telecommunication circuits and equipment to connect Commonwealth Business Partners to the proposed data center facilities are not included in this solution and will be the

responsibility of the Commonwealth.

We understand that the Commonwealth's Business Partners (BP) provide the physical circuits to the Commonwealth's BP network into the Commonwealth's Co-Location space within the [redacted] and DPH. The Business Partner determines the number, size and redundancy of the individual BP connections. Unisys will support these connections by providing Security, Access, and Network Connections to the Commonwealth Network, Floor/Cabinet Space, Cooling, and Power. The Commonwealth or the Business Partner is financially responsible for these circuits.

The Commonwealth can access the Enterprise Services Catalog for services pertaining to Business Partner connections such as colocation services to host, relocate connections to the Unisys data center, etc. When services are selected, we will work with Commonwealth Business Partners to plan for an effective relocation/installation of their connections in the [redacted] and the DPH to the Unisys data centers as necessary.

Unisys Team Experience

Unisys has developed a working relationship with Commonwealth staff currently providing this service. As a result of the Data PowerHouse contract and constantly expanding demands in this arena, Unisys has had to become familiar with the Commonwealth's responsibility in order to effectively support and complement network connectivity.

Benefits to the Commonwealth

Because Unisys has been delivering connectivity services for the past 13 years, the transition effort will be better understood mitigating risk of poorly planned transition of connectivity.

3.2.1.1.5 Additional Planning Services

The Commonwealth may use different/additional methods for requesting technical information and support. Depending on the type of request those methods could include but not be limited to:

- Statement of Objectives (SOO)
- Work Order
- Service Request
- Request for Technical Analysis
  - Cost-Benefit Analysis
  - Conceptualization
  - High Level Estimate (HLE)
  - Technical Opinion(s)

Reference Documentation

N/A

Requirements		Describe Compliance
1.	Statement of Objectives - Perform requested additional Services across various functional areas, where the work requires funding either because of materials needed or because the activity requested is not part of the base contract.	Offeror must describe its ability and timeframes to support these additional service requests.
2.	Work Orders - Perform work across various functional areas, where the work is considered part of the base contract and where no additional funding is required.	Offeror must describe its ability and timeframes to support these additional service requests.
3.	A Service Request will be used to request work within one functional area, where the work is considered part of the base contract and where no additional funding is required.	Offeror must describe its ability and timeframes to support these additional service requests.

4.	Requests for Technical Analysis will be used to seek information regarding potential technical solutions. The documents generated by the Offeror must provide the Commonwealth with direction regarding a specific technology and possibly the estimated cost to implement the solution. Four types of requests for technical analysis may be made by the Commonwealth. These requests are described below: • Cost-Benefit Analysis - A cost-benefit analysis is requested when the Commonwealth wants to know not only the implementation cost of a solution, but also the cost-benefit ratio for Commonwealth implementation of the solution. It may be used to analyze a single solution against the status quo, or compare the relative costs of multiple solutions. • Conceptualization - A conceptualization is requested when the Commonwealth has an objective, but is unsure about the possible technical means of fulfilling it. The Offeror must examine multiple paths for achieving the objective, and provide the technical benefits and consequences of the possible solutions presented. Costs are not considered in a conceptualization. • High Level Estimate (HLE or sometimes referred to as a rough order of magnitude ROM) - A	Offeror must describe its ability and timeframes to support these additional service requests.

	HLE is requested when the Commonwealth has a clear technical direction and needs rough estimates on the cost of implementing it. HLEs may be used to attach a cost estimate to a prior conceptualization or technical opinion produced by the Offeror. • Technical Opinion(s) - A technical opinion is requested when the Commonwealth has a specific technology or set of technologies it wants the Offeror to analyze for both technical merits and suitability for deployment in the Commonwealth environment. While product and operational costs provided in Offeror's literature may be considered in a technical opinion, the Offeror's deployment and operational costs will not be calculated or presented.	

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

As the Commonwealth's business needs change, different types of requests may be submitted to the Unisys team for various solutions and activities. These requests can go from activities to perform regular pre-approved functions to complex solution development or investigations supporting Agency projects or plans.

Each type of Solution request will proceed through the following activities.

1. Service Request submittal
2. Requirements Gathering

3. Requirements Approval by Requesting Agency
4. Solution Development
5. Unisys Solution and Architecture Review
6. Commonwealth Solution and Architecture Review
7. Agency Approval
8. Transfer Approved Request to Implementation Project Team

1. Statement of Objectives - Perform requested additional Services across various functional areas, where the work requires funding either because of materials needed or because the activity requested is not part of the base contract. Offeror must describe its ability and timeframes to support these additional service requests.

The Commonwealth can submit Statement of Objectives solution requests to receive additional services for multiple functional areas which require additional materials or functions not available as a regular service from the base contract. The Agency Infrastructure Architects will develop and present the solution based upon the completion of the above activities. Depending on the complexity of the requirements, the solution can be presented within 4-6 weeks on average.

2. Work Orders - Perform work across various functional areas, where the work is considered part of the base contract and where no additional funding is required. Offeror must describe its ability and timeframes to support these additional service requests.

The Commonwealth can submit Work Order solution requests to receive additional services for multiple functional areas which do not require additional materials and functions are available as a regular service from the base contract. The Agency Infrastructure Architects will develop and present the solution based upon the completion of the above activities. Depending on the complexity of the requirements, the solution can be presented within 2-4 weeks on average.

3. A Service Request will be used to request work within one functional area, where the work is considered part of the base contract and where no additional funding is required. Offeror must describe its ability and timeframes to support these additional service requests.

The Commonwealth can submit Service Request to receive additional services for a single functional area and is defined as regular service from the base contract. For requests which are not defined within the CCPM as a Standard Service Request, the Agency Infrastructure Architects will develop and present the solution based upon the completion of the above activities. Depending on the complexity of the requirements, the solution can be presented within 1-2 weeks on average.

For Standard Service Requests, the request will be entered within the Enterprise Service Catalog and then routed to the appropriate support team to implement a scheduled change request. Standard Service Requests will include a completion due date.

4 Requests for Technical Analysis will be used to seek information regarding potential technical

solutions. The documents generated by the Offeror must provide the Commonwealth with direction regarding a specific technology and possibly the estimated cost to implement the solution. Four types of requests for technical analysis may be made by the Commonwealth. These requests are described below:

- ***Cost-Benefit Analysis - A cost-benefit analysis is requested when the Commonwealth wants to know not only the implementation cost of a solution, but also the cost-benefit ratio for Commonwealth implementation of the solution. It may be used to analyze a single solution against the status quo, or compare the relative costs of multiple solutions.***
- ***Conceptualization - A conceptualization is requested when the Commonwealth has an objective, but is unsure about the possible technical means of fulfilling it. The Offeror must examine multiple paths for achieving the objective, and provide the technical benefits and consequences of the possible solutions presented. Costs are not considered in a conceptualization.***
- ***High Level Estimate (HLE or sometimes referred to as a rough order of magnitude ROM) - A HLE is requested when the Commonwealth has a clear technical direction and needs rough estimates on the cost of implementing it. HLEs may be used to attach a cost estimate to a prior conceptualization or technical opinion produced by the Offeror.***
- ***Technical Opinion(s) - A technical opinion is requested when the Commonwealth has a specific technology or set of technologies it wants the Offeror to analyze for both technical merits and suitability for deployment in the Commonwealth environment. While product and operational costs provided in Offeror's literature may be considered in a technical opinion, the Offeror's deployment and operational costs will not be calculated or presented.***

Offeror must describe its ability and timeframes to support these additional service requests.

Requests for Technical Analysis - The Commonwealth can submit Technical Analysis solution requests to receive architectural or additional technical support. The Agency Infrastructure Architects will develop and present the estimate to produce the Technical Analysis based upon the completion of the above solution request activities. Depending on the complexity of the requirements, the solution to provide the technical analysis estimate can be presented within 2 - 4 weeks on average.

Technical Analysis requests can be submitted for several different types of activities. Each activity will require various amounts of time to complete and will be based upon the requirements provided during the initial solution requirements gathering. The resulting report for the technical analysis can be presented from 2-12 weeks after the approval of the analysis's estimate.

Cost-Benefit Analysis – The Unisys process steps to build a cost benefit analysis include the following actions: develop a list of alternative projects/programs; identify the stakeholders for each of the alternate projects; select measurements and measure all cost/benefit elements. Then we form work groups to assess and predict outcome of cost and benefits over relevant time period; convert all costs and benefits into a common set of numbers that can be compared; and then calculate net present value of project options. Using the available information we perform sensitive analysis and down select the options to a single choice. We document the choice, and provide the background data on the non-selected options to provide a complete picture.

Conceptualization – During Technical Analysis, Unisys Enterprise Architect team will identify and address possible options to achieve requirements. During the collection of options, we evaluate each option, consider the utility and ability to address the requirement, assess the vulnerability of the option (how stable it is when combined with other functions), and we determine the likelihood the option will meet requirements and consequences of using the

option on the rest of the system (interoperability and maintainability). We continue to identifying options and evaluating the utility by looking at the integrated effect (options joined together into a system to achieve the commonwealth requirements). From this conceptualization process emerges a framework to describe and produce the desired result.

High Level Estimate – Estimating methods used by Unisys are tailored to the specific project. The method used for most definitive estimates is to fully define and understand the scope, develop a work breakdown structure (WBS) that encompasses all deliverables for the project, decompose the deliverables to sufficient depth to be able to estimate the components as tasks. Quantify the work breakdowns structure within the boundaries set by project scope. Then apply costing to each element of the work breakdown structure which is summed to a total cost. As the WBS is formed, we develop extensive documentation for review (to provide consistent pricing).

Early estimates may employ various means of cost modeling. The basic characteristics of effective estimating include: clear identification of task, broad participation in preparing estimates, availability of valid data, standardized structure for the estimate, provision for program uncertainties, recognition of inflation, recognition of excluded costs, independent review of estimates, and revision of estimates for significant program changes.

During the costing process we follow a set of best practices that provide repeatable methods that result in high-quality cost estimates that are comprehensive and accurate and that can be easily and clearly traced, replicated, and updated.

Technical Opinion – Providing Technical Opinions is a 4-step process consisting of formulating alternative opinions, evaluating alternative plans, comparing alternative plans, and selecting the recommended integrated plan.

Formulate Alternative Opinions. Alternative plans are developed in a systematic manner to confirm that all reasonable alternatives are evaluated for feasibility. In addition to requirements, Commonwealth architectural guidelines are considered, interoperability, availability, maintainability, and reliability are considered. We also look at data restoration, service definitions, and service level agreement concepts when gathering data for technical opinions.

Evaluate Alternative Plans. The evaluation of each individual alternative consists of measuring or estimating the economic, environmental, and social effects of each plan, and determining the difference between the without- and with-project conditions. Feasible opinions (plans) are carried forward for comparison against one another.

Compare Alternative Plans. Alternative opinions (plans) are compared, focusing on the differences among the plans identified in the evaluation phase including commonwealth senior engineering comment. Differences between the benefits produced by the opinions are assessed. The overall strategic planning objectives are quantified and used for comparison/screening.

Select Recommended Integrated Plan. A recommended plan is identified from a cost effectiveness perspective and requirements allocation perspective The two plans are then combined into a third option to create the recommended technical opinion with two feasible opinions.

Unisys Team Experience

We are uniquely qualified as a result of the experience gained on the Commonwealth systems

and business environments. Even more importantly, we have developed long term relationships and trust with Commonwealth staff. We do not provide a "one size fits all" solution, but work in partnership with each agency on their specific needs and requirements.

In addition, because we manage other data centers, we can leverage a broad base of expertise and staff as situations warrant.

Benefits to the Commonwealth

We already utilize many of these techniques with the Commonwealth and can continue to build upon that foundation as needs change and expand. Processes are already in place, having developed them with the Commonwealth's specific needs and requirements in mind and with their input and participation. Therefore, lost time as a result of transition will be minimized, with reduced learning curves and less duplicate effort. In choosing Unisys to continue data center services, transition risk and knowledge transfer is drastically reduced.

3.2.1.1.6 Continual Service Improvement

The purpose of the Continual Service Improvement is to reduce risk, improve service quality, improve client satisfaction, and ensure service transparency through a continuous cycle of evaluation and improvement.

Reference Documentation

N/A

Requirements		Describe Compliance
1.	Reduce service risks.	Related to the project management and contract management role, Offeror must describe its methods for eliminating or mitigating service risks.
2.	Improve service quality.	Offeror must describe its methods for addressing continuous service improvement processes.
3.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
4.	Ensure service transparency.	Offeror must describe its methods for ensuring service transparency and providing visibility into service execution.
5.	Customer Satisfaction Surveys – Survey of Service Desk satisfaction is a key component of providing best in class customer service. Receive completed surveys of Service Desk satisfaction from the Commonwealth and tabulating results from such surveys	Offeror must describe its approach to perform surveys of Service Desk satisfaction for a subset of the problems, questions, or requests that are resolved by, or coordinated by, the Service Desk. Offeror must describe its approach to creating and advertising a web site for day-to-day feedback from datacenter customers which is accessible through the Offeror's KMP. Offeror must describe its approach to performing a customer satisfaction survey on a quarterly basis.

6.	Improve/reduce costs	Offeror must identify its methods for addressing continuous service improvement targeted at minimizing or reducing costs of Services and operations.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Quality, Continuous Service Improvement and client satisfaction all begin with the voice of the client. Unisys recognizes the voice of the Commonwealth and the significant importance of quality and continuous service improvement to reduce risk, improve service quality, improve client satisfaction, and provide service transparency through a continuous cycle of evaluation and improvement within an IT infrastructure.

Customer Satisfaction. Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Unisys is establishing a dedicated Service Excellence Office (SEO) to proactively oversee quality management, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive Quality Plan which specifically addresses all stated requirements. We believe this is a key differentiator in our partnership with the Commonwealth.

Quality Planning. Unisys will develop, implement, manage and govern two detailed quality plans. The initial quality plan will be a Transition Quality Plan to confirm that quality is a primary focus in the critical transition of the Commonwealth agencies to the new data center compute services contract. Unisys will also develop and manage the IT Service Management Quality Plan, to oversee improvement on steady state ongoing operations. These plans will be documented, updated, and governed through the Commonwealth Computing Procedures Manual (CCPM). The SEO will use the quality plans to drive best in class services and the highest customer satisfaction experience throughout entire engagement with the Commonwealth.

Service Excellence Office. The SEO quality plan defines the Service Excellence Office. The SEO function provides definition and oversight of all ITIL process management and analysis functions including change management, release management, incident management, problem management, asset management, configuration and CMDB management, availability management, and service level management. Process managers and analysts working in the Service Excellence Office will audit process effectiveness, ensuring service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous Service Improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Figure 3.2.1.1.6-1 Service Excellence Office Functions

The functions of the Service Excellence Office are shown in **Figure 3.2.1.1.6-1** above. The SEO will manage and drive quality across the Commonwealth's multi-dimensional, complex, and matrixed IT service delivery organizations. The SEO will standardize quality across Commonwealth agencies, Unisys, partner organizations, as well as across all ITIL IT services processes, IT monitoring and automation tools, and client satisfaction surveys and processes. Unisys will leverage the ITIL framework, ISO certifications, Six Sigma Lean tools, and our Continuous Service Improvement and Innovation Process (CSIIP) to proactively verify the highest quality IT services are being provided.

1 CI Service Risk

1.A Related to the project management and contract management role, Offeror must describe its methods for eliminating or mitigating service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and ensuring business objectives are achieved and ensuring quality processes are followed. Risk will be mitigated through the implementation of tight quality controls: standard policies, procedures, roles, risks assumptions, issues, and definitions (RAID) etc. Unisys will manage multiple risk registers for large projects, changes, implementations, and transitions. In addition Unisys will manage an overall Program Risk Register. The risk types, tools, analyses, and processes are outlined in **Figure 3.2.1.1.6-2** below.

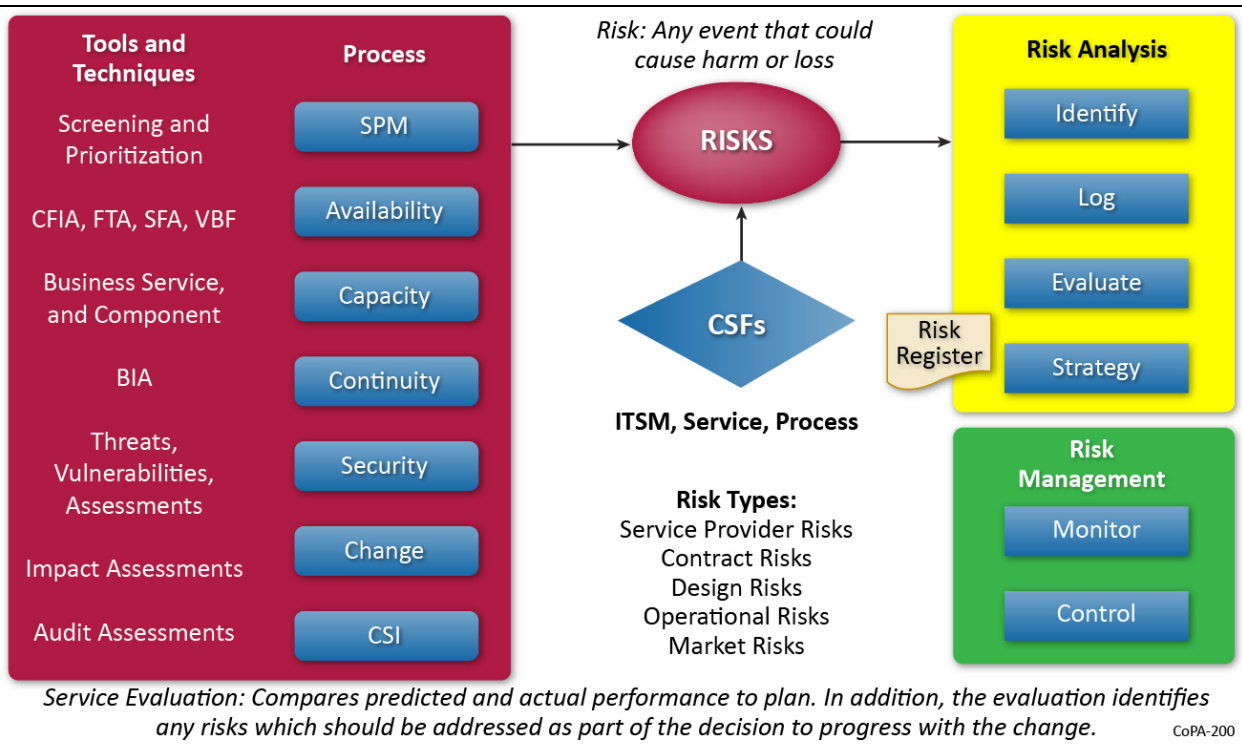

Figure 3.2.1.1.6-2 Reducing Service Risks

2 CI Service Quality

2.A Offeror must describe its methods for addressing continuous service improvement processes.

Improve service quality

To implement continuous service improvement and overall service quality, Unisys will implement an ITIL service delivery framework drives standardization and service excellence.

ITIL Service Delivery Framework – Driving Standardization and Service Excellence

The ITIL process management function is at the core of Service Excellence. This function effectively designs the management practices, processes, functions, roles, knowledge and skills the Unisys Team will use to enable us to deliver services that create value to the Commonwealth. Through IT Service Management, processes are developed and executed to facilitate the implementation and management of quality IT services which meet the needs of the Commonwealth. This discipline is essential to verify we consistently produce quality services in a timely and cost-effective manner.

Unisys engages in quality planning activities to verify changes are planned, documented, accomplished and evaluated. The quality planning process establishes quality goals and objectives are appropriate to meet the requirements of the Commonwealth.

Quality planning provides a framework to guide the evolution and continuous improvement of

the quality plans through the Plan-Do-Check-Act (PDCA) continuous improvement cycle.

PLAN - Who will do what by when? What materials are needed?

DO - Implement the plan

CHECK - Evaluate the effort and results

ACT - Identify actions that need to be taken

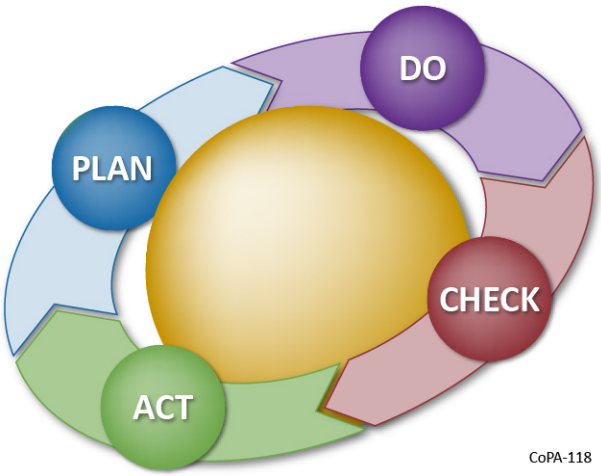

Figure 3.2.1.1.6-3: Plan-Do-Check-Act Cycle

The quality planning PDCA cycle pictured in **Figure 3.2.1.1.6-3** above requires input from each of the highly matrixed organizations and processes within the Commonwealth IT Infrastructure: Input will be proactively obtained from the Commonwealth agencies; Unisys; 3rd party partners; as well as from the ITIL management processes: Service request, capacity and performance, incident and problem, change and Release, availability, service level management; monitoring and automation tools and CSAT surveys. The outputs of each phase of the PDCA cycle provide the inputs to the subsequent phase. This PDCA will be proactively managed by the SEO during the Commonwealth Transition as well as through the steady state IT service delivery processes.

Continuous Service Improvement

Continuous Service Improvement and quality will be the key objectives of the Service Excellence Office. The SEO objectives will be to focus on increasing efficiency, maximizing effectiveness and optimizing the cost of Commonwealth IT services and the underlying IT Service management processes, while maximizing customer satisfaction. Unisys will continually align and re-align IT services to the changing business needs of the Commonwealth agencies by identifying and implementing improvements to IT services support business processes. SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. These reviews, analyses, and recommendations will also leverage Six Sigma Lean methodologies to drive specific, measurable results. We identify and implement individual activities to improve IT service quality and improve efficiency and effectiveness of the ITIL processes. Quality standardization will be a major objective for the Service Excellence Office. This will improve the cost-effectiveness of delivering IT services to the Commonwealth while driving service excellence and maximizing customer satisfaction.

These Continuous Service Improvement objectives will be accomplished through listening to the voice of the customer, building effective relationships, learning each Agencies business goals and priorities, leading and managing ITIL processes, and delivering quality services to the Commonwealth. The SEO will proactively manage the ITIL lifecycle processes, while leveraging ISO certified processes, and best in class industry tools and methodologies. The SEO will

manage key continuous service improvement activities to confirm Unisys is meeting the Commonwealth's IT service objectives, and driving quality and client satisfaction within each Commonwealth Agency and its clients. Unisys SEO will review management information and trends to verify services are meeting agreed service levels, as well as to confirm the output of the ITSM processes are achieving the desired results. Unisys will leverage Six Sigma Lean practices to drive definitive results.

In addition conducting maturity assessments against the process activities and roles to highlight areas of improvement or concern will be a key focus, along with internal audits to verify compliance. Six Sigma Lean Kaizen workshops will be periodically conducted to identify and prioritize CSI opportunities, analyze data, and present recommendations to senior management to confirm Unisys is hearing the voice of the customer and meeting client expectations, while driving quality results. The SEO will work with all levels of Commonwealth management to confirm service improvement activities are receiving the necessary support and are resourced sufficiently to implement quality, best in class solutions. The SEO will proactively work with each Commonwealth agency to verify ITIL processes are consistently implemented and managed and quality standards are created and adhered to. Quality management reviews will be conducted consistently across the Commonwealth to drive continuous service improvement to drive value to the Commonwealth of Pennsylvania, through improved services, lower costs, improved return on investment, and improved quality, client satisfaction, and customer value.

The Unisys Resolution Optimization Model in **Figure 3.2.1.1.6-4** below provides a clear example of how Unisys will provide Continuous Service Improvement to the Commonwealth. The Unisys SEO organization will proactively manage IT incidents, problems, and changes through ITIL service management processes and operations. Leveraging ISO certified processes and Six Sigma Lean Tools to drive quality and client satisfaction. These processes will be managed across all of the Commonwealth agencies and domains. The Quality management processes will be standardized and be integrated across the Commonwealth agencies, Unisys, IBM, Deloitte, and the Small Diverse Businesses.

Unisys Resolution Optimization Model

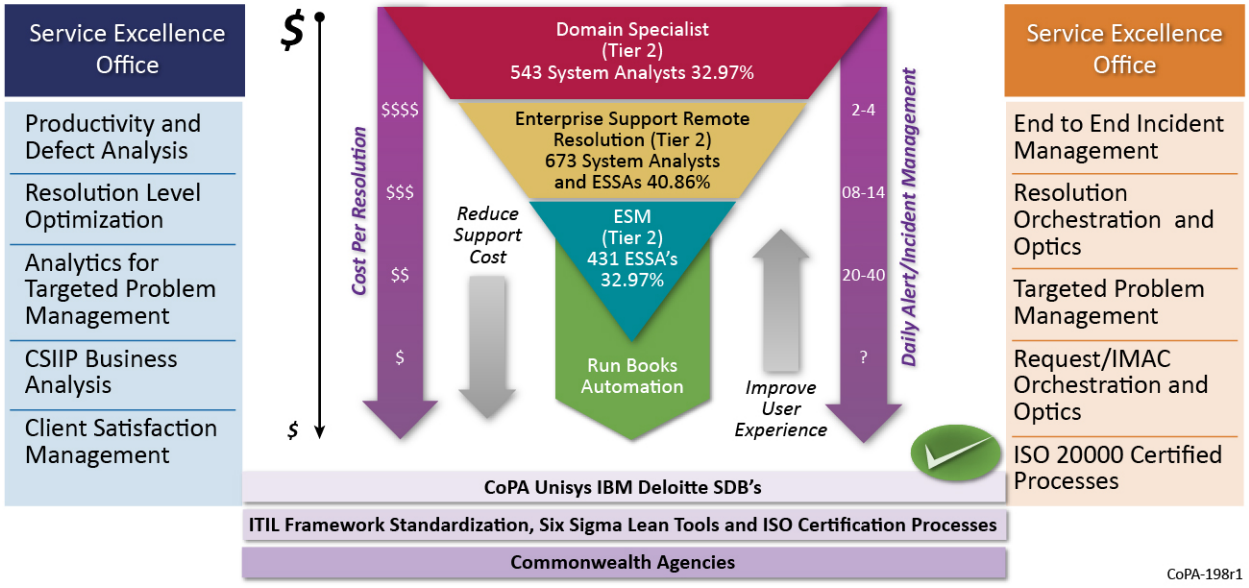

Figure 3.2.1.1.6-4 Unisys Resolution Optimization Model

3 CI Client Satisfaction

3.A Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction

Improve client satisfaction.

The Project Quality Office is the independent organization within Unisys chartered as the key quality advisor to the operating groups on deal structures, risk management, and project performance. The PQO reviews and evaluates all aspects of proposals and project engagements with the goal to minimize risk while maximizing client satisfaction over the entire lifecycle.

Unisys will work with the Commonwealth to conduct two types of project reviews, Project Readiness Reviews (PRR) and Quality Assurance Reviews (QAR), to identify any potential problems or gaps.

The Project Readiness Reviews (PRR) is designed to verify: the project is properly planned; the project plans are sufficiently adequate, accurate and detailed; the projects contracted solution can be delivered on-time and on-budget; and the appropriate risk management is included (identify approaches to manage/mitigate risks). Unisys will conduct these project readiness reviews during major project implementations. These PRRs will specifically be conducted during transition to confirm a quality solution and implementation will be provided.

Unisys will also work with the Commonwealth to conduct quality assurance reviews (QAR). QARs will be performed periodically by independent reviewers, who are not part of the Unisys account team. This process provides a second level of quality and risk review using individuals who are independent of the Unisys client serving team. This process also provides an unbiased view of engagement progress, risk management actions, client satisfaction, and advice on solving problems and making improvements. The client interview is part of the QAR process.

Business Continuity Management (BCM)is an integral aspect of Corporate Governance and Unisys quality solution. BCM includes key areas of - disaster recovery, facilities, risk, HRM, supply chain , quality, health and safety, knowledge , emergency , and security management, crisis communication and public relations. Unisys provides for three levels of business continuity - basic, custom and emergency. Unisys will work with the Commonwealth to provide a comprehensive BCM program management, maintain a suitable BCM Policy, and verify decisions are made based on Business Impact Analysis (BIA). We will also create business continuity, crisis management, resource recovery and solution plans. The implementation of recovery plans will follow a defined and approved risk assessment methodology. Every Business Continuity Plan, Resource Recovery and Solution Plan, and Crisis Management Plan will be tested (annually at a minimum).

Risk Management, Independent Program Quality Office Audit Reviews, and Business Continuity Planning are key programs Unisys will provide and manage in order to minimize risk throughout the ITIL lifecycle phases.

4 CI Service Transparency

4.A Offeror must describe its methods for ensuring service transparency and providing visibility into service execution

Ensure service transparency.

In addition, Unisys will implement the Continuous Service Improvement and Innovation Process (CSIIP) and leverage Six Sigma Lean methodologies to govern the quality process and drive transparency for the Commonwealth for all the quality initiatives and process improvements. A CSIIP SharePoint portal will be created and maintained with all improvement and innovation actions. **Figure 3.2.1.1.6-5** demonstrates how we build business value into our support of the Commonwealth through careful application of 6 sigma lean methodologies. We accomplish assessments to baseline our current state of operations. Then we build principles of operation to guide data to day functions. Using CSIIP we clarify, optimize the concepts, and collaborate with a wide range of subject matter experts to verify we are focused on the right subjects for innovation. Then we focus our intent, proactively defining and designing the innovations which lead to improvement.

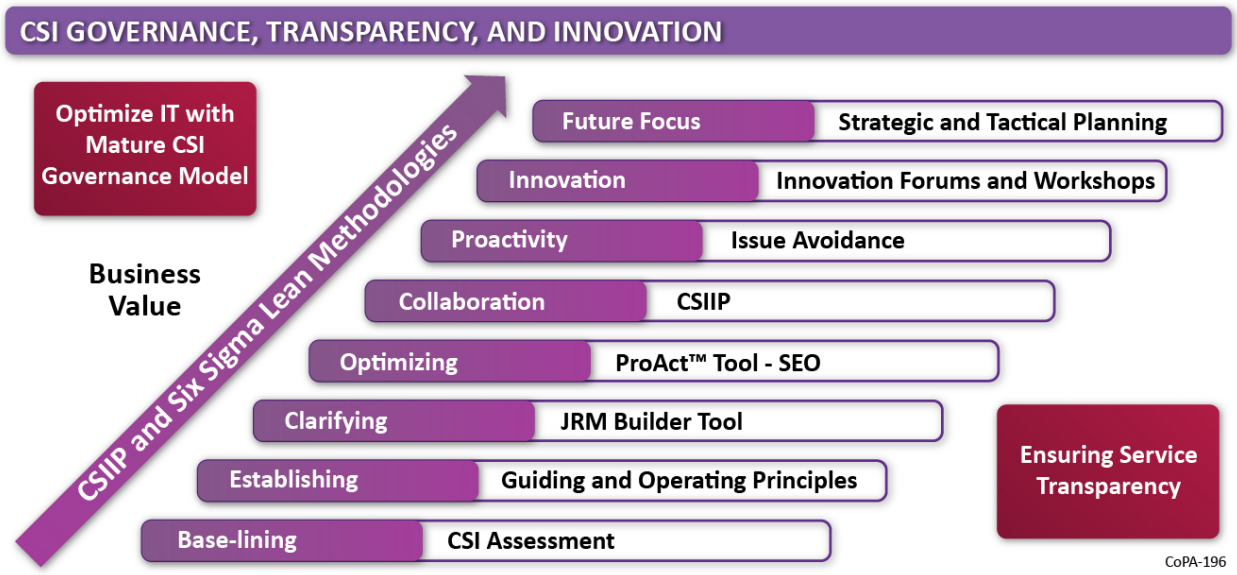

Figure 3.2.1.1.6-5 CSI Governance, Transparency and Innovation

We will build a CSIIP portal which will be accessible to all the Commonwealth agencies. The SEO and SSL team also support innovation activities managed through Innovation Workshops to collaborate with the Commonwealth agencies to plan and develop the future IT strategies and IT solutions.

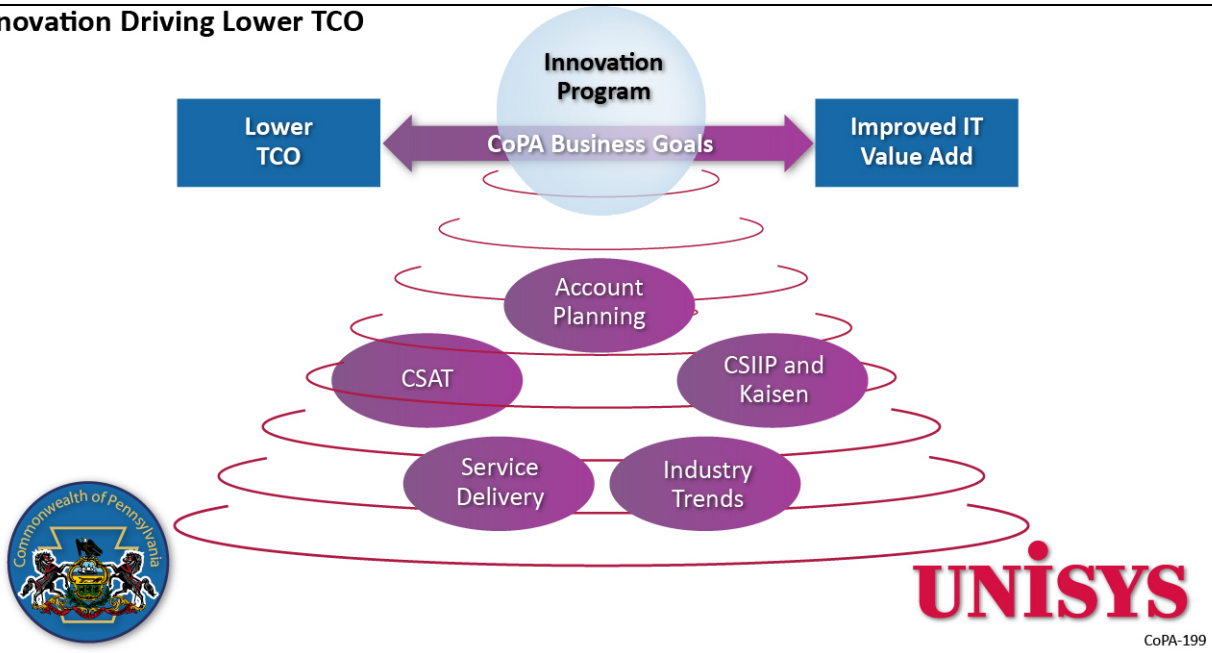

Figure 3.2.1.1.6-6 Innovation Driving Lower TCO

Our innovation program (see **Figure 3.2.1.1.6-6**) is driven by several concepts and programs. We are always gathering new industry trends and best practices for service delivery. We evaluate the trends and then gather metrics on our operations looking for places we can apply the industry best practices to drive down our TCO. Innovation is and continuous improvement is a central focus of our system architects as they support day to day operations.

5 CI Customer Satisfaction

5.A Survey of Service Desk satisfaction is a key component of providing best in class customer service. Receive completed surveys of Service Desk satisfaction from the Commonwealth and tabulating results from such surveys

Customer Satisfaction Surveys

Providing best in class ITIL V3 based IT service management and driving excellent client satisfaction is extremely important to Unisys and a key focus in our IT Solution. The SEO will manage a multi-pronged approach to client satisfaction. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT services being provided.

5.B Offeror must describe its approach to perform surveys of Service Desk satisfaction for a subset of the problems, questions, or requests that are resolved by, or coordinated by, the Service Desk.

The Service Desk will randomly survey Commonwealth clients who call into the Service Desk with a request or change which needs to be completed or an incident which needs to be resolved. Customer satisfaction surveys drive the Unisys client satisfaction program. Unisys conducts these surveys to confirm user satisfaction levels, identify opportunities to improve

agents and processes, and measure the qualitative aspects of providing Service Desk Services.

Unisys can expand and modify our customer satisfaction survey to include questions about the data center support dispatches, or we can conduct separate surveys for the separate Service Desk and data center functions. Customer satisfaction surveys complete the feedback loop between the user experience and the services received.

Unisys collects clearly defined performance criteria to permit analysis deemed important. For surveys of our Service Desk support, for example, we collect at least the agent's name, ticket number, narrative free-form text, and assessment ratings of the agent such as: courtesy and professionalism; technical knowledge; problem-solving skills; communication on ticket progress and resolution; and overall satisfaction.

Typically, we ask callers to rate performance for call responsiveness, problem resolution time, problem resolution quality, service orientation, and overall satisfaction.

Unisys sends a request to complete a customer satisfaction survey via e-mail to users who recently reported an incident via a phone call to our Service Desk. The e-mail contains a hyperlink which takes a user to a Web site to enter his or her responses on a HTML form. Responses are delivered back to our Service Desk by e-mail and collected in a database.

Unisys will use the information collected in our customer satisfaction survey as a basis for continuous improvement of service delivery. To calculate customer satisfaction, we take the sum of all scores for all surveys performed in a month and divide it by the total number of surveys performed in that month.

To conduct customer satisfaction surveys, Unisys uses an automated survey process and a set of questions for the end user to rate our service on a scale of 1 to 5:

5—Very Satisfied

4—Satisfied

3—Neither Satisfied nor Dissatisfied

2—Dissatisfied

1—Very Dissatisfied.

For questions the end user rates with a 1 or a 2, Unisys asks for supporting detail; we record this detail in the survey record and escalate customer satisfaction issues which require follow-up electronically to the Unisys Service Manager or the appropriate management representative. A survey follow-up process can consist of any one or all of the following:

- Review by a manager; review by a manager and an analyst or review by a service group
- Calling the end user to verify the rating, obtain additional information as required, and if possible, resolve the issue with the end user
- If applicable, retrieving the original incident call and listening to the recording for detailed information
- Creating and implementing a corrective action plan.

Unisys documents all survey follow-up activity and establishes corrective action plans, as

required. We end users to survey from the following criteria:

- End users with more than one service request in a 30-day period are surveyed for one request only.
- Service requests more than 7 days old are not surveyed.
- End users requesting not to be surveyed are not surveyed.
- Callers with invalid contact information are not surveyed.

5.C Offeror must describe its approach to creating and advertising a web site for day-to-day feedback from datacenter customers which is accessible through the Offeror's KMP.

Unisys will provide an Internet accessible Knowledge Management Portal (KMP) housed in the Unisys Service Portal tool. A Unisys Knowledge Manager will be responsible for working closely with the designated Commonwealth resources, as well as Data center Service Desk team, to keep the KMP current and relevant.

Training provided to data center customers (commonwealth employees) will always include a brief cameo discussion of the KMP. An option within the Knowledge Management Portal will be developed to allow for direct feedback from Commonwealth agencies and departments.

5.D Offeror must describe its approach to performing a customer satisfaction survey on a quarterly basis.

A formal client satisfaction survey will be conducted quarterly to clearly understand the client satisfaction of each agency and all of the ITIL service management operations areas. Unisys is currently providing these client satisfaction survey summary results to the Commonwealth. An example of these CSAT survey summaries by agency and operational area are shown in **Figure 3.2.1.1.6-7** below. Client facing leadership meetings between the Commonwealth CSAT Director and the Service Excellence Officer will be conducted quarterly to review this summary and the corresponding results from the multi-pronged input gathered through this robust CSAT process. Specific CSAT action plans will be documented and implemented to drive rapid service improvement if a remediation plan is required. This detailed CSAT process, analysis, and proactive communication will drive improved quality, greater transparency, while significantly improving the client experience.

Figure 3.2.1.1.6-7 DPH Agency Satisfaction Summary

6 CI Improve / reduce cost

6.A Offeror must identify its methods for addressing continuous service improvement targeted at minimizing or reducing costs of Services and operations.

Improve/reduce costs

Unisys is committed to providing the Commonwealth of Pennsylvania with best in class IT services, managed and driven through a dedicated Service Excellence Office. The SEO will drive Continuous Service Improvement throughout the ITIL V3 lifecycle. Standardization of ITIL V3 Frameworks, along with leveraging ISO certified processes, and Six Sigma Lean Tools will drive continuous service improvements. Governance, transparency and innovation workshops will verify the Commonwealth agencies plan and develop their future IT strategies and IT solutions. Risk management, independent quality audits, and business continuity planning will minimize risk throughout the ITIL V3 lifecycle phases.

Our method to identify and implement cost savings involves several activities. First we identify the strategy for improvement, define what will be measured, gather the data via carefully constructed surveys, audits, reviews, and process the collected data. We then analyze the gathered data to define cost saving action, test the cost saving action, and refine the cost saving

action as needed to confirm it will be effective. Finally, we implement the cost saving action to bring about the improvement. Once the cost savings action is in place, we define and collect metrics to monitor effectiveness of the cost savings action. We continue to adjust the cost savings activity to achieve the cost savings goal.

Our multipronged client satisfaction processes will verify Unisys clearly understands the voice of the customer, and will drive quality continuous improvement actions based collaborative feedback. All of this collectively represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania shown in **Figure 3.2.1.1.6-8** below. This Quality Plan will provide the Commonwealth with the highest customer satisfaction experience, best in class quality IT services and ITIL processes, and a significant lower total cost of ownership.

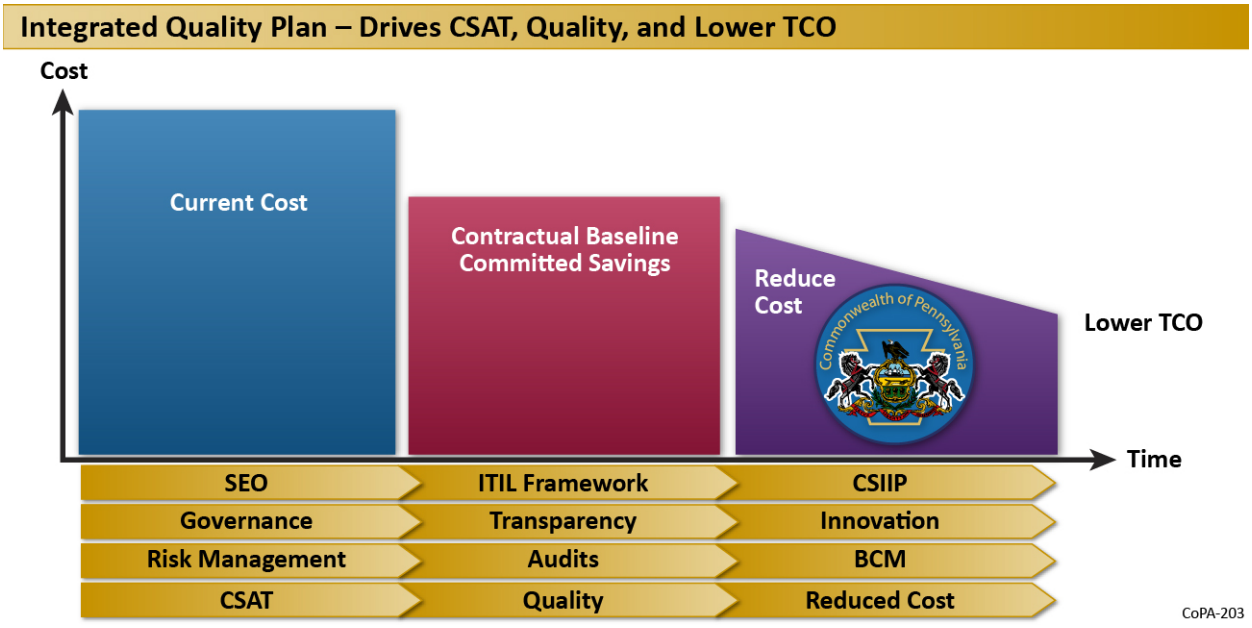

Figure 3.2.1.1.6-8 Unisys Integrated Quality Plan

3.2.1.2 Availability/SLA Management

The purpose of the System Availability and SLA function is to ensure that each service is delivered within, or exceeds, the agreed availability service level, and prescribed credits are received by the Commonwealth when the service level has not been achieved. Availability Management provides a point of focus and management for all availability related issues, ensuring that availability targets are established, measured, and achieved. The basic requirement is to balance the value and quality of Services with the costs of the Services. Availability and SLA management will be responsible for establishing and reviewing the SLA's to meet the Commonwealth's requirements. Offeror should review referenced exhibits for a list of SLAs and associated descriptions, tools and methodologies.

Availability/SLA Management ensures that datacenter service availability standards, as prescribed in appropriate datacenter SLAs, are achieved.

Reference Documentation

Schedule J.1 - Datacenter Service Level Management

Schedule J.2 - Datacenter Service Level Matrix

Schedule J.3 - Datacenter SLA Definitions

	Requirements	Describe Compliance
1.	Establish a formal Availability and SLA Management service. This service will include representatives from the Offeror and the Commonwealth for reviewing and approving the availability and SLA metrics. Offeror must publish the formal Availability and SLA Management plan based on a Services Catalog. Identify key Services and the associated level of availability or capacity as appropriate. Identify the Services that will be measured by an SLA. Define the basis the SLA service levels will be monitored and obtained. Obtain approval from the Commonwealth.	Offeror must describe its methodology and approach to Availability Management and Service Level Management.

2.	Identify Service Level Measurement Tools	Offeror must provide a list of those Service Level measurement and monitoring tools that it will use to measure and report Offeror's performance of the Services at a level of detail sufficient, as determined by the Commonwealth, to verify Offeror's compliance with those Service Levels described in **Schedule J.3 Datacenter SLA Definitions**. Offeror must review and update the required sections within Schedule J.3 Datacenter SLA Definitions. Offeror must complete the following sections in each of the Critical Service Levels and Key Measurements: • Collection Process – identify how the measurement data will be collected • Reporting Tools – identify any tools, automated or manual, that will be used • Raw Data Storage (Archives) – identify where data will be stored and accessible by the Commonwealth for further analysis. • Reporting Format/s – identify the proposed reporting format
3.	Integrate Availability Management with other service management processes, such as SLA, Capacity Management, Problem Management and Service Desk.	Offeror must describe how its proposed Availability Management process is integrated with other service management processes such as SLA, Capacity Management, Problem Management and Service Desk.

4.	Establish automated non-compliance indicators. Automatically e-mail the designated Commonwealth contact when SLA service parameters are not met. Create email notification groups by major service. Utilize this, or a similar process for outage notification.	Offeror must describe its process for managing Services performance.
5.	Investigate all instances of non-compliance. Notify the Commonwealth of an outage as defined in the CCPM. Complete a root cause analysis (RCA) for all major outages, and provide a detailed report to the Commonwealth and impacted user. Completion of the Incident report must occur within 2 days of the incident and the RCA within 10 days of the incident.	Offeror must describe its process for root cause analysis and for meeting the required SLAs. Offeror must include definitions of outage types and how it will make reports available to the Commonwealth.
6.	Identify integrated tools, methods, and activities to be used for reporting service and component availability. Ensure proactive measures to improve availability of Services are implemented whenever it is cost justified.	Offer must identify tools, methods, and activities it will use for reporting service and component availability. Offeror must describe its offerings in this area.
7.	Integrate Agency Availability Management processes with SLA Management. On a monthly basis, consolidate all system SLA availability reports into a management operations report, summarizing availability, outages, and SLA compliance by platforms.	Offeror must describe its offering in this area.

8.	Develop and maintain a Portal/Website for agencies to view operational status, planned maintenance, and component level outages.	Offeror must describe its Portal/Website to view operational status, planned maintenance and component level outages.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Unisys will establish System Availability and Service Level Management (SLM) processes to help confirm that each service is delivered within, or exceeds, the agreed availability service level, and prescribed credits are received by the Commonwealth when the service level has not been achieved.

Availability Management provides a point of focus and management for all availability related issues, ensuring that SLA availability targets are established, measured, and achieved. The objective of this capability is to balance the value and quality of Services with the costs of the Services.

The Unisys Team will map critical Configuration Items (CIs) and relationships for infrastructure components to the Commonwealth/Agency Application CI during transition, using the mapping and discovery tools used to populate the Unisys CMDB. The Unisys Team will also utilize the current information from the Commonwealth to assist in this effort. The end result will be an approved mapping of an application to infrastructure with relationships that will be used to calculate application supporting infrastructure SLA's and assist in determining service impacts.

1 SLA, Availability Management and Service Level Management

1.A Offeror must publish the formal Availability and SLA Management plan based on a Services Catalog.

Unisys will publish a formal plan for supporting Availability and SLAs based on the agreed upon Services Catalog as represented in Schedule I of the RFP response. This is the outcome of the first few steps in the Availability Process described in 1.F below.

Establish a formal Availability and SLA Management service. This service will include representatives from the Offeror and the Commonwealth for reviewing and approving the availability and SLA metrics.

The Unisys Team will establish the governance for the Availability and SLA Management Service together with the Commonwealth during transition. The combined governance team will be comprised of PMO Representatives (Account Managers, Service Delivery Managers, Service Level Managers (Analysts), Financial Managers from both the Unisys Team and the

Commonwealth.

The Team will agree on the process for reviewing SLA results on a monthly basis to review:

- SLA results
- Acceptance of the results
- Exceptions to SLAs
- Required action items

The Team will also review and track SLA metrics, financial penalties, and earn backs.

1.B Identify key Services and the associated level of availability or capacity as appropriate.

Unisys will identify key services identified in the Enterprise Services Catalog through the relationships identified in the Unisys CMDB. Underpinning services are mapped to application services identified in the Enterprise Services Catalog with associated SLA's. In order to meet availability SLA's of the Enterprise Services Catalog Services, these underpinning services and SLA's are used to establish precedence and relationships for availability calculations.

Capacity information is stored in the Capacity Data Base described in the Unisys Capacity Management Solution described in Section F3.2.1.7 and is available as necessary to support any Availability Management calculations or reporting objectives.

1.C Identify the Services that will be measured by an SLA.

Services and associated SLA's are in the agreed to Enterprise Services Catalog and stored in the Unisys CMDB and Service Level Management (SLM) application. The Service Level Management application is used to calculate SLA's utilize the SLA information stored in the Unisys CMDB to calculate SLA compliance.

1.D Define the basis the SLA service levels will be monitored and obtained

The basis for obtaining the SLA definitions comes from the SLA definitions in Schedule J.3 of the RFP. These definitions will be used to configure the tools to monitor SLA compliance as shown in **Figure 3.2.1.2-1** below. Each SLA will be reviewed with the Commonwealth to determine the methods for gathering data used to calculate each agreed to SLA. The Commonwealth will approve these SLA monitoring methods during transition or for any required changes before they are implemented into production.

1.E Obtain approval from the Commonwealth

The Commonwealth will approve the methods for gathering data and measuring SLA results.

1.F Offeror must describe its methodology and approach to Availability Management and Service Level Management.

The following is the Unisys methodology and approach to Availability Management and Service Level Management for the Commonwealth agencies. These processes will be reviewed with the Commonwealth during transition and adjusted to meet Commonwealth requirements.

Availability Management

The Unisys Availability Management Process will be implemented during transition for the Commonwealth. The process and methodology outlined in **Figure 3.2.1.2-1** below will be reviewed and approved with the Commonwealth.

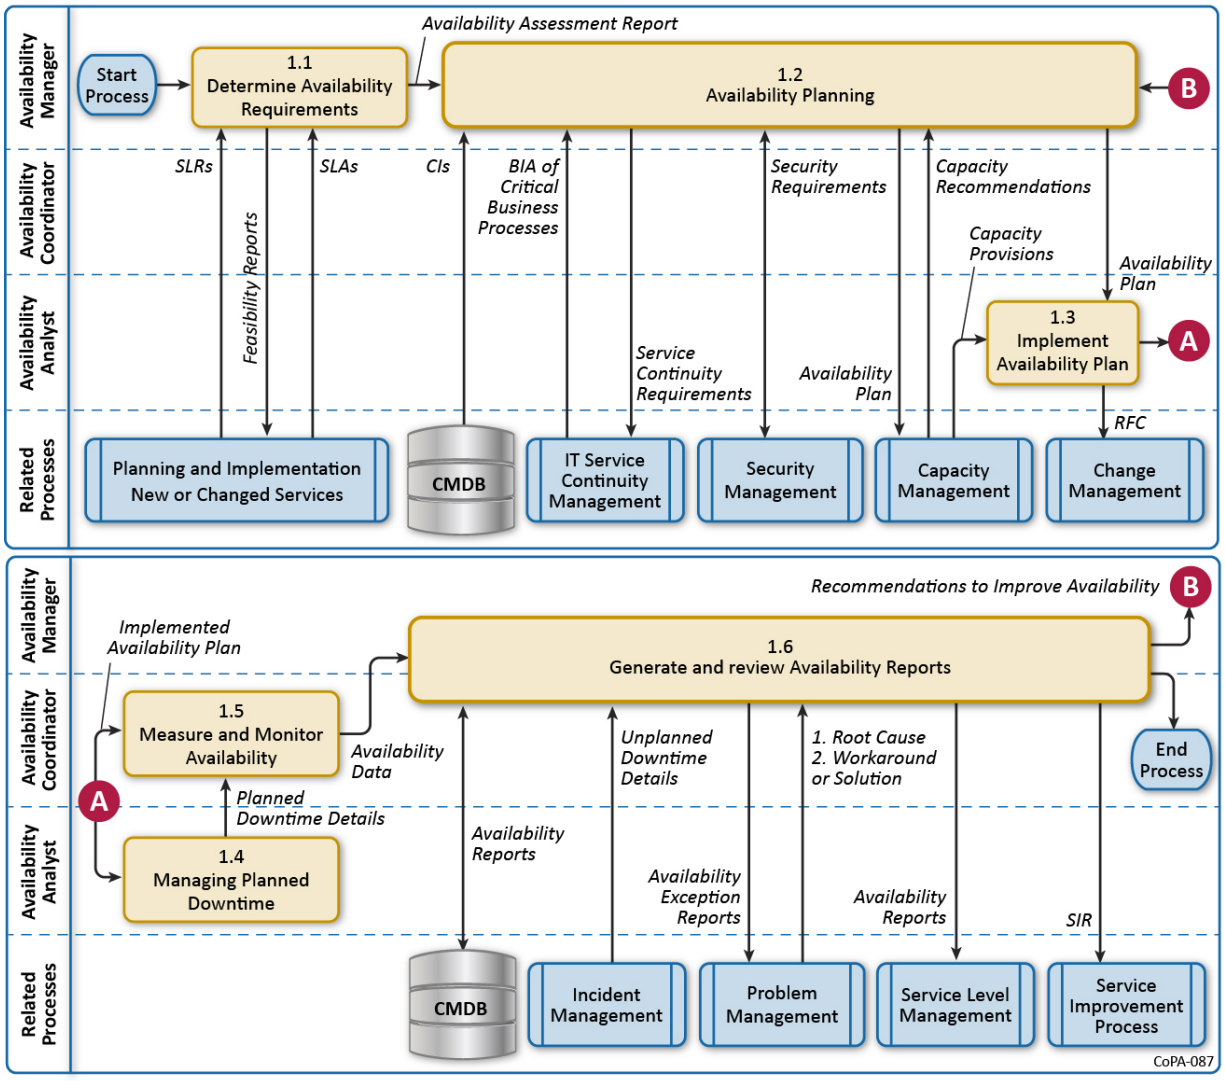

Figure 3.2.1.2-1 Availability Management Process

The following outline summarizes the Availability Process shown above. The details of this process will be determined during transition, reviewed with the Commonwealth for acceptance,

and documented in the CCPM.

1.1 Determine Availability Requirements

- Review SLA's with Commonwealth service owners and stakeholders
- Agree on revised SLA's where applicable using governance process
- Implement ongoing process to determine availability requirements
- Develop preliminary availability design for Commonwealth Agency services
- Assess service outages
- Develop countermeasures to prevent service outages
- Assess Internal/External suppliers for service components
- Prepare availability assessment report

1.2 Availability Planning

- Design solution with cost constraints and assumptions
- Review with Commonwealth agencies and modify design
- Test design and perform risk analysis
- Design solution meeting availability requirements
- Develop maintenance plan with underpinning agreements to support plan
- Review with Commonwealth agencies and obtain approval

1.3 Implement Availability Plan

- Implement and monitor availability plan
- Modify implementation as needed to meet plan
- Obtain Commonwealth agency signoff

1.4 Manage Planned Downtime

- Schedule maintenance activities
- Communicate the maintenance schedule
- Implement process to back out maintenance if necessary

1.5 Measure and Monitor Availability

- Monitor services and components
- Register incidents
- Review service outages and impacts
- Measure impact of outages
- Determine any changes required in availability design
- Process change requests if required

1.6 Generate and Review Availability Reports

- Consolidate IT component and service outage information

- Prepare availability reports
- Review and analyze reports
- Distribute availability reports
- Recommend availability improvements
- Update availability plan as required

Service Level Management

The Unisys Service Level Management (SLM) Process will be implemented during transition for the Commonwealth. The process and methodology outlined in **Figure 3.2.1.2-2** below will be reviewed and approved with the Commonwealth. This process will be reviewed with the Commonwealth during transition and adjusted to meet Commonwealth requirements.

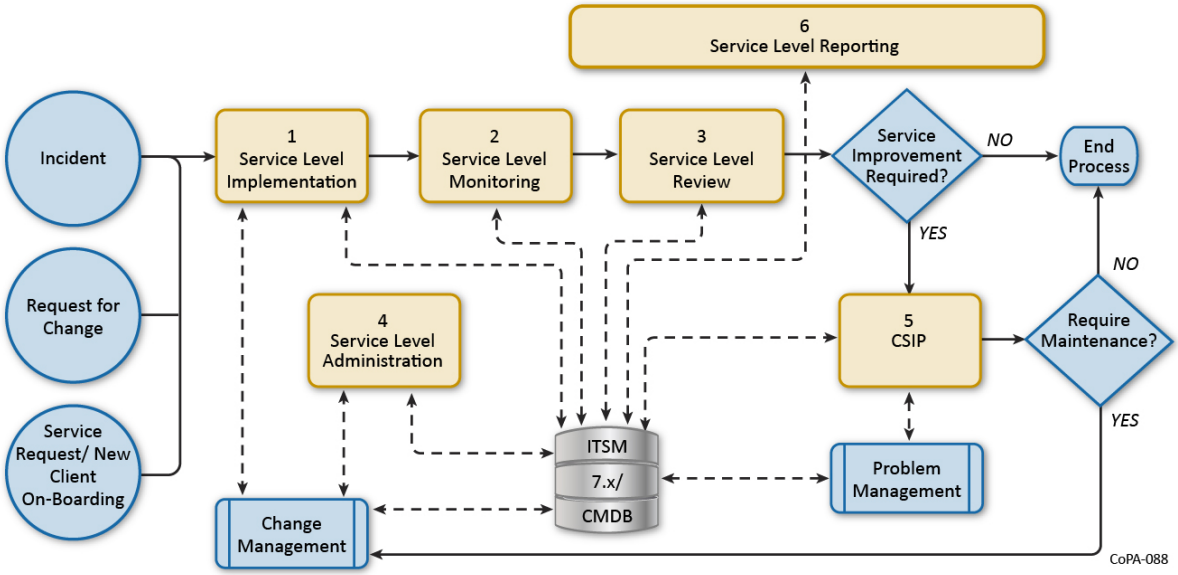

Figure 3.2.1.2-2 Service Level Management Process

The following outline summarizes the Service Level Management Process shown above. The details of this process will be determined during transition, reviewed with the Commonwealth for acceptance, and documented in the CCPM.

1. **Service Level Implementation.**

   Design SLA Framework. Use the Enterprise Services Catalog as an aid and design the most appropriate SLA structure to confirm that all services and customers are covered in a manner best suited to the organization's needs

   Determine, Document, and Agree to Requirements and Produce Service Level Requirements (SLRs). Once the Enterprise Services Catalog has been produced and the SLA framework has been agreed to, this activity drafts the SLRs.

   Review, Negotiate and Sign OLAs. Determines and negotiates the OLA requirements necessary for service delivery, and develops OLAs and obtains signatures for OLAs that

support the SLA.

Review, Negotiate & Sign Ucs. Reviews, negotiates, develops, and has signed the UCs that support the SLA and OLAs.

Create Service Level Agreement and Negotiate Terms. Drafts and negotiates the SLA that is needed to meet specified SLRs and objectives.

Activate the SLA. Oversees the signing and activating of the SLA.

2. **Monitor Service Performance Against SLA and Produce Service Reports.** Monitors performance in an ongoing manner and reports on specified service level measurement.
3. **Perform Service Level Review.** Performs periodic reviews of service level performance.
4. **Service Level Administration.** Conduct periodic reviews of SLAs with stakeholders to review SLA's and determine if any changes are required to support existing or modified SLA's
5. **Create a Service Improvement Plan (CSIP).** Creates a CSIP that is a formal plan to implement improvements to a process or IT service. A CSIP is managed as part of the Continual Service Improvement (CSI) element of ITSM.
6. **Service Level Reporting.** Produce SLA reports and make accessible to stakeholders with capabilities to drill down into details.

2 SLA Service level Measurement Tools

2.A Offeror must provide a list of those Service Level measurement and monitoring tools that it will use to measure and report Offeror's performance of the Services at a level of detail sufficient, as determined by the Commonwealth, to verify Offeror's compliance with those Service Levels described in Schedule J.3 Datacenter SLA Definitions.

Identify Service Level Measurement Tools

Figure 3.2.1.2-3 below shows the architecture and tools to support the Service Level Management measurement, monitoring and reporting.

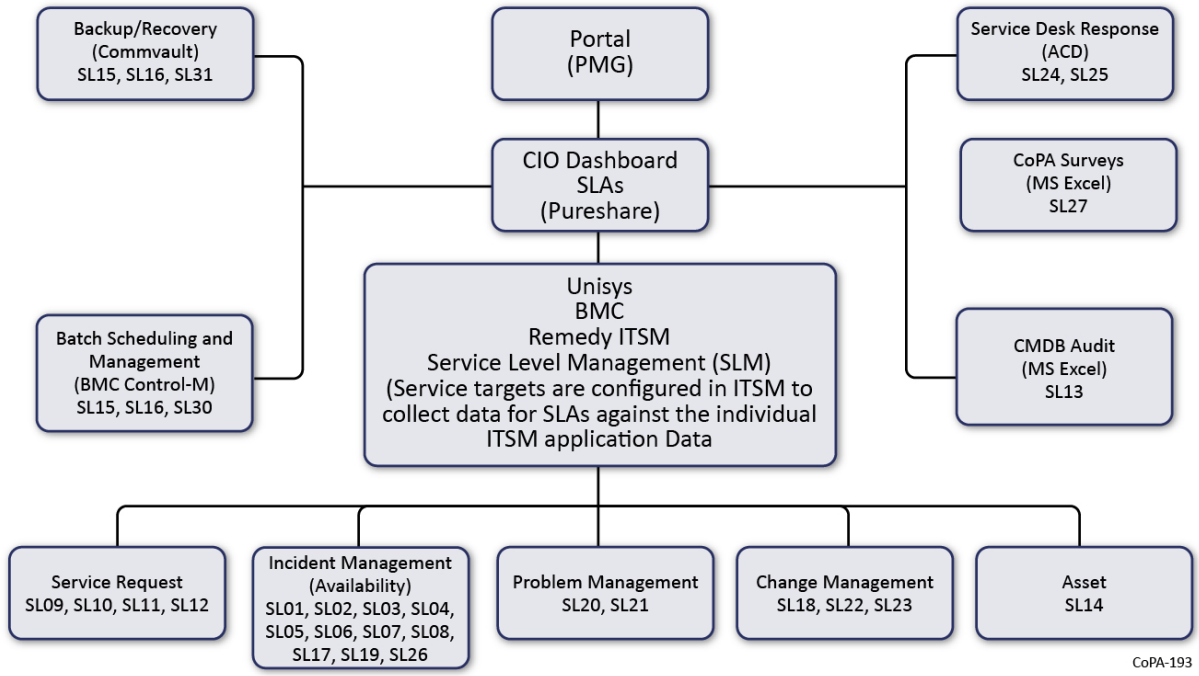

Figure 3.2.1.2-3 SLA Supporting Tools Architecture

The diagram shows how the various tools collect the data for calculating the SLA's for this contract and how the SLA's are reported in the Unisys Real-time Dashboard. Commonwealth stakeholders will be able to view the SLA compliance and drill down into supporting details. Monthly SLA reports are made available in the Unisys reporting Portal for the Commonwealth to access and review.

The Unisys and Commonwealth PMO will review and agree to the supporting tools, measures, monitors, and reports for SLA's calculations during transition using Schedule J.3 Datacenter SLA Definitions to verify compliance.

2.B Offeror must review and update the required sections within Schedule J.3 Datacenter SLA Definitions. Offeror must complete the following sections in each of the Critical Service Levels and Key Measurements:

Please refer to Schedule J.3, which is an attachment to Section 3 for a description of each SLA outlining the following:

- Collection Process – identify how the measurement data will be collected
- Reporting Tools – identify any tools, automated or manual, that will be used
- Raw Data Storage (Archives) – identify where data will be stored and accessible by the Commonwealth for further analysis.
- Reporting Format(s)

2.C Collection Process – identify how the measurement data will be collected

Please refer to the SLA Measurement Tools in **Figure 3.2.1.2-3** above which are used to collect measurement data for each SLA. Also, please refer to Schedule J.3. Section 3 for a detailed discussion for each SLA.

2.D Reporting Tools – identify any tools, automated or manual, that will be used

Please refer to the SLA Measurement Tools above **Figure 3.2.1.2-3** which are used to collect measurement data for each SLA. Also, please refer to Schedule J.3. Section 3.4 for a detailed discussion for each SLA.

2.E Raw Data Storage (Archives) – identify where data will be stored and accessible by the Commonwealth for further analysis.

Thirteen months (13) of online data supporting the SLA's will be retained in the Reporting tools shown above with a rotation to archive tape backup. This will allow the Commonwealth to review supporting details online up to 13 months. A data archive will exist on tape.

2.F Reporting Format/s – identify the proposed reporting format

Reporting formats for the online display of SLA's in Real-time Dashboard and monthly reporting for SLA performance will be reviewed and approved during the first six months of the contract in establishing the ITSM platform for operational readiness. The samples of report formats can be found in Schedule J.3, Section 3 for each SLA.

3 Integration, Availability integrated with SLA, Capacity

3.A Offeror must describe how its proposed Availability Management process is integrated with other service management processes such as SLA, Capacity Management, Problem Management and Service Desk.

Integrate Availability Management with other service management processes, such as SLA, Capacity Management, Problem Management and Service Desk

Unisys will integrate Availability Management with other service management processes, such as Incident , Problem and Change Management. These are the main processes for Availability SLA integration. Other processes contribute as necessary to support these including Configuration and Capacity Management.

For example, incidents that impact availability, are reviewed by the Unisys Availability Manager and Problem Manager in order to determine how to prevent availability issues in the future. The Availability and Problem Manager will make recommendations for change, and if accepted by the Commonwealth, will be processed through the Change Management Process. If the Change requires additional Capacity this will be coordinated with the Capacity Management Process.

The Service Desk is involved if the Availability Issue is reported by the Commonwealth agencies. The Service Desk will record an incident ticket that would follow the process

described above.

4. Service Performance Management

4.A Automatically e-mail the designated Commonwealth contact when SLA service parameters are not met. Create email notification groups by major service. Utilize this, or a similar process for outage notification.

Establish automated non-compliance indicators.

The Unisys Incident Management application as part of the ITSM Solution will automatically send email messages for SLA's exceeding thresholds to the appropriate stakeholders. These thresholds will be determined by the SLM Application(s) examining the CMDB structure to determine SLA precedence and relationships to notify stakeholders appropriately. Unisys will establish for all major services, email notification groups by major service to support notification of to all Unisys, Subcontractor and Commonwealth stakeholders.

Outage notifications are handled through the incident management process which will notify SLA stakeholders through email, and visually SLA violations and status will be displayed on the Real-time Dashboard which is available to all SLA stakeholders.

4.B Offeror must describe its process for managing Services performance.

The Unisys Service Level Management Analyst and the Unisys Account Managers are responsible for managing Services performance. Dashboards will be made available to assist with monitoring. This team will be notified of services performance incidents or SLA violations as described above in 4.A.

The Unisys Commonwealth Account Managers and service level analysts will review all Service Level breaches or approaching violations and lead corrective actions stemming out of Incident/Problem Investigations.

Unisys will investigate all instances of service performance SLA non-compliance or approaching non-compliance. If the Unisys Account Managers, Problem Manager or Service Level Management Analyst identifies potential issues from the dashboard reviews or automated incident notifications they will review and analyze the situation with the support teams. If the service levels are achievable a Problem Management case may be opened to investigate an issue. The Root Cause Analysis (RCA) is a collaborative effort of multiple teams to identify the reasons for the SLA breach. The possible solutions are identified to prevent the recurrences of similar failures in the future. The users and stakeholders are informed about the plans to prevent an SLA breach in the future.

The Service Level Management Analyst provides a consistent interface to the Unisys/Commonwealth PMO Teams for all service-level related issues. He/she provides the agreed service targets and the required management information to verify that those targets have been met. Where targets are breached, the SLM Analyst provides feedback on the cause of the breach and details of the actions taken to prevent the breach from recurring. The SLM Analyst and process provides a reliable communication channel and a trusted relationship with

the appropriate stakeholders for Unisys and the Commonwealth Agencies.

5 SLA Reporting, Root Cause analysis, outage reporting

5.A Notify the Commonwealth of an outage as defined in the CCPM. Complete a root cause analysis (RCA) for all major outages, and provide a detailed report to the Commonwealth and impacted user

Investigate all instances of non-compliance.

Unisys will investigate all instances of non-compliance using the Problem Management Root Cause Analysis Process and produce an RCA Analysis as described in **Figure 3.2.1.2-4** below.

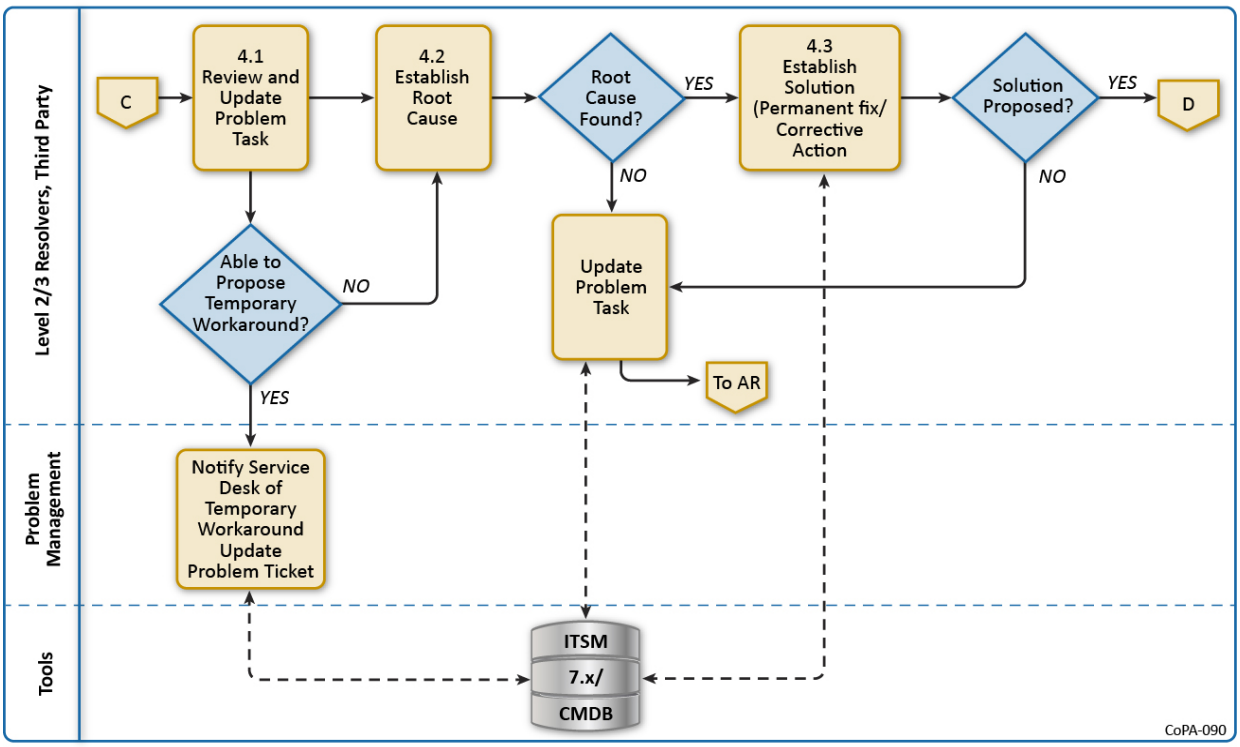

Figure 3.2.1.2-4 Problem Management – Root Cause Analysis Process

Root Cause Analysis (RCA)

4.1 Review and Update Problem Task - RCA involves investigation of the problem by the relevant Level 2 or 3 Technical Teams and/or Third-Party Vendor. The primary aim of this procedure is to determine a work-around and to establish the root cause.

The Root cause analysis procedure details the activities carried out to establish a work around/root cause and a permanent solution (corrective action).

Completion of the associated SLA incident report must occur within 2 days of the incident and

the Root Cause Analysis must be completed within 10 days of the incident.

The L 2/3 Resolver/Resolver Groups assigned with the Problem Tasks need to review and update the problem task with relevant information regarding the task assigned. If they are able to propose a temporary workaround for the problem, information needs to be sent to the Problem Management team and the Service Desk.

4.2 Establish Root Cause - Once the task has been reviewed and updated the next step would be to establish the root cause of the problem. Several different methods like the 5 why method or fishbone analysis could be used to get to root cause of the Problem. Once the root cause has been established, information needs to be updated in the problem task assigned. In the event root cause cannot be established the procedure would move directly to Analysis review.

4.3 Establish Solution - The next step in this procedure is establishing the permanent solution or the corrective action to fix the root cause of the problem. Once a solution is proposed it needs to be approved before it can be implemented. A proposed solution and change ticket is the outcome from this procedure.

The Change Process is used to review the recommended solution and approve or reject the solution. The approval or rejection of the Solution provided is done in consultation with the Unisys Account Manager and Support Team technical leads. This procedure also involves the creation and managing of Known Errors.

5.B Completion of the Incident report must occur within 2 days of the incident and the RCA within 10 days of the incident.

Per the root cause process described above, the incident report will be completed within 2 days and an RCA will be completed within 10 days of the incident.

5.C Offeror must describe its process for root cause analysis and for meeting the required SLAs.

See the complete root cause analysis process described above in 5.A above for meeting the required SLAs and taking any corrective actions through the Change Management Process.

5.D Offeror must include definitions of outage types and how it will make reports available to the Commonwealth.

Unisys will perform the following procedure to provide reports on outage types:

- Collect the service outage data.
- Assemble the team who is familiar with outages.
- Group related service outages together such as grouping by vendor, product, application, customer and project. This will leverage the CMDB relationships and SLA structure to assist in grouping, determining SLA priorities and precedence.
- Categorize each outage as “High, Medium and Low.”

- Focus on outages which are categorized as "High."
- Monitor "Medium" for future outages.
- Review the Root Cause of unavailability for the "High" outages.
- Rank related outages and their causes.
- Examine the reasons for the duration of the unavailability for each grouping of similar outages (for example, the outages might have occurred because of faulty hardware or software, but the duration of unavailability might have been extended by lack of tools, training, process, and resources).
- Review existing Operations procedures that were invoked or used during this outage and the Technical Support Staff who were involved in the outage or restoration.
- Determine if anything might have lessened the duration of the outages and list them (for example, the lack of tool, process and resources).
- Quantify the avoidable outage time (for example, if there was one (1) hour of down time resulting from trying to locate the proper tool, then the avoidable outage time is one (1) hour x the number of outages affected).
- Raise a Request for Change (RFC) to address the "High" outages with a suggested solution to prevent the down time.
- Summarize the number of outages analyzed, listing the avoidable outage time and suggestions for minimizing or avoiding the outage. Present the report to the Commonwealth agencies on a monthly basis.

6 SLA Availability Reporting tools

6.A Identify integrated tools, methods, and activities to be used for reporting service and component availability. Ensure proactive measures to improve availability of Services are implemented whenever it is cost justified.

All tools to support SLA Availability Reporting are shown in Section 2.A above.

The process, procedures and activities to support availability reporting are shown in Sections 1 (Process), 2 (Process Integration), 4 (Service Performance Management) and 5 (Reporting, Root Cause Analysis) and outage notification, all above.

Proactive measures are handled in the Unisys SEO and ITSM Continual Service Improvement Services as part of the Unisys SEO described in Section F3.2.1.1.6.

Please refer to Site Operations Section F3.2.3.2 for a complete integrated view of services management end-to-end.

6.B Offer must identify tools, methods, and activities it will use for reporting service and component availability.

Please review the description above in 6 A. for all tools, methods, and activities used for reporting service and component availability.

6.C Offeror must describe its offerings in this area.

Please review the description above in 6 A. for all tools, methods, and activities used for reporting service and component availability.

7 Integration, Availability integrated with SLA Management

7.A Integrate Agency Availability Management processes with SLA Management. On a monthly basis, consolidate all system SLA availability reports into a management operations report, summarizing availability, outages, and SLA compliance by platforms.

During transition, the Unisys Availability, Service Level Managers and PMO stakeholders will review the Commonwealth Agency processes for Availability and SLA Management to determine how best to incorporate these within the overall framework for management and reporting purposes.

The Availability Management Processes that Unisys will provide to the Commonwealth and Agencies are described above in Section 1.A. The Processes will be support the Commonwealth Agencies, incorporating an Agency specific procedures when approved by Unisys and the Commonwealth agencies during transition.

Availability reporting, outages and SLA compliance are displayed in the Unisys Real-time Dashboard with drill down capability to supporting details. Monthly SLA and operations reports will be made available in the Service Portal. All Commonwealth and Unisys stakeholders who need this information will have access to the Service Portal.

7.B Offeror must describe its offering in this area.

See offering above in 7.A.

8 Portal, SLA Web Portal

8.A Develop and maintain a Portal/Website for agencies to view operational status, planned maintenance, and component level outages.

Unisys will develop and maintain a Portal for the Commonwealth agencies to view operational status, planned maintenance, and component level outages. The following section discusses the Service Portal in detail.

8.B Offeror must describe its Portal/Website to view operational status, planned maintenance and component level outages

Commonwealth, Unisys and subcontractors will use a Portal and Real-time Dashboard integrated together to view SLA status, operational status, planned maintenance and component level outages.

Unisys will provide the Commonwealth with Portal access to view SLA status (See **Figure 3.2.1.2-5** below) , operational status, planned maintenance and component level outages with the following information:

- Service Status - SLAs
- Contract obligation and health
- Maintenance windows
- Enterprise device management and health
- Project management and health
- Drill down capability on any of the above (ticket data, outage data, project data)
- Agency specific operational views
- Standard periodic reports
- Knowledge Management Portal (KMP)

The Commonwealth agencies and stakeholders will be able to use the Services Portal and Real-time Dashboard to easily view the SLA status, operational status, any planned maintenance schedules, and drill down to see program level details supporting these metrics.

The following is an example of how SLAs will be reported near real time in the Real-time Dashboard available through the Services Portal.

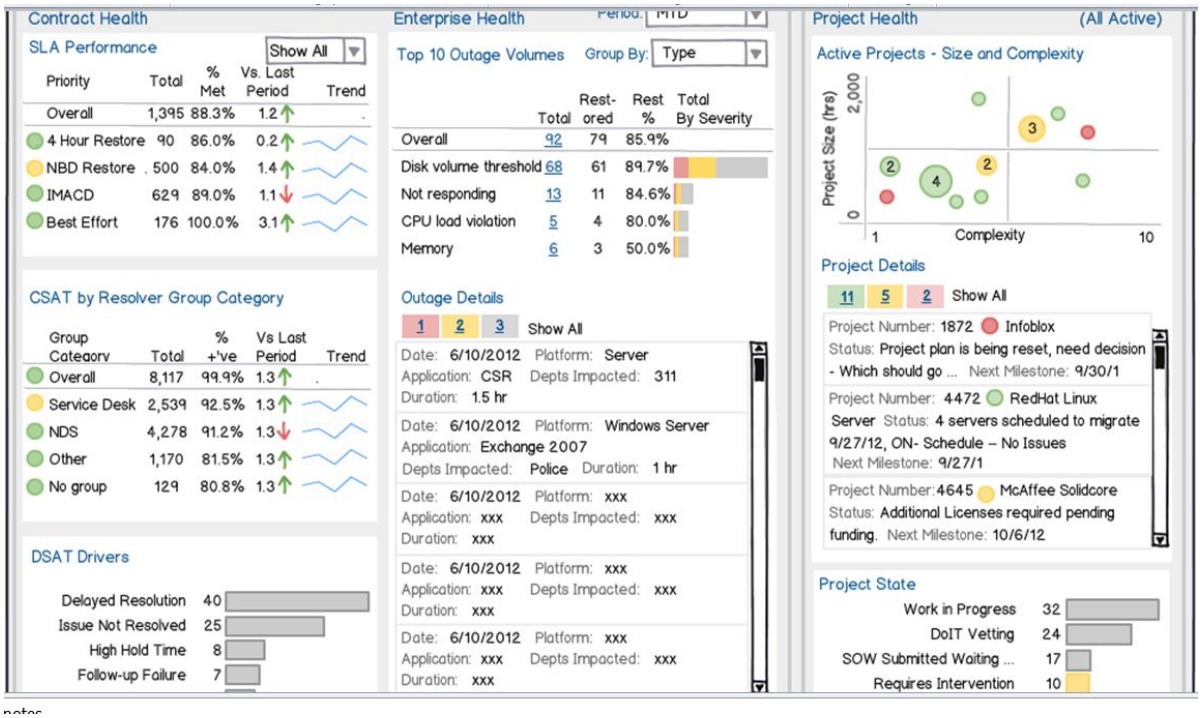

Figure 3.2.1.2-5 CIO Program Health Portal Dashboard

Unisys Team Experience

Unisys currently provides IT Service Management Services to more than 150 customers worldwide. Unisys is a leading provider of Managed Services utilizing an integrated suite of ITIL V3, ISO 20000 certified management processes and leading ITSM tools to provide outstanding service levels to our customers.

Unisys currently successfully manages more than 400 SLA's for the Commonwealth, achieving 99.7% SLA compliance in 2012.

Benefits to the Commonwealth

The Unisys value proposition for the Availability and Service Level Management Solution described above is summarized as follows:

- Reliable service level attainment and dependability to support the Commonwealth/Agency business and application consumers
- Flexibility to customize SLA's and meet them for the Commonwealth

3.2.1.3 Change & Release Management

Change & Release Management ensures that all changes within the datacenter environment are planned, executed, monitored, documented, and that the change produced the intended effect. The Offeror must establish the overall Change & Release Management function and manage the daily operations of the functions. This will ensure that all changes are processed in a uniform manner that required documentation, approvals, and notifications are completed before the change is implemented within each of the lower infrastructure environments and then moved into the production environment. Post implementation review and approval will require that all steps have been completed as documented, and within the time frame allotted. All change and release documentation must be maintained in a manner that will facilitate random compliance auditing. On a yearly basis, random selections of changes will be audited for compliance purposes.

Reference Documentation

Schedule H - Commonwealth Computing Process and Procedures Manual (CCPM)

Requirements		Describe Compliance
	Establish a formal Change & Release Management function. This function will include representatives from the Offeror and Commonwealth to support the review and approval of all changes. Offeror must publish the formal Change & Release Management plan. Identify key elements and roles; Request for Change Form & Process, Change Manager, Change Advisory Board, Emergency Change Advisory Board, Notification process, Change review process. The documentation and process will follow industry best practices. Train appropriate Commonwealth staff on the process as requested by the Commonwealth. The Offeror's Change Management & Release management process must consider and integrate with the Commonwealth's individual change management policies and procedures,	Offeror must described its proposed process and provide a sample overview of its process and procedures. Offeror must describe the system tool it will use to support the Change & Release Management processes. Offeror must describe how it will integrate its Change & Release Management tool with the Commonwealth's Enterprise ITSM solution. Offeror must describe its process and procedure for the Commonwealth to perform random audits.

	for example from January to May of each year, Department of Revenue (DOR) maintains a “no update policy” to DOR servers that have any production Tax-Related Applications running on them.	
1.	Institute a Change Advisory Board (CAB) The CAB members shall ensure that the requested changes are thoroughly checked and assessed from both a technical and business perspective.	Offeror must describe its proposed approach to creating a CAB and describe how members should be selected. Offeror must describe its approach to handling changes at an agency level. Offeror must provide a sample CAB organization and meeting schedule.
2.	Test infrastructure related changes & releases before implementation. This includes Offeror managed hardware and any Offeror managed software. Offeror must file a Pre-Change Test Plan, as part of the Change & Release request process, including results before final approval to proceed. Offeror must create and maintain test environments where testing will be conducted and evaluated prior to implementing any change into production environments.	Offeror must described its proposed process and provide a sample overview of process and procedures.
3.	Establish scheduled maintenance periods, and communicate the scheduled outages. Create a notification process for maintenance, emergency, and unplanned outages. Offeror must establish regular maintenance periods for each computing platform. Maintenance periods must be coordinated per agency due to different peak business requirements.	Offeror must describe its process for managing maintenance periods and system outages, with examples. The Offeror must provide an approach to managing multiple agency specific maintenance periods with different peak periods.

	Create mechanism to notify clients of expected and unexpected outages.	
4.	Notify affected Commonwealth agencies before and after any changes. Provide Change & Release Notifications prior to implementation via a central web site and e-mail.	Offeror must describe its proposed process and procedure related to notifications. Offeror must describe any other change notifications capabilities available to the Commonwealth.
5.	Validate all changes after implementation. Complete a post change review to validate the success or failure of the change or release, and post the information within the change record. Take follow up action as appropriate.	Offeror must describe its proposed process and procedure.
6.	Prepare back out procedures for all changes. As part of the Change & Release process, file a back out plan as appropriate to remove the change and restore Services to the prior level.	Offeror must describe its proposed process and procedure related to back out procedures.
7.	Track all (successes / failures) changes and produce Change & Release management statistics. Create and deliver a monthly Change & Release Management Report to the Commonwealth, detailing changes, implementation status, and outage time periods as compared to planned outage schedules.	Offeror must describe its proposed process and procedure.
Deliverables		
Deliverables are defined in **Schedule K – Key Program Deliverables**		
Offeror Response		
Introduction		

Unisys will implement a Change & Release Management Process to help confirm that all changes within the data center environment are analyzed, planned, tested, monitored, documented, and that the change produced has the intended effect for the Commonwealth.

All changes will be processed in a uniform manner with the required documentation, approvals, back out plans and notifications complete, before the change is tested and then released and deployed into the production environment.

Post implementation reviews will be conducted to help verify that all steps have been completed, documented , and released and deployed within the time frame allotted. All change and release documentation will be maintained in a manner that will facilitate random compliance auditing. On a yearly basis, random selections of changes will be audited for compliance purposes.

1 Change and Release Process, tools, integration, random audits

1.A Establish a formal Change & Release Management function. This function will include representatives from the Offeror and Commonwealth to support the review and approval of all changes

Unisys will Establish a formal Change & Relapse Management Process and supporting functions in line with ITIL V3 guidance.

The Change Management process shown in **Figure 3.2.1.3-1** below controls the life cycle of all changes. The goal is to respond to changing business requirements while maximizing value and reducing incidents, disruption, and rework. The objectives of this process are:

- To enable beneficial changes to be implemented with minimum disruption to IT service
- To confirm that changes are recorded and evaluated, authorized, prioritized, scheduled, tested, implemented, documented, and reviewed in a controlled manner.

The Change Management process verifies that any changes to service assets and CIs are properly planned, managed, and reviewed prior to their implementation and release.

The Change Management process and the Release and Deployment Management process closely govern the daily activities of the testing environment shared between Unisys and the Commonwealth's agency application testing environments for testing, evaluating, and deploying applications and services to the production data centers. This forms the basis for establishing an operational capability and serves as the foundation for other ITIL V3 processes that guide the day-to-day operation.

A normal change is a change that follows the normal Change Management process, requiring review and approval, etc. A standard change is a minor change with low risk that has been preapproved by the Change Manager because it follows a well-known and established procedure.

Unisys will establish formal Change and Release Management Processes in **Figure 3.2.1.3-1** below to help facilitate all changes within the data center environments are planned, executed, monitored, documented, and released and deployed to produce the intended outcomes. The

following Unisys Change and Release Management Processes will be reviewed and modified to meet the enterprise and agency specific Commonwealth requirements during transition.

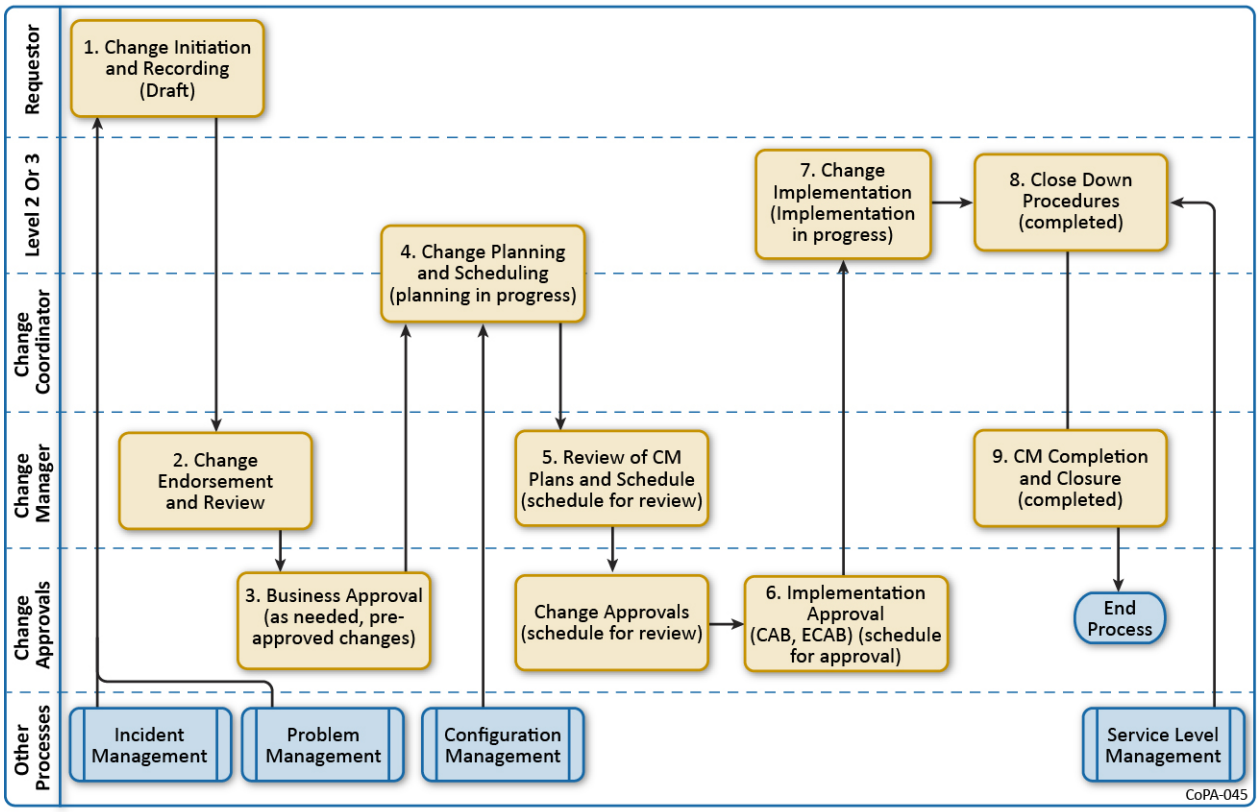

Figure 3.2.1.3-1 Change Management Process

1. Change Initiation and Recording - Receives Request for Change's (RFC's) from requestors. In some cases RFCs are logged on the requestor's behalf through the Service Desk.

2. Change Endorsement and Review - All RFCs are reviewed for completeness and accuracy, risk and potential impact on services.

3. Business Approval (pre-approved changes) – Receive business approval for pre-approved changes

4. Change Planning and Scheduling – Preliminary change planning for an RFC and Release Plan

5. Review of Change Management Plans and Schedule - Reviews the change to determine when it should be planned and scheduled for implementation. A forward schedule of changes is maintained for stakeholder review and approval.

   Change Approvals – Changes are approved at the proper level and with appropriate personnel depending on whether the change requests types are standard, emergency, expedited, latent or normal, and their potential impact and priority.

6. Implementation Approval – The Change CAB or Emergency Change Approval Board (ECAB) approval is obtained to implement changes to the production environment after reviewing test results.

7. Change Implementation – The change deployment team deploys the change during the approved maintenance window.

8. Close Down Procedures – Review the change request to determine its disposition after reviewing the change compliance with service levels.

9. Change Management Completion and Closure – Reviews the change implementation results including if it followed the release and deployment plan and was completed within the release window. The Change Manager reviews with the change stakeholders to determine satisfaction and success with the change implementation, lessons learned, and closure of the change.

Release Management Process

The Release and Deployment Management process, in the **Figure 3.2.1.3-2** below, delivers significant business value by delivering changes at optimized speed, risk and cost, and offering a consistent, appropriate and auditable implementation of usable and useful business services.

The Release and Deployment Management process covers the whole assembly and implementation of new and changed services for operational use, from release planning through Early Life Support (ELS).

As previously stated, the Release and Deployment Management process and the Change Management process closely govern the daily activities of Unisys and the Commonwealth's agencies testing, evaluating, and deploying applications and services to the production data centers.

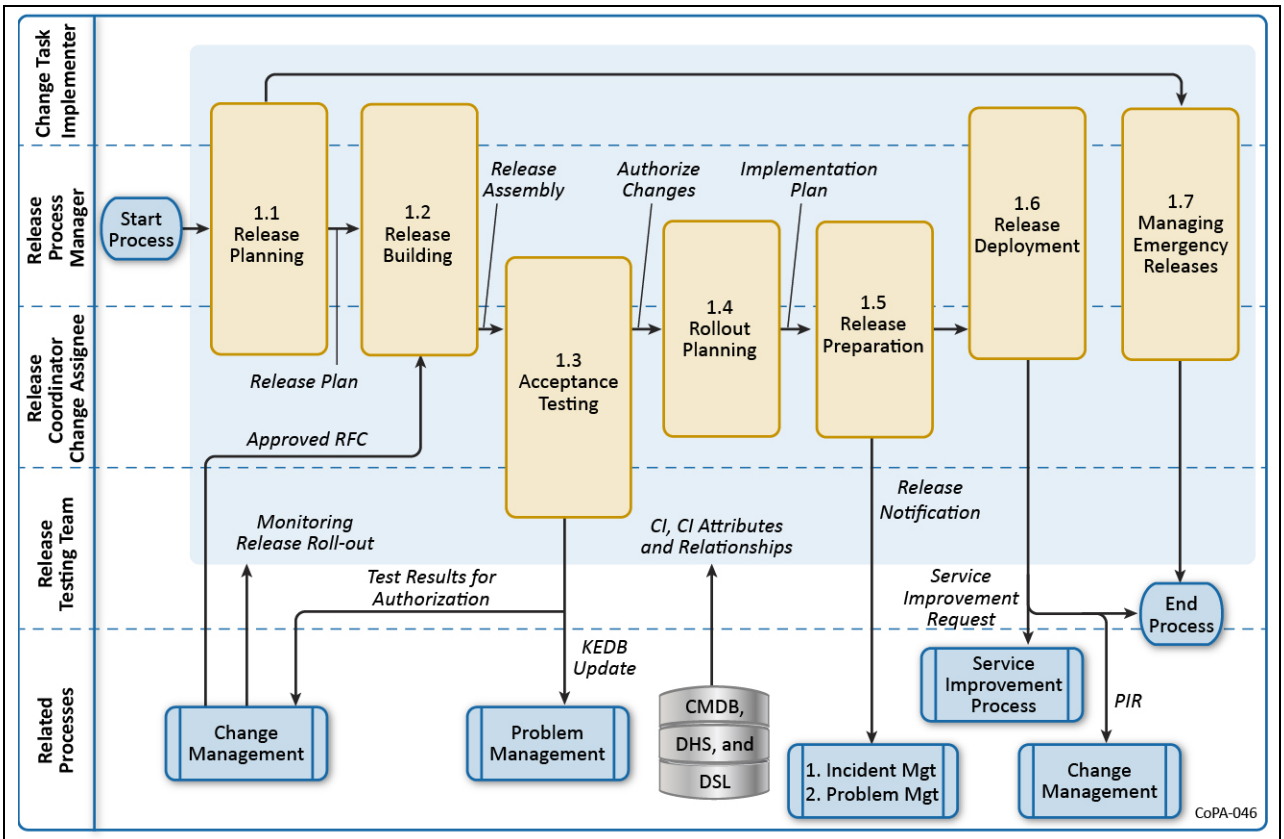

Figure 3.2.1.3-2 Release Management Process

1.1 Release Planning – The Release and Deployment Manager and the planning and support teams work on the service transition package to establish, review, and periodically update the release policy document and schedule for releases.

1.2 Release Building – After an RFC is validated and approved as part of the Change Management process, this activity begins the process of preparation for the release that includes one or several RFC's. This activity evaluates the service design baseline to confirm that the service release build and test begins with a stable, base-lined and approved design.

1.3 Release Acceptance Testing – Test Management personnel coordinate the plans and controls for testing execution. Testing aims to build confidence in the service capability prior to final acceptance during the pilot or Early Life Service Support. Testing is based on the test strategy and model for the service being changed. The test plans are followed for executing the tests and the results are summarized and presented to the CAB to gain approval for implementation planning and rollout.

1.4 Rollout Planning – The implementation plan for the Release is prepared and accepted.

1.5 Release Preparation – Prepares the organization and people for change, including the development of a detailed implementation plan that includes training, assigning individuals to specific process activities, etc.

1.6 Release Deployment – Transfer assets, transfer/transition businesses and organizations, deploy processes and materials, deploys Service Management capabilities, transfer services, deploy services, decommission services, and retire services.

Provide Early Life Support (ELS) – Provides a smooth transition for the new or changed service to Service Operations in a controlled manner and establishes the new service capability and resources are stable and operating according to specifications and SLA's.

Verify Deployment – After the deployment and ELS activities are completed, this activity verifies that users, Service Operations and other staff and stakeholders are capable of using or operating the service.

Review and Close Deployment – Reviews the deployment against the requirement. Deployment is completed with a handover of the support for the deployment group or target environment to Service Operations.

1.7 Managing Emergency Releases – Process to manage emergency releases with documentation following the emergency release and deployment activity.

The Change and Release Management Processes will minimize the impact of changes to mission critical services that Commonwealth agencies provide. The Unisys Change Management team will work with the Commonwealth Enterprise CAB and agency representatives to help verify that SLA's are met and risk managed appropriately based on priority, impact and urgency criteria. Changes that can be standardized and have lower risk will not be managed at the CAB level. Instead, they will continue to be managed and approved following a defined standard Change Management Process. This includes the use of standard template change procedures and maintenance windows for deploying standard changes. This will help to focus the CAB on managing those changes that have the most risk to disruption of critical services within and between agencies to help provide successful change and release deployment success.

1.B Offeror must publish the formal Change & Release Management plan. Identify key elements and roles; Request for Change Form & Process, Change Manager, Change Advisory Board, Emergency Change Advisory Board, Notification process, Change review process. The documentation and process will follow industry best practices.

Unisys will provide the Commonwealth with a Change and Release Management Plan during transition to the new ITSM Platform for Operational Readiness. The Table of Contents from a typical plan is outlined below:

1. Process, Procedures and work instructions (including RFC submittal form)
2. A RACI chart with key roles and responsibilities identified
3. CAB structure and governance
4. Release Management schedule and plan
5. Emergency Change Process and CAB
6. Change Notification Process
7. Change Post Implementation Review Process
8. An ongoing training plan for Change and Release Management roles
9. SLAs
10. Change and Release freeze periods for the Commonwealth /Agencies
11. Continuous Improvement Process and Plans

1.C Train appropriate Commonwealth staff on the process as requested by the Commonwealth.

Unisys will train the Commonwealth staff on the agreed upon Change and Release Management Processes agreed to during the transition period to the Operational Readiness ITSM Platform. This pertains to the other processes on this platform also and how they are connected.

1.D The Offeror's Change Management & Release management process must consider and integrate with the Commonwealth's individual change management policies and procedures, for example from January to May of each year, Department of Revenue (DOR) maintains a "no update policy" to DOR servers that have any production Tax-Related Applications running on them.

Unisys will consider and integrate the Commonwealth's Change Management Policies and procedures during transition to include change freeze periods for each agency.

1.E Offeror must described its proposed process and provide a sample overview of its process and procedures.

Please refer to 1.A above for a complete overview of the Change and Release Management Processes Unisys will review with the Commonwealth to agree to during transition.

1.F Offeror must describe the system tool it will use to support the Change & Release Management processes

Unisys will implement Change and Release Management processes on the Unisys ITSM platform. Please refer to Site Operations in Section 3.2.3.2 for a complete integrated overview of how Change and Release Management tools support the end to end service management capability. Please refer to 1.A above for the complete process descriptions of Change and Release Management.

1.G Offeror must describe how it will integrate its Change & Release Management tool with the Commonwealth's Enterprise ITSM solution.

The Commonwealth will utilize the Unisys Service Desk capability to process change requests. These change requests will be combined potentially with other approved change requests into release packages and processed through the release process and the individual changes will be deployed and closed out. All change requests will be synchronized with the Commonwealth ITSM System.

Unisys synchronizes all identified data between the Commonwealth and Unisys ITSM systems. This will provide the Commonwealth with enhanced capabilities and transparency and synchronized data between the two ITSM Systems (Unisys and the Commonwealth) via replication. During transition the replication requirements, triggers, outputs, timing of updates between the two systems will be defined, configured, and tested before being accepted by Unisys and the Commonwealth and deployed into the production environment.

1.H Offeror must describe its process and procedure for the Commonwealth to perform random audits.

Unisys supports random audits of the Change and Release Management process and procedures and effectiveness. This would include review of Change and Release Management tickets for closure as outlined below. The Commonwealth can select change and release tickets and participate in the closure reviews and post implementation reviews outlined below.

Change Management Completion and Closure – Reviews the change implementation results including if it followed the release and deployment plan and was completed within the release window. The Change Manager reviews with the change stakeholders to determine satisfaction and success with the change implementation, lessons learned, and closure of the change.

Review and Close Deployment – Reviews the deployment against the requirement. Deployment is completed with a handover of the support for the deployment group or target environment to Service Operations.

2 Change Advisory Board

"2.A Institute a Change Advisory Board (CAB)

1. The CAB members shall ensure that the requested changes are thoroughly checked and assessed from both a technical and business perspective."

Unisys will institute a Change Advisory Board (CAB)

The Change Advisory Board or CAB considers requests for change (RFC's) based on business needs and determines whether they should be accepted and implemented or rejected. Recommendations are based on several factors; for example, they could include impact, risk, priority and urgency on service and cost of change. The CAB has responsibility for reviewing RFCs (Requests for Change), analyzing and determining acceptance of all change requests. It is imperative that the CAB monitors and controls the use of the emergency change process and limits the number of emergency change requests, as they attract higher levels of risk.

The following actions are performed in a CAB meeting:

- Reviews and approves Changes on the basis of individual area of authority.
- Reviews Emergency Changes.
- Schedules Changes.
- Raises issues and concerns in areas such as risk mitigation, business impact and scheduling as appropriate.
- Reviews previous meeting minutes.
- Reviews failed Changes.
- Reviews Incidents caused by Changes.
- Reviews Progress reports on on-going Change Requests.
- Prioritizes Changes (as needed).
- Periodically validates Criteria of Change Requests to be assessed by the CAB.

- Validates/Approves FSC – identifies risks, impacts and gains client approval to delay Changes.
- Validates and updates any modifications to the Freeze periods, Business events, holidays and maintenance periods.

2.B Offeror must describe its proposed approach to creating a CAB and describe how members should be selected.

Unisys proposes the following approach to creating a CAB and how members should be selected.

The Unisys Change Manager will work with the Commonwealth Enterprise and Agency Change Managers during transition to the operationally ready ITSM platform to define the appropriate CAB structure for local Agency reviews of changes and how they will be processed through the Unisys and Commonwealth Enterprise CAB structure. It is important to get this structure correct in order to balance local and enterprise requirements for change and to keep it streamlined in order to facilitate change while managing risk. It is also important to balance emergency changes and engineering reviews to manage time effectiveness and manage risk while also helping to provide that the process does not become too bureaucratic.

CAB members are chosen to help verify that changes can be adequately assessed from both the business and technical viewpoint. **Figure 3.2.1.3-3** is a template for determining if members should be chosen to fill certain roles and responsibilities on each CAB. Unisys will collaborate with Commonwealth and agency leadership to define the following agency CAB membership roles.

Change Advisory Board				
Mandatory Attendees				
Member	Name	Email Address	Role	Permanent /Member by Change Requirement
Change Manager or an appropriate deputy (theatre/client/business unit or area specific)			Chair the Meeting	Permanent
Client Change Authority			Participant	Permanent (by client)
Client Business Continuity Authority (or appropriate deputy)			Participant	Permanent (by client)
Change Coordinator(s)			Scribe	Permanent
Configuration Manager			Participant	Permanent
Program Management Office			Participant	Permanent
Business Representatives			Participant	Permanent (Client & Unisys)

Business Testers			Participant	Permanent
Capacity Manager			Participant	Permanent
Security Manager			Participant	Permanent
Change Requester - (client or internal support personnel)			Participant	Member by Change Requirement
Change Assignee of Change being discuss at CAB			Participant	Member by Change Requirement
Client Service Delivery Managers			Participant	Member by Change Requirement
Experts/Technical Consultants (Production, Support, Development Analysts)			Participant	Member by Change Requirement
Service Desk Representative			For understanding impact to user experience	Member by Change Requirement
Suppliers, maintainers and developers (client suppliers, Unisys, or third-party contributors)			Participant	Member by Change Requirement
Client Service Owners			Participant	Member by Change Requirement
Office services and other non-IT supporting services			Participant	Member by Change Requirement
Business and technical Testers			Participant	Member by Change Requirement

Emergency Change Advisory Board				
Title	Name	Email address	Role	Permanent /Member by Change Requirement
Unisys Change Manager			Chairs the Meeting	Permanent
Unisys Change Coordinator			Facilitates the Meeting	Permanent
Service Delivery Manager			Participant	Member by Change Requirement
Service Desk Supervisor (for understanding impact to user community)			Participant	Permanent
Technical Service Owner			Participant	Member by Requirement
Incident Resolver			Participant	Member by Requirement
Relevant Client Service Owner			Participant	Member by Requirement
Experts/technical consultants			Participant	Member by Change Requirement

Figure 3.2.1.3-3 Change Advisory Board Template

2.C Offeror must describe its approach to handling changes at an agency level

Unisys proposes the following approach to handling changes at an agency level. Unisys will review the process below and incorporate agency requirements and modifications during transition. Unisys will:

- Conduct weekly Change Management meetings with Commonwealth and agency representatives to address all concerns prior to change implementations. Unisys will notify affected Commonwealth agencies before and after any changes.
- Establish scheduled maintenance periods, and communicate the scheduled outages to confirm Commonwealth agency maintenance windows are properly aligned with agency and Unisys resources.
- Manage multiple Commonwealth agency maintenance windows by using a flexible methodology to account for agency individual needs.
- Coordinate agency maintenance windows with Commonwealth agencies and establishes agency annual maintenance schedules.
- Utilize agency approved e-mail distribution accounts to broadcast upcoming maintenance windows and provide status updates during maintenance window.
- Deploy extensive maintenance playbooks that are aligned with the ITSM Change Management.
- Provide the Commonwealth with a daily Change Report, which includes all changes scheduled for installation. The contents of Daily Change Reports include:
  - The date the change is targeted for installation.
  - A description of the change.
  - Change request number.
  - The risk factor assigned to the change.
  - Business impact of installing the change.
  - The current change status.
  - The organizational unit assigned to the change with a contact person.
  - Estimated time of installation.
  - Change request records - changes submitted in the last 24 hours.
- Validate all changes after implementation to verify Commonwealth Agency compliance.
- Obtain Commonwealth Agency approvals prior to closing all implemented changes.

2.D Offeror must provide a sample CAB organization and meeting schedule.

The following is a sample CAB structure depicted in **Figure 3.2.1.3-4** to confirm Commonwealth agency changes are fully vetted before implementation.

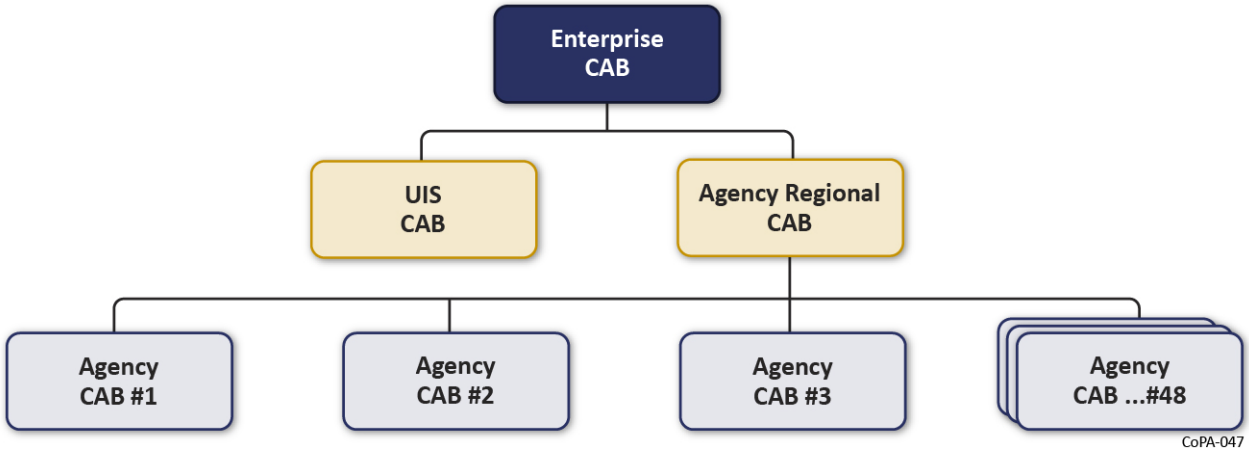

Figure 3.2.1.3-4 Change Advisory Board Sample Structure

The CAB meeting schedule will depend upon the structure for CAB's that is decided between Unisys and the Commonwealth during transition.

3 Test, Infrastructure, Test Plan

3.A Offeror must file a Pre-Change Test Plan, as part of the Change & Release request process, including results before final approval to proceed.

Test infrastructure related changes & releases before implementation. This includes Offeror managed hardware and any Offeror managed software.

Unisys will test infrastructure related changes and releases before implementation as per the process defined in **Figure 3.2.1.3-5** below. This includes Unisys managed hardware and Unisys managed software.

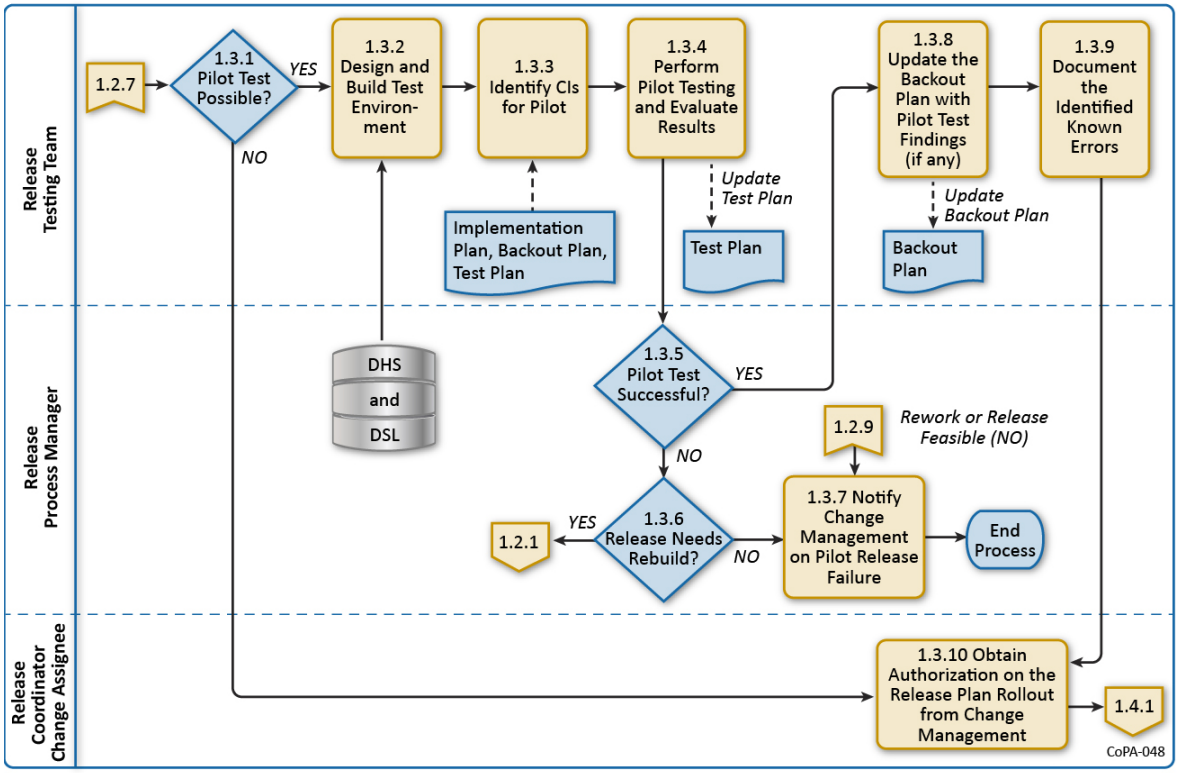

Figure 3.2.1.3-5 Release Testing Process

The Unisys process is to complete acceptance testing of infrastructure related changes and releases before implementation to prevent production services impact to Commonwealth Agencies. Unisys consistently follows the following process before migrating infrastructure related changes into the data center production environments. Prior to implementation, planned change requests are reviewed to confirm that:

- A Pre-Change Test Plan is completed and approved by Commonwealth agencies and the CAB
- Pilots are evaluated for release deployment of changes
- Test environments are planned to support Test Plan and then ordered by the Commonwealth through the Enterprise Services Catalog
- The change can be completed within the requested change window.
- Thorough testing in non-production environments has been accomplished by Vendor and the Commonwealth, as applicable.
- On-site coverage is provided or available via callout procedures.
- Back out plans and detailed instructions are in place.
- Installation instructions are understandable and complete.
- Test results are compiled, reviewed with the Commonwealth and retested after appropriate changes are made
- Commonwealth Agency and CAB approvals have been obtained prior to release and deployment

3.B Offeror must create and maintain test environments where testing will be conducted and evaluated prior to implementing any change into production environments

The Unisys Change & Release Management Team working with the Commonwealth will indicate what testing environments need to be ordered from the Enterprise Services Catalog in order to test specific change requests. This will be part of the Change & Release Management process and procedures.

3.C Offeror must described its proposed process and provide a sample overview of process and procedures.

Please refer to a sample process overview of test process and procedures in **Figure 3.2.1.3-5** above.

4 Scheduled Maintenance

4.A Establish scheduled maintenance periods, and communicate the scheduled outages. Create a notification process for maintenance, emergency, and unplanned outages

Unisys will create standard change windows for standard changes and release schedules for major releases. Unisys will create a standard method to notify the appropriate agency personnel of expected and unexpected outages. This will be completed through Agency CAB meetings for deployment approvals, electronic notifications and Remedy broadcast messages and Unisys/Commonwealth Portal messages.

4.B Offeror must establish regular maintenance periods for each computing platform. Maintenance periods must be coordinated per agency due to different peak business requirements.

Unisys will establish regular maintenance periods for each computing platform. Maintenance periods will be coordinated with each agency due to different peak business requirements.

4.C Create mechanism to notify clients of expected and unexpected outages

Unisys will create a mechanism to notify the appropriate agency personnel of expected and unexpected outages. This will be completed through Agency CAB meetings for deployment approvals, electronic notifications and ITSM system broadcast messages and Unisys/Commonwealth Portal messages.

4.D Offeror must describe its process for managing maintenance periods and system outages, with examples

Please refer to 4.E below for a description of the process for managing maintenance periods with outages with examples.

4.E The Offeror must provide an approach to managing multiple agency specific maintenance periods with different peak periods.

The process for managing maintenance periods is complex by nature for supporting many different agencies across the enterprise. This will have to be managed by SLA agreements, reviewing conflicts for releasing changes into the environment by utilizing the CMDB and application relationships to infrastructure to determine the best approach to accomplish particular types of changes. In some cases the release of changes will have to be managed in stages with a complete project plan, tested and released , in order to support SLA's and still meet the requirements for change management.

An example for managing maintenance periods and system outages with different peak period requirements involves Unisys managing the complex change request to upgrade the IBM Mainframe in 2011 to zEnterprise that involved multiple agencies. This required formally managing the change using formal project management disciplines to initiate, plan, execute, monitor and control, and close out the project in support of the change request. The key to the plan was getting the different agencies and stakeholder's requirements and developing a plan that would accommodate their requirements to support their customers.

5 Change and Release Notifications

5.A Notify affected Commonwealth agencies before and after any changes

Unisys will establish scheduled maintenance periods, and communicate the scheduled outages for release schedules in advance according to an agreed schedule. Unisys will create a notification process for maintenance, emergency, and unplanned outages.

Unisys will establish regular maintenance periods for each computing platform. Maintenance periods will be coordinated with each agency due to different peak business requirements.

Unisys will create a mechanism to notify the appropriate agency personnel of expected and unexpected outages. This will be completed through Agency CAB meetings for deployment approvals, electronic email notifications and Unisys/Commonwealth Portal messages.

Unisys will establish with the Commonwealth agencies, maintenance periods for system outages. The process will support multiple agency specific maintenance periods with different peak periods.

5.B Provide Change & Release Notifications prior to implementation via a central web site and e-mail.

Unisys will create a mechanism to notify the appropriate agency personnel of expected and unexpected outages. This will be completed through Agency CAB meetings for deployment approvals, electronic email notifications and Unisys/Commonwealth Portal messages

5.C Offeror must describe its proposed process and procedure related to notifications.

Unisys will notify affected Commonwealth Agencies with change and release notifications.

Unisys will notify affected Commonwealth agencies and stakeholders before and after any releases of approved changes as per the Release Communication process defined below in

Figure 3.2.1.3-6

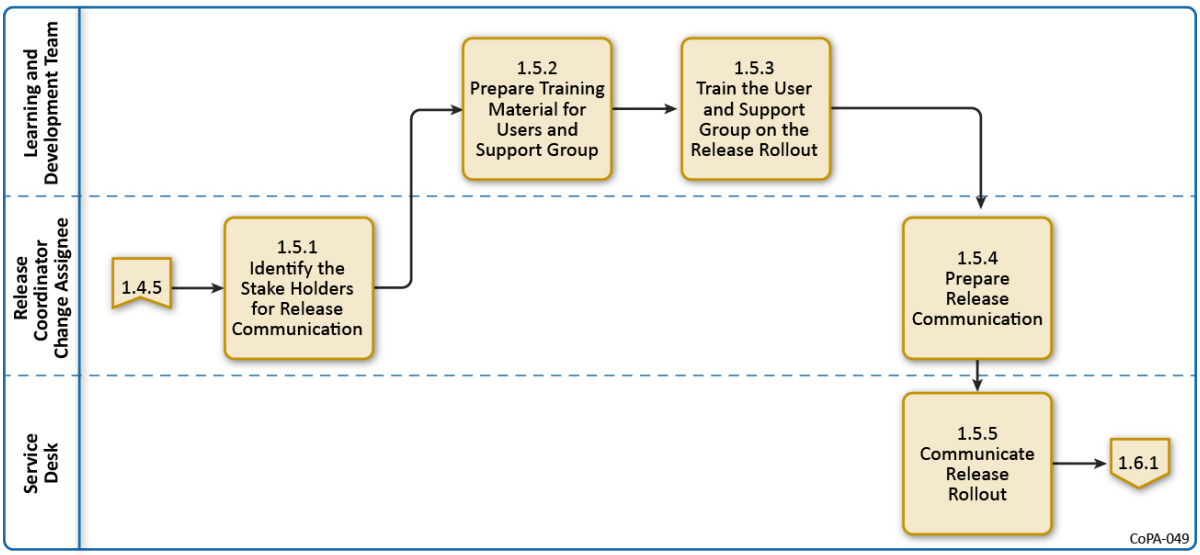

Figure 3.2.1.3-6 Release Communication Process

5.D Offeror must describe any other change notifications capabilities available to the Commonwealth.

Unisys will review with the Commonwealth during transition change notification through tools and processes to determine the most effective ways to notify stakeholders.

6 Change Review, Change Validation

6.A Complete a post change review to validate the success or failure of the change or release, and post the information within the change record. Take follow up action as appropriate

Validate all changes after implementation.

All changes are validated as part of the release process described above

6.B Offeror must describe its proposed process and procedure.

All changes and releases are reviewed by the implementation team to verify the change and release are technically implemented correctly and then with stakeholders to confirm that the change and release had the intended outcomes.

Depending on the size and risk of the change and release there may be an Early Life Cycle team to support the change and release for a period of time to confirm it is stable before the change and release tickets go through their post implementation closure process and procedures.

Please refer to the Change and Release Processes Closure process and procedures described above in section 1.

7 Change and Release Backout Process

7.A Prepare back out procedures for all changes.

All change requests will be required to have back out plans. These plans will be reviewed by the appropriate technical reviewer(s) of the changes. Depending on the risk of the change, a test of the back out plan may be required to be performed during the release testing process.

7.B As part of the Change & Release process, file a back out plan as appropriate to remove the change and restore Services to the prior level.

Unisys will require a back out plan for each change and release before a change and release is approved. The Change Manager and Release Manager working with the change implementation team, will determine when a release or individual changes need to be backed out.

7.C Offeror must describe its proposed process and procedure related to back out procedures.

Figure 3.2.1.3-7 below is the proposed process and procedure at a summary level for backing out a release.

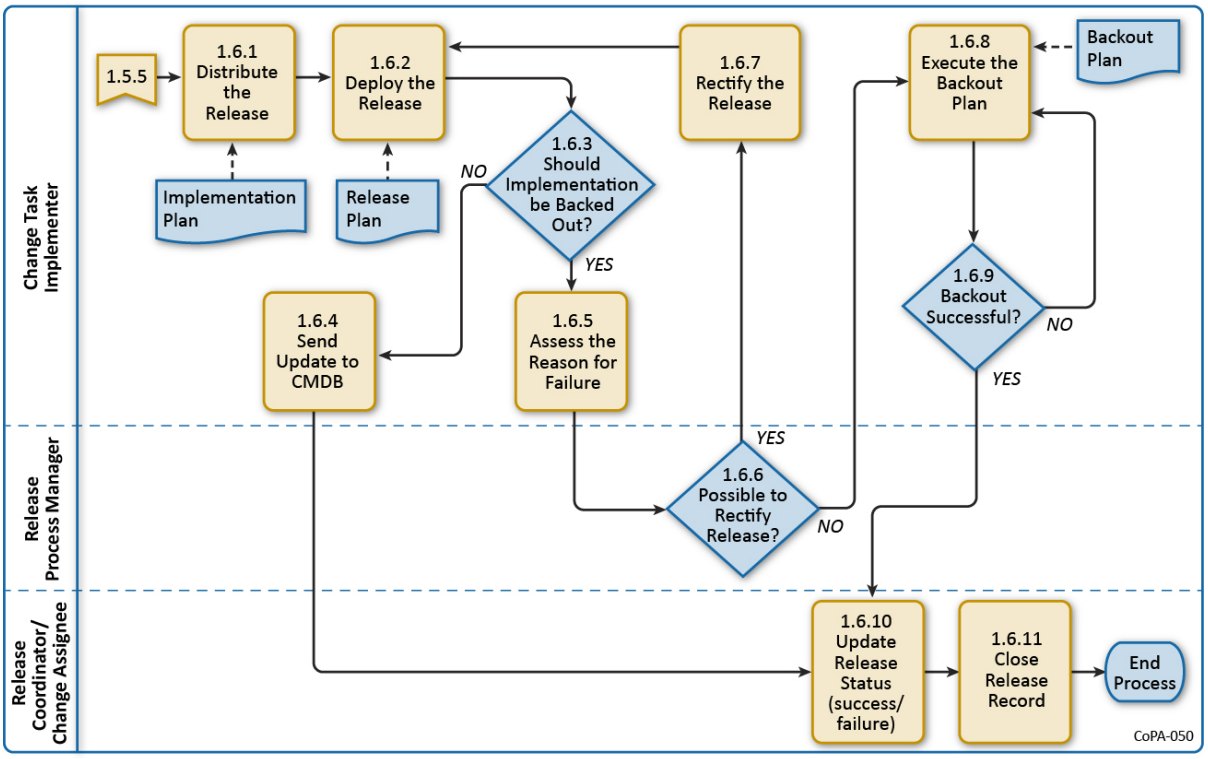

Figure 3.2.1.3-7 Release Back Out Process

1.6.3 Should Implementation Be Backed Out

Before proceeding with further deployment, the Change Task Implementer confirms whether the Deployed Release is working as planned together with the Change and Release Managers.

If the deployment is successful, then proceed to step "Send update to CMDB," to update the changes in the CMDB, or proceed to step "Assess the reason for failure," in the Release Management process workflow.

1.6.4 Send Update to the Configuration Management Database

If the release implementation is as expected, the Change Task Implementer sends the details of the changes affected due to release to the Configuration Manager to update the CMDB.

1.6.5 Assess the Reason for Failure

If the release implementation fails, the causes for the failure of the release are assessed, diagnosed, and documented. The determination for the implementation failure would be performed through a Post Implementation Review.

1.6.6 Possible to Rectify Release

The Release Process Manager decides whether rectifying the release is possible. If it is decided that the release cannot be rectified, then proceed to step, "Execute Back-out Plan," or proceed to step, "Rectify the Release," in the Release Management process workflow.

1.6.7 Rectify the Release

The Change Task Implementer tries to identify the reason for the failure in release implementation. If the reason for the failure and its remedial action are identified, then the Change Task Implementer proceeds with the deployment of the release.

1.6.8 Execute Back-out Plan

If the Release Process Manager has decided to abort the release, then the Change Task Implementer executes the steps detailed in Release Back-out Plan.

1.6.9 Back-out Completed Successfully

After executing the Back-out Plan, the Change Task Implementer validates if the release back-out was executed successfully. If the Back-out Plan executed successfully, proceed to step, "Update Release Status (Success/Failure)," or proceed to step "Execute Back-out Plan," in the Release Management process workflow.

1.6.10 Update Release Status (Success/Failure)

The Change Coordinator updates the status of release rollout with "Success," "Success with Issues," or "Failure" against the Change record based on the details provided by the Release Coordinator/Change Assignee and/or Change Task Implementer.

1.6.11 Complete Release Record

The Release Coordinator or Change Assignee completes the Change record.

8 Change and Release Statistics

8.A Track all (successes / failures) changes and produce Change & Release management statistics.

All change and release tickets which bundle changes to be deployed are tracked in the Unisys ITSM Suite. The details of the changes and releases are captured in these tickets and reported as described below.

8.B Create and deliver a monthly Change & Release Management Report to the Commonwealth, detailing changes, implementation status, and outage time periods as compared to planned outage schedules.

Unisys will create and deliver a monthly Change & Release Management Report to the Commonwealth, detailing changes, implementation status, and outage time periods as compared to planned outage schedules. The following is a standard report template that Unisys will deliver to the Commonwealth for Released Changes.

ID No	Related Changes	Description	Start Date Time	End Date Time	Clients Affected	Release Success / Failure	Impact	Root Cause	Corrective Actions	Responsibility for implementing corrective actions

8.C Offeror must describe its proposed process and procedure.

The process and procedure for reporting change and release ticket statistics is part of the overall Change and Release Management Processes described in 1.A.

The statistics reporting will be produced monthly in a format similar to what is shown above in 8.B.

Unisys Team Experience

Unisys currently provides IT Service Management Services to more than 150 customers worldwide. Unisys is a leading provider of Managed Services utilizing an integrated suite of ITIL V3, ISO 20000 certified management processes and leading ITSM tools to provide outstanding service IT services to our customers. Unisys currently successfully manages Change and Release Management for many of these customers.

Unisys has been managing Change and Release management for the Commonwealth DPH and [redacted] since 1999.

Benefits to the Commonwealth

The Unisys value proposition for Change and Release Management Solution to the Commonwealth is as follows:

- Unisys focuses on the Change and Release Management Processes from an ITIL best practices perspective, by actively managing changes with the highest risk to business applications and users. This helps to minimize impact to Commonwealth Mission critical

services. Standard changes with well documented procedures for implementation are handled through automated change and release approval procedures with summary change management review.

- Unisys has proven success in managing high risk changes for the Commonwealth that have multiple agency critical business risks associated with them.

3.2.1.4 Service Desk

As part of the Services, Offeror shall provide telephone support (e.g., a "Service desk") to the Commonwealth to assist the appropriate end users in determining, tracking and resolving questions regarding the Services. Offeror shall provide telephone support through such telephone support infrastructure maintained by the Offeror. This telephone service desk is to augment the required “online” Service Desk capabilities as set forth in the RFP.

The Service Desk will be the single point of contact for authorized Commonwealth users regarding incidents, which include events that cause or may cause an interruption or reduction of service, as well as requests for information, and requests for Services relating to all of the Services provided within the Offeror’s catalog of Services. The Offeror’s Service Desk must have processes for Service Delivery and Service Management that are ITIL-conformant. The Service Desk process includes Service Management processes: Incident Management, Problem Management, Change Management, Configuration Management and Service Request Management.

Currently most Commonwealth agencies provide a local Help Desk function to support staff’s desktops, local printing systems, applications, and the general public users it serves. The Offeror must develop a process and electronic connection to these agency Help Desks. The majority of the agency Help Desks utilizes the Commonwealth’s Enterprise ITSM. A connection between the Commonwealth’s Enterprise ITSM and the Offeror’s Service Desk will be required to keep Help Desk tools synchronized.

In addition, the Offeror must provide an Internet accessible KMP as a central repository for processes and procedures, communications plans, and other relevant documentation to be shared with the Commonwealth. Knowledge Management will be a function shared by the Commonwealth along with the Offeror. This will allow the Commonwealth to combine data from all Commonwealth agencies and the Offeror, reorganize it, make it understandable, and present it to the Commonwealth.

The Offeror must coordinate with the Commonwealth to provide feedback on the effectiveness and accuracy of KMP content. In addition, the Offeror must notify the Commonwealth when incorrect information is identified, reference material becomes outdated, or when the content is rendered inaccurate. At the Commonwealth’s discretion, the Offeror may be required to develop content, as needed, including answers to frequently asked questions, reference/educational materials, and other documents to be added at the Commonwealth discretion.

The Offeror must create and keep current a CPPM that documents the processes, procedures and timelines used to meet the requirements of this contract. The CPPM must provide detailed process descriptions to support the computing needs of the Commonwealth utilizing best practices and be made available (via Offeror’s Portal) to all Commonwealth agencies throughout the term of the contract.

Reference Documentation

Exhibit K - OA Enterprise ITSM System and Volumetrics

Schedule H - Commonwealth Computing Procedures Manual (CCPM)

Requirements		Describe Compliance
1.	Provide an integrated Service Desk process with the other Service Management processes, including Incident Management, Problem Management, Change Management, Configuration Management and Service Request Management. The final Service Desk processes and procedures must consider current Commonwealth service management policies and procedures.	Offeror must describe its Service Desk solution offering (processes, procedures, staffing, and technologies). Offeror must provide a sample of its KMP from a previous or current engagement of Offeror.
2.	Provide a Service Desk with processes and tools for Service Delivery and Service Management that are ITIL-conformant.	
3.	Seamlessly integrate the Service Desk (including tools, technology and processes) with the Service/Help Desk(s) of other identified Agency Service Desks as required. The Offeror must coordinate the integration of the proposed Service Desk with the Commonwealth's Enterprise ITSM System and other agency Help Desks as required. Integration with other agency ITSM systems is not required.	
4.	Analyze incident trends, and recommend and implement actions, with Commonwealth's approval, to reduce incidents.	
5.	Conduct random surveys of authorized	

	users of the Service Desk in accordance with the Commonwealth each month.	
6.	Develop and document processes regarding interfaces, interaction, and responsibilities between Level 1 Support personnel, Level 2 Support personnel, and any other internal or external persons or entities that may either submit notice of an incident or receive notice of an incident.	
7.	Ensuring staffing levels and work allocation remains appropriate to handle incident volumes and incident response targets.	
8.	Provide trained service desk personnel.	
9.	Ensure that the Service Desk is available at all times (i.e. 24 hours a day, 365 days a year).	
10.	Manage all Incidents and/or Service Requests from authorized users relating to Contracted Services.	
11.	Provide weekly reports to the Commonwealth on Service Desk activities, performance, and adherence to established SLAs. Service Desk reporting must include at a minimum: • Key issues relating to Service Desk processes, improvements, script development. • Status as to Service Desk staffing, training, and authorization. • Integration activities and issues with other Service Desks	

	belonging to the Commonwealth. • Trend analysis shall include (13) most recent months. If the Service has been in place less than thirteen months then trend analysis shall include all months of Service. • Calculate metrics and provide monthly reports. • Number of Contacts, to include all interactions (Calls, phone calls, electronic, automated or otherwise). • Number of calls abandoned, average call duration, average time to answer, average time to abandon. • Number and percentage of Contacts resolved. • Number and percentage of Contacts passed to other Service Desks. • Other pertinent information regarding Service Desk operation and performance.	
12.	Enable a KMP accessible by all authorized users. Content for the KMP will be approved by the Commonwealth.	
13.	Offeror must record all incidents, problems, service requests, change requests, and configuration information in the software recording tool. All updates to the record, contacts with clients or vendors, and resolutions will be recorded in a real-time and consistent manner. This recording tool	

	will house the KMP.	
14.	Monitor reporting system to ensure incidents and problems are being addressed to meet agreed SLAs.	
15.	Transition must include the transfer of system and application monitoring alerts with the ability to turn-off the problem alert process during maintenance windows and other scheduled outages.	Offeror must describe its approach to ensure alerts are transitioned successfully.
16.	Interim Support Desk Procedures will be required as the Commonwealth transitions from its current support architecture to the Offeror's Service Desk.	Offeror must describe an interim approach and procedure(s) for providing Service Desk operation throughout the transition to the Offeror's fully managed service.
17.	Incident Management - The Offeror's Incident Management process shall encompass Incident Management processes deployed across all Service Components that are designed to: restore service as quickly as possible, minimize disruption to the Commonwealth, aim for highest levels of availability and service quality, completely transparent and auditable delivery of service, and promote the highest level for user satisfaction.	Offeror must describe its Incident Management Process and how it will be applied to the overall IT Service Management Program for the Commonwealth.
18.	Problem Management - The Offeror's Problem Management Process must minimize the adverse effect on the business of Incidents and Problems caused by errors in the IT infrastructure, Applications, systems and supporting components, and proactively prevent the occurrence of Incidents and Problems by identifying	Offeror must describe its Problem Management Process and how it will be applied to the overall IT Service Management Program for the Commonwealth.

	and eliminating causes of failure.	

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Unisys understands the Commonwealth's need for a high-quality Service Desk to front-end outsourced data center support with predictable delivery. With the complexity of the Commonwealth's data center environment, you can trust Unisys to provide the critical Service Desk front end to our data center support program that delivers timely response, efficient resolution, and a high level of service for Incident Management and Problem Management.

Unisys will use our many years of experience in delivering services to the Commonwealth, and will Transition from the DPH Help Desk to an ITIL V3 based Service Desk. Resources with additional technical and Request Management experience will be put in place to provide the required support to deliver to the Commonwealth quality and service flexibility in support of the expanded data center services scope.

1 Service Desk Process, staffing, technology, experience

1.A Provide an integrated Service Desk process with the other Service Management processes, including Incident Management, Problem Management, Change Management, Configuration Management and Service Request Management. The final Service Desk processes and procedures must consider current Commonwealth service management policies and procedures.

The Service Desk Process will integrate with the other Service Management processes and procedures that we will implement including:

- Incident Management
- Problem Management
- Change Management
- Release Management
- Configuration Management
- Service Level Management
- Service Request Management.

All processes are supported by the Unisys ITSM Solution used to track and manage all service delivery and management functions.

During the transition of services, Unisys will conduct a series of workshops in which our base processes will be aligned with Commonwealth processes for the in-scope services to establish a common understanding and gain approval of the process framework deployed to support service delivery from Unisys.

1.B Offeror must describe its Service Desk solution offering (processes, procedures, staffing, and technologies).

The **Service Desk** function provides a central point of communication for all authorized Commonwealth users agency staff to report incidents, requests for information, and service requests relating to all of the services provided within the Enterprise Services Catalog. The Service Desk staff manages ITIL V3 conformant Service Management processes leveraging the ITSM Incident Management system that is electronically connected to Commonwealth agency help desks. This functional team also manages the Knowledge Management Portal, a central repository for processes and procedures, communications plans, and other documentation to be shared with the Commonwealth.

The Unisys Service Desk will be delivered from our Harrisburg, Pennsylvania location during core hours (Mon – Fri 7am – 6pm Eastern) with supplemental services provided after hours, weekends, and designated holidays from our U.S. based Managed Service Center (MSC) located in Salt [redacted] All personnel used in the delivery of the Commonwealth solution are U.S. based employees. This team will be utilizing the dedicated instance of the Unisys ITSM systems modules in support of this engagement.

Unisys believes that our success in quality delivery, employee satisfaction, and innovation is dependent upon training, active feedback coaching, and employee retention. Critical success factors for our training focus on increasing agent productivity and fostering skill development and career advancement.

Active feedback and coaching is the second method we apply for personnel development. We utilize both formal performance planning processes and informal, mentored feedback. The latter takes the form of call monitoring, shadowing, being shadowed and team oriented projects. These informal measures have proven invaluable in fostering a culture of can-do attitude and good collaborative work process development and re-engineering.

The Unisys Service Desk utilizes standard position descriptions and processes for the worldwide delivery of service desk services. These standards result in a worldwide consistency of service delivery. Skill levels maintained in the Commonwealth support team include:

- **Service Desk Agents** who possess basic technical knowledge of data center infrastructure, as well as effective customer service demeanor. Agents provide primary telephone support for approved Commonwealth users that call the Service Desk.
- **Service Desk Manager** who is the liaison between the Service Desk and Commonwealth management staff proactively monitors ACD queues to identify incidents affecting Commonwealth users of the Services or a significant number of End Users at a site. The manager also trains, supervises and guides agents working at the Service Desk.
- **Incident Managers** are the escalation point that leads the Service Desk effort in responding to Commonwealth user events or disruptions as quickly as possible, in order to minimize the adverse impact on business operations.
- The **Problem Manager** leads the Service Desk effort to identify, determines resolution or temporary work-around, and creates detailed documentation of the underlying problem that caused a disruptive incident (i.e. root cause analysis).
- The **Knowledge Manager** is responsible for ensuring that the Knowledge Management Portal is kept current with updated resolutions and information facilitating up-to-date communication between the Unisys team and the Commonwealth.

- The **Service Desk Reports Analyst** will be responsible for producing all Service Desk reporting including volume based statistics and required SLA reporting. This analyst works to identify positive and negative trends ensuring that in coordination with the Service Excellence Office, corrective action plans are established and monitored.

Additionally, the items below outline from a high level the functions that the Unisys team listed above will deliver from a data center Service Desk perspective.

Unisys will provide:

- Service Desk Agents and Management staff to be co-located with our Program Management Office (PMO) at the local Unisys Harrisburg office Monday – Friday 7am-6pm Eastern, with off-hours, holidays, and weekends supported from the Unisys Managed Service Center (MSC) located in Salt [redacted]
- Toll free 800 number for Commonwealth IT staff and Agency Help Desk resources to contact the Service Desk
- Integration interface between the OA ITSM and the Unisys ITSM system for bi-directional passing of data center incident and request tickets
- Service Portal with links to required CCPM, KMP, and Enterprise Services Catalog, all of which will be created and updated by Unisys.
- Internet accessible KMP housed in the Unisys Service Portal tool. A Knowledge Manager will be responsible for working with Commonwealth agencies and the Service Desk team to keep the KMP information current and relevant for the duration of the engagement.
- End to End Incident and Service Request Management
- Problem Management and Root Cause Analysis
- Field dispatch tools for Unisys to dispatch its engineers (and Partner resources) to perform onsite service in the data centers.
- Service Excellence Office for Trend analysis, service improvement, and incident reduction initiatives.

Unisys has designed the Service Desk response to the Commonwealth based on implementing the following core principles for both organizations:

Partnership

- Work together to inform and serve the Service Desk users, and enhance the experience of the services received;
- Foster a teaming attitude in order to perform, govern and enhance the Services;

Innovation

- Drive constant innovation throughout the life of the Agreement;
- Deliver meaningful innovation while providing a return on the Commonwealth's investment;
- Engage relevant SDB partners to bring creativity and diversity to the Service delivery team.

End-to-end service

- Provide a comprehensive Service Desk team that manages all elements and allows the Commonwealth to concentrate on core functions;
- Manage relevant parties involved in the delivery of the Services; and

Service Quality

- Deliver the Service Levels as agreed; Deliver a consistent service to the Commonwealth;
- Promote a culture of service improvement.

1.C Offeror must provide a sample of its KMP from a previous or current engagement of Offeror.

This section provides sample screenshots from a Knowledge Management Portal. The screenshot in **Figure 3.2.1.4-1** provides a sample of a homepage the user will see upon entering the KMP.

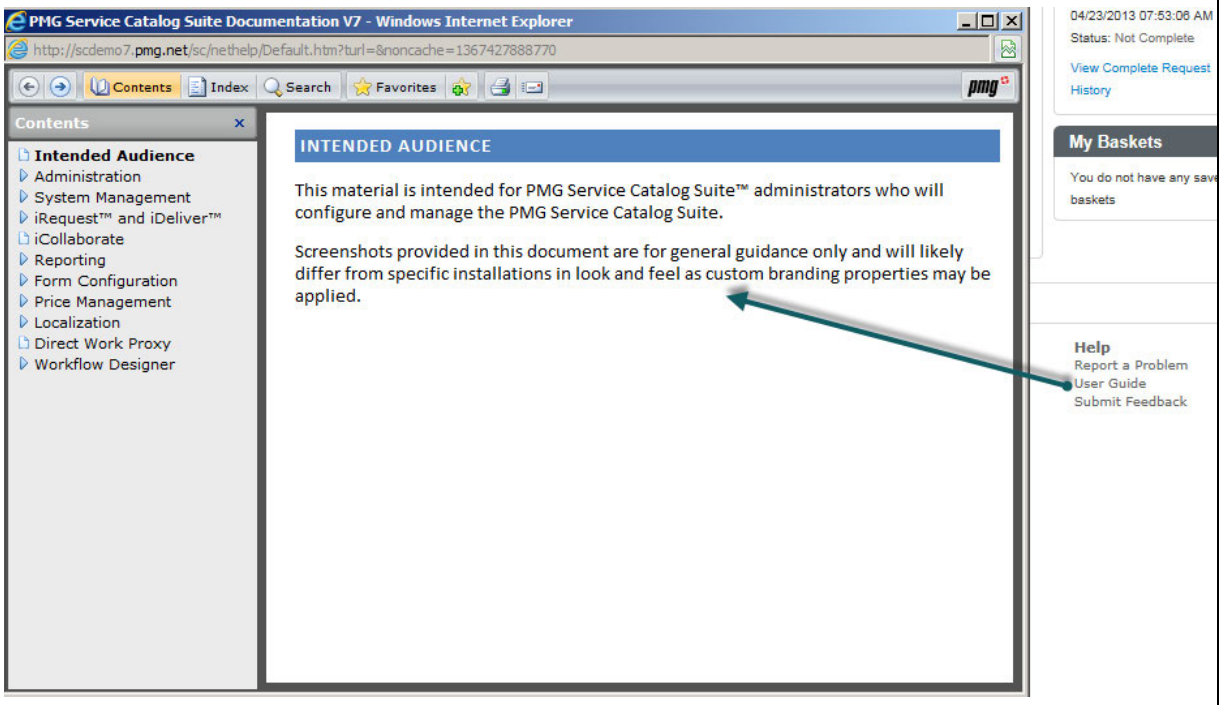

Figure 3.2.1.4-1 Sample Knowledge Management Portal Homepage

The Commonwealth user can select from a variety of options provided on the customized KMP homepage. Options for the Commonwealth will be determined during transition.

The sample homepage screenshot in **Figure 3.2.1.4-2** below provides a news, knowledge, and notification area on the homepage.

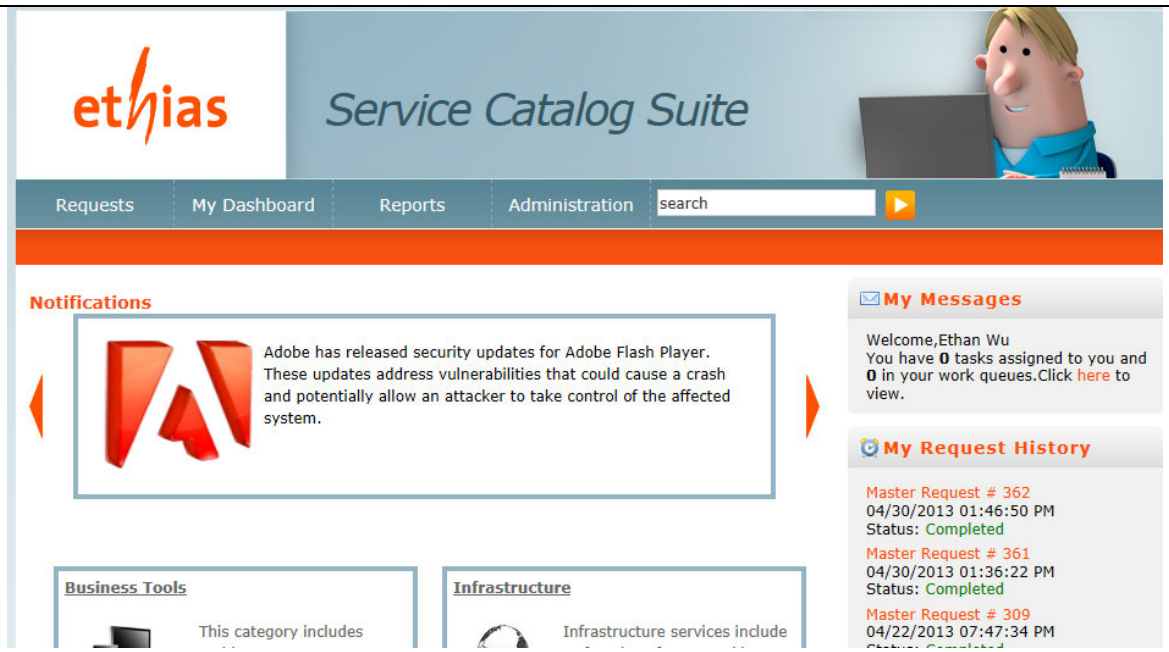

Figure 3.2.1.4-2 Sample Knowledge Management Portal Homepage

In Figure 3.2.1.4-3 below a KMP search box and the returned matching articles are shown.

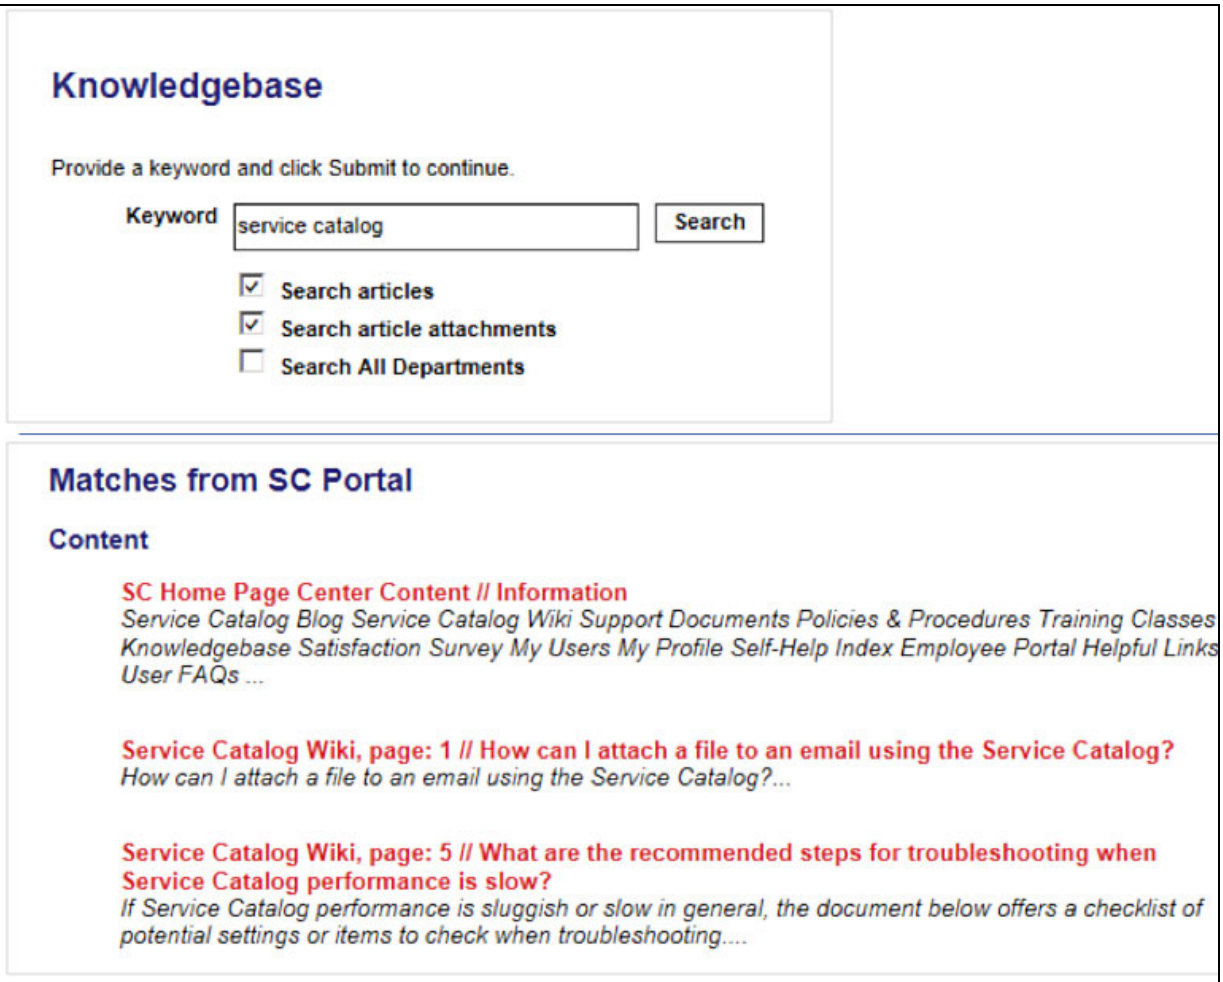

Figure 3.2.1.4-3 Sample Knowledge Management Portal Search

2 ITIL, Service Desk compliance

2.A Provide a Service Desk with processes and tools for Service Delivery and Service Management that are ITIL-conformant.

ITIL (the IT Infrastructure Library) is the most widely accepted approach to IT service management in the world. ITIL provides a comprehensive and consistent set of best practices for IT service management, promoting a quality approach to achieving business effectiveness and efficiency in the use of information systems.

ITIL V3 processes are well known as the de facto standard for service delivery and support in most IT organizations. Not only did Unisys implement these processes, but over the past few years we also developed procedures and work instructions that complement the ITILV3 Framework; these procedures and instructions take a process from a best practice to a powerful daily tool used throughout our global delivery organization. The supporting tools are aligned, consolidated, and rationalized so that Unisys can leverage the long history and legacy of service delivery with the process framework.

3 Integration, Service Desk Integration with other agencies

3.A Seamlessly integrate the Service Desk (including tools, technology and processes) with the Service/Help Desk(s) of other identified Agency Service Desks as required

The Offeror must coordinate the integration of the proposed Service Desk with the Commonwealth's Enterprise ITSM System and other agency Help Desks as required.

The Unisys Transition Team will work with the Commonwealth to develop the integration between the Unisys ITSM System and the Commonwealth ITSM System.
The integration will address process and technology requirements. The integration will be developed to pass information both ways between these systems in a near real-time fashion in order to support Commonwealth and Unisys personnel and partners to support services. The data that is required to be synchronized with the Commonwealth's ITSM System includes:

- Incident (Incident records)
- Problem (Problem records)
- Change (Change requests)
- Configuration (Services, Applications, supporting CI's)
- Asset (Billing data)

4 Incident trend analysis

4.A Analyze incident trends, and recommend and implement actions, with Commonwealth's approval, to reduce incidents.

The Service Excellence Office (SEO) is a Unisys team that will interact with our PMO and all service delivery teams that Unisys is providing. Our SEO's ultimate goal by providing incident trend analysis is to drive continuous improvement in service delivery, with concentration in the following areas:

- **Resolution Optimization and Incident Reduction.** The continual analysis of incidents, and accompanying enabling actions, to move resolutions towards the co-developed KMP content
- **Quality Oversight and Defect Management.** The reporting, analysis, and action plans for service defects, such as inaccurate incident records, incorrect diagnosis, and excessive resolution times
- **Service Management Optimization**. Variance and exception-oriented reporting and analysis that helps to guide Problem Management efforts as well as oversight of ticket coding accuracy and quality to create quality information for data analysis and mining
- **Strong Opportunity Pursuit and Corrective Action.** A tested method that applies the core principles of Six Sigma, incorporates use of Known Solutions Libraries to enable known solutions for previously experienced undesired conditions, and a highly structured investigative and recommendation process that addresses new unexpected, undesired conditions

The Unisys SEO positions us to deliver a unique approach to quality and continuous improvement, creating real, tangible business value for the Commonwealth. Honed by expert design, deep client experience, and collaboration with clients and business partners, our SEO will help your management team see value through Unisys innovation, thought leadership, and data intelligence.

5 Random Surveys

5.A Conduct random surveys of authorized users of the Service Desk in accordance with the Commonwealth each month

Customer Satisfaction Surveys drive the Unisys Client Satisfaction Program. Unisys conducts these Service Desk surveys to:

- Confirm user satisfaction levels
- Identify opportunities to improve agents and processes
- Measure the qualitative aspects of providing Service Desk Services.

Unisys can expand and modify our Customer Satisfaction Survey to include questions about the Data center support dispatches, or we can conduct separate surveys for the separate Service Desk and data center functions. Customer Satisfaction Surveys complete the feedback loop between the user experience and the services received.

Unisys collects clearly defined performance criteria to permit analysis that is deemed important. For surveys of our Service Desk support, for example, we collect at least the agent's name, ticket number, narrative free-form text, and assessment ratings of the agent such as:

- Courtesy and professionalism
- Technical knowledge
- Problem-solving skills
- Communication on ticket progress and resolution
- Overall satisfaction.

Typically, we ask callers to rate performance for:

- Call responsiveness
- Problem resolution time
- Problem resolution quality
- Service orientation
- Overall satisfaction.

Unisys sends a request to complete a Customer Satisfaction Survey via e-mail to users who recently reported an incident via a phone call to our Service Desk. The e-mail contains a hyperlink that takes a user to a Web site to enter his or her responses on a HTML form. Responses are delivered back to our Service Desk by e-mail and collected in a database.

Unisys will use the information collected in our Customer Satisfaction Survey as a basis for continuous improvement of service delivery. To calculate customer satisfaction, we take the sum of all scores for all surveys performed in a month and divide it by the total number of surveys performed in that month.

To conduct Customer Satisfaction Surveys, Unisys uses an automated survey process and a set of questions that ask the end user to rate our service on a scale of 1 to 5:

5—Very Satisfied

4—Satisfied

3—Neither Satisfied nor Dissatisfied

2—Dissatisfied

1—Very Dissatisfied.

For questions the end user rates with a 1 or a 2, Unisys asks the user to provide supporting detail; we record this detail in the survey record and escalate customer satisfaction issues that require follow-up electronically to the Unisys Service Manager or the appropriate management representative. A survey follow-up process can consist of any one or all of the following:

- Review by a manager
- Review by a manager and an analyst or review by a service group
- Calling the end user to verify the rating, obtain additional information as required, and if possible, resolve the issue with the end user
- If applicable, retrieving the original incident call and listening to the recording for detailed information
- Creating and implementing a corrective action plan.

Unisys documents all survey follow-up activity and establishes corrective action plans, as required. We determine calls to survey from the following criteria:

- End users with more than one service request in a 30-day period are surveyed for one request only.
- Service requests more than 7 days old are not surveyed.
- End users requesting not to be surveyed are not surveyed.
- Callers with invalid contact information are not surveyed.

6 Service Desk, Level 1 and level 2 process

6.A Develop and document processes regarding interfaces, interaction, and responsibilities between Level 1 Support personnel, Level 2 Support personnel, and any other internal or external persons or entities that may either submit notice of an incident or receive notice of an incident.

Unisys Incident Management process describes the interfaces, interactions and responsibilities of Level 1 and 2 support personnel in relationship to the complete Incident Management Process lifecycle. This is discussed in detail in the response to requirement 17 below.

7 Staff allocation

7.A Ensuring staffing levels and work allocation remains appropriate to handle incident volumes and incident response targets.

The Unisys Service Desk Manager (SDM), to be located onsite at our Harrisburg area service desk, is responsible for the day to day management of the Service Desk Agents and SLA achievement. The SDM monitors ongoing incident and service request volumes, and has the ability to scale up or scale down Agent staffing levels as needed with an eye on delivery within specified SLAs.

The SDM will use a Workforce Management tool to forecast volumes based on historical information, schedule agents, track agent adherence, and provide robust forecast and "actuals" reporting. The tool applies 24 months of call volume history to forecast monthly volumes, coupled with 13 weeks of the most recent history to calculate expected volumes in specific 15-minute call arrival patterns, using multiple "what-if" algorithms to produce optimal forecast, and recommend optimal scheduling.

8 Staff Training

8.A Provide trained service desk personnel

Unisys recognizes training as one of the critical facets of effective delivery, both to indoctrinate new resources onto the Service Desk and to maintain and continually enhance the skill capabilities of veteran resources to progress improvement and change initiatives. This section details the Service Desk training program for Commonwealth support resources.

The table below summarizes each training track, a high-level description of content, intended audiences, and anticipated duration. The information to follow will discuss how Unisys continually measures resource effectiveness, and leverages training to deliver continuous improvement, as well as how assessments are applied to immediately measure training effectiveness.

Service Desk Resource Training			
Course	Audience	Duration	Content
Unisys Service Desk	Service Desk Agents for the Service Desk	5 Days	• Administrative (Corporate Policies, Security, Time Keeping) • Customer Service (Customer Management, Call Control, Escalation Handling) • Key Systems and Tools (Call Management System, Knowledge Base, Help File, Remote Control) • ITIL/Service Management Overview • Commonwealth Training Track (see below)
Commonwealth Track Training (Commonwealth content)	All Commonwealth Support Resources	As Required (est. 5-10 days)	• Commonwealth - General • Commonwealth Agencies • Data center Services
Commonwealth Track Training (Unisys content, via Discovery and Ongoing	All Commonwealth Support Resources	As Required (est. 5-10	• Commonwealth Application, Infrastructure, Troubleshooting/ Problem Resolution

Knowledge Transfer)		days)	• Service Request Approvals, Processes and Procedures • Key Commonwealth External suppliers; functions and referral methods • Commonwealth Resolution Groups; functions and referral methods • Commonwealth Authorized User Differentiation and Recognition • Major and Critical Event Recognition and Handling
Continuous Improvement	All Commonwealth Support Resources	6-8 hours	Targeted training based on Quality and Resolution Optimization Program, Known Change, Tool Updates, and other required regular training

Effective training should result in measurable, tangible impact that contributes directly to the quality of service, and overall value to the Commonwealth.

9 Availability

9.A Ensure that the Service Desk is available at all times (i.e. 24 hours a day, 365 days a year).

Unisys will provide data center Service desk services on a 7x24 basis as required. The Automated Call Distribution (ACD) and ITSM systems we utilize enable Unisys to operate the Commonwealth Service Desk from multiple locations (Harrisburg M-F core hours; Salt Lake [redacted] Off-hours/weekends) as though they are a single virtual call center. This is a key component of our ability to apply the redundant, multi-center solution we have designed for the Commonwealth. The ACD will be programmed to re-direct calls from our Harrisburg Service Desk to a pool of Commonwealth-trained agents in [redacted] at the specified time each day. This also enables the natural redundancy afforded by multi-center solutions, as well as an ability to quickly tap into available capacity in [redacted] to provide quick "burstability" in the event of sudden, unexpected call volume that may hit the core Service Desk in Harrisburg. Additionally, in the rare instance that the Service Desk onsite in Harrisburg were to go down, all calls can be re-routed to [redacted] until Harrisburg is back online.

10 Incidents and Service Request Management

10.A Manage all Incidents and/or Service Requests from authorized users relating to Contracted Services.

The Unisys Service Desk will be the contact point for all data center-related Incidents and Service Requests. The Service Desk team will provide end-to-end management of all Incident and Requests, whether they are resolved at the Service Desk, or assigned to another designated Unisys, IBM, 3rd party, or internal Commonwealth resolver. A more detailed view of our end-to-end Incident Management process is provided below in our response below to #17 – Incident Management.

11 Service Desk, Weekly Reports

11.A Provide weekly reports to the Commonwealth on Service Desk activities, performance, and adherence to established SLAs. Service Desk reporting must include at a minimum:

Key issues relating to Service Desk processes, improvements, script development.

Status as to Service Desk staffing, training, and authorization.

Integration activities and issues with other Service Desks belonging to the Commonwealth.

Trend analysis shall include (13) most recent months. If the Service has been in place less than thirteen months then trend analysis shall include all months of Service.

Calculate metrics and provide monthly reports.

Number of Contacts, to include all interactions (Calls, phone calls, electronic, automated or otherwise).

Number of calls abandoned, average call duration, average time to answer, average time to abandon.

Number and percentage of Contacts resolved.

Number and percentage of Contacts passed to other Service Desks.

Other pertinent information regarding Service Desk operation and performance.

Unisys will implement a reporting solution for the Commonwealth that will deliver all of the detailed and summary Service Desk reports required as outlined at the top of this Section. The Reports will be created from data located within the Unisys ITSM system, as well as from our ACD, and will be posted on a Service Portal for access by designated Commonwealth management resources only. Additionally, the Service Delivery Manager will review the reports with your designated management team at designated intervals in order to address Critical open items and SLA achievement.

12 KMP

12.A Enable a KMP accessible by all authorized users. Content for the KMP will be approved by the Commonwealth.

Unisys will provide an Internet accessible KMP housed in the Unisys Service Portal. A Unisys Knowledge Manager will be responsible for working closely with the designated Commonwealth resources, as well as Data Center Service Desk team, to keep the KMP current and relevant. Unisys KM Technical Writers will be available to the Knowledge Manager to assist in developing content as required. This may include FAQ's and answers, service briefs, white papers, workarounds, or other documents as determined by the Knowledge Management and/or Commonwealth management. A sample of KMP screen shots is provided to our response to requirement 1C above.

13 Service Desk Recording Tool

13.A Offeror must record all incidents, problems, service requests, change requests, and configuration information in the software recording tool. All updates to the record, contacts with clients or vendors, and resolutions will be recorded in a real-time and consistent manner. This recording tool will house the KMP.

The Unisys Team will utilize a dedicated ITSM tool in order to record all incidents, problems, service requests, change requests and configuration information.

The Unisys Service Portal will house the KMP which is accessible to all authorized Commonwealth personnel.

14 Monitor Reporting

14. Monitor reporting system to ensure incidents and problems are being addressed to meet agreed SLAs

The Unisys Service Desk Manager (SDM), to be located onsite at our Harrisburg area service desk, is responsible for the day to day management of the Service Desk. This includes monitoring the end-to-end handling of Incidents and Problem activity in our ITSM system on an ongoing basis, with a special focus on active P1 and P2 Incidents. The Unisys PMO as well as the Incident Managers, Problem Managers, and Agents at the Service Desk, will utilize these reports to support attaining SLA's for Incidents and Problems.

15 Transition of Service Alerts

15.A Transition must include the transfer of system and application monitoring alerts with the ability to turn-off the problem alert process during maintenance windows and other scheduled outages.

Offeror must describe its approach to ensure alerts are transitioned successfully.

Unisys will adopt existing monitoring of infrastructure and application monitoring and direct all events to a centralized platform for event management in order to facilitate a timely transfer of an agency application monitoring or data center infrastructure when it makes sense to do so to minimize transition issues and support a timely transition.

This will allow Unisys to manage all infrastructure from a centralized event management platform thereby supporting an efficient and effective process for event management.

The Unisys Operations Team will have the ability to turn off automated incident creation in this centralized platform in support of maintenance windows for changes to applications or infrastructure Configuration Items (CIs). Unisys does not recommend turning off event management monitoring during a maintenance window.

16 Service Desk, Tiered Support, Transition Operations

16.A Interim Support Desk Procedures will be required as the Commonwealth transitions from its current support architecture to the Offeror's Service Desk.

16.B Offeror must describe an interim approach and procedure(s) for providing Service Desk operation throughout the transition to the Offeror's fully managed service

The existing Unisys Help Desk will continue to deliver service for DPH until the agreed 'Go Live' date for the new Unisys Service Desk team to take over responsibility for all of the data center services in scope for the engagement. While the current help desk is running as usual, behind the scenes Unisys will start the data gathering, data assessment, ITSM, Portal and KMP setup. In parallel the agent recruitment and training process will commence to get the additional new Agents in place and ready for a gradual Go Live period. Approximately 2-3 weeks before the scheduled Go Live period we will pilot handling a portion of the new expanded volumes to help the agents improve in a low volume live setting. This allows them to test the quality of the support scripts and help files that were developed during Transition, and give time to make adjustments as needed before a full go Live.

17 Incident Management

17.A Incident Management - The Offeror's Incident Management process shall encompass Incident Management processes deployed across all Service Components that are designed to: restore service as quickly as possible, minimize disruption to the Commonwealth, aim for highest levels of availability and service quality, completely transparent and auditable delivery of service, and promote the highest level for user satisfaction

The primary goal of incident management is to respond to issues and/or requests and return to normal operation as quickly as possible and minimize the adverse impact on business operations, thus ensuring the maintenance of the best possible quality and availability of levels of service. The incident management process records incidents, as well as service requests. Recording verifies that there are no lost incidents or service requests, allows the records to be tracked, and provides information to aid problem management and planning activities. The process includes the use of technology to provide self-service facilities to clients, providing them with flexible and convenient interfaces to the support function while also reducing the workload and personnel requirements of the service desk.

Incident management also includes the process of preventing the recurrence of faults, and the application of preventative maintenance to reduce the likelihood of faults occurring in the first instance.

It should be noted that the service desk owns the monitoring, communications, and resolution of all registered incidents. Although specialty groups may be called in to aid in the incident resolution, the service desk maintains ownership of the incident until it has been resolved and closed.

The effective management of incidents is a complex process that requires interaction with many other service management functions, most notably problem management, configuration management, and change management.

A more detailed description of the incident management process utilized by Unisys is as follows in our response to #17B below:

17.B Offeror must describe its Incident Management Process and how it will be applied to the overall IT Service Management Program for the Commonwealth.

The Unisys Team will utilize the following Incident Management Process framework shown below to support Incident Management for the Contract. The Unisys Incident Management Process is comprised of the following summary steps in **Figure 3.2.1.4-4** below:

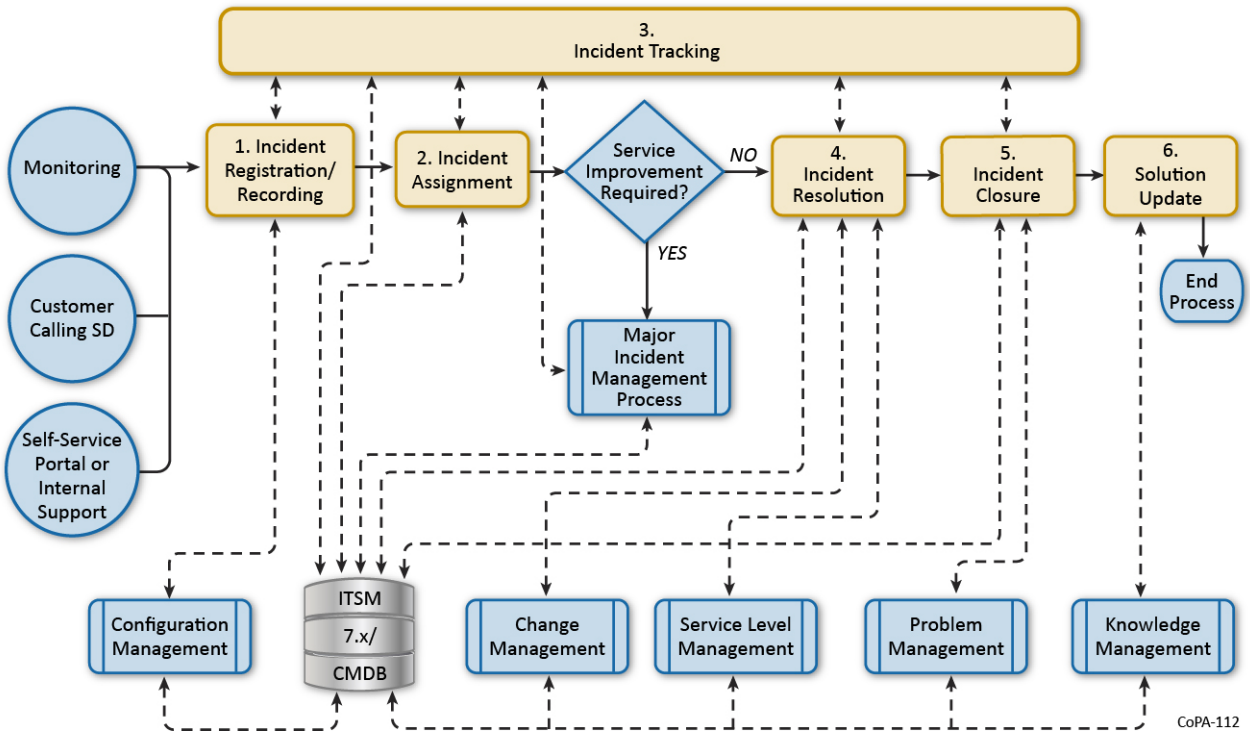

Figure 3.2.1.4-4 Incident Management Process

1. Incident Registration & Recording

Incident tickets can be detected and recorded several ways:

- The end user or Agency Service Desk will contact the Unisys Service Desk via telephone and the Unisys Service Desk will record the ITSM Incident Ticket
- The Unisys Event Management System will detect critical events that auto-generate an incident ticket into the Unisys ITSM Incident Ticket System

  or

- The Commonwealth's ITSM System will forward incident tickets to the Unisys ITSM Incident Ticket System

Classification & Initial Support

The service desk agent completes all required incident record data, validates stored information and gleans incident specific information from the end user. The unique incident record number is created and provided to the end user for reference purposes. While classifying the incident, the service desk agent will also classify the incident in regards to Impact, Urgency and Priority.

The Priority is defined by the expected effort. An incident with a low impact and average urgency that can be resolved with minor effort will be resolved immediately in most organizations (e.g. a password reset).

Severity	Definition
P1 – Critical	Severe Business Disruption
P2 – Major	Major Business Disruption
P3 – Medium	Minor Business Disruption
P4 – Low	Minor Disruption
P5 - Very Low	Inquiry

Initial support involves resolution of the incident to the satisfaction of the client by the service desk. The resolution may be derived from several areas, including:

- Identification of a known error
- Service Desk staff expertise
- A knowledge search.

Investigation & Diagnosis

Investigation and diagnosis is the process whereby the Level I Service Desk agent is able to resolve the incident to the satisfaction of the client without reference to any other support areas.

The service desk agent resolves incidents through the use of:

- Business specific processes and procedures documented within the client-specific knowledgebase
- Generic technical training, personal experience and technical knowledgebase information
- Remote access tools
- Mentor-type support from other Agent and Management resources within the service desk.

The Service Desk may be able to achieve this by matching the reported incident to a known error and providing details of the known resolution or workaround to the client. If a resolution is proposed by either source, then the known error database will be updated and full details of the resolution will be recorded against the incident record.

2. Incident Assignment

In cases where the initial Service Desk support team is unable to resolve the incident, the Service Desk agent will assign the incident in the ITSM System to a resolver group based on the incident classification. Depending on the type of incident, the resolver group may be a Level 1 or Level 2 Unisys Subject Matter Expert Architect or Client Engineer, or a Level 3 Commonwealth internal resolver or an external vendor. In all of these cases, the Service Desk retains ownership of tracking the incident against the escalation and response times and is

responsible for monitoring and tracking progress of the incident.

3. Incident Tracking

The Service Desk Incident Manager will track incident management queues to determine if an incident is approaching an SLA threshold or determine if it needs to be escalated to a functional resolver team or a vertical management team in order to resolve the incident.

4. Resolution & Recovery

The Service Desk or resolver group's focus is to restore the service to the client's satisfaction. When the service is restored the Service Desk Level I agent who owns the incident ticket will inform the ticket submitter and affected stakeholders that the service has been restored.

5. Incident Closure

The incident will be closed and the ITSM Incident Ticket updated when the workaround or resolution has been confirmed with the end user. If the incident is referred to a resolver group, it is the responsibility of the resolver group to close the incident in the Incident Management System upon successful resolution. Unisys will send email notifications to the end user to confirm that the incident is closed.

Service Desk Incident Managers monitor incidents placed in a resolved state and contact the initiator to confirm the resolution. This provides an independent check to verify that the initiator is happy with the support received and agrees that the incident has now been resolved.

18 Problem Management

18.A Problem Management - The Offeror's Problem Management Process must minimize the adverse effect on the business of Incidents and Problems caused by errors in the IT infrastructure, Applications, systems and supporting components, and proactively prevent the occurrence of Incidents and Problems by identifying and eliminating causes of failure.

The Unisys Problem Management Process, integrated with our Incident Management Process described above, will be utilized to minimize adverse business effects caused by IT infrastructure issues. A Problem Manager assigned to the engagement, as well as the back office Unisys Problem Management team, will take the lead on proactively working Problem identification and elimination.

18.B Offeror must describe its Problem Management Process and how it will be applied to the overall IT Service Management Program for the Commonwealth.

The Unisys Team will utilize the following Problem Management Process framework shown below to support Problem Management for the Contract. The Unisys Problem Management Process is comprised of the following summary steps in **Figure 3.2.1.4-5** below:

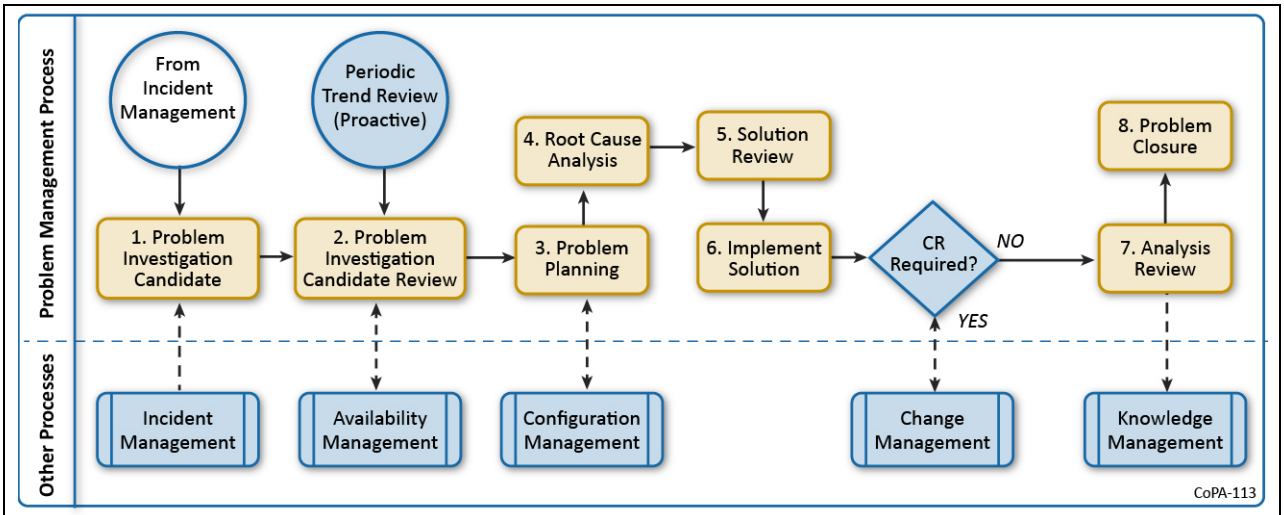

Figure 3.2.1.4-5: Problem Management Process

Unisys Problem Management Process

1. Problem Investigation Candidate

Unisys Problem Manager identifies a Problem from the following conditions:

- Multiple incidents that indicate an infrastructure problem. This is normally discovered by multiple end users reporting the same disruption
- A single incident recognized as a catastrophic problem that must be corrected immediately i.e. labeled as a major incident
- Proactive analysis of products and devices that indicates possible future system failure.

2. Problem Investigation Candidate Review

Unisys Problem Manager reviews a Problem validating the information to confirm it warrants investigation and either cancels the problem ticket or moves it to the next step of investigation, Problem Planning.

3. Problem Planning

Problem Planning is the procedure used by the Problem Manager/ Coordinator to plan the entire problem investigation including resources, timelines, kick-off meeting, creating and assigning problem root cause analysis tasks.

4. Root Cause Analysis

This stage involves investigation of the Problem by the relevant Level II or III Technical Teams and/or IV Third-Party Vendor. The primary aim of this procedure is to determine a work-around and to establish the root cause.

5. Solution Review

The Problem Manager reviews the recommended solution and approves or rejects the solution. The approval or rejection of the Solution provided is done in consultation with the SDM/Technical leads and the Commonwealth stakeholders. This procedure also involves the

creation and managing of Known Errors.

6. Solution Implementation
The Solution Implementation procedure is primarily used by the Level II/ III Resolver groups and Change implementers wherever a change is required to implement the suggested solution.

7. Analysis Review
The Problem Manager reviews the results and determines if the analysis is acceptable. This procedure also checks for the successful implementation of the proposed solution.

8. Problem Closure
The Problem Manager verifies the Problem has actually been solved. This procedure also includes managing the closure of Known Errors and impasse procedures where required.

Unisys Team Experience

Unisys has vast experience in providing Service Desk support services, with over 2800 resources handling over 8.5 million inbound events annually at our Managed Service Centers located worldwide. Over 3 million of these events are supported onshore in the U.S. by over 800 experienced resources. Gartner and Forrester have endorsed Unisys Service Desk Services in their most recent Analyst Reports.

- The Forrester Wave™: Global Workplace Services, Q1 2013 analysis has placed Unisys in the Strong Performer category of providers
- Gartner's 2012 Magic Quadrant for help desk outsourcing services lists Unisys in the 'Leaders and Visionaries' quadrant

Benefits to the Commonwealth

The Service Desk team will provide outstanding service to the Commonwealth users. For example, at our American Red Cross account, which transitioned to Unisys from another provider last year, Unisys has achieved the following results:

- In the data center, we are achieving 99.9% uptime at a 40% lower cost than with their previous provider.
- Service Desk wait time is down from more than 200 seconds to consistently below 30 seconds. Customer satisfaction rating is consistently above 4.2 out of 5.

For information regarding our value added services to American Red Cross refer to References Section 4.5.1.

3.2.1.5 Technical Architecture

The Technical Architecture function will oversee the ongoing design of the various computing platforms that will support the Commonwealth's existing computing topologies, as well as plan for the approaching consolidation of the Commonwealth datacenters. The intent is to design an infrastructure which will ultimately utilize multiple datacenters for processing, tiered DR Services, and on-demand Services in a secure environment. At the conclusion of the design, and after approval by the Commonwealth, the Offeror must document the environment via a Service Catalog.

Offeror must design the technical architecture of the computing systems based on current best practices, to support the evolving technologies and business needs of the Commonwealth. The volume of computing and storage will vary during the term of the contract due to applications development, testing, certification, the retirement of existing production environments, as well as cyclical processing demands such as the various tax seasons. The Offeror must be able to expand and contract service offerings based on Commonwealth needs in a timely and cost effective manner.

	Requirements	Describe Compliance
1.	Create a Service Catalog. Define the Services and platforms to be offered.	Offeror must describe the catalog of Services it proposes.

	Provide a detailed list of Services, via a common Service Catalog to be provided to the Commonwealth. Utilize an industry standard software product to ensure the detailed service offering is recorded.	Offeror must provide a sample of a Catalog of Services that includes both Services and platforms that it proposes.
2.	Design and build the IT architecture required to support the Services. Design and build the IT technical architecture to support the Services selected by the Commonwealth. Provide the design to the Commonwealth for review and approval prior to execution. All designs must be approved by the Commonwealth.	Offeror must describe its overall service design process.
3.	Design platform and support lifecycles. Provide a technical support staff structure for the Services and platforms to be offered. Support will consider all skills needed to plan, operate and support each technology platform.	Offeror must describe its proposed technical architecture team. Resumes for proposed key personnel must be provided as described in **Schedule G - Staffing Plan and Key Positions**.
4.	Define Technical Support Services. Provide the skills of and the size of the support staff to plan, manage, and operate the various IT infrastructure platforms.	Offeror must describe its proposed technical architecture team. . Resumes for proposed key personnel must be provided as described in **Schedule G - Staffing Plan and Key Positions**.
5.	Interoperability Strive to design architectures with system components that facilitate system data accessibility.	Offeror must describe its methodology and approach to designing technical architecture
Deliverables		
Deliverables are defined in **Schedule K – Key Program Deliverables**		
Offeror Response		

Introduction

The Unisys solution team presents considerable detail on the Enterprise Services Catalog and ITIL-based Service Design and functionality because these are the most critical elements in the design on any ITIL-based Managed Service solution. The ITIL V3-based Service Design includes not only the design of new services but also the changes and improvements to existing services through ITIL-defined processes.

The competitive advantage that Unisys offers the Commonwealth in this solution is deep expertise in using ITIL V3 based ITSM processes and Service Design processes to deliver higher productivity and costs savings for its customers.

The Unisys solution brings forward a staff of experienced technical architects who have provided service to Commonwealth agencies for decades. The Unisys Program Management Office provides the organizational structure by which the technical architects and the Senior Enterprise Infrastructure Architect meet regularly with Agency directors and business leaders. During these meetings the Unisys Enterprise Architecture staff seeks updates on near-term and long-term Agency strategic requirements. In addition, the Unisys PMO manages a regular schedule of Innovation Workshops led by Enterprise Architects who apprise Agency leaders of recent and forecasted technology innovations that may accelerate the Commonwealth's strategic interests.

1 Services Catalog

1.A Create a Services Catalog. Define the Services and platforms to be offered.

1.B Offeror must describe the catalog of Services it proposes.

The Unisys solution team brings forward an expanded more flexible ITSM Services Catalog that aligns to the Commonwealth's strategic initiatives. To further the Commonwealth's strategy to reduce costs, Unisys will implement an Enterprise Services Catalog based upon the Service Tiers, Hardware Configurations and Operating Systems found in Schedule I.

Utilizing this Enterprise Services Catalog, the Commonwealth can order incremental capacity across the hardware platforms within the enterprise. The Enterprise Services Catalog will allow the end user to first choose a high level service from the service family, a virtual or physical platform if applicable, then an operating system, followed by a server size. Lastly, the end user will choose a service tier where applicable.

The Enterprise Services Catalog is designed to be comprehensive and applied across the enterprise. For more information about the Unisys Enterprise Services Catalog, please review Section 3.4.4, Services Catalog.

1.C Provide a detailed list of Services, via a common Services Catalog to be provided to the Commonwealth. Utilize an industry standard software product to ensure the detailed service offering is recorded.

The Enterprise Services Catalog will be provided online through the Unisys Service Portal which is based upon PMG's Services Catalog platform. The Unisys governance process and

Unisys Service Design manage the detailed service offerings. The Commonwealth has access to the online Enterprise Services Catalog offering which provides an authoritative record of service offerings and the Commonwealth has access to the Unisys-maintained Change Management records of prior changes which can be used to summarize or evaluate the evolution of the Enterprise Services Catalog over time.

The Services Catalog (Schedule C) provides a detailed list of the services which will be provided to support the Commonwealth's requirements for Compute Services.

1.D Offeror must provide a sample of a Catalog of Services that includes both Services and platforms that it proposes

The Services Catalog (Schedule C) provides a list of the services which will be provided to the Commonwealth for both Services and platforms.

2 Service Design

The Unisys ITIL V3 based Service Design is managed at the Program Management Office level supported by the IT Services Management (ITSM) team to deliver the offerings available to the Commonwealth through the Service Portal as outlined in the upper three layers shown in **Figure 3.2.1.5-1**.

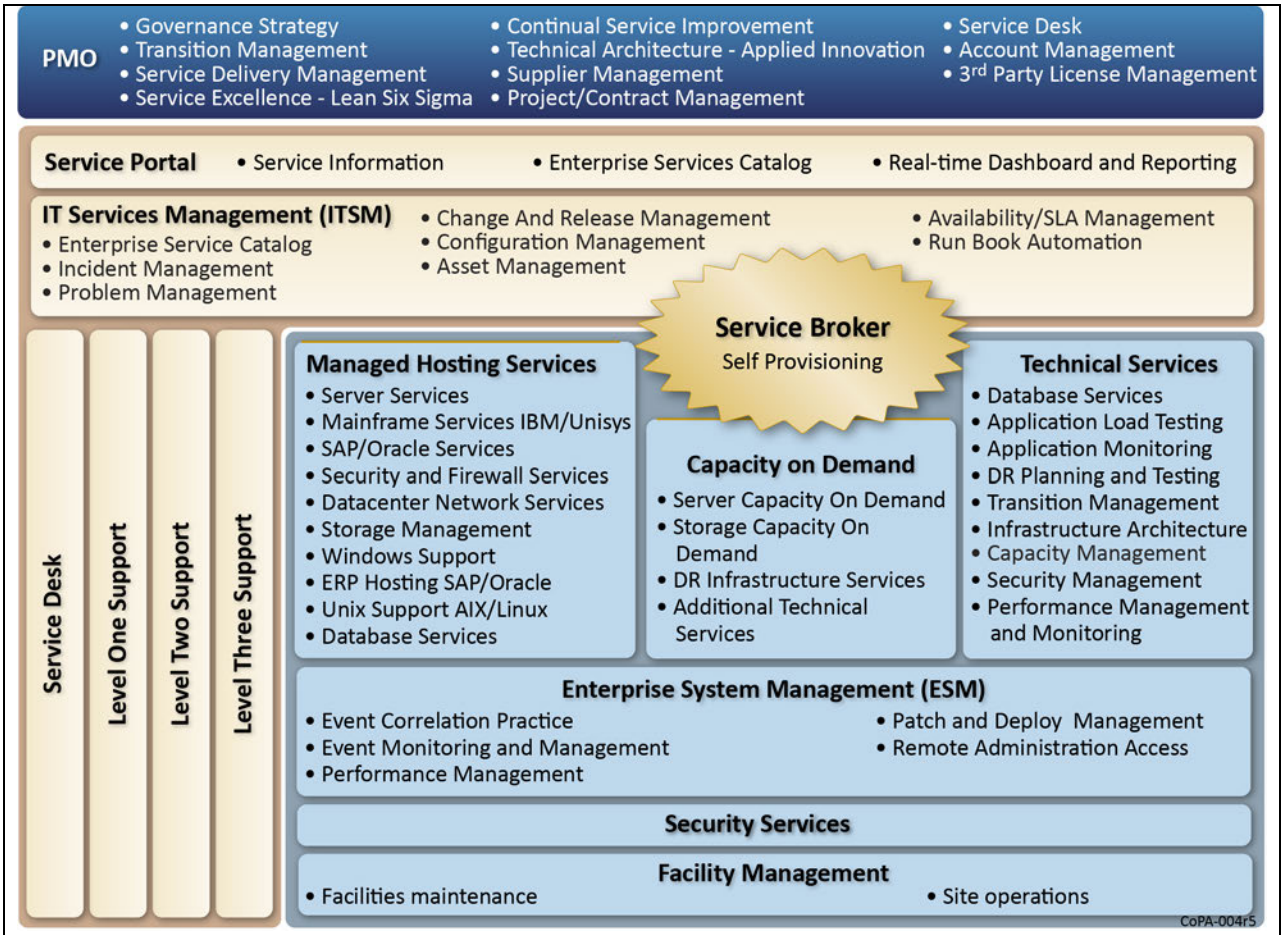

Figure 3.2.1.5-1 Component Based Operating Model

2.A Design and build the IT architecture required to support the Services

The Service Design includes the following ITIL V3 processes managed by the Unisys Program Management Office:

- Design Coordination: Coordinates service design activities within Unisys Governance so that Commonwealth agency input, requirements, and oversight are included.
- Services Catalog Management: Coordinate initial approvals for Services Catalog changes and the quality of the service descriptions and interdependencies.
- Service Level Management: Provides governance on changes to existing SLAs, when desired, and SLAs for new services.
- Risk Management: Provides Security and Continuity oversight for Services
- Capacity Management: The Unisys-provided and managed Capacity-on-Demand infrastructure
- Availability Management: the Unisys-provided management of metrics and improvements

for infrastructure availability

- IT Service Continuity Management: Provides Service Availability through DR and Continuity support to mitigate risks to services
- Information Security Management: Provides Service Confidentiality and Integrity to round out the Security Triad of Confidentiality, Integrity, and Availability.
- Compliance Management: Unisys management to the Commonwealth's Regulatory compliance
- Architecture Management: Unisys governance over technology life-cycles and innovations.
- Supplier Management: Unisys Program Office Management over the coordinated Unisys team

2.B Design and build the IT technical architecture to support the Services selected by the Commonwealth. Provide the design to the Commonwealth for review and approval prior to execution.

As shown in **Figure 3.2.1.5-1** above, the Unisys Program Management Office (PMO) provides the governance process around the design and build of the IT technical architecture. The Unisys PMO overlays commitments to Continual Service Improvement to deliver a much higher service value to the Commonwealth than that which another vendor would offer by simply following the proscribed process road maps.

2.C Offeror must describe its overall service design process.

The scope of Service Design is not limited to new services, but also includes the changes and improvements necessary to increase or maintain value to customers over the lifecycle of services, the continuity of services, achievement of service levels, and conformance to standards and regulations. It provides guidance on how to develop design infrastructure capabilities for Commonwealth applications and service management.

The primary goal of Service Design is to design IT services, together with the governing IT practices, processes and policies, to realize the Commonwealth's IT Service strategy and to facilitate the introduction of these services into the live environment ensuring quality service delivery, customer satisfaction and cost-effective service provision. Service Design for the Commonwealth/Agencies will be focused on Availability, Capacity and Service Level Management and is described in the following sections.

The Unisys Service Design process engages Commonwealth leadership through the PMO to set the design scope for Service Design changes. This initial review verifies that the Commonwealth can set priorities to Service Design changes that have the highest strategic or tactical value to the Commonwealth. The Commonwealth's approval is also required before Service Design changes can be introduced to the Enterprise Services Catalog and offered to Commonwealth Agencies.

3 Technical Architecture Team

3.A Provide a technical support staff structure for the Services and platforms to be offered. Support will consider all skills needed to plan, operate and support each technology platform.

Enterprise Architecture: The Enterprise Architecture function owns the development and management of the technology management program for the Data Center Services delivered. In collaboration with Commonwealth agencies, Agency Account Managers and the balance of the Unisys Team, this function provides leadership in the forecasting and outlook for new technologies and services to be added during the term of the program. This group provides guidance to IT operations in addition to performing planning, design, build, and transition support on all technical matters.

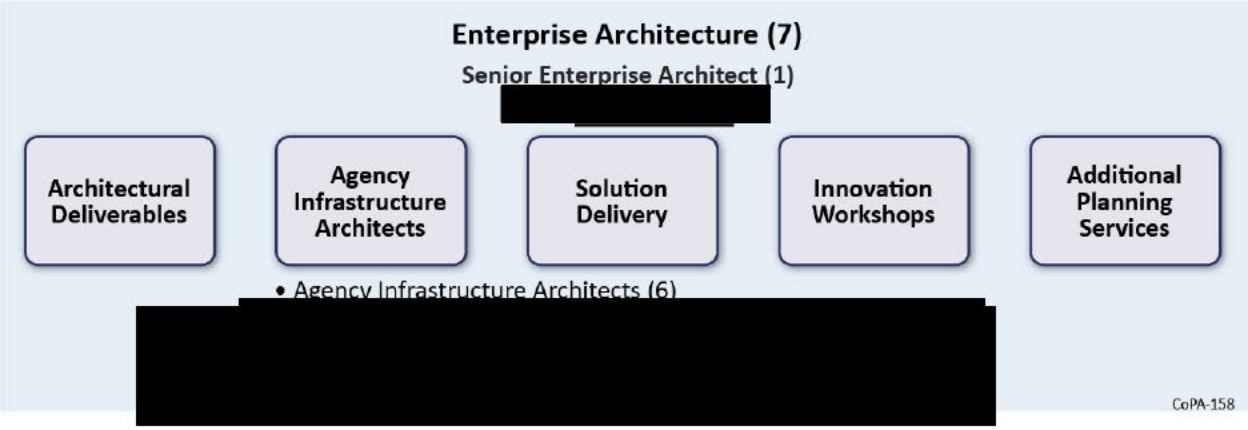

Figure 3.2.1.5-2: Enterprise Architecture – Functional Overview

The Architectural Deliverables function is responsible for the development and delivery of a number of key program deliverables including:

- **Data Center Architecture Plan and Roadmap** which includes the 2+ Data Center Architecture, the Data Center Network Architecture, and the Data Center Security Architecture.
- **Technology Architecture and Refresh Approach** which addresses Data Center Technology Refresh and Infrastructure Architecture strategy.

The Agency Infrastructure Architects are technology architects who bring a wide set of skills and experience that collectively cross all platforms and technologies supported under the Data Center Services contract. The architects, many with years in service to Commonwealth Agencies, are aligned to specific agencies and work hand-in-hand with the Agency Account Managers to verify that agency technology needs are fulfilled. They are responsible for the detailed design engineering of the Commonwealth's specific data center services design quotes and for coordinating Commonwealth related requests.

The Solution Delivery function is responsible for all aspects of the solution delivery including conducting the requirements definition process with the agency requesting service, development of a detailed technical solution, quantifying solution costs, and delivery of a viable proposal to the Commonwealth within established time frames.

The Innovation Workshops are essential to provide the opportunity for collaboration, technical information exchanges, and forums that will address issues, needs, and interests of the Commonwealth team. These innovation workshops are a key component of our overall Continuous Improvement Program.

The Additional Planning Services function provides the Commonwealth with different/additional methods for requesting technical information and support. Depending on the type of request those methods could include:

- Statement of Objectives (SOO)
- Work Order
- Service Request
- Request for Technical Analysis
  - Cost-Benefit Analysis
  - Conceptualization
  - High Level Estimate (HLE)
- Technical Opinion(s)

Unisys will establish and maintain an architecture office. The Senior Enterprise Architect, [redacted] will lead this office, and have six Agency Infrastructure Architects dedicated to him. The architecture office of the PMO will be responsible for the fulfillment of all architectural requirements contained within this RFP.

This team confirms the delivery of all required architecture related deliverables. They are fully accountable end-to-end for the solution delivery process. Enterprise Architecture works with the Commonwealth through Innovation Workshops to verify agency leadership is kept abreast of industry and technology trends. They are also required to provide additional planning services as needed by the Commonwealth to aid in their budgeting and technology planning processes.

The Senior Enterprise Architect is an Executive Level position that has the capability to reach into the sales organization, as well as the service delivery towers to draw additional architectural expertise as needed.

The Unisys Senior Enterprise Architect for the Commonwealth is a results-oriented leader with proven experience that has over 10 years of experience on accounts with increasing levels of complexity and responsibility. He has demonstrated the ability to handle increasing scope of responsibilities and to deliver deep and wide impact through innovative solutions to customer requirements for extremely large contracts.

The Agency Infrastructure Architects who staff this team are technology architects who bring a wide set of skills and experience that collectively cross all platforms and technologies supported under the Data Center Services contract. A number of our Agency Infrastructure Architects have been providing support to the Commonwealth for as many as 30 years. The architects are aligned to specific agencies and work hand-in-hand with the Agency Account Managers to confirm that agency technology needs are fulfilled. They are responsible for the detailed design engineering of the Commonwealth's specific data center services design quotes

and for coordinating Commonwealth related requests.

The Agency Infrastructure Architect will have primary technical solution responsibility and will verify the technical solution is state-of-the-art and fit for purpose. Primary responsibilities include:

- Ensuring that operational requirements of the Commonwealth are met by the technical solution deployed.
- Identification and planning of future technology updates.
- Data Center IT Design and Costing: Large scale architecture and implementation design. Design and application of best practices to optimize steady-state cost in pursuit of IT strategy and governance. Leadership role in adopting new technology to deliver cost savings and business goals.
- Technology and Architecture Strategies: Develop and Implement multi-generational strategic plans to restructure IT Infrastructure and implement a "best in class" application and data modeling framework. Leverage a variety of technologies and process to dramatically improve service while decreasing costs.
- Business Management: Full responsibility for developing business case support to underlie architecture change including milestone markers for cost savings during and following implementation
- Change management: Organizational transformation in support of successful IT implementations.

Unisys will develop solutions and provide architectures with a focus on quality to support the Commonwealth and its business needs. The architecture of the services provided by the Unisys team will be documented within the Key Deliverables D-01 (Datacenter Architecture Plan and Roadmap), D-03 (Technology Architecture and Refresh Approach), and D-04 (IT Service Continuity Architecture and Plan). Each of these documents will be reviewed within the Solution and Architecture Review Boards as part of Transition and when architecture changes are developed. To maintain the consistency and quality of the Commonwealth's requested services, each solution will be developed using a common set of activities which cover the solution development lifecycle up to the Agency's approval. This lifecycle includes the following activities.

i. Receive Request

ii. Gather Requirements

iii. Review and receive Commonwealth approval for requirements

iv. Review current services against requirements

v. Develop solution

vi. Review and approve solution within Unisys Solution and Architecture Review Board. The Unisys Solution and Architecture Review Board will be comprised of the Senior Enterprise Infrastructure Architect, Agency Infrastructure Architects, Chief Information Security Officer and technical support leads.

Review and approve solution with Commonwealth Solution and Architecture Review Board. The Commonwealth Solution and Architecture Review Board should be comprised

of the Unisys Enterprise Architect team, Unisys technical support leads (as needed), Commonwealth IT Governance participants, and Agency representatives (as needed).

See Figure 3.2.1.5-3 below.

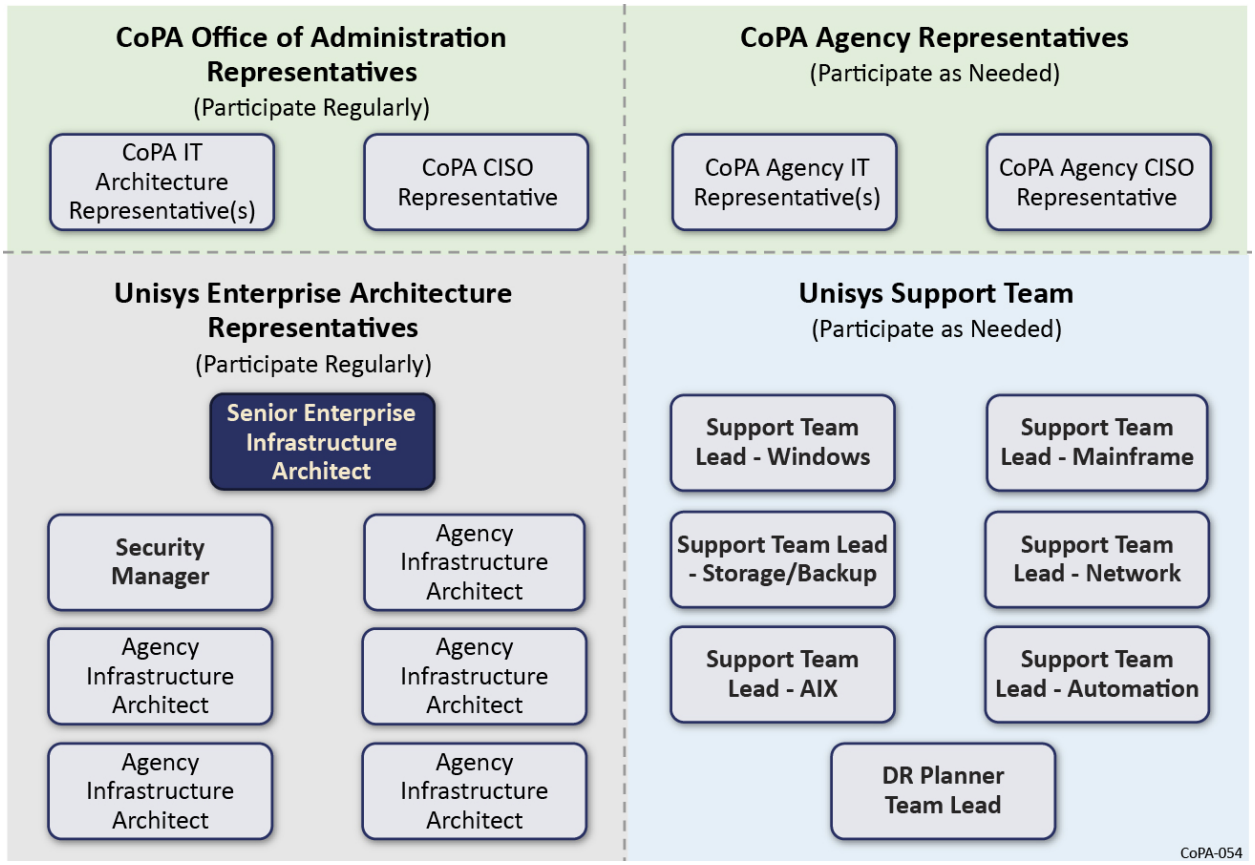

Figure 3.2.1.5-3: Enterprise Architecture – Representatives

vii. Review and approve solution with Commonwealth Agency requestors

viii. Transfer to Project Implementation team.

Design platform and support lifecycles.

As the Commonwealth's environment supports a diverse set of business activities and applications, the architecture team is composed of multi-discipline infrastructure architects. The architects will be organized to support the Commonwealth and the Program Management Office. The Agency Infrastructure architects will report to the Senior Enterprise Infrastructure Architect.

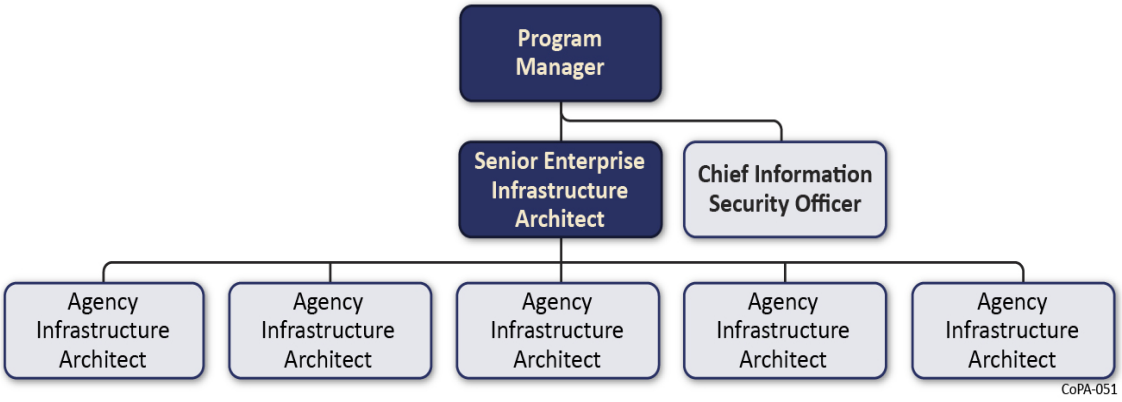

Figure 3.2.1.5-4: The Enterprise Architect team along with the CISO will develop solutions.

Based on an Agency's service request activity and types of infrastructure technologies used, an Agency will be assigned to an Agency Infrastructure Architect. The Agency Infrastructure Architect will work with the Agency Account Manager to understand an Agency's overall business needs, identify requirements, and define solutions to support the Agency's requests. Please see **Figure 3.2.1.5-5** below.

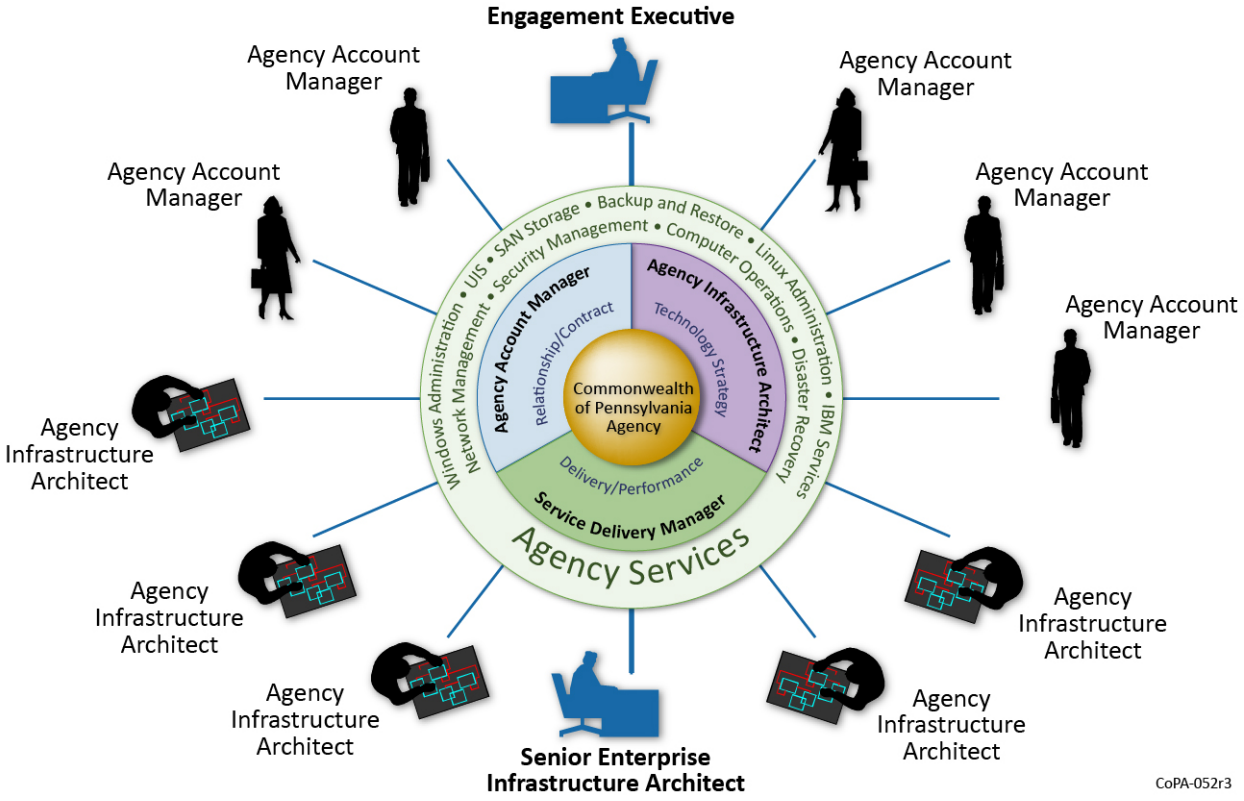

Figure 3.2.1.5-5: The Enterprise Architect team will work with the Agency Account Managers to understand the business needs and develop solutions for the Commonwealth.

3.B Offeror must describe its proposed technical architecture team. Resumes for proposed key personnel must be provided as described in Schedule G - Staffing Plan and Key Positions.

As the Commonwealth's environment supports a diverse set of business activities and applications, the architecture team is composed of multi-discipline infrastructure architects. The architects will be organized to support the Commonwealth and the Program Management Office. The Agency Infrastructure architects will report to the Senior Enterprise Infrastructure Architect. See **Figure 3.2.1.5-6.**

Resumes of named key personnel and representative resumes for personnel providing Technical Architecture Services are located in the tab marked Rep-Resumes in section 5.0 Personnel.

4 Technical Support Services

4.A Provide the skills of and the size of the support staff to plan, manage, and operate the various IT infrastructure platforms.

The Technical Architecture team is engaged to support the planning for various IT infrastructure platforms as part of the Service Design process described above.

Following ITIL V3 process guidelines the Technical Support Services are provided by a blend of cross-functional and tower-specific experts divided between Level 1, Level 2, and Level 3 support tiers. A detailed description for this staff as well as the escalation procedures to support and managed operations across various IT infrastructure platforms is located in Schedule F, Section 3.2.3.2.

4.B Offeror must describe its proposed technical architecture team. . Resumes for proposed key personnel must be provided as described in Schedule G - Staffing Plan and Key Positions.

In support of the Commonwealth's Compute Services, the Unisys team provides a diverse set of skills and resources. A table of these resources and skills along with resumes for key personnel and representative resumes is located in section 5.0 Personnel.

5 Interoperability

5.A Strive to design architectures with system components that facilitate system data accessibility.

Unisys had two governing principles in the design of the Commonwealth: first, standardization of the compute environment, as much as possible, in each of the hardware towers, and second, to technology that can be redeployed rapidly to other purposes. Unisys believe that from a server perspective, this is the easiest way to achieve the Commonwealth's goal of interoperability.

In particular these tower architectures have specific adaptations to increase interoperability and facilitate system data accessibility:

- ITSM Services Catalog
- Database and ERP
- Server

- Network
- Storage

IT Service Management Interoperability

The ITSM design that is detailed in Schedule F, Section 3.1.3 Data Center Architecture is designed to support service management of services and applications across diverse environments and architectures to support a service management focus. With a focus on Service Management the Commonwealth can implement business and applications services on interoperable technical platforms and manage the business and application technical services from a single ITSM platform.

Database and ERP Interoperability

As the core part of many applications, the database service was designed with flexibility and interoperability in mind. As part of the solution development activities, the Unisys team will work within the Commonwealth to design each database implementation to meet the requirements for the application including interoperability with other applications.

The database services are much more agile and cost-effective due to the underlying Enterprise Services Catalog that provides the computer infrastructure services of compute power, network, storage, and data protection through a variety of tiered options. The Commonwealth will be able to manage the flexibility of the services by running databases at higher utilizations rates with the security that additional resources can be purchased when needed and released when no longer needed.

Based on the current implementations of the Commonwealth's SAP and Oracle ERP systems, ERP interoperability is a major component of this implementation. By applying the governing design principles and using standardized infrastructure architectures as indicated above, the Commonwealth's ERP systems will have a flexible and interoperable environment. More specifically the Commonwealth's application architects can make use of the proposed, and evolving, Services Catalog to select appropriate utility resources to support the changing needs for the SAP and Oracle Test, Development, Q/A and Production environments. These application architects can use the Enterprise Services Catalog to order just-in-time infrastructure to test new application features. This relieves the application team of the need to justify significant up-front-spends to purchase infrastructure with long term commitments. Instead the application teams can establish lower-costs proof-of-concepts projects to prove-out the benefits of new application features. This will allow application architectures to be much more nimble in marrying new application features to tangible benefits to the Commonwealth with virtually no long-term investment in infrastructure. In addition to the flexibility provided by the Enterprise Services Catalog's just-in-time infrastructure application architects can scheduled longer duration tests in the permanent Test Environment specified in the Commonwealth's RFP and provided by the Unisys team solution.

Server Interoperability

By utilizing IBM Flex Blades within IBM Flex Chassis, the Commonwealth will be able to deploy physical and virtual workloads, on both AIX and Windows, within the same physical chassis.

This will allow the Commonwealth to quickly and efficiently re-align the compute infrastructure to meet all existing and future regulatory framework requirement where any type of physical isolation is required.

Network Interoperability

By co-locating AIX and Wintel (Windows and Linux) application workloads in the same chassis, network latency can be drastically reduced, and application management efficiencies recognized. By providing these capabilities, Unisys has created a unique solution that the Commonwealth's services can leverage for future application needs as well as regulatory framework requirements.

To further address application latency concerns that can reduce interoperability between applications, point-to-point high speed (10Gb) fiber links will be deployed between the data centers. Based on the fact that it takes approximately 1 millisecond (ms) for light to travel 100 miles, we are estimating that latency between any 2 of the 3 data centers should be less than 5ms. The reason the latency it is not less than 5ms is because additional latency (i.e., non-distance related) is added by the physical telecommunication equipment at either end of the circuit. Point-to-point circuits offer the lowest latency (versus network "cloud" or "star" topologies), as the distance the light needs to travel is the shortest.

Storage Interoperability

To meet the Commonwealth's goals of a flexible and cost-effective Utility model Unisys has relied on standard, market-leading Open Systems and Mainframe storage and backup vendors who have always designed and marketed their products with high flexibility to meet interoperability requirements.

Unisys has, in all cases, sought competitive pricing from at least 2 market-leading vendors for the components necessary to deliver the services sought by the Commonwealth. These market-leaders maintain, as part of their competitive advantage over niche-players, extremely comprehensive lists of servers, applications, appliances, and even network interconnect devices such as Host Bus Adapters (HBAs) in servers for storage connections and high-throughput IP-based ports in distribution layer switches.

Other vendors might bring forward niche-based solutions that offer a great many product models each designed to provide lowest costs for particular service segments. Unfortunately this approach too often locks a customer into long-term vendor locks as data volumes grow and it becomes costly to migrate data from the original niche product to the cheaper niche product that later displaces it.

Unisys has taken very seriously the Commonwealth's desire to take a 10-year focus on the delivery of storage and backup services and narrowed its vendor selection to these market leaders: EMC, IBM, Oracle/Sun backup systems and CommVault. Our partners have long-term product strategies that preserve the value of the current products provided in the Unisys proposal and have provided roadmaps for the refresh of these product lines in 5-years.

Unisys will conduct regular architecture review meetings with Commonwealth stakeholders to review the benefit that new technologies may bring to lower costs and increase service quality and flexibility for Commonwealth services. The Unisys solution team has favored current market-leading technology providers in the selection of infrastructure hardware, software, and

tools because these platforms provide the most interoperability across vendors in upstream or downstream technology layers. Thus as the server or network virtualization layers transform Unisys will be able to present opportunities to begin refreshing into these technologies or adding them as additional capacity is needed. This can be done without, for instance, requiring a replacement of the existing storage infrastructures which will continue to be interoperable across all new vendors and new server and network technologies.

5.B Offeror must describe its methodology and approach to designing technical architecture

Through the Service Design process described above, Unisys develops solutions and provides technical architectures with a focus on quality to support the Commonwealth and its business needs. The architecture of the services provided by the Unisys team will be documented within the Key Deliverables D-01 (Datacenter Architecture Plan and Roadmap), D-03 (Technology Architecture and Refresh Approach), and D-04 (IT Service Continuity Architecture and Plan). Each of these documents will be reviewed within the Solution and Architecture Review Boards as part of Transition and when architecture changes are developed. To maintain the consistency and quality of the Commonwealth's requested services, each solution will be developed using a common set of activities which cover the solution development lifecycle up to the Agency's approval. This lifecycle includes the following activities.

- Receive Request
- Gather Requirements
- Review and receive Commonwealth approval for requirements
- Review current services against requirements
- Develop solution
- Review and approve solution within Unisys Solution and Architecture Review Board. The Unisys Solution and Architecture Review Board will be comprised of the Senior Enterprise Infrastructure Architect, Agency Infrastructure Architects, Chief Information Security Officer and technical support leads as illustrated in the Unisys Enterprise Architecture Representatives in Question 3 above in **Figure 3.2.1.5-3.**
- Review and approve solution with Commonwealth Solution and Architecture Review Board. The Commonwealth Solution and Architecture Review Board should be comprised of the Unisys Enterprise Architect team, Unisys technical support leads (as needed), Commonwealth IT Governance participants, and Agency representatives (as needed).
- Review and approve solution with Commonwealth Agency requestors
- Transfer to Project Implementation team.

Unisys Team Experience:

Since 1999, the Unisys team has provided a variety of services to support the applications hosted in the Data Power House. As the Commonwealth's business needs have changed and grown, the Unisys Service Design team has worked with the Commonwealth to identify new technologies and services:

- **Shared Storage.** By introducing shared storage for agencies, the Commonwealth has

benefited from a cost effective solution to support the continuing growth in data.

- **Virtualization.** The use of [redacted] products has enabled to Commonwealth to reduce the hardware footprint while also supporting the continued increase in server capacity and flexibility.
- **Disk Based Backups.** The introduction of EMC's Data Domain disk backup technologies has provided flexibility in backing up the active data on many platforms including the IES SAP and DOR ITS platforms as well as a cost effective data replication option to support Disaster Recovery activities.

The Unisys Team dedicated to the Commonwealth has ready access to the Unisys Portfolio team which has developed the mature Unisys Service Design practices to evolve technical architectures for a broad based of Unisys customers.

The Australian National Audit Office Control (ANAO) (an equivalent office to the Federal GSA) asked Unisys to implement ITSM Services Catalog delivery. As a result of this request, Unisys provided these benefits:

- Incident Response Time improved from 80 to 98%
- Incident Resolution Time improved from 85 to 94%
- Incidents Logged reduced 30%, measured monthly
- Problem Resolution Time reduced from average of 28 to eight days
- Network Availability monthly average increased from 99.7% to 99.99%
- Business System Availability monthly average increased from 99.7% to 99.999%
- Improved Client Account Satisfaction Levels increased from 8 to 9.03 (scale to 10)
- Client User Satisfaction improved from 4.5 to 5.95 (scale to 7; optimal band 4.5 to 5)

Unisys was given the global TPI Sourcing Industry Award for Service Provider Excellence as a result of the ANAO improvements. These improvements also provided a 10% reduction in baseline costs that exceeded ANAO's expectations.

Benefits to the Commonwealth

The Unisys Team and the Commonwealth have, over the years, built a solid Service Design governance process that is flexible enough to expand to encompass all of the Commonwealth agencies. No other vendor brings this advantage of a proven, scalable Service Design infrastructure.

The proposed Service Design process is now overlaid with a specific Program Management Office responsibility to deliver Continual Service Improvement as part of the ITIL V3 based processes. Other vendors adopt ITIL V3 processes, Unisys improves on them in order to meet the Commonwealth's strategy of seeking continual cost reductions as part of the life cycle for services.

The Unisys Enterprise Services Catalog reduces transition costs by anticipating requirements that individual Agency applications will present. The Unisys Enterprise Services Catalog is architected to the specified RFP requirements but also anticipates services currently provided to DPH applications. The Unisys Team brings forward 12 years of experience that empowers

the Unisys to design a solution to optimize application stability and security of Commonwealth applications.

The Unisys Service Design process reduces transition costs by adapting rather than replacing existing Unisys/Commonwealth governance processes for Service Design. Other vendors will spend considerable time first learning and second integrating into the Commonwealth's OA and Agency structures and gaps in this initial effort will only be discovered during time-critical migrations when service offerings may need to be adjusted. By contrast adjustments to service design or offerings are already a regular review item within Unisys/Commonwealth governance meetings.

The Unisys Service Design process reduces transformation costs because the Enterprise Architecture team brings forward a founder's expertise on current Commonwealth architectures. Other vendors will approach transition and transformation as if the existing infrastructure poses threats of uncertainty and complexity. They will increase risks and costs during transition by proceeding with what they deem to be the minimum level of understanding required to move the Commonwealth to their new gear and remove the "uncertainty threat" as quickly as possible.

3.2.1.5.1 Technology Refresh

Technology refresh will be an ongoing activity required of the Offeror. The Offeror will prepare technology impact statements that address the key technologies planned for refresh or technologies identified to be of interest to the Commonwealth. These impact statements will provide a wide range of information, including the following matters applicable to the Offeror's environment:

- Technology trends
- IT Infrastructure Offeror releases and offerings
- IT Infrastructure Offeror retirement of older versions of products
- Proposed scheduling of Offeror releases into the datacenter environment
- Potential impact of the new releases on business applications in the datacenter infrastructure
- Potential impact of the new releases on deployment and operational processes
- Risk analyses with recommendations for mitigation of risks

The Commonwealth and the Offeror will review the impact statements. Based on these reviews, the Offeror must recommend a plan and schedule for technology refresh to the Commonwealth. Since the expected usable life of any hardware approved for the datacenter environment is about 36 months, the plan shall project an 18-month window into the future, and include resource estimates for each recommended refresh activity. Software refresh will depend on software releases and the Offeror must ensure operational compatibility with existing Commonwealth applications and/or functionality or must provide upgrade alternatives and options. The Offeror must obtain Commonwealth approvals prior to implementing technology upgrades that will affect Commonwealth operations.

Reference Documentation

N/A

	Requirements	Describe Compliance
1.	Update Technical Architecture approach and project plan including; Services Catalog, IT Architecture, and Technical support	Offeror must document its Technical Architecture approach and project plan including; Services Catalog, IT Architecture, and Technical support
2.	Technology refresh approach - describe methodology for reviewing and refreshing technology on a scheduled basis.	Offeror must describe its methodology for reviewing and refreshing technology on a scheduled basis.

3.	Technical Architecture Staffing	Offeror must identify its technical architecture organization and staff.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

As a recurring activity of the services and infrastructure lifecycle, Unisys will include a Technology Refresh planning program to support the Commonwealth's environment and operations. The Commonwealth benefits from the recurring plan and refresh activity as it provides replacement of individual installations and technologies and maintains the Commonwealth's applications and business functions. As part of the Technology Refresh program, Unisys will provide an impact statement during the planning activities. The impact statements will include:

1) Technology Trends

   a. Technology and service trends will be evaluated and monitored. As the Commonwealth's Business requirements change, the industry trends will be evaluated to map Commonwealth's identified requirements to new capabilities and technologies.

   b. As trends and new technologies are identified to provide improvements or meet requirements which cannot be met with the existing services, new services or changes to existing services will be recommended and developed with the Commonwealth's approval.

2) IT Infrastructure Offeror Releases and Offerings

   a. Working with the Commonwealth, the architect team will identify and recommend new offerings available from the team's portfolios to support the Commonwealth's ongoing business needs.

   b. As offerings and services are retired or upgraded, the architecture team will provide recommendations to support the updates or removals of services based upon the Commonwealth's business needs and requirements.

3) Proposed Release Schedule

   a. Schedules for introducing new technologies and services will be provided as part of the approval process. The release schedule will include testing and validation as well as the proposed roll out plan for new or upgraded services.

4) Impact of New Releases

   a. As new service or technology releases are defined and recommended, the impact to the Commonwealth's business application environment will be identified with the risks and associated mitigation recommendations.

   b. New technologies and services can require changes to the deployment and operational processes. Process changes will be evaluated to identify the impact and

the risk. The impact evaluation will include mitigation recommendations.

The impact statements will be included in the technology selection activities to add new technologies and services within the Commonwealth's environment. Not all new technologies and services will be used in the support of the ongoing Technology Refresh. Some of the new technologies and services will be made available as a separate option when it does not support current technology refresh requirements.

The Commonwealth Technology Refresh Plan will include the following activities and reviews. New requirements from the Commonwealth will not be directly supported within the Refresh Plan. A service request will be submitted for any Commonwealth environment which is expected to have a technology refresh, but has new requirements beyond the services or technology currently in place. By using the service request process, the new requirements can be defined and used to determine the overall solution required while also including the technology refresh.

1) Identification of the active hardware and software components which should be replaced within 18 months of the technology refresh planning period. Technical Iinfrastructure will be recommended based upon the replacement cycle defined for each technology. For Unisys Fully Managed Services supplied and supported components, the replacement cycle will be 60 months. Unisys supported Software will be reviewed and recommendations provided based upon the available product releases.

2) Review of the technology refresh recommendations with the Commonwealth to validate and approve components to be refreshed. The review will include the options for individual components to be used in the technology refresh, recommended refresh groups, and an initial estimate of resource activity.

3) Upon approval of selected components, Unisys will develop a technology refresh project plan which includes the activities to migrate the Commonwealth's applications, data, and services to the replacement technologies.

   a. To maintain alignment with solution delivery processes, a service request for the technology refresh project will be opened and the project activities tracked within the Service Request tool.

   b. If the Commonwealth rejects or requests a delay of a component refresh, an impact review and recommendation for changes to the Commonwealth's application assigned service levels will be developed and provided in substitution of technology refresh project plan. The Commonwealth must provide the final approval of the changes to the service levels for applications, technology or services which will not be refreshed.

   c. The Commonwealth must approve the project plan before the technology refresh project will begin.

1 Technical Architecture Approach

1.A Offeror must document its Technical Architecture approach and project plan including; Services Catalog, IT Architecture, and Technical support

1) Technical Architecture Approach

In support of the Commonwealth's service environment, an enterprise infrastructure

architecture practice will be established to manage and support Unisys technical design and capabilities implemented. The services will be defined within the Enterprise Services Catalog. As new services and technologies are approved for implementation, the Enterprise Services Catalog will be updated with new services and unit pricing. The Unisys Team provides skilled resources which are experienced and regularly trained on the products which support the services.

The architecture supporting the services and Commonwealth environment will be documented and updated within the following Key Deliverables. The initial copy of these deliverables will be published based upon the target dates defined within the Transition Plan located in Schedule M within section 3.0 Work Plan. The target dates for the key deliverables to meet the Schedule K (Key Deliverables) and Schedule M (Transition Plan) milestones.

1) D-01 Datacenter Architecture Plan and Roadmap

2) D-03 Technology Architecture and Refresh Approach

3) D-04 IT Service Continuity Architecture and Plan

The Technical Architecture team will also be supported by the Security Manager and infrastructure system support team leads during the development of solutions. To maintain the quality of the solutions and the technology refresh plan, the Security Manager and team leads will also participate as part of the Unisys Architecture and solution review team as voting members. Upon approval within the Unisys architecture and solution review team, the solutions and technology refresh plans will be presented to the Commonwealth for review and approval.

Solutions development, architecture changes, and technology refresh will follow a common process.

a. Service Request or recurring cycle

b. Requirements gathering

c. Requirements approval by agency (Service Requests only)

d. Solution Development

e. Internal solution and architecture review and approval

f. Commonwealth review and approval

g. Transfer to a solution fulfillment activity

2 Technical Architecture Refresh, scheduled

2.A Offeror must describe its methodology for reviewing and refreshing technology on a scheduled basis.

2) Technology Refresh Methodology

As part of the overall architecture support, the Commonwealth's environment will be reviewed on a quarterly basis to identify technology, services or components which require

replacement to maintain the Commonwealth's business needs and associated service levels. The review will include the following activities.

1) Using the data within the Asset Management and Configuration Management databases, identify the technical components within the Fully Managed, Managed Only, and Capacity on Demand environment which require replacement within the next 18 month period based upon the a 60 month replacement cycle.
2) Review End of Sales and Service Life notices from the Manufacturers to validate if a component has been discontinued or has available ongoing maintenance options.
3) Review ongoing Capacity and Performance reports to identify any components with a refresh requirement which have additional needs driving a requirement or opportunity to change the component's classification to a different component to maintain the functionality and service levels.
4) Identify replacement technical components based upon the current Enterprise Services Catalog offerings.
5) Validate replacement technical components meet the current requirements for the impacted Commonwealth applications.
6) Identify risk and impact for the Commonwealth environment to replace existing technical components or services.
7) Create technology refresh recommendations, impact and high level implementation plan.
8) Present the technology refresh plan to the Commonwealth using the Solution Architecture review process.
9) Upon approval the refresh plan, open service requests for each migration group and develop the detailed project plan for the migration plans.

3 Staff, Technical Architecture

3.A Offeror must identify its technical architecture organization and staff.

1) Technical Architecture Staffing

The Enterprise Architecture organization (**Figure**) owns the development and management of the technology management program for the Data Center Services delivered. Unisys will establish and maintain this architecture office led by our Senior Enterprise Infrastructure Architect, [redacted]), who reports to [redacted]. Reporting to [redacted] will be six dedicated Agency Infrastructure Architects. This organization has direct responsibility for the fulfillment of all architectural requirements of the program. The functions that fall under Enterprise Architecture include meeting Architectural Deliverables, Agency Infrastructure Architecture, Solution Delivery, Innovation Workshops, and Additional Planning Services.

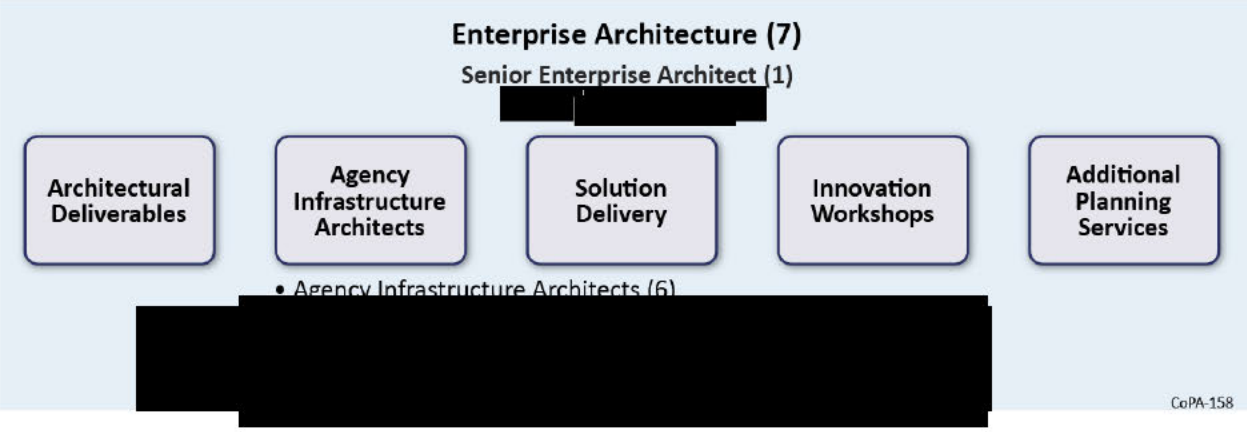

Figure 3.2.1.5.1-1. Enterprise Architecture Organization

This team is responsible for meeting **Architectural Deliverables,** including:

- **Data Center Architecture Plan and Roadmap,** which includes the 2+ Data Center Architecture, the Data Center Network Architecture, and the Data Center Security Architecture
- **Technology Architecture and Refresh Approach,** which addresses Data Center Technology Refresh and Infrastructure Architecture strategy.

Agency Infrastructure Architecture is comprised of technology architects who bring a wide set of skills and experience that collectively cross all platforms and technologies supported under the Data Center Compute Services contract. Several of our Agency Infrastructure Architects—including [redacted] have provided support to the Commonwealth for as long as 30 years. The architects are aligned with specific agencies and work hand in hand with the Agency Account Managers to enable agency technology needs to be fulfilled. They are responsible for the detailed design engineering of the Commonwealth's specific data center services, design quotes, and coordination of Commonwealth-related requests.

The technical architecture staff is described in Section F.3.2.1.5 Requirement 3. Each of the architects is introduced in more detail in Section 5.0 Personnel.

Unisys Team Experience

1) Commonwealth Data PowerHouse
   a. 2008 Renewal and Transition
      i. With the contract extension of 2008, Unisys executed a complex and comprehensive transformation throughout the entire Data PowerHouse. This transformation consisted of a vast technology refresh spanning all supported platforms and agencies with a new architecture approach. Previous to transformation, each agency application infrastructure platform was segregated from the others with its own separate system frames, storage units, tape silo, SAN and network switches. Unisys transformed the Commonwealth mission

critical applications from distinctly separate and siloed environments to an enterprise architecture consisting of highly redundant shared infrastructure components that could be leveraged by many agencies.

ii. The Transformation project spanned from July of 2008 through September of 2009, completing 3 months ahead of schedule. This project consisted of:

1. Introduction of [redacted] virtualized Windows environment including the virtualization of hundreds of servers,
2. Unisys mainframe environments were refreshed for [redacted] and the [redacted] providing more capacity, faster processors, the capability for metered [redacted] for [redacted] and the introduction of the [redacted] environment for the [redacted].
3. [redacted] mainframe customers were consolidated from [redacted] onto a [redacted]. This platform introduced the Integrated Facility for Linux used to host approximately 100 servers for [redacted] With this technology, [redacted] were able to take advantage Workload Capacity features that enable agencies to have access to additional idle processing capacity as long as they're meant allocation was not exceeded on a rolling four-hour average. The proactive implementation of this feature enabled the Commonwealth to avoid the need to procure additional MIPS for heavy processing time frames.
4. Several physical servers were upgraded and refreshed.
5. Consolidation of numerous workgroup network switches into a [redacted] core switching platform,
6. Reduction of more than [redacted] mass storage units to [redacted] units,
7. Implementation of disk-based backup on mainframe platforms,
8. Consolidation of numerous small tape silos into two large capacity tape silos shared by the entire enterprise,
9. Consolidation of agency SAN switching islands to an enterprise class core SAN switching infrastructure shared by all agencies.

iii. The process followed to execute the transformation included [redacted] Solution architects determined the most effective infrastructure to be used in the solution and how each agency could take advantage of the best features of the new architecture. Meetings were held to brief the agencies about technology changes, the benefits, and what to expect during the transformation project. An overall Transformation Executive managed the program working through project managers on the Harrisburg team with extensive experience supporting the Commonwealth for years. Program changes were implemented focusing on no more than two technology changes at a time. Workload and changes were distributed across the 15 month duration of the project. This enabled the Data PowerHouse team to tightly control change to the environment, and monitor the effectiveness of the change before proceeding to the next change. The approach was very successful resulting in most cases no impact to the majority of agencies.

iv. Consolidation of technologies, implementation of virtualization, and the

introduction of enterprise class devices resulted in millions of dollars of savings to the Commonwealth over the 5-1/2 year term. This transformation also provided smaller agencies with the opportunity to utilize enterprise class equipment that is highly available with inherent redundancy that they could not previously afford in a standalone environment.

2) Annual Technology Refresh

The Data PowerHouse monitors end of service life (EOSL) on devices so that technology refreshes can be funded and planned for in order to keep system availability high. All asset lifecycle dates are tracked in a database and verified during the maintenance contract renewal process. The capacity planning process is used to showcase devices which have or will reach EOSL in the near future. Asset selection for inclusion in the capacity planning process is done by identifying assets with a vendor published EOSL date.

When technology refreshes are necessary to provide high levels of system availability, the RFS process is used to document requirements and the appropriate solution to replace the devices which have reached end of service life. A solution is presented to the Commonwealth for consideration and if a change order is signed then implementation activity begins. The RFS process provides opportunity for continuous discussion on the requirements and possible solution options. If the Commonwealth makes the decision to fund the refresh then the solution will include support for implementation, testing, and cutover. This approach allows the transition to be well planned and executed to a schedule than support Commonwealth's business requirements.

The technology refreshes have primarily been focused on Unisys branded Dell hardware starting in 2012 as the environment was refreshed in 2008. This approach was primarily driven by a focus on asset management and the fact that Dell has a published 5 year service life on their commodity servers. In addition, TCIS watches the support notices on ES7000 servers and confirms that Unisys is proactively marketing a replacement product to address EOSL.

3) California State University

As a part of the 2011 Renewal for data center services for California State University, Unisys replaced the obsolete hardware and technologies within the production data center and included new features including a disaster recovery solution at a second data center.

4) City of Minneapolis

As part of ongoing operations, Unisys provides an annual technology refresh program for the data center infrastructure. The program reviews the current infrastructure for any equipment which is out of warranty or has reached the manufacturer's end of support. To reduce the impact to the City's business, Unisys works with the City's application support teams to coordinate the infrastructure upgrades with application upgrades whenever possible. When appropriate, Unisys provides recommendations to convert physical infrastructure to virtual to manage overall hardware costs of the environment during the technology refresh projects.

Benefits to the Commonwealth

The Unisys Team will work with the Commonwealth to develop technology refresh plans which not only replace the existing compute systems, but also incorporate newer technologies and

services over time to improve services, reduce cost, and meet changing needs.

3.2.1.5.2 IT Service Continuity Architecture

The Offeror's IT Service Continuity Architecture will provide tiered DR capabilities and Services for applications that have been identified by the Commonwealth. The Offeror must provide a Service Continuity solution that includes DR computing, storage, networking systems and recovery processes and will be included in the overall Commonwealth architecture design. Only critical applications and associated equipment identified by the Commonwealth will be addressed with DR systems. Additional information regarding Tiered Service Delivery and Tiered DR can be found in referenced supporting exhibits.

The Commonwealth will lead the Business Continuity effort with assistance from the Offeror.

Reference Documentation

Schedule J.1 - Datacenter Service Level Management

Requirements		Describe Compliance
1.	DR Architecture and Plan will be documented by the Offeror and approved by the Commonwealth.	Offeror must describe its infrastructure and service offering for a DR and Business Continuity Plan.
2.	IT Service Continuity Architecture and Plan - Backup hardware and software will be obtained, configured and available per an agreed to Service Level to process the identified critical applications. Where applicable, data will be electronically replicated (including disk-2-disk) to the backup systems (off site) to insure a successful recovery. Wherever data replication is not viable, backup tape data will be utilized.	Offeror must describe the design of its Tiered DR plan in the design of the Commonwealth technical architecture. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth. Offeror must describe its process for modifying the scope/service level for DR coverage.
3.	Recovery systems must be available via network access. Routing must be configured and tested during initial	Offeror must describe the network requirements of its DR plan in its proposed design of the network architecture.

	system architecture design. Include the network requirements of the DR plan in the design of the network architecture.	
4.	Recovery documentation for each identified system/ application will be required. Information will include the targeted backup hardware, software, networking changes, data location, restoration and access process, execution authorization, and notification to service owner when an application has been restored to service. Offeror must create recovery documentation for each system / application identified as a critical system where DR is required.	Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the tiered DR needs of the Commonwealth.
5.	A DR support plan must be created. The DR team must notify the Commonwealth when a recovery plan will be put into action, and must manage questions and issues that may arise after implementation. Create a DR team that will manage the execution of the DR plan from declaration to recovery when required.	Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the DR needs of the Commonwealth.
6.	For critical systems identified as having a current tested DR Plan within the DPH, the Offeror will update the associated DR test plans for the new target environment. Successful testing of each revised DR Plan is required prior to Commonwealth acceptance.	Offeror must provide its approach to creating and testing DR Plans.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Unisys solution includes an IT Risk Manager to work closely with the Commonwealth's Business Continuity personnel to frequently review, revise and update Agency Disaster Recovery Plans. These DRPs will be maintained in the new Unisys-managed online disaster recovery planning tool. The Unisys IT Risk Manager oversees all remediation efforts identified through twice-annual testing of each Agency's DRP.

The Commonwealth can implement granular tiers of Disaster Recovery services and even Business Continuity services to mitigate the risks associated with critical applications as described below.

1 DR, Data Recovery Architecture, Business Continuity Plan

1.A Offeror must describe its infrastructure and service offering for a DR and Business Continuity Plan.

The Unisys solution manages the infrastructure and service offering through the Infrastructure Architecture services described in Schedule, Section 3.2.2.2 (Infrastructure Architecture).

The DR services are available to Commonwealth agencies through the Enterprise Services Catalog which allows the agencies to select services to provide the quality of Disaster Recovery required to provide sufficient recovery times to critical applications in the unlikely event of a disaster.

2 IT Service Continuity Architecture and Plan

2.A IT Service Continuity Architecture and Plan - Backup hardware and software will be obtained, configured and available per an agreed to Service Level to process the identified critical applications.

The Unisys proposal includes a variety of data protection software tools to provide service continuity.

These software tools provide data protection for Commonwealth applications:

- [redacted] software manages nightly backups.
- [redacted] provides replication of backup data
- [redacted] provides data replication within [redacted] frames
- [redacted] provides data replication and snapshotting capability for [redacted]-based storage.
- [redacted] provides data replication with integration to the server O/S level for virtual

servers.

- [redacted] Storage Volume Controller provides replication and snapshot services.

More detailed descriptions are available in section F.3.2.4.2 Storage Management.

2.B Where applicable, data will be electronically replicated (including disk-2-disk) to the backup systems (off site) to insure a successful recovery

Unisys has provisioned DR that relies on both tape and disk based products to provide better recovery RPOs than tape based recovery. The Unisys has allotted sufficient Storage capacities from Schedule I Volumetrics to allow the Config4 servers to utilize SAN-based disk in order to meet the faster RTOs. These will be supplemented with application and host-based replication tools to meet the Platinum availability requirements.

2.C Wherever data replication is not viable, backup tape data will be utilized.

The Unisys solution provides a means for the Commonwealth, through the Catalog of Services items, to select sufficient resources to provision data replication as needed. Thus viability is not an issue. The Agencies of the Commonwealth are able to choose backup tape as a sole means of providing DR protection. The Unisys IT Risk Manager will help Agencies chose the appropriate means of providing cost-effective data protection while mitigating the risks associated with a data center disaster.

Unisys complies with requirement.

2.D Offeror must describe the design of its Tiered DR plan in the design of the Commonwealth technical architecture

The Enterprise Services Catalog offering includes these DR Tiers:

- Tier 1: Recovery from tape-based Backup within reasonable time frame.
- Tier 2: Recovery from a tape-based Backup with an accelerated process.
- Tier 3: Recovery from Backups replicated to DR via the [redacted] infrastructure.
- Tier 4: Recovery through asynchronous data replication for Open Systems SAN storage removing the need for Data Recovery.
- Tier 5: Data and O/S level replication for Virtual Windows/Linux instances removing the need for Data Recovery.
- Tier 6: With Agency approval the Tier5 offering can be configured to provide an automatic failover.

A detailed description has been provided in Section F.3.2.2.4 DR Planning and Testing.

2.E Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth

The California State University (CSU) system relies upon Unisys for delivery of Disaster Recovery services. After years of reliable managed services for Production services CSU elected, after a competitive bid, to renew these services in the [redacted] Unisys data center and also expand services to include a complete Disaster Recovery service at the [redacted] Unisys data center.

The CSU infrastructure includes not only the world's largest PeopleSoft implementation but also file servers and applications rely upon but are less critical than the PeopleSoft servers.

Unisys provided a Tiered DR solution that provides both tape-based and disk-based data protection to deliver to a variety of RTO and RPO targets. Because CSU located its private clouds exclusively in Unisys-managed data centers they were able to take advantage of the Unisys Shared Storage rate-based data replication. Like the Commonwealth, CSU sought a pay-by-the-drink model rather than invest in upfront capital expenditures to acquire storage services.

The Commonwealth may opt to further reduce operating costs by leveraging the DR infrastructure to provide compute resources for development and testing. The Unisys team can help establish processes to set aside these test and development resources during DR testing exercises.

2.F Offeror must describe its process for modifying the scope/service level for DR coverage.

The Unisys Program Management Office manages the modification of scope and service levels for DR coverage within the context of ITIL V3 based Service Design. Through this process Unisys and the Commonwealth work together to define the requirements and benefits sought for needed service changes. This process is described in detail in the Technical Architecture services guide in section F.3.2.1.5 Technical Architecture.

The Commonwealth and the Agencies can change the scope or service levels for DR coverage for existing compute resources through the provisioning process initiated when the Commonwealth or its Agencies engage the Enterprise Services Catalog process to select or change DR services levels for compute assets.

3 DR, Recovery Systems

3.A Recovery systems must be available via network access. Routing must be configured and tested during initial system architecture design.

Include the network requirements of the DR plan in the design of the network architecture.

Offeror must describe the network requirements of its DR plan in its proposed design of the network architecture.

The Unisys solution leverages the same network for DR as it does for Production applications. The Unisys solution meets the COPANET connectivity requirements by connecting locally at [redacted] (DC1) via 10Gb Ethernet and via 2 x 1G Ethernet connections to an alternate COPANET location from another data center. Should direct connectivity to the Verizon PIP network be required Unisys can terminate Commonwealth provided PIP circuits on Unisys owned and managed equipment at the data centers.

In addition to DC1, two new data centers will be utilized – Unisys [redacted] (DC2) and Unisys [redacted] (DC3). In DC1, a new connection to the existing COPANET node will be built using two 10Gb fiber connections within the Commonwealth Technology Center located at 1 Tech Park in Harrisburg, PA. Since the distance to connect DC1 to COPANET is so short, these connections do

not require a WAN circuit to be installed, thus saving cost. The 1 Tech Park connectivity is shown on the far left in the diagram below (**Figure 3.2.1.5.2-1**)

Figure 3.2.1.5.2-1 Commonwealth Network Architecture

In the middle and far right side of the diagram above, COPANET connections to DC2 and DC3 are shown. Based on predicted future usage, both the DC2 and DC3 data centers will be connected to COPANET via 1 Gb circuits. To prevent a single point of failure in the connection to COPANET, the COPANET circuits from DC2 and DC3 will terminate in a different physical facility than the connection from DC1. The locations being considered to terminate the DC2 and DC3 circuits are

A deeper technical description is provided in section F.3.1.2 Network and Security Architecture.

4 DR, Recovery Documentation example

4.A Recovery documentation for each identified system/ application will be required. Information will include the targeted backup hardware, software, networking changes, data location, restoration and access process, execution authorization, and notification to service owner when an application has been restored to service.

Unisys proposes to rely upon the LDRPS online disaster recovery tool to maintain access to all DR run books so that these are always available to any Commonwealth or Unisys staff involved in executing DR tests or an actual Disaster Recovery.

In addition Unisys will exploit the full capabilities of the tool to build:

- Crisis management plans to fit each Agency's operational structure.
- Technology recovery plans to match a matrix management approach, including dependency mapping for the infrastructure supporting your applications.
- Critical application recovery plans to smoothly interface with your infrastructure recovery plans.
- Process or departmental recovery plans to support your planning decisions and strategies and to identify dependencies between critical business processes.
- Site event management plans to document how to deal with a specific incident at a

particular business location.

4.B Offeror must create recovery documentation for each system / application identified as a critical system where DR is required

The recovery documentation is created and maintained within the LDRPS online disaster recovery tool which is supplemented with critical documentation that is backed up with offsite copies specifically for use during both Disaster Recovery testing and in case of an actual, though unlikely, disaster.

4.C Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the tiered DR needs of the Commonwealth.

Cross-Country DR for Telecommunication Service Provider: Unisys crafted a complex DR service infrastructure for a primary telecommunication service provider that uses Unisys-managed data centers for both Production and Disaster Recovery operations. See **Figure 3.2.1.5.2-2**.

Figure 3.2.1.5.2-2: Disaster Recovery Example: Telecommunication Supplier

The existing Unisys customer had been operating effectively with the Disaster Recovery services in a like-to-like Prod/DR fashion and sought to reduce costs and complexity while, if possible, improving DR services to reduce potential data loss during a Disaster event.

In pursuit of these business objectives and following the Unisys applied ITIL V3 Service Design process, the Unisys Enterprise Architecture team successfully designed and implemented a transition to a refreshed Infrastructure Architecture with a serve consolidation to greater reliance upon virtual server instances. This reduced complexity during recovery testing for DR

services. The refresh also included replacement of a tape-based DR recovery process to a disk-based infrastructure that reduced complexity and costs and improved overall service quality by reducing the time to recover services during a Disaster event.

California State University DR Services: When Unisys crafted the Disaster Recovery plan for the California State University system (CSU) they were reluctant to incur the cost of an identical compute power for a DR plan that they hoped never to use. Unisys presented two options to reduce cost:

1. For virtual servers the computer power was provisioned at a less than 100% of that available for production. CSU was willing to accept a diminished level of service immediately following an actual data center disaster and Unisys was able to propose a reasonable delivery date to augment the DR facility if an actual disaster occurred. The difference between the current computer power in the DR site and that of the Production data center delivers a monthly savings for CSU.
2. Unisys also provided a means for CSU to utilize assets provisioned for their DR plan as Test and QA/Dev servers under the agreement that if an actual disaster occurred then these services would be suspended so that these assets could be pulled into use as the Production infrastructure at the DR site. This allowed CSU to leverage the compute power of the DR site at relatively little risk.

The Agencies in the Commonwealth can, working with the Unisys IT Risk Manager, select servers and storage in the DR facility that would provide a diminished services in the event of an actual disaster. Given the unlikely chance of an actual disaster this would allow the Agencies to better balance the full cost of a Like-to-Like DR solution against the risk of occurrence of an actual disaster.

5 DR, Data Recovery Support Plan

5.A A DR support plan must be created. The DR team must notify the Commonwealth when a recovery plan will be put into action, and must manage questions and issues that may arise after implementation.

The activation of a recovery plan occurs only through escalation to appropriate Commonwealth and Agency leaders. During the process the Unisys Program Management Office engages technical and business continuity experts in order to present options and recommendations for Commonwealth leaders to that they are able to select the best service recovery option available to provide the least disruption to Pennsylvania constituents.

5.B Create a DR team that will manage the execution of the DR plan from declaration to recovery when required.

The Unisys proposes a dedicated DR team that will manage the execution of the DR plan from declaration to recovery when required.

However the Unisys proposal provides far more value to the Commonwealth than other vendors can provide in terms of Disaster Recovery and Business Continuity because the Unisys proposal provides the Commonwealth with continuity with the team that has performed

extremely well over the years. The Unisys disaster recovery team increased the quality and reliability of the Disaster Recovery services that support the Commonwealth. The Unisys proposal also elevates the importance of the service but placing it under a named resource in the Program Management Office under the title of IT Risk Manager.

5.C Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the DR needs of the Commonwealth.

The Unisys Team provided the State of Alabama with a Disaster Recovery system with high availability needs that match the Tier5 offering in the Unisys proposal. The State of Alabama's Criminal Justice Information Center has similar security and compliance requirements to the Commonwealth's police and justice agencies.

Business Challenge: Improve Data

Delivery to Enhance Citizen Safety

The Alabama Criminal Justice Information Center (ACJIC) is a state agency providing local, state, and federal criminal justice agencies with the information needed to ensure citizen safety.

In 2004, ACJIC realized that gaps in its information technology were hindering communications and business continuity. It needed to more efficiently deliver critical information from its network and systems.

Maury Mitchell, Director of ACJIC explains, "We're connected to the FBI's National Crime Information Center, and we're in sync with all 50 states via the National Law Enforcement Telecommunication System. As such, our web applications handle about 18 million transactions a month. We were leasing space and time on the state's mainframe for data storage – a system we don't own – performing backups on tape and manually delivering them to a site a few blocks away for disaster recovery. We needed our own scalable, reliable, cost-effective system that would grow with our needs and provide hot failover."

ACJIC decided to change the way it was doing business. Jim Walker, Homeland Security Director for the State of Alabama, comments, "We had an opportunity to build redundancy into our system and improve the availability and use of information. We needed a solution that would build trust and deliver value to our user population." ACJIC explored several solutions and solution providers before choosing Unisys to help establish an IT infrastructure specifically designed to address the agency's requirements.

Enhancing officer and citizen safety while building trust among constituents – by re-engineering the IT infrastructure to improve communications and business continuity.

By implementing a solution based on Unisys ES7000/one and SafeGuard 30m technology, the Alabama Criminal Justice Information Center created a dependable, cost-effective system that delivers real-time information to end users, supports future growth, and provides robust, reliable operations.

Results: Unified Law Enforcement through a Real-Time Infrastructure

The center's more powerful and resilient IT infrastructure has improved real-time

communications among multiple levels of criminal justice agencies – enabling greater collaboration, and ultimately, a better response to criminal activities and other security concerns.

Metrics

- **Better Security:** Reduced downtime and risk – 24x7 availability with failover in less than one minute from the primary site to the disaster recovery site
- **Reduced Costs:** Lowered costs while processing some 18 million transactions monthly
- **Improved Satisfaction:** Enhanced citizen and officer safety by ensuring a constant flow of real-time information
- **Better Productivity:** Enabled one-to-two-second searches for up to 40 million records in the Law Enforcement Tactical System

6 Test, DR, Creating and Testing DR Plans

6.A For critical systems identified as having a current tested DR Plan within the DPH, the Offeror will update the associated DR test plans for the new target environment.

During transition the Unisys IT Risk Manager in the Program Management Office will review existing DR Plans for each Agency. This consultation builds our the initial Service baseline for the overall DR coverage for Commonwealth Agencies. The IT Risk Manager makes use of the Unisys Enterprise Architecture staff to provide consultative recommendations for migration of Agency compute assets into the new data centers with as well as for the provisioning of appropriate DR services.

The Commonwealth benefits from the current Unisys Disaster Recovery team who have continuously improved DR services to levels even better than the required SLAs. Unisys expects that with the acquisition of a Unisys-managed data center for DR and the increased frequency of testing, the team's performance will improve.

The Commonwealth benefits from the Online Disaster Recovery planning tool that can be used across all agencies. The Unisys Program Management Office will coordinate the agency-by-agency planning tasks. This coordination of activity will provide the Commonwealth with a common means of evaluating to overall IT Service Continuity afforded by the various plans. The IT Risk Manager in the Unisys Program Management Office will reference the tool to compare agency plans and notify the Commonwealth Office of Administration of any variances that lead to too large a gap in continuity plans or, conversely, high costs or over-preparedness relative to risks.

6.B Successful testing of each revised DR Plan is required prior to Commonwealth acceptance

Unisys complies with this requirement.

6.C Offeror must provide its approach to creating and testing DR Plans.

During transition the Unisys IT Risk Manager in the Program Management Office will review existing DR Plans for each Agency. This consultation builds our the initial Service baseline for

the overall DR coverage for Commonwealth Agencies. The IT Risk Manager makes use of the Unisys Enterprise Architecture staff to provide consultative recommendations for migration of Agency compute assets into the new data centers with as well as for the provisioning of appropriate DR services.

Following transition the Unisys IT Risk Manager meets with each Agency at least twice annually to review existing DR plans.

Unisys Team Experience

As described above, the Unisys team has provided significant savings for Unisys customers through creative Disaster Recovery services. The Unisys Team also benefits from supervision and innovations provided by the Unisys Director who serves as a Practice Lead for Disaster Recovery testing and service improvement. This director engages the IT Risk Manager in the Unisys Project Management Office for the Commonwealth to keep that Officer apprised of results from disaster recovery testing across the Unisys customer base. In this way the ITIL V3 Service Design process managed by the Unisys Program Management Office has the benefit of considering all recent Unisys Disaster Recovery innovations when apprising service changes for DR Services for the Commonwealth.

Benefits to the Commonwealth

The common disaster recovery services and testing that Unisys will bring to all participating Commonwealth Agencies will lower costs overall for the Commonwealth and provide a faster acceleration of DR service improvement for all Agency DR plans. The lessons learned during a single Agency's annual DR test can be applied across all Agencies fairly quickly because they will share common DR services and practices.

3.2.1.6 Account Management

The Account Management function is responsible to provide each Commonwealth agency with oversight of the contracted Services and support required to satisfy the Commonwealth's computing needs. The Account Manager will provide direct interface with the Commonwealth agencies ensuring daily operations and needs are provided, and create monthly operational summaries reporting to both the agencies and the Commonwealth. This report will address all operational events and issues that occurred during the month that would have effected service level attainments, problems and incidents, and recommendations for changes needed to provide continuous, secure computing Services. Each Commonwealth agency will interact with its assigned Account Manager to discuss needs, issues, problems or costs.

Reference Documentation

Schedule G - Staffing Plan and Key Positions

Requirements		Describe Compliance
1.	Assign an Account Manager to each identified agency. The Account Manager will be responsible for all Services provided, represent the Commonwealth agency's needs, and be the advocate for the agency throughout the Offeror's organization. Based on the size and application complexity of the Commonwealth agency, the Offeror must assign additional account management resources. Account Managers shall understand agencies line of business and business trend analysis. Offeror must assign a minimum of 6 dedicated account managers.	Offeror must identify its account management structure, roles, and responsibilities. The Offeror must provide resumes and qualifications for each of its proposed Account Managers and other key positions.
2.	Account Managers will meet with assigned agency contacts on a regular basis. It is anticipated that this will be at minimum weekly during the initial program start and through transition.	Offeror must describe its approach to meet this requirement.
3.	Meet with Commonwealth teams on a monthly basis. It is anticipated that this will be at minimum weekly during the initial program start and transition to monthly meetings with the Commonwealth teams to address problems and assure continuous service improvements.	Offeror must describe its approach to meet this requirement.
4.	Participate in agency-sponsored IT planning sessions on a quarterly basis. Offeror must schedule quarterly	Offeror must describe its approach to meet this requirement.

	computing capacity reviews to ensure sufficient processing capacity, needs, and issues are being addressed. Suggest changes when necessary.	
5.	Advocate for agency interests. Offeror's Account Management team will advocate for the Commonwealth's interests. For example, intervene with Service Desk personnel to resolve a major problem; problem escalation process, support root cause analyses process. Another example, coordinate with agency and service providers to ensure timing of technology refreshes have the least impact on the agency.	Offeror must describe its approach to meet this requirement.
6.	Monthly status reports - Ensure The Commonwealth is aware of operational status and project update information on a monthly basis. Create and deliver a monthly status report, summarizing operational metrics as defined in the CCPM, by service platform, including highlights and exceptions, and project status.	Offeror must describe approach and provide a representative sample report.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Unisys Account Management function is a long established function within the service delivery model. The objective of this function is to verify that Commonwealth agencies understand the terms of the Data Center Services Contract, and how it can be leveraged to meet requirements of each agency's business. The Agency Account Manager (AAM) assigned to a Commonwealth agency acts as a liaison between the Commonwealth agency and the Data Center Support Services organization. The AAM advocates on behalf of the agency to confirm contractual service levels are being met, problems and issues are quickly addressed and tracked properly, and costs are optimized wherever possible. The AAM coordinates and leads the effort

to implement any changes to service.

1 Staff, Account Management Structure, resume

1.A Assign an Account Manager to each identified agency. The Account Manager will be responsible for all Services provided, represent the Commonwealth agency's needs, and be the advocate for the agency throughout the Offeror's organization. Based on the size and application complexity of the Commonwealth agency, the Offeror must assign additional account management resources. Account Managers shall understand agencies line of business and business trend analysis.

Offeror must assign a minimum of 5 dedicated account managers."

Agency Account Management is the organization in which all Agency Account Managers report. These six managers serve the critical purpose of providing a single point of contact for agencies to the Unisys Team. These leaders are highly organized, resourceful and adept at bringing the right resources together to meet customer needs. Each individual selected has extensive experience managing customer relationships on outsourced data center services engagements with outstanding customer satisfaction.

Each of these team members has been supporting the Commonwealth of Pennsylvania on various engagements for years and understands the importance of dedicated agency focus and works to accomplish business objectives at the agency level. Their role is essential to ensuring that agency leadership understands how to leverage the contract to their benefit, and these leaders act as the agency's advocate on the Unisys team. Agency Account Management is led by the Agency Account Manager, Peter Cavanaugh who reports directly to [redacted] The Agency Account Managers are responsible for the four major functions of Contract Liaison, Agency Advocate, Agency IT Planning Sessions, and Monthly Status Reporting. They have all achieved ITIL V3 Foundations certification and most are PMP certified.

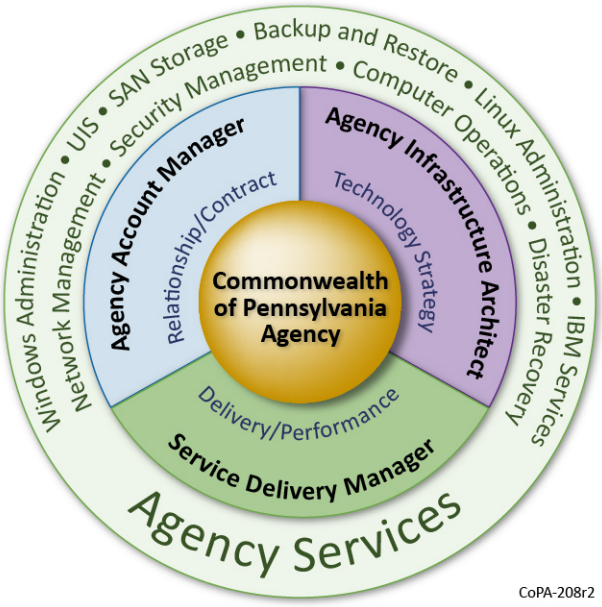

Figure 3.2.1.6-1 Agency Centric Team Approach

Account management resources will be assigned based on the size and application complexity

of the Commonwealth agency. We believe that our Agency Centric Team approach depicted in **Figure 3.2.1.6-1** will provide maximum leadership coverage for any particular agency regardless of size or complexity. Each team has a dedicated management structure that includes an Agency Account Manager who is responsible for managing the relationship with each agency supported and all aspects of the contract, an Agency Infrastructure Architect who is responsible for managing the Technology Strategy for assigned agencies, and the Service Delivery Manager who is responsible for end-to-end delivery performance and has direct oversight for managing all technicians aligned to the agencies supported by the team. The technical professionals managed by the Service Delivery Manager represent the technology disciplines necessary to provide comprehensive managed compute services to the Commonwealth. This model facilitates end to end accountability for availability and performance of Commonwealth application infrastructure supporting assigned agencies.

1.B Offeror must identify its account management structure, roles, and responsibilities.

The graphic below **Figure 3.2.1.6-2** depicts the functional roles of account management with its roles, responsibilities, and personnel specified. There are four primary functions associated with account management including Contract Liaison, Agency Advocate, Agency IT Planning Sessions, and Monthly Status Reporting.

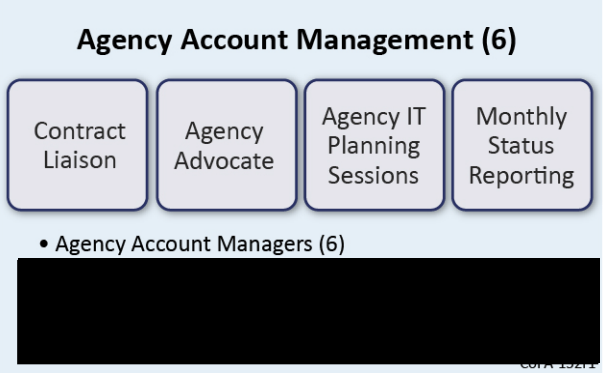

Figure 3.2.1.6-2 Agency Account Management Duties and Staffing Requirements

The **Contract Liaison** function owns the relationship at the agency level acting as a liaison between agency information technology staff and the Unisys Team. Agency Account Managers are responsible for understanding all Unisys services and providing guidance to the agencies in understanding how to leverage the contract to meet their Data Center needs. They maintain overall responsibility for sales, support, and operations ensuring that agreements are finalized and signed by all parties.

The **Agency Advocate function** provides that the Unisys Team understands agencies needs and requirements and advocates for agency and Commonwealth interests. This function provides the agencies with assistance needed to quickly navigate all facets of the Data Center Services support team.

The **Agency IT Planning Sessions** function in conjunction with Enterprise Architecture who briefs the Commonwealth on new services and technology, and is a key member of the agency's

planning team.

The **Monthly Status Reporting** function keeps contacts at the agency informed regarding service level performance. This function meets monthly with the agencies to address problems and provide continuous service improvements. This function is responsible for the creation of monthly operational summaries that will address all operational events and issues that occurred during the month that would have affected service level attainments, problems and incidents and recommendations for changes needed to provide continuous, secure computing Services.

The Agency Account Management organization chart is provided below **Figure 3.2.1.6-3.**

[redacted]

Figure 3.2.1.6-3 Agency Account Management Organization Structure

1.C The Offeror must provide resumes and qualifications for each of its proposed Account Managers and other key positions.

The key personnel of the Agency Account Management team consists of five **Agency Account Managers** introduced below including Peter Cavanaugh, [redacted] and [redacted] Account Manager resumes can be found under the Key Resume tab under Section 5 Personnel. A high level review of Agency Account Managers and their qualifications is provided below.

[redacted] **(based in Harrisburg, PA)** will be serving the Commonwealth as an Agency Account Manager under the new contract. He is a 23 year Unisys employee that has been working for the Commonwealth of Pennsylvania since 2002 in a variety of Project Management and Client Services Management roles supporting numerous Commonwealth organizations. Since 2005, he has been working on-site at the Commonwealth Technology Center in very close collaboration with the CTO, CISO, Client Management, Enterprise Data Center, Enterprise Networking and Security, Enterprise Services, GIS, PMO and many agencies.

[redacted] developed and introduced a customer satisfaction program for the Enterprise Data Center that continues today under the Enterprise Services as an important component of OIT's process for continuous improvement and building strategic relationships. Under this program, he facilitated regular communications and acted as a liaison for OIT with the CIOs for half of the agencies, describing the center's managed services programs, facility services and

benefits.

Communications, customer service and satisfaction, facilitation, infrastructure, project and program management, and strategic relationship building are common threads for more than a decade working with the Commonwealth and more than 20 years working for Unisys.

[redacted] **(based in Harrisburg, PA)** will be serving the Commonwealth as an Agency Account Manager under the new contract. He is a seven year Unisys employee that has been working for the Commonwealth of Pennsylvania for over 15 years providing technology solutions, consulting and complex project management services. For the past seven years, Brian has served the Commonwealth of Pennsylvania on the Unisys Data PowerHouse contract in various Service Delivery and Business Management roles acting as a liaison to the Office of Administration and agencies receiving service.

[redacted] provided exceptional leadership to the Data PowerHouse team through the alignment to ITIL best practices and the migration to the new ITSM Remedy system. With a service-centric approach, he has provided direction to the service delivery organization in support of complex solution/design implementation, managed service functions, quality improvement, and cost management activities. Brian is skilled at contract management and managing vendors and subcontractors ensuring shared accountability for outcomes.

[redacted] **(based in Harrisburg, PA)** will be serving the Commonwealth as an Agency Account Manager under the new contract. She has worked in the IT industry for 14 years, and is a five year Unisys employee supporting the Commonwealth of Pennsylvania as a Service Delivery Manager on the Data PowerHouse contract. Lydia has worked with numerous Commonwealth agencies to develop strong partnerships with agency leadership while aligning Unisys service delivery teams with executing policies and procedures as outlined in the contract with a focus on agency priorities and outstanding customer service.

[redacted] adroitly provides subcontractor oversight to provide top-notch service delivery across environments deployed at the DPH. She has managed numerous successful initiatives including new system implementations for the Pennsylvania Liquor Control Board and the Department of Health, along with hardware upgrades for the Department of State. Lydia is a superb communicator who verifies agency management is kept informed of initiative status, and she has received numerous accolades from Commonwealth management about her unwavering professionalism and skilled leadership.

[redacted] **(based in Harrisburg, PA)** will be serving the Commonwealth as an Agency Account Manager under the new contract. He has held a variety of IT leadership positions since joining IBM in 1976, and has worked with many Commonwealth agencies in the capacity of Service Delivery Manager for the past 12 years. He has a strong background and proven expertise in many IBM technologies including zSeries and iSeries technical management, support of the Disaster Recovery process, and relationship management. Barry possesses strong working knowledge of many Commonwealth agencies' business priorities, aligning cost-effective Data Center solutions to meet agency needs.

[redacted] has extensive experience managing Commonwealth agencies through planning and smooth execution of system migrations and upgrades to new hardware, and software product upgrades. He possesses superior knowledge of disaster recovery and business continuity planning demonstrated by creation of the disaster recovery plans supporting all IBM mainframe customers of the Data PowerHouse and coordination of all disaster recovery tests. Barry is

highly regarded as an expert in the field and for his knowledge of the Commonwealth as evidenced by commendable ratings in customer satisfaction surveys during his tenure.

[redacted] **(based in Harrisburg, PA)** will be serving the Commonwealth as an Agency Account Manager under the new contract. He has over 15 years of experience working in the IT industry, and has been supporting the Commonwealth of Pennsylvania since 1999, holding positions of progressive responsibility including his current role as the Service Delivery Manager at the Commonwealth's Enterprise Data Center. In this role, Kannan actively collaborates with many Commonwealth agency IT managers to formulate technology solutions to address business needs with long-term operational strategies that provide real value is delivered to the Commonwealth. Kannan is well versed with the Commonwealth standards and ITBs and has personally contributed to developing a few of the ITBs.

[redacted] understands the importance of agency participation in major consolidation and migration projects as he played a large role in architecting the e-Government server farm for the Commonwealth to host web applications for various agencies. On this project, Kannan leveraged excellent leadership and communication skills to provide direction to a team of technical consultants and to collaborate with over 40 agencies in their successful application deployment and operation, functioning as a liaison, moving ideas between the development community and the customer community to confirm the needs of the Commonwealth were represented in the design and delivery of the server farm.

2 PMO, Agency Meetings

2.A Account Managers will meet with assigned agency contacts on a regular basis. It is anticipated that this will be at minimum weekly during the initial program start and through transition. Offeror must describe its approach to meet this requirement.

Unisys AAMs recognize that each agency has different needs at different times and varying levels of activity associated with Data Center Compute Services. The AAM will work to identify and schedule the appropriate frequency, type of meeting with appropriate attendees to maximize productivity and effectiveness for the Commonwealth staff. Agendas are provided to all participants prior to meetings and meeting minutes are provided in a timely manner following the meeting. All action items from agency meetings are tracked and the AAM follows up to verify issues and actions are brought to closure.

3 PMO, Commonwealth Meetings

3.A Meet with Commonwealth teams on a monthly basis. It is anticipated that this will be at minimum weekly during the initial program start and transition to monthly meetings with the Commonwealth teams to address problems and assure continuous service improvements. Offeror must describe its approach to meet this requirement.

At a minimum, the following types of meetings are held:

- Monthly meetings of the operational personnel representing Commonwealth and Vendor to discuss performance any planned or anticipated activities and changes that might affect performance.
- During transition, meetings will be scheduled with Commonwealth designated agency contacts as needed and as applicable to each respective agency, at a minimum weekly. The

purpose of this meeting will be to address transition status, agency concerns and issues, develop resolutions jointly with affected Commonwealth participants, and to proactively minimize day-to-day agency business impacts.

- A monthly service review will be conducted to review performance against agreed service levels, current projects, potential capacity issues, and change order activity.
- Meetings as may be necessary and appropriate in the discretion of the Unisys and the Commonwealth.

The AAM is responsible to work with the agency to determine frequency and topic of all scheduled meetings.

Additionally, the Service Excellence Office described in Section 3.2.1.1.6 will lead meetings with agencies monthly to review completed and planned changes, service performance, incidents, problems, major project implementations, and any other item of interest for that month.

4 PMO, IT Planning Sessions

4.A Participate in agency-sponsored IT planning sessions on a quarterly basis. Offeror must schedule quarterly computing capacity reviews to ensure sufficient processing capacity, needs, and issues are being addressed. Suggest changes when necessary. Offeror must describe its approach to meet this requirement.

Unisys AAMs and Agency Infrastructure Architects forge a close working relationship with agency contacts, as well as their Commonwealth counterparts within the Office of Administration. AAMs will participate in all agency-sponsored IT planning sessions as requested by agency contacts, and will work with agencies to plan sessions important to the successful and improved operation of the agency.

AAMs schedule quarterly computing capacity reviews to confirm sufficient processing capacity for Commonwealth agencies. This provides a proactive approach to planning and preventing crisis situations that might otherwise arise during peak business cycles. AAMs conduct monthly performance reporting reviews and Capacity Planning process reviews two times per year. The Capacity Planning process is discussed in more detail in Schedule F, Section 3.2.2.3 Capacity Management.

5 PMO, Advocate Role

5.A Advocate for agency interests. Offeror's Account Management team will advocate for the Commonwealth's interests. For example, intervene with Service Desk personnel to resolve a major problem; problem escalation process, support root cause analyses process. Another example, coordinate with agency and service providers to ensure timing of technology refreshes have the least impact on the agency. Offeror must describe its approach to meet this requirement.

Unisys AAMs have a 10+ year history of performing this type of advocacy on behalf of Commonwealth agencies. The AAM acts as an extension of the agency management team to identify agency priorities and issues and leverages influence within the Unisys Team to communicate impactful agency information to obtain desired results on behalf of the agency. The AAM works closely with the Service Delivery Manager and Agency Infrastructure Architect to drive this information throughout the entire team supporting the agency. Some examples

include:

- Educating the Unisys Team on agency applications, their importance to citizens, and the criticality of the infrastructure
- Escalation of change activities to accommodate agency business needs
- Accommodating agency maintenance schedules through proactive Unisys resource realignments when required
- Communicating agency desires/constraints to Unisys personnel
- Facilitating the understanding of agency customer satisfaction feedback with Unisys personnel review
- Communicate agency business needs to Unisys staff to verify understanding
- Escalation of agency resource procurements to satisfy business needs and milestones
- Holds team accountable for completion of tasks and action items that are important to the agency
- Asserts the agency's position on business requirements when planning the timing of multi-agency outages

6 Monthly Status Reports, Sample Report

6.A Monthly status reports - Ensure The Commonwealth is aware of operational status and project update information on a monthly basis. Create and deliver a monthly status report, summarizing operational metrics as defined in the CCPM, by service platform, including highlights and exceptions, and project status. Offeror must describe approach and provide a representative sample report.

Unisys management will hold a monthly meeting with the Commonwealth Office of Administration and all participating agencies. The purpose of this meeting is to share information across the Commonwealth regarding performance successes and failures, service improvement initiatives, project status, and topics of interest that arise from time to time. This is an opportunity for the agencies to learn what other agencies are doing to improve their operations and to share ideas and information that is applicable to everyone. This encourages participation and enhances everyone's ability for process improvement across the Commonwealth.

There are two sample monthly reports being provided in the attachments**. Attachment F-1 - DPH Monthly Service Performance Management Meeting**, shows the monthly performance report delivered at an agency level and **Attachment F-2 - Managed Services IES and Unisys – Measurement Report**, is an example of the aggregated program view discussed in the previous paragraph. These monthly reports will be available to Commonwealth management via the Service Portal, and data of this nature can be accessed on a real-time dashboard on the Service Portal.

Unisys Team Experience

The Unisys Team has had team members representing the interests and acting on behalf of Commonwealth agencies on the Data PowerHouse contract for several years. They have been known as Customer Service Managers (CSMs) and Service Delivery Managers (SDMs), but functionally, the role is the same.

IBM provides very robust set of Account Management Services in conjunction with the Georgia Technology Authority. IBM staffs a position called the Program LifeCycle Manager (PLM). In this role the PLM is responsible to align with the Agency to understand and manage Program requirements on an End to End basis – from the time the Program is envisioned to the time the Program goes live.

Additionally IBM staffs a number of Architects assigned on an Agency basis who are responsible to understand and work with the agency in developing requirements for their service requests.

Benefits to the Commonwealth

Unisys has deep knowledge of the Commonwealth agencies, their priorities and their business. Our Agency Account Managers have worked with agency leadership for several years and understand the sensitivities of each agency, and will be matched to agencies where they add the most value. Our AAMs are respectful of the differences between agencies and will tailor support to the requirements of the agency rather than treating them like just another number.

3.2.1.7 Configuration Management

The Offeror's Configuration Management system must ensure complete and accurate recordkeeping relative to datacenter assets; hardware, operating system software, firmware, and network. The Offeror's Configuration Management Database (CMDB) system must be synchronized with the proposed datacenter Change and Release Management processes. Also included will be associations of infrastructure configuration items (CIs) and Agency application infrastructure to support application infrastructure related SLAs.

At the end of the contract the Offeror will be responsible to provide the Commonwealth with a final electronic copy of the CMDB.

The following list identifies but does not limit the roles and responsibilities that the Offeror must perform:

- Define and document Configuration Management standards and procedures per ITIL v3 standards.
- Establish an electronic interface to the Commonwealth's CMDB(s) to keep current both the Commonwealth's CMDB and the Offeror's CMDB.
- Establish process for tracking configuration changes
- Establish process interfaces to Incident and Problem Management, Change Management, technical support, maintenance and asset management processes
- Establish appropriate authorization controls for modifying configuration items
- Establish configuration baselines as reference points for rebuilds, and providing ability to

revert to stable configuration states

- Establish process for verifying the accuracy of configuration items, adherence to Configuration Management process, identify process deficiencies and recommend corrective actions

The Commonwealth will require online access to configuration related information and reports to satisfy application updates and audit requirements.

Reference Documentation

Schedule H - Commonwealth Computing Procedures Manual (CCPM)

Requirements		Describe Compliance
1.	Provide a documented process to track configuration changes accordingly to ITIL V3 framework	Offeror must describe how its Configuration Management System addresses the list of requirements described above. Offeror must provide a toolset description and an example of a configuration management system from a prior or current engagement of the Offeror.
2.	Per agency request, provide specific application related infrastructure component configuration information.	Offeror must describe how its configuration management systems can support this requirement.
3.	Provide current configuration reports at an agency level by datacenter component.	Offeror must describe its process to request configuration management reports. Offeror must provide a sample of a Configuration Management report used by Offeror on a current or previous engagement.
4.	Continuous review and updates to the Offeror's and Commonwealth's CMDB	Offeror must describe its approach to maintaining the accuracy of the CMDBs (Offeror & Commonwealth).
5.	CMDB that constitutes the common repository created by the Offeror to include, but not be limited to, location information, service information, configuration	Offeror must describe its approach to meet this requirement.

	information, application information, billing data, inventory data, and performance data. This data will be provided to the Commonwealth via electronic interface in a format approved by the Commonwealth.	

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Unisys will provide a Service Asset and Configuration Management Process and Configuration Management Data Base (CMDB) that will help to provide complete and accurate recordkeeping relative to service and application relationships, data center assets, hardware, operating system software, firmware, and network configuration items (CI's). The Unisys maintained CMDB system will be managed through the Change and Release Management Processes to help verify that all CI's are maintained timely and accurately.

Unisys will map the relationships of infrastructure configuration items (CIs) to Commonwealth/Agency application (CI's) that will be completed when agencies transition to Unisys managed infrastructure. These relationships will be used to support infrastructure availability SLA calculations, billing, etc. The following is the approach to transitioning the CMDB.

1. Determine requirements to support availability SLA's for each application or set of data center assets transitioned using the J3 definition for Infrastructure Availability

2. Determine the alternatives to establish the CMDB relationships to support these availability SLA's including:

   - Utilizing the Commonwealth / Agency CMDB sources
   - Discovery using [redacted]
   - Using the [redacted] utility to finalize the mapping labels, relationships etc. to support the SLA's
   - Obtaining the Commonwealth approval for the mapping during transition

Unisys will provide the Commonwealth with a final electronic copy of the CMDB at the end of the contract.

Unisys accepts full responsibility for maintaining the Configuration Management Process and CMDB to the levels of accuracy required by the SLA for CMDB accuracy.

Unisys will perform the following roles and responsibilities as it pertains to Configuration Management:

- Unisys will define and document Configuration Management Process and procedures per ITIL V3 guidelines and Unisys standards.
- Unisys will establish an electronic interface to the Commonwealth's CMDB(s) to keep current both the Commonwealth's CMDB and the Offeror's CMDB synchronized.
- Unisys will establish the process for configuration control to track and manage all configuration changes. This will be accomplished by implementing change and configuration management processes to verify that configuration analysts who will be responsible for making any required configuration changes to the CMDB are part of the change and release and deployment processes to register CMDB changes for specific types of change and release activities (e.g., break/fix replacements to infrastructure CI's, provisioning of new CI's, software updates, etc.). Also, the configuration analysts will verify that automated processes for provisioning infrastructure when selecting Enterprise Services Catalog items have updated the CMDB properly.

1 ITIL Framework, CM Process, ITIL Toolset example (experience)

1.A Provide a documented process to track configuration changes accordingly to ITIL V3 framework

Unisys will provide a documented process to track configuration changes using the ITIL V3 framework based on its proven enterprise process implemented for customers. This will be reviewed with the Commonwealth during transition and adjusted accordingly to fit any Commonwealth unique requirements.

The Service Asset and Configuration Management Process addresses service assets throughout the entire service life cycle. It provides a complete inventory of assets, and identifies the individuals responsible for their control. It includes:

- Full life cycle management of IT and service assets, from the point of acquisition through disposal
- Maintenance of the asset inventory

The Service Asset and Configuration Management (SACM) process provides a configuration model of the services, assets, and infrastructure that will contribute to meeting the ITSM objectives and to assist the Unisys team in meeting service levels, by recording the relationships between service assets that will be managed as CIs. Assets are elevated to Configuration Items (CI's) for management purposes by augmenting asset data with configuration details that will support the management goals of ITSM and assist the Unisys team in meeting SLA's.

The SACM process provides that selected components of a complete service, system, or product (the configuration) are:

- Identified, baselined, and maintained
- Controlled through the Change Management process
- Released into controlled environments with operational use allowed only on the basis of formal approvals

The scope for SACM may cover non-IT financial assets, including work products that are used to architect and document services, and CIs required supporting a service (e.g., documentation to support ongoing operations). The SACM scope covers interfaces to internal and external service

providers where there are assets and CIs that need to be controlled, e.g., shared assets.

The Unisys Configuration Management Process is summarized in **Figure 3.2.1.7-1** below.

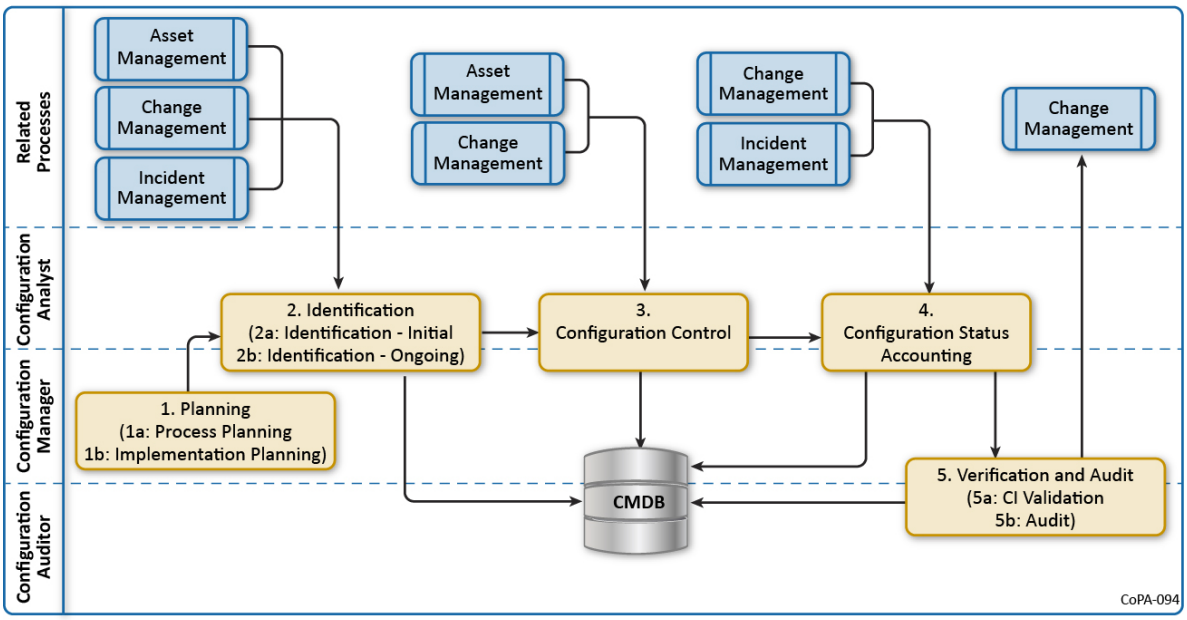

Figure 3.2.1.7-1: Configuration Management Process

1. Planning – This activity creates and delivers the Service Asset and Configuration Management plan. The Configuration Manager working with the Asset Manager(s) and Commonwealth Configuration Management team will develop and document a detailed Configuration Management Plan that will include:

   - Configuration Management Process and procedures
   - Configuration Items and Attributes
   - Reconciliation Processes and procedures
   - Audit Processes and procedures
   - Baseline Management and recovery procedures
   - Technology to support

2. Identification – This activity selects and identifies the configuration items for all of the infrastructure items supporting applications and services , including identification of CI owners, CI interrelationships, CI attributes, and configuration documentation. This includes allocating identifiers and version numbers for CIs, labeling each item, and entering it into the Configuration Management Database (CMDB).

3. Configuration Control – This activity verifies that only authorized and identifiable CIs are accepted and recorded and it provides that no CI is added, modified, replaced, or removed without the existence of the appropriate controlling documentation (e.g., an approved RFC

or an updated specification). These activities happen throughout the CI life cycle from deployment into production until disposal Configuration Control.

4. Configuration Status Accounting and Reporting – This activity governs the reporting of all current and historical data regarding each CI throughout its life cycle. This information allows changes to CIs and their records to be traceable (e.g., tracking the status of a CI as it moves from one state to another).

5. Verification and Audit – This activity includes a series of reviews and audits that verify the physical existence of CIs and check that they are correctly recorded in the Configuration Management system.

The Unisys Solution for the Configuration Management Process includes the people, process and technology to provide a comprehensive solution in support of the Commonwealth.

Unisys will provide a Configuration Management and Asset Management team to support the SACM processes and maintain the Asset and CMDB databases to the accuracy level defined in the CMDB Accuracy SL13. Please refer to the Service Excellence Office description in F3.2.1.1.6 for a more complete description of the organization.

The Configuration Management Process is described above for SACM. It will be implemented to support the other significant ITSM processes including:

- Asset
- Incident
- Problem
- Change
- Service Level Management
- Capacity

Assets will follow the financial asset management lifecycle for requisition, procurement, receipt, deployment, and retirement and form the foundation for Configuration Management (CMDB). The Configuration Management Team will identify assets that will become assets to maintain as Configuration Items (CI's) to track additional configuration related information in order to support ITSM processes and service management objectives.

1.B Offeror must describe how its Configuration Management System addresses the list of requirements described above (below).

Define and document Configuration Management standards and procedures per ITIL v3 standards.

Please refer to 1.A for the Configuration Management ITIL V3 process overview that Unisys will review with the Commonwealth during transition to the ITSM Operational Readiness Platform.

Establish an electronic interface to the Commonwealth's CMDB(s) to keep current both the Commonwealth's CMDB and the Offeror's CMDB.

Unisys will establish an electronic interface to the Commonwealth's ITSM Platform to keep current both the Commonwealth's CMDB and the Offeror's CMDB synchronized.

The Commonwealth will receive updates to the Commonwealth's CMDB for all CMDB data including but not limited to configuration information for servers, network, and storage CI's as well as relationship data between these CI's and applications where applications can be discovered.

This will meet the requirement of supplying the Commonwealth with service, application, configuration, and location inventory data.

Establish process for tracking configuration changes
