This activity confirms that only authorized and identifiable CIs are accepted and recorded and it verifies that no CI is added, modified, replaced, or removed without the existence of the appropriate controlling documentation (e.g., an approved RFC or an updated specification). These activities happen throughout the CI life cycle from deployment into production until disposal Configuration Control

The Configuration Analyst will verify that all CI's are updated according to change and release management processes for:

- Standard RFC CI's that are released and deployed
- Automated discovery and CMDB updates
- Provisioned Enterprise Services Catalog items into production

Establish process interfaces to Incident and Problem Management, Change Management, technical support, maintenance and asset management processes

Unisys will establish process interfaces to Incident and Problem Management, and Change Management including technical support and maintenance procedures.

Incident and Problem Processes will be implemented to help confirm that all incidents and Problems are properly attached to CI's in the CMDB. This will support Problem Management in determining problematic CI's, establish problem records and determining root causes to process changes for eliminating defects in the infrastructure supporting Commonwealth applications. Unisys will implement technical support procedures and work instructions will be implemented to support use of the CMDB for all work activities requiring incident, problem, or change work tasks. Maintenance records and maintenance contracts with contact information for support activities will be accessible to the technical support teams.

Establish appropriate authorization controls for modifying configuration items

Unisys will establish appropriate authorization controls for modifying Configuration Items (CI's). During transition detailed process and procedures will be implemented to restrict CMDB update capabilities to the authorized the Unisys Configuration Management Team.

Establish configuration baselines as reference points for rebuilds, and providing ability to revert to stable configuration states

Unisys will establish configuration baselines as reference points for rebuilds, and providing ability to revert to stable configuration states. Configuration Management CMDB baselines will be established following reconciliation after major updates to the CMDB (e.g., after significant transitions, or major releases. A configuration management baseline strategy will be part of the Configuration Management Plan and reviewed as part of the transition and release plans. The baselines will be used in the event of required rollback, recoveries, or rebuilds.

Establish process for verifying the accuracy of configuration items, adherence to Configuration Management process, identify process deficiencies and recommend corrective actions

Unisys will establish process for verifying the accuracy of CI's, adherence to Configuration Management process, identify process deficiencies and recommend corrective actions. Unisys will implement periodic reconciliation procedures in support of the Configuration Management Process to help confirm the timeliness and accuracy of the CMDB. This involves detailed procedures to support several sources of CMDB updates including:

- Import of discovered data from the discovery tool (ADDM) to normalize and reconcile CI's before updating the CMDB.
- Auditing or updating release and deployment configuration changes in the CMDB
- Conducting periodic audits with the Commonwealth to identify and determine the root causes of any discrepancies including any process issues.

Figure 3.2.1.7-2 below shows the process for configuration discovery, normalization, and reconciliation , and updating the production CMDB.

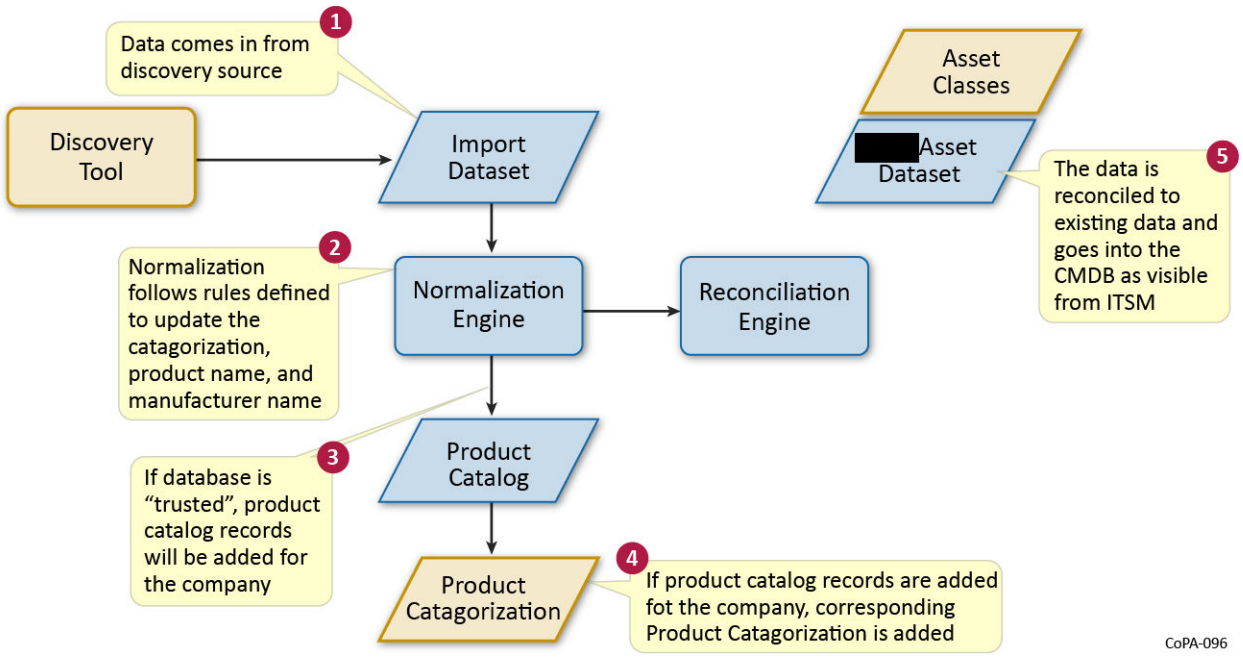

Figure 3.2.1.7-2 CMDB Discovery, Normalization and Reconciliation Process

The Commonwealth and Unisys will conduct CMDB audits following the process shown below in **Figure 3.2.1.7-3**, on a scheduled periodic basis in order to determine the accuracy of the CMDB and to determine any root cause for discrepancies discovered. The audits will be used to calculate the SL13 CMDB Content Accuracy and Timeliness SLA. Unisys proposes that the audit items include CI's and all selected attributes for each selected CI. CI's selected for audit should be limited to those items that can be discovered by the automated discovery tool [redacted].

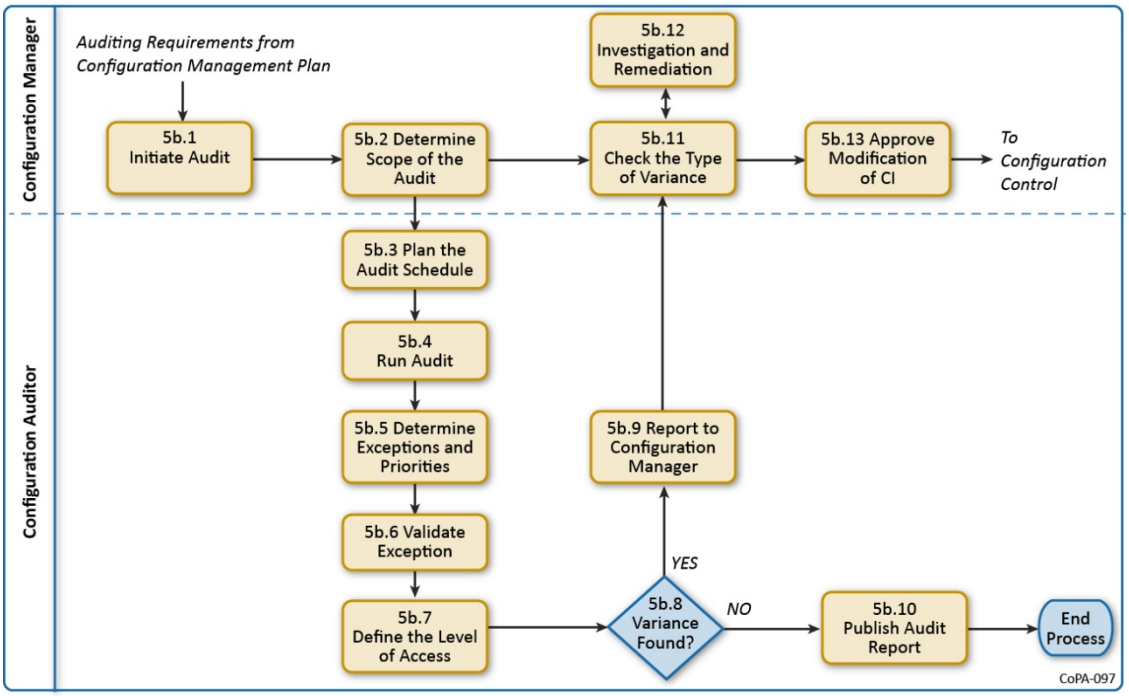

Figure 3.2.1.7-3 – CMDB Audit Process

Unisys will work with the Commonwealth to plan each audit. The criteria for selecting which CI's will be used for calculating SL13 will be random.

In addition to official Commonwealth audits of the CMDB, Unisys will also conduct internal CMDB process audits focused on helping to improve CMDB accuracy. These areas include:

- Change Management Reviews – check to verify changes that impact CI's have been updated properly in the CMDB
- Incident and Problem Management Reviews – Review incident and problem records associated with break fix items in the data centers and determine if the CI's have been properly recorded in the CMDB
- Change Management Software installation reviews – Review change requests associated with software installations or removal to confirm the CMDB reflects the proper recording of these changes

The formal CMDB audits will be jointly executed, the results compiled and reviewed. The SL13 calculation will be determined and the overall audit results will be summarized with supporting

details tracked, through the recording and processing of incident, problem and change records. Problem records will be created to perform root cause analysis for an identified exception in order to resolve any defect from a process, manual or automated step from updating the CMDB. Change records will be created and executed to eliminate the defect and the CMDB updated with the correct configuration item information.

1.C Offeror must provide a toolset description and an example of a configuration management system from a prior or current engagement of the Offeror.

Unisys has implemented a Configuration Management Solution for the Australian Government Department of Education and Training Administration (DETA) as an example. Unisys currently hosts (DETA) on its shared Global 7.6.04 ITSM platform. The CMDB configuration utilizes the [redacted] discovery toolsets for discovery of CI's to populate the populate the [redacted].

The following software components, descriptions and versions comprise the DETA CMDB solution implementation

[redacted]

2 CM Application CM

2.A Per agency request, provide specific application related infrastructure component configuration information.

Unisys will provide mapping of infrastructure to agency applications as part of the CMDB availability SLA transition services for agency applications onto Schedule I infrastructure.

This configuration information for each item supporting an Agency Application can be presented to the Agency Application stakeholders as views into the Unisys CMDB without having to request it specifically. Views for application owners can be configured to be viewed on

the Unisys ITSM Platform.

This same information is synchronized with the Commonwealth's CMDB and should be available for viewing and reporting from the Commonwealth's ITSM platform.

Following transition, Unisys offers a Services Catalog item for mapping specific application related infrastructure component configuration information for Commonwealth agencies. This will apply for changes to applications and their supporting infrastructure following transition. This service will be tiered according to the complexity of mapping infrastructure to specific agency applications (small, medium, complex). The service involves a workshop to review what current CI's the [redacted] have discovered, including all infrastructure and network related CI's and any components of the application. The Unisys Configuration Analyst will map and label infrastructure items to the application CI's, utilizing a mapping tool.

An additional Catalog Service is offered to monitor application workflow on supporting infrastructure including:

- Viewing discovered CI's supporting a specific application,
- Monitoring the transaction flows, queues and bottlenecks visually through each supporting CI.

This will help Commonwealth/Agency Application's teams troubleshoot applications in the test or production environments.

2.B Offeror must describe how its configuration management systems can support this requirement.

Please refer to 2.A to see the description of how these standard and catalog services support the Commonwealth/Agencies in providing application specific infrastructure component information.

3 CM Reporting, sample reports

3.A Provide current configuration reports at an agency level by datacenter component.

Unisys will provide configuration reports to Commonwealth Agencies for all data center CIs. Commonwealth users will be able to utilize the Unisys Portal and Real-time Dashboard to select reports and drill down to detailed reports accessible in the [redacted]. The following is a summary of Asset / Configuration Management standard reports:

Report Name	Description	Frequency
Software Licenses Management		
Software License Compliance Sub Reports: Software License	Displays the total number of software products that are compliant compared with the total number of software products that are non-compliant. This report includes discovered data elements, as well as client provided contract and license information.	Monthly

Compliance Detail report Compliance Summary for Software Product report Deployment Detail for Software Product report		
Software Inventory Profile for Licensable Products	Provide total number of software instances available in CMDB, broken down by product	Monthly
Enterprise Asset Management		
Inventory Profile Sub Reports: includes Inventory Profile-Drill-Down View report	Displays the total number of assets in the in the production CMDB grouped by Hardware and Software asset types.	Monthly
Asset Aging Sub Reports: Asset Aging-Drill-Down View report	Displays a summary of the aging of various assets in the production CMDB.	Monthly
Asset Relationship Analysis Sub Reports: Asset Relationship Analysis – Selection of assets	This report is used for selecting an asset for the Asset Relationship Analysis report. Report used to view the CIs and their relationships that exist in [redacted]	Ad-hoc (Account Team will have it cost involved for ad-hoc report) – 15 min Effort to run report
CIs Data Dump	Details of CIs (hardware and software) that for the selected company (i.e., Commonwealth Agency) and class for XLS format.	Weekly
Configuration Management Reports		
Deliverable Name	Description	Frequency
Discovery Datasets Comparison Sub Reports: Datasets Comparison-Drill-down View	Displays a summary of the comparison of discovery datasets within [redacted]. The differences between these datasets are displayed by hardware and software components. A drill down is available for components within each dataset to view its details, which are displayed in the Discovery Datasets Comparison-Drill-down View sub-report. This report also displays the changes in the CI data between	Daily/Weekly/Monthly

	each discovery scan.	
Staleness Analysis of Discovery Data Sub Reports: Staleness Analysis of Discovery Data -Drill Down I report Staleness Analysis of Discovery Data - Drill Down II report	Displays an analysis of CI discovery data. The report identifies those CIs that have remained undiscovered during the previous scans. All the CIs are grouped into various time intervals by last scan date. Drill-downs show the CIs belonging to various time intervals. Sub reports of this report include Staleness Analysis of Discovery Data -Drill Down I and Staleness Analysis of Discovery Data - Drill Down II report.	Monthly
Reconciliation Job Analysis	Displays the details of all reconciliation jobs that are set up in [redacted].	Daily/Weekly/Monthly(depends on Recon Job scheduled)

3.B Offeror must describe its process to request configuration management reports.

Commonwealth users will be able to utilize the Unisys Services Portal to select reports and drill down to detailed reports.

3.C Offeror must provide a sample of a Configuration Management report used by Offeror on a current or previous engagement

The following is an example of a Configuration Management Report from a current Unisys customer. This represents the Configuration Management CI relationships supporting an application with the associated incidents for each CI node. This report is online via the ITSM CMDB toolset and can be extracted into a Report format. Please see the example below in **Figure 3.2.1.7-4.**

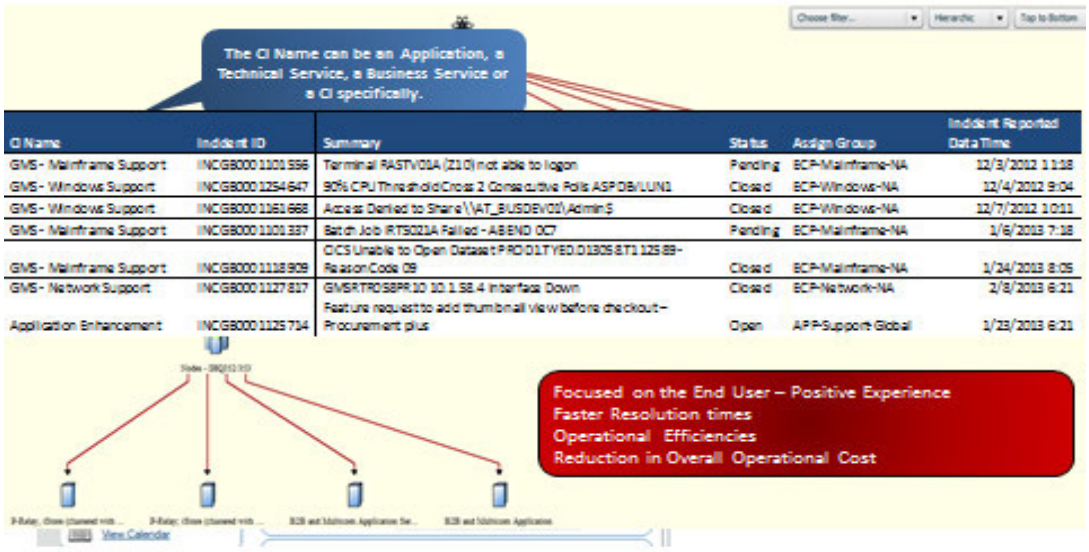

Figure 3.2.1.7-4 Configuration Management Report

4 CM, Continuous Review of CMDB

4.A Continuous review and updates to the Offeror's and Commonwealth's CMDB

Unisys will be conducting continuous reviews of the CMDB to help verify its accuracy as described above in 2.B. This is a combination of processes that support configuration control for change and release management, audits, and reconciliation procedures. The Unisys Remedy CMDB will be synchronized with the Commonwealth's Remedy CMDB.

4.B Offeror must describe its approach to maintaining the accuracy of the CMDBs (Offeror & Commonwealth

Unisys will establish process and procedures for verifying the accuracy of CI's, adherence to Configuration Management process, identify process deficiencies and recommend corrective actions. Unisys will implement periodic reconciliation procedures in support of the Configuration Management Process to help confirm the timeliness and accuracy of the CMDB. This involves detailed procedures to support several sources of CMDB updates including:

- Import of discovered data from the discovery tool (ADDM) to normalize and reconcile CI's before updating the CMDB.
- Auditing or updating release and deployment configuration changes in the CMDB
- Conducting periodic audits with the Commonwealth to identify and determine the root causes of any discrepancies including any process issues.

5 CM, CMDB Repository

5.A CMDB that constitutes the common repository created by the Offeror to include, but not be limited to, location information, service information, configuration information, application information, billing data, inventory data, and performance data. This data will be provided to the Commonwealth via electronic interface in a format approved by the Commonwealth.

Unisys will develop a detailed Configuration Management Plan during transition to identify with the Commonwealth Agencies, CI's and attributes to be managed for a complete CMDB data model and repository including but not limited to:

- Location information (where the asset resides)
- Service information (maintenance contracts and service contacts)
- Configuration information (for servers, mainframes, storage and LAN Network devices)
- Application information (for applications mapped to infrastructure)
- Inventory data for all assets under change control
- Performance data (maintained and reported in BPPM and Capacity Optimization Toolsets)
- Relationship data between CI's

5.B Offeror must describe its approach to meet this requirement.

There will be a heavy emphasis on using the CMDB discovery tool to initially populate and maintain the accuracy of the Unisys ITSM CMDB in ongoing operations and to also synchronize the Unisys CMDB from information stored in the Commonwealth CMDB. Unisys will work diligently to maintain the accuracy of manually entered CMDB data.

All CMDB information will be provided to the Commonwealth via electronic interface in a format approved by the Commonwealth. Unisys will provide a summary of standard Unisys [redacted] of CI's, attributes and relationships

Unisys Team Experience

Unisys currently provides IT Service Management Services to more than 150 customers worldwide. Unisys is a leading provider of Managed Services utilizing an integrated suite of ITIL V3, ISO 20000 certified management processes and leading ITSM tools to provide outstanding service IT services to our customers. Unisys currently successfully manages Service Asset and Configuration Management for many of these customers.

Currently, the Unisys Team successfully manages Service Assets for the Commonwealth.

Benefits to the Commonwealth

The Unisys value proposition for Service Asset and Configuration Management Solution is to maintain an accurate CMDB that represents the CI's and relationships supporting Agency Application CI's which will support adding the following value:

- Supporting availability infrastructure SLA's calculations for Commonwealth/Agency applications

- Avoiding significant service impacts by providing configuration management service impact information that allows Change Analysts to plan successful changes. This will prevent significant service impacts to Commonwealth application users.
- Eliminating infrastructure defects though the Problem Management Process utilizing CMDB data that links incidents to CI's. With these relationships established it is easier for the Problem Manager to identify service impacting defects to be eliminated through root cause analysis.

3.2.1.8 3rd Party License Management

Currently the Commonwealth manages over 2,000 business applications that require numerous software platforms and products. The Offeror's 3rd Party License Management service must ensure accurate inventory and licensing compliance for all Offeror provided infrastructure software products. The Offeror will be solely responsible for the management of all infrastructure software products provided through this contract.

The Offeror must coordinate with the Commonwealth to ensure compatibility between Commonwealth provided applications related software, and the Offeror provided infrastructure software. The Offeror must provide a method for tracking and reporting on both Offeror provided and Commonwealth provided software that will reside on the managed infrastructure.

The Offeror must provide the ability to purchase the Third Party Software listed in Exhibit B.4 - DPH - Third Party Software and additional third party software if required to provide the contracted services. The Offeror shall be responsible for the licensing and maintenance and support for the Third Party Software. The Commonwealth at its sole discretion may procure third party software from appropriate contracts.

The Offeror must provide the ability to purchase maintenance and support for the Third Party Software listed in Exhibit B.10 - DPH – Hybrid Third Party Software. The Offeror shall be responsible for the maintenance and support for the Third Party Software. The Commonwealth at its sole discretion may procure third party software maintenance and support from appropriate contracts.

Reference Documentation

Exhibit B.3 - DPH - Commonwealth Software Asset Listing

Exhibit B.4 - DPH - Third Party Software

Exhibit B.10 - DPH – Hybrid Third Party Software

See each target datacenter exhibits for current applications supported.

Requirements		Describe Compliance
1.	Provide, as requested, current software license reports for in scope infrastructure. For example specific OS version and patch levels per service instance.	Offeror must describe its approach to providing 3rd party software inventory and tracking per agency related infrastructure.
2.	Improve service quality, efficiency, and effectiveness.	Offeror must describe its methods to address continuous service improvement process

		related to 3rd party software management.
3.	Improve/reduce cost of service.	Offeror must provide examples of 3rd Party Software Management initiatives it has implemented and which may be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Unisys will provide 3rd Party License Management Service for the Commonwealth/Agencies and Unisys provided infrastructure software products. Unisys will be solely responsible for the management of all infrastructure software license products provided through this contract. The goals of this service are to:

- Verify software contract compliance (to avoid non-compliance legal issues and expenses)
- Manage costs of software inventory by matching requirements for use to needs
- Confirm software maintenance contracts are maintained on schedule through early notifications

1 Software License Inventory and Tracking

1.A Provide, as requested, current software license reports for in scope infrastructure. For example specific OS version and patch levels per service instance.

Unisys will provide software license reports for in scope infrastructure. These reports will include the level of detail agreed to and tracked in the [redacted] and Asset Management Database. These reports will include the OS versions they are running on and versions. Patch levels may be tracked and reported using the [redacted].

1.B Offeror must describe its approach to providing 3rd party software inventory and tracking per agency related infrastructure.

Unisys will implement the following process (**Figure 3.2.8.1-1**) to load and manage software license inventory and management to meet these goals:

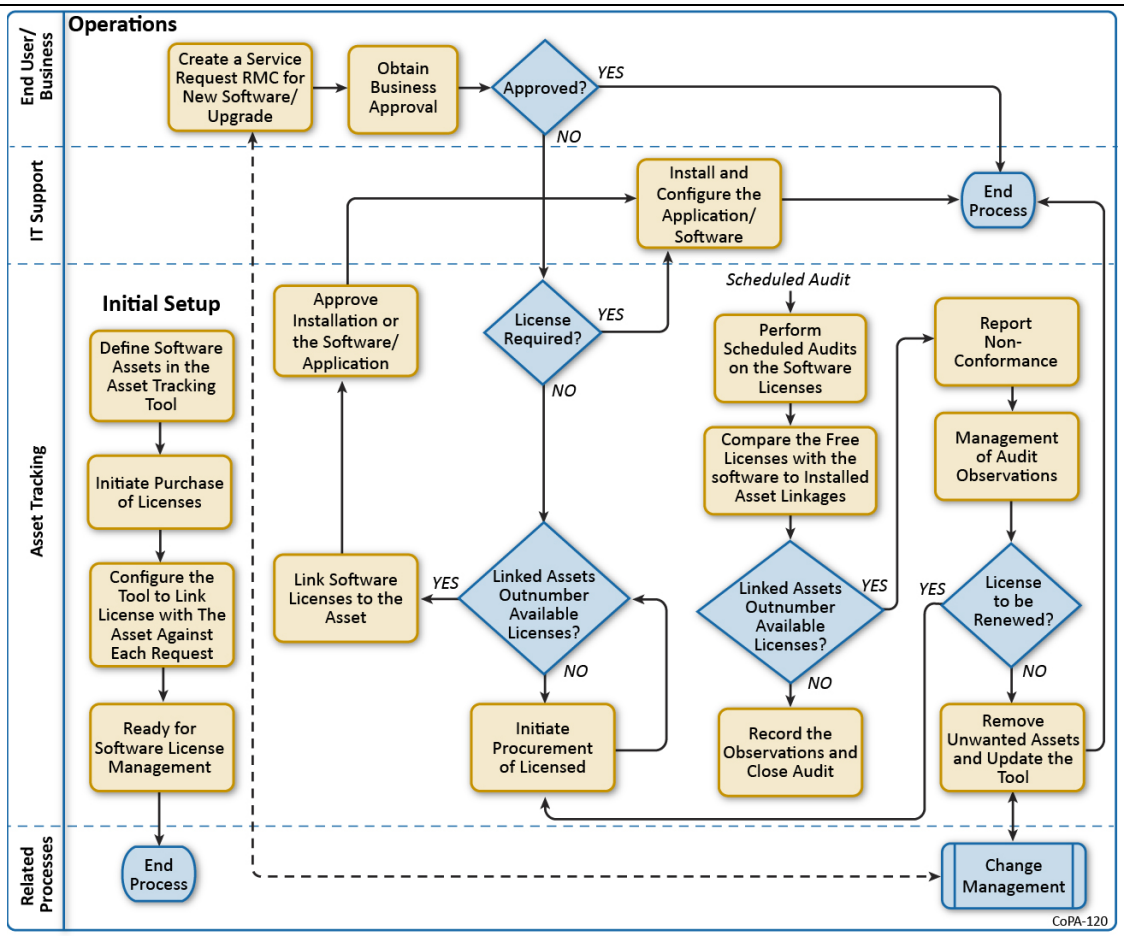

Figure 3.2.1.8-1: Manage Software License Process

The process for license tracking in transition and as an ongoing process involves the following activities:

i) Load all Unisys and Commonwealth software asset license contract information into the [redacted] Asset Management Contract application

ii) Load all software license certificates including the following data in the B[redacted] [redacted] for a Software License:

- certificate
- license type
- entitlements
- manufacturer
- product information

iii) Run discovery through [redacted] to identify all software installations

iv) Run the [redacted] software to build relationships between the discovered software CI's recorded in the [redacted] and the license certificates

v) Run the [redacted] to identify non compliant licenses and inventory for the Unisys and Commonwealth Asset Managers to audit the completeness and accuracy of

the information

vi) Identify any discrepancies in the information and make corrections

vii) Rerun Compliance Reports and 3Rd party software license inventory reports to get signoff from the Commonwealth and Unisys Asset managers that inventory is properly linked to license certificates in the production environment and the information is complete and accurate

viii) Provide notifications to Commonwealth/Agencies/Unisys and other Commonwealth service providers when there are software compliance issues or requirements for licenses to be purchased or retired from analysis of license inventory.

Unisys will coordinate with the Commonwealth to provide compatibility between Commonwealth provided applications related software, and Unisys provided infrastructure software. This will be managed through testing services provided in the Enterprise Services Catalog and ongoing change processes to evaluate the risk of any change in the production environment.

Unisys will notify the Commonwealth Asset Manager(s) of required maintenance agreements in a timely fashion to help confirm that these agreements are in place to support ongoing operations. Unisys cannot be held responsible to any delays on the Commonwealth's part for negotiation these contracts in support of SL14.

2 Continuous Improvement

Unisys follows a detailed set of processes and procedures as describe above to help verify that 3rd party software license information is maintained and reported accurately as an ongoing operation. This is a subset of the Asset Management Process and procedures. The Asset Manager will review all RFC's pertaining to 3rd party software to confirm that the information is properly recorded in the [redacted] he Asset Manager is also responsible for conducting audits of the software license information. The audits will reveal any inaccuracies in the information. Incident tickets and problem tickets will be opened for audit discrepancies. A problem ticket root cause will be determined for each information accuracy type and a change ticket will be opened to correct the root causes for these information problems related to 3rd party software licenses. Change tickets can be opened for any technical, process or personnel related issue. This is how Unisys will continue to maintain and improve the 3rd party software license tracking service's quality, efficiency and effectiveness.

3.B Offeror must provide examples of 3rd Party Software Management initiatives it has implemented and which may be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

An example of where Unisys has implemented or reduced costs involves the identification and quantification of actual software licenses that were underutilized for the PA Dept. of State who had 1500 Citrix XenApp licenses. After reviewing statistics on usage during the spring 2012 election, it was determined that the highest usage was 200 at any given time. During the full election cycle, the maximum number of users experienced was approximately 600. Unisys recommended to the PA Department of State to reducing software maintenance renewals by 750 licenses thereby yielding a cost savings of $69,600 over two (2) years.

Unisys Team Experience

Unisys has a long history of software license tracking with the Commonwealth and other customers. The Unisys processes for tracking software assets, license renewals are solid and effective to help provide the ongoing operations for the Commonwealth.

Benefits to the Commonwealth

The Unisys Solution for Software License Tracking involves the entire people, process and technology to deliver an effective solution for the Commonwealth. The software license assets are tracked in the [redacted] and linked effectively to the assets in the [redacted] so that the details of where the licenses are located and how they are used are known and reported. Software license reconciliation is performed using the [redacted] This means the Commonwealth can be confident that the risks for management of software licenses are mitigated for maintaining :

- Ongoing operations of the supporting infrastructure tools for Commonwealth/Agency applications
- Compliance for software licenses to help avoid penalties
- Notifications of software license maintenance renewals are processed and sent to asset managers in a timely manner

3.2.2 Technical Services

3.2.2.1 Transition Management (New Customer and/or Services)

The Transition Management service ensures the systematic planning, management, execution, and monitoring of major changes to the datacenter environment(s). This Services offering is to support new customers and/or new Services (i.e. remote file servers, remote databases, etc.). This service offering includes the phased migration of Commonwealth applications to the Offeror's managed service excluding initial transition.

Information and tasks pertaining to the transition of the initial Targeted Datacenters and Agencies can be found in Section 3.3 – Transition Services.

Reference Documentation

N/A

Requirements		Describe Compliance
1.	Transition Management Office - Create a Transition Management Office and team that will be responsible for the migration projects	Offeror must describe its transition management approach and its proposed transition team. Provide resumes for key

	of hardware and applications from the Commonwealth's locations to the new target datacenter environments.	members of the proposed transition team.
2.	Create a computing environment; hardware, software, network systems, peripherals, and devices as required to migrate the Services from the Commonwealth.	Offeror must discuss its approach to migrating the Commonwealth's computing platforms (mainframe, mid-range and x86) and associated infrastructure to the Offeror's proposed solution.
3.	Provide recommendations for the repurpose, replacement, or retirement of existing Commonwealth hardware, software, network systems, and peripheral devices as required after system migrations have been completed.	Offeror must discuss its approach.
4.	Optimize Current Process and Procedures – Coordinate with Commonwealth customer to review and plan for a transition of processes and procedures.	Offeror must describe its overall plan for optimization of the existing processes, procedures, tools, etc. to provide more efficient and effective Services. The description must include approach, plan, and methodologies.
5.	Develop detailed plans to migrate Commonwealth applications, and associated infrastructure from Commonwealth datacenters to the Offeror's datacenters. On a monthly basis, Offeror must create a report to detail the transition projects on the plan, status, risks, and the forecasted transition date.	Offeror must discuss its approach to support the migration of Commonwealth applications to the proposed solution including communicating and reporting on the migration plan, risks and schedule.
6.	Coordinate with Commonwealth applications project teams to plan and execute the application and infrastructure migration plans.	Offeror must discuss its approach.
7.	Revise datacenter disaster recovery plans on the occasion of major changes to the datacenter hardware,	Offeror must discuss its approach.

	software, or network portfolio.	
Continual Process Improvement		
8.□	Reduce service risks.	Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.
9.□	Improve service quality.	Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.
10.□	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
11.□	Provide service transparency.	Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.
12.□	Ensure service sustainability.	Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.
13.□	Improve/reduce cost of service	Offeror must provide examples of previous technology initiatives implemented by Offeror that achieved reduced costs of Services and that met or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

As new customers come on board or services are requested by the existing Commonwealth agencies, Unisys will utilize our standard transition methodologies and processes as the basis to develop the work plan. The size and makeup of the team will depend on the scope and complexity of the projects that have been identified. The project will be very similar to the Data Center Consolidation transition discussed in Schedule F, Section 3.3 within this document. At

the point in time additional customers are transitioned, standard tools and processes will be implemented which will reduce the transition of services to a minimal effort. The data center migration projects will have the same makeup as found in Schedule F, Section 3.3. These teams will work under the direction of the Project Management Office.

1 TPMO, Transition Management Approach

1.A Transition Management Office - Create a Transition Management Office and team that will be responsible for the migration projects of hardware and applications from the Commonwealth's locations to the new target datacenter environments.

1.B Offeror must describe its transition management approach and its proposed transition team. Provide resumes for key members of the proposed transition team.

The transition management approach will be similar to the approach employed during the Data Center Consolidation Program. The tools, processes and team makeup will be the same as the projects required to move DOR, DOH, PSP and DPW. As we initiate these projects, we will review lessons learned in each of those projects and use our continuous improvement process to make them better.

As new opportunities are identified, oversight responsibilities will go to the Project Management Office. Unisys will leverage our global transition team's processes, experience and staff much as we are doing for the Data Center Consolidation Project. The projects will fall under the guidance of the Project Management Office which will be led by [redacted]

The Transition Program Management Office (TPMO) will provide standards, oversight and cross-functional support to the project within the initial Transition and any future transition activity that may occur during steady state. This organization takes advantage of the collective experiences of Unisys, IBM, and prior experience of the staff. The TPMO organization structure, its roles and responsibilities are discussed in detail in Section 3.3.2.1 "Transition Program Management" . For key personnel resumes, please see the Key Resumes tab in Section 5, and for representative resumes, please see the Representative Resumes tab in Section 5.

2 Platform Migration

2.A Create a computing environment; hardware, software, network systems, peripherals, and devices as required to migrate the Services from the Commonwealth.

2.B Offeror must discuss its approach to migrating the Commonwealth's computing platforms (mainframe, mid-range and x86) and associated infrastructure to the Offeror's proposed solution.

Data Center migrations are complex projects which cannot utilize a one-size-fits-all method. As in the plan for migrating applications within the current scope of services, the Migration Project team will gather the application requirements, assess the requirements against the current environment and determine the appropriate course of action to be taken for each application and technical environment in scope. The possible solutions will include data transfer methodology such as over the wire to existing or new equipment in the target data center or lift-and-shift via tape backup or whole storage frame as appropriate. This will also include a determination on the best approach for migrating the servers either through lift-and-shift, over-the-wire operating system migration or greenfield installs onto seed hardware. The Capacity on Demand solution provided by Unisys can support a faster implementation project. For more information on Capacity on Demand, please see Section 3.2.5.1.

More detailed information regarding the Unisys transition approach can be found in Schedule M.

3 Repurposing, replacement, retirement

3.A Provide recommendations for the repurpose, replacement, or retirement of existing Commonwealth hardware, software, network systems, and peripheral devices as required after system migrations have been completed.

3.B Offeror must discuss its approach.

1) Recommendations for Technology Reuse after Migration

a. As part of the Transition planning process for each data center migration, Unisys will review the hardware; software; except applications; network systems, and peripherals devices to provide recommendations for the technology post-migration. The Technology Refresh activities will be used as a basis for the analysis and development of the recommendations. The following recommendations may be used by a subset of the options presented as part of the review.

i. Repurpose

1. Reusing the technology as a part of an Agency's Managed Only infrastructure at the Unisys managed data center. The technology may not be used in the same function as it was used previously, but it will be used until it is refreshed through the an approved Technology Refresh plan or retired when its function is no longer required.

ii. Replacement

1. Technology which has reached an end of life due to age or from technical changes in the architecture, but does have a match in the current Unisys Fully Managed service offerings will be recommended for replacement. Unisys will work with the Commonwealth to identify replacement technology. The recommendation may also generate additional service offerings.

iii. Retire

1. Technology which has reached end of life due to age or from technical changes in the architecture and has a functional match in the current Unisys Fully Managed service offerings will be recommended to be retired after its function has been migrated to Unisys Fully Managed hardware or software services.

4 Process Optimization

4.A Optimize Current Process and Procedures – Coordinate with Commonwealth customer to review and plan for a transition of processes and procedures.

4.B Offeror must describe its overall plan for optimization of the existing processes, procedures, tools, etc. to provide more efficient and effective Services. The description must include approach, plan, and methodologies.

The Transition of Services Project(s) will be dedicated to understanding and documenting the Commonwealth's current state environment. When these tasks are completed, the team will

turn its focus to identifying the gaps between current processes and the Unisys Team's best practices in order to develop a strong detailed plan for a seamless implementation and conversion to those appropriate best practices. The Unisys Team will apply their current experience and knowledge of the Commonwealth will enhance their ability to identify opportunities for transition improvements and expedite the transition. For a more detailed explanation please see Section 3, Attachment 89 "Schedule M: Detailed Transition Plan". Additional information on the Unisys Team's approach to Continuous Improvement can be found in Schedule F, Section 3.2.1.1.6.

During the initial transition of services project, the Unisys Team will meet with the Commonwealth and key agency representatives to gain insight needed to create an effective plan, and then to obtain concurrence on the plan.

5 Application Migration

Applications are the central focus of the Unisys Migration Strategy. As additional opportunities for consolidation are identified, the Unisys Team will continue to utilize the same processes as the initial transition program that can be found in Schedule F, Section 3.3.

5.A Develop detailed plans to migrate Commonwealth applications, and associated infrastructure from Commonwealth datacenters to the Offeror's datacenters.

The application migration processes for additional agencies and services will begin with a standard template and then customized for each situation. The final resulting plan will be developed based on number of factors including timing, planning, testing and method of migration, and will always be based on the specific needs and requirements of the applications being migrated. For more details, please see Schedule F, Section 3.3.

5.B On a monthly basis, Offeror must create a report to detail the transition projects on the plan, status, risks, and the forecasted transition date.

Similar to the migration projects that are currently in scope, the Unisys Team will provide weekly status which includes a current status of the project, a risk register which includes mitigation strategies and the up to date schedule. For additional details, please see Schedule F, Section 3.3.

5.C Offeror must discuss its approach to support the migration of Commonwealth applications to the proposed solution including communicating and reporting on the migration plan, risks and schedule

Unisys has developed a detailed multi-tier communication plan for the Data Center Transition services. Unisys will utilize a similar communications plan for the transition of new customer or new services. For additional information, please see Schedule F, Section 3.3

6 Application Migration Coordination

Coordinate with Commonwealth applications project teams to plan and execute the application and infrastructure migration plans.

Offeror must discuss its approach.

It is expected the Commonwealth application project teams will continue to be an integral part of the transition projects and attend all project meetings. The Unisys Team requests that an application owner be named for each application to be migrated. This role will be responsible for and authorized to make decisions on behalf of the application project team and users. In addition, the application owner will be expected to support all communications with the application project team and user community not directly involved with the project.

7 DR, Disaster Recovery Plan

7.A Revise datacenter disaster recovery plans on the occasion of major changes to the datacenter hardware, software, or network portfolio.

7.B Offeror must discuss its approach.

The specifics of the Commonwealth's new DR Infrastructure on Demand are detailed in the Schedule F, Section 3.2.5.3 DR Infrastructure on Demand section.

The Unisys IT Risk Manager in the Program Management Office will oversee an agency-by-agency review of each Disaster Recovery plan during transition. As part of this review, each Agency plan will be entered into the new online DR planning tool, Living Disaster Recovery Planning System (LDRPS). This transition process populates the LDRPS with the DR runbooks and provides the initial capture of the Commonwealth's Disaster Recovery capacity required.

Following transition, the Unisys IT Risk Manager in the Program Management Office will oversee the maintenance of the Commonwealth's new online disaster recovery tool as part of our proposal. The IT Risk Manager and DR Coordinators have broad oversight at the agency level and meet with agency leaders regularly to review, update, and maintain all Agency Disaster Recovery plans within the new online DR planning tool. As part of this governance the IT Risk Manager will review new service offerings to validate that new Customers and Services have been incorporated into Agency-level Disaster Recovery Plans. The addition of new Customers or Services will also initiate an action to schedule an oversight review with the appropriate agency-level leader.

The Unisys Team responsible for maintaining the Unisys-managed Disaster Recovery will rely on review of changes to the online Disaster Recovery planning tool, regular Disaster Recovery trend reports and new project roster reviews to gauge and maintain adequate supply and appropriate tiers of service in the Disaster Recovery sites.

Ultimately the above actions are tested for quality and completeness during two annual tests that the Commonwealth stipulates. Upon completion of the tests the Disaster Recovery Testing team will review all DR test results as part of the regular remediation and improvement cycles that follow any DR testing.

Continual Process Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

1. Reduce service risk,
2. Improve service quality,
3. Improve client satisfaction,
4. Provide service transparency, and
5. Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

1. Service Excellence Office,
2. Quality Plans: transition and steady state service delivery
3. Industry standard frameworks and methodologies: ITIL, ISO, SSL
4. Industry accepted measurement tools
5. Continuous Service Improvement & Innovation Processes (CSIIP)
6. Risk management, audits and business continuity management
7. Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

8 CI Service Risk

8.A Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.

Identifying project risks, developing mitigation strategies, and developing contingency plans are vital to a successful project. Risk management is continuous and requires that proactive steps be built into the Project Management Plan. The Unisys Team will complete a detailed Risk Management Plan in conformance with the Unisys Services & Solution Delivery Framework (SDF) methodology. This will occur early during project or migration startup and create one of the first project deliverables. The SDF follows the approved approach to risk management based on the Project Management Institute (PMI) Standard—PMBOK. The Risk Management Plan will detail the process so all project participants have a clear and common understanding of how risks will be managed and their individual responsibilities. The SDF provides the

processes, techniques, and tools to support project management. Our four guiding principles are:

- Clear goals are essential for successful projects.
- Adherence to formal and constantly improving best practice processes will provide that all solutions and deliverable products meet their stated requirements.
- Planning and scheduling of all tasks and resources and subsequent monitoring, control, and reporting are essential to solution delivery.
- Agreement on deliverables and definition of an effective change management process are essential to achieving the project's goals.

Our framework provides best practices, templates, and guidelines for all project phases from the initial proposal, transition and migration, through implementation and project closeout. The risk management process is divided into two areas:

1. Risk Management Planning
   This area focuses on how to approach, plan, and execute risk management activities, including identification, assessment, and management of potential risks.
2. Risk Management Control
   This area focuses on the implementation of the processes and actions defined during risk planning. This includes the process for tracking risks, identifying new risks, executing risk response plans, and evaluating their effectiveness.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

9 CI Service Quality

9.A Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.

Unisys will integrate new agencies, customers and services into our total quality approach. The quality approach begins with the Service Excellence Office. The SEO function provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the

Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

10 CI Client Satisfaction

10.A Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

11 CI Service Transparency

11.A Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.

The service organizations will use standardized ITSM services processes, IT monitoring & automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

12 CI Service Sustainability

12.A Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.

Service will be sustained by integrating any new agencies, customers, or services into our standard operational and quality processes and methodologies leveraging ITIL processes, creating quality project plans, utilizing industry accepted measurement and monitoring tools, analyzing trending reports and providing proactive continuous service improvement throughout the IT lifecycle. These processes and methodologies enable new Commonwealth services to experience and sustain IT services and client satisfaction.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

Unisys continuous improvement examples

In 2010, the Integrated Enterprise System (IES) ERP environment was transitioned into the DPH by the Unisys Team. Leveraging lessons learned from the Pennsylvania Liquor Control

Board ERP transition of 2008, project plans were more formally documented and communication methods were improved for the IES migration. We are routinely learning from project activities. After the implementation of IES, the DPH team implemented a formal quality improvement program with IES consisting of a 48 question written survey, in-depth analysis, a formal management interview and joint development and tracking of action plans. This has resulted in a 30% increase in overall agency satisfaction in less than 2 years.

13 CI Improve or Reduce Cost

13.A Offeror must provide examples of previous technology initiatives implemented by Offeror that achieved reduced costs of Services and that met or exceeded ROI (Return on Investment) analysis projections.

Unisys is establishing a Service Excellence Office to proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys provides best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Unisys Team Experience

Unisys and IBM regularly handle large-scale incremental workload additions and deletions for data center outsourcing customers around the world. Most recently, we managed the integration of two brand-new Commonwealth customers into the DPH, the Pennsylvania Liquor Control Board and the Integrated Enterprise System (IES), both critical Commonwealth ERP systems. Additionally, we have performed significant technology refreshes, the largest of which was the transformation of 2008 and 2009, which provided new infrastructure to every agency supported in the DPH.

In 2012, the DPH team migrated critical applications for four agencies from the IBM z10 mainframe platform to the IBM z196 platform. This migration was conducted using the same project plans that were used to conduct the move to the IBM z10 in 2009 during transformation. All agency workload was relocated with minimal risk or disruptions.

It is through projects like these that the Unisys Team has gained considerable knowledge of agency configurations, priorities, and business needs. This knowledge will help us to effectively plan successful transitions for Commonwealth workload regardless of the scope and complexity.

Benefits to the Commonwealth

Unisys and IBM have worked together on migrations, technology refreshes, and changes in scope for the Commonwealth agencies for several years. Our processes have been honed to reduce risk and minimize downtime.

Unisys, IBM and Deloitte know the Commonwealth culture, know many of their environments and have strong relationships with the agencies. This knowledge and the relationships that have been forged over the years of working together give this team a significant advantage. We

know what to expect from each other, we know how each other works and we have large, strong companies behind us with a strong understanding of the industry and technologies.

Throughout the program you will no doubt see this team bringing in new team members who bring with them industry experience from other large companies. The synergies of combining the Commonwealth, Unisys, IBM, Deloitte and the diverse experience of the new team members will no doubt provide a world class solution for the Commonwealth which we believe can be achieved faster, with higher quality and a lower cost.

3.2.2.2 Infrastructure Architecture

The Infrastructure Architecture service will define and manage the scope and design of the infrastructure architecture for the computing systems to support the evolving needs of the Commonwealth. This range of Services includes design of the mainframe, mid-range, x86 servers, (both physical and virtual), Local Area Network (LAN), storage, backup systems, and the DR systems. The design will also need to detail how the most current data will be restored to the targeted DR system.

Efforts are underway to re-write many of the Commonwealth business applications. For example, some of the mainframe applications are being migrated to newer server based systems. The Offeror must consider the planned retirement of some of the mainframe workload, and at the same time consider the offsetting growth in other server platform environments.

At the direction of the Commonwealth, the Offeror must transition Commonwealth based computing infrastructure to one of the datacenters. The Offeror must work with the Commonwealth agencies to understand the systems involved, and the timeframe of these migrations. Working with the Commonwealth agencies, the Offeror must provide the design, project management, hardware and technical support required to test and migrate these systems to the new production environment. At its discretion, each agency will provide the applications staff to support the migrations.

The Infrastructure Architecture service will review and recommend hardware, software, and the technical configurations required to build the requested infrastructure environments. Prior to migrating each of the current application workloads to the new target infrastructure, the Offeror must work with each Commonwealth agency to develop a mutually agreed to Acceptance Test Plan that includes the testing of application infrastructure performance characteristics.

Requirements		Describe Compliance
1.	Define the infrastructure technology Services to be offered. Provide a detailed list of Services and computer platforms to be provided to the Commonwealth.	Offeror must describe its ability to provide infrastructure technical Services across multiple computing platforms (mainframe, mid-range and x86). Include explanation of different service tiers (e.g. gold, silver and bronze).
2.	Design and build the IT infrastructure architecture to support the Services required by the Commonwealth. Design will provide as much interoperability and open standards as possible. All designs must be approved by the Commonwealth. Provide the design in a Visio format to the Commonwealth for review and approval prior to execution. This diagram will be dated and maintained as Services are altered for the duration of the engagement.	Offeror must describe its methodology and approach to infrastructure architecture design Services. Offeror must describe the documentation requirements, timelines for both normal requests and emergency situations. Offeror must provide representative sample of infrastructure design documentation.
3.	Address CJIS and Criminal History Record Information Act (CHRIA) requirements for agency application infrastructure designs where required. Some agency application infrastructure designs (e.g. PSP) require additional security and encryption level requirements imposed by CJIS.	Offeror must provide examples of its experience in designing infrastructures that adhere to CJIS and CHRIA requirements.
4.	SAP Infrastructure Design The Offeror's proposed target infrastructure design for the	Offeror must provide examples of its experience in sizing and design of SAP infrastructures. All designs must be approved

	Commonwealth's SAP environments must include a certified SAP sizing report prior to migration of the systems.	by the Commonwealth.
5.	Commonwealth Wide Area Net connectivity. Provide connectivity from the datacenter to the Commonwealth Network. Redundant network links are required.	Offeror must describe its capabilities to connect to and manage the requisite connections. Explain ongoing network support Services to manage these links including the ability to increase capacity as needed to support changes in the application infrastructure requirements.
6.	Develop Acceptance Test Plan. Prior to migrating each of the current application workloads to the new target infrastructure, the Offeror will work with each Commonwealth Agency to develop a mutually agreed to Acceptance Test Plan that includes the testing of application infrastructure performance characteristics.	Offeror must discuss its proposed approach to systems acceptance testing and include the approach to performance testing.
7.	Provide System Acceptance testing. The Offeror must conduct system acceptance testing, and provide the Commonwealth with written verification prior to declaring the system is fit for use. This acceptance test must include validation of infrastructure performance against system performance characteristics agreed to by both parties.	Offeror must discuss its proposed approach to systems acceptance testing.
8.	Ready for use certification	Offeror must provide the Commonwealth with written verification prior to declaring the Service is ready for use. The Service will not be considered ready for use until written acceptance is obtained from the Commonwealth.

9.	Support User Acceptance Testing.	Offeror must support the Commonwealth's user acceptance testing. The Commonwealth shall not be charged for Services until written acceptance is obtained from the Commonwealth.
10.	Provide Application Infrastructure environments. Provide non-production and production environments for each of the application computing platforms. The non-production environments will be used for testing new technologies and applications, updates and upgrades, prior to production implementations.	Offeror must describe its approach to the design and management of multiple application infrastructures. Identify proposed solution to individual or consolidated non-production environments for agencies.
11.	Design service lifecycle. Provide the infrastructure design for the Services and platforms to be offered. Provide ongoing evaluation and recommend new technologies to enhance, improve, and reduce the cost of Services.	Offeror must describe its approach to provide service lifecycle design for all Commonwealth computing platforms and associated infrastructures. Offeror must provide the Commonwealth and its agencies the ability to request new technologies to be available.
12.	Define Technical Support functions.	Offeror must list Offeror's support staff levels required to plan, manage, and operate the IT infrastructure, based on the various service levels offered.
Continual Service Improvement		
13.	Reduce service risks.	Relative to the service in question, Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.
14.	Improve service quality.	Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.

15.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
16.	Provide service transparency.	Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.
17.	Ensure service sustainability.	Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.
18.	Improve/reduce cost of service	Offeror must provide examples of previous technology initiatives implemented by Offeror that achieved reduced costs of Services and that met or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K - Key Program Deliverables**

Offeror Response

Introduction

The Unisys team understands that this RFP is much broader and far more significant than simply consolidating infrastructure. In the same way, the Infrastructure Architecture service is about more than just providing platforms and technologies to the Commonwealth. Properly designed and implemented, architecture services become a powerful tool to be utilized by the Commonwealth to meet its compute needs now and in the future, while driving efficiency, scalability and compatibility into the enterprise. The essence of the Infrastructure Architecture service is optimized “compute services,” supporting the Commonwealth’s applications by providing the right service in the right capacity when it is needed and in a way that is cost effective, transparent, and secure.

As you will see below, the Unisys team has selected a common hardware platform, the IBM Flex system, for all AIX, Windows and Linux servers. This platform will deliver all IaaS and Fully Managed and Capacity on Demand services. Using a common hardware platform eliminates risk in interoperability, bringing the Commonwealth a common deployment process across all server platforms via the Enterprise Services Catalog. Standardized hardware platforms also allow powerful workflow automation to be deployed very quickly. Additionally, compute workloads on AIX, Linux and Windows can now share the same blade chassis backplane where necessary and mixed workloads can be completely isolated down to the chassis level. This confirms that the Unisys team can respond quickly and confidently to any future regulatory or compute

requirements in the future.

From a storage perspective, the Unisys team has taken the approach of providing choice to the Commonwealth. No longer is it necessary to sacrifice the benefits of one storage solutions to choose another. Both IBM and EMC solutions are available to the Commonwealth, again reducing the risk of incompatibilities and increasing operational stability and performance. By utilizing storage virtualization, the Unisys team will deploy a storage solution capable of isolation when needed, maximizing reuse of storage, and providing powerful building blocks on which to run disaster recovery.

The Unisys team's Infrastructure Architecture service is designed to provide power, flexibility and agility, stability and security to the Commonwealth in a cost effective manner. When the transition to the new service is complete and the benefits are realized, the industry will recognize this initiative for what it is—a paradigm shift in service delivery for state government.

1 Infrastructure Service Tiers

1.A Define the infrastructure technology Services to be offered.

The Unisys Team offers a solution that provides these managed infrastructure technology services:

- Unisys OS2200
- IBM zSeries
- IBM iSeries
- Network
- Security
- Server/Midrange
- Storage
- Backup
- Disaster Recovery
- IaaS Services
- Data center Facilities

1.B Provide a detailed list of Services and computer platforms to be provided to the Commonwealth.

Figure 3.2.2.2-1 below shows the computer platforms the Unisys team will deploy the following technologies as part of the Infrastructure Architecture services. Following, there is a description of each of the technologies, and overview of how the Unisys team will utilize those technologies, and the section of this proposal where further information can be found.

Figure 3.2.2.2-1 - Detailed List of Infrastructure Services

- [redacted] blade technologies will be utilized by the Unisys team to provide all x86 server services to the Commonwealth. The Flex Systems form the infrastructure for both virtualization and physical servers. Utilization of this technology provides the Commonwealth with power and agility, able to meet the compute needs of the Commonwealth now and into the future. For more information on how the Unisys team will utilize x86 Pure Systems, please refer to Schedule F, Sections 3.2.4.1, Windows Support; 3.2.5.1, Server Capacity on Demand, and the Linux section of 3.2.4.4 Unix Support.

- [redacted] is an AIX variant of the Flex Systems line of blade servers. The Unisys team will deliver all AIX services referenced in this RFP on this platform. Combined with the x86 Flex, the Unisys team brings to the Commonwealth the unique ability to co-locate AIX, Linux and Windows workloads in the same blade chassis. For more information on the use of the IBM pSeries Flex Systems, please see Schedule F, Section 3.2.4.4 Unix Support.

- [redacted] processor based mainframe which the Unisys team will utilize to deliver Unisys mainframe services to the Commonwealth. Please see Schedule F, Section 3.2.4.5 Mainframe Support for more information.

- [redacted] is an x86 processor based mainframe which the Unisys team will utilize to deliver Unisys mainframe services to the Commonwealth. Please see Schedule F, Section 3.2.4.5 Mainframe Support for more information.

- [redacted] is the mainframe on which the Unisys team will deliver both IBM mainframe and zLinux services to the Commonwealth. Please see Schedule F, Section 3.2.4.5 Mainframe Support for more information.

- [redacted] designed for high performance, reliability, and flexibility and will be utilized by the Unisys team to provide storage to the [redacted] mainframe. Please see Schedule F, Section 3.2.4.5 Mainframe Support for more information.

- [redacted] is a high-end disk storage system designed to provide consistent performance, high availability and simple usability. The [redacted] will be one of the storage platforms the Unisys team will utilize to deliver storage services to the Commonwealth. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] provides storage virtualization by presenting itself to server hosts as a storage device, and to storage devices as a server host. Utilization of the [redacted] brings power and agility to the Commonwealth at the storage layer, and compliments the virtualization at the server layer. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] is a virtualization engine (virtual tape library) for [redacted] mainframes that uses disk drives for cache to accelerate backup operations. The design is intended to protect data while having shorter backup windows. End-to-end encryption protects data in motion, on cache hard drives and on tape. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] is an enterprise class storage system, used by the Unisys team to deliver storage to open systems and [redacted] mainframes. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] Series storage devices provide both file and block storage services. The Unisys team will utilize the [redacted] Series as one of the storage options available to the Commonwealth through the Enterprise Services Catalog. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] as one of the options to provide the Commonwealth tape based backup and recovery services. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] will be used by the Unisys team to deliver VTL services for the [redacted] mainframes. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] is equivalent in many ways to the [redacted] capable of storage virtualization and replication of data and virtual machines across data centers. The Unisys team will use [redacted] as one of the storage service options for the Commonwealth. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] is a continuous data protection solution offered by [redacted] which supports asynchronous and synchronous data replication of block based storage. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] – The Unisys team will utilize [redacted] to perform de-

duplication of disk based backup. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] will be utilized by the Unisys team to provide tape based backup and recovery services to the Commonwealth. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] will be utilized by the Unisys team to provide tape based backup and recovery services to the Commonwealth. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] will be utilized by the Unisys team to provide tape based backup and recovery services to the Commonwealth. Please see Schedule F, Section 3.2.4.2 Storage Management for more information.

- [redacted] is a web-filtering, content caching internet perimeter security device for large enterprises. The Unisys team will deploy [redacted] to provide internet security and content filtering to the Commonwealth. Please see Schedule F, Section 3.1.2 Network and Security Architecture.

- [redacted] is a distributed sniffer system. The Unisys team will utilize [redacted] to quickly analyze problems on the network or to isolate problems specific to an application. Please see Schedule F, Section 3.1.2 Network and Security Architecture.

- [redacted] Nexus Routers and Switches – Long recognized as a leader in data center networking, the Unisys team will utilize [redacted] Nexus routers and switches to provide the Commonwealth LAN and WAN services. Please see Schedule F, Section 3.1.2 Network and Security Architecture.

- [redacted] Firewalls – The Unisys team will deliver network firewall services to the Commonwealth using [redacted] Firewalls. The [redacted] firewalls chosen by the Unisys team allow advanced functionality at the firewall layer. Please see Schedule F, Section 3.1.2 Network and Security Architecture.

- [redacted] load balancers deployed by the Unisys team will offer the Commonwealth ubiquitous load balancing of applications across data centers. Please see Schedule F, Section 3.1.2 Network and Security Architecture.

1.C Offeror must describe its ability to provide infrastructure technical Services across multiple computing platforms (mainframe, mid-range and x86). Include explanation of different service tiers (e.g. gold, silver and bronze).

The Unisys team has extensive experience operating and managing complex, mixed computing environments globally. This experience, combined with a common IT Service Management Platform and ITIL V3 aligned processes designed to maximize the capabilities of that platform, allow the Unisys team to manage a complex environment such as the Commonwealths, while increasing efficiency and bring savings year over year to the Commonwealth.

From the perspective of technical capabilities and the ability to provide Infrastructure Architecture services for the Commonwealth, the Unisys team has more experience on the critical platforms that house the Commonwealths applications than any other provider in the

industry. Whether it is Unisys or IBM mainframes, AIX, Windows, Linux or storage, the Unisys team can bring expertise and experience from level 1 though level 4. Additionally, the Unisys team has either in house level 4 expertise, or the close relationships that can be leveraged to bring that expertise to the Commonwealth.

The Unisys Infrastructure Architecture solution, combined with a common IT Services Management platform and ITIL V3 processes, provides a tightly integrated solution to manage the availability standards required in the Commonwealth RFP. The table below describes the characteristics associated with each of our levels of service.

Tiered Support Level	Description
Platinum	• **Provides 99.999% Application Infrastructure Availability** • **Server is monitoring via** [redacted] • **Fully Managed Services** • **Asset Tracked In CMDB** • **Requires 3 active servers load balanced and geographically dispersed**
Gold	• **Provides 99.99% Application Infrastructure Availability** • **Server is monitoring via** [redacted] • **Fully Managed Services** • **Asset Tracked In CMDB** • **Requires 2 active servers load balanced and geographically dispersed**
Silver	• **Provides 99.9% Application Infrastructure Availability** • **Server is monitoring via** [redacted] • **Fully Managed Services** • **Asset Tracked In CMDB**
Bronze	• **Provides 99.4% Application Infrastructure Availability** • **Server is monitoring via** [redacted] • **Fully Managed Services** • **Asset Tracked In CMDB**
Basic	• **Provides 98.5 % Application Infrastructure Availability** • **Server is monitoring via** [redacted] • **Fully Managed Services** • **Asset Tracked In CMDB**

Based on the tired Service Levels, the Unisys team will provide the Commonwealth a tiered approach to the UNIX environment. For the Platinum (99.999%) support level the Unisys team will enlist all three Unisys data center to provide an active-active-active solution with all components being fully redundant and each site supporting 50% of the peak load The three sites will provide redundancy and will allow for planned outages in one site at a time. For the Gold (99.99%) level support, the Unisys team will enlist two of the Unisys data centers and provide an active-active solution with all components being fully redundant with automatic failover. For Silver (99.9%) the Unisys team will require only one of the Unisys data centers for production. For Platinum, Gold and Silver support levels, clustering and/or load balancing (either application or infrastructure level) will be required. For Bronze (99.4%) and Basic support a single data center is sufficient and clustering is not required.

More details on the specific components required to meet the service tiers can be found in Schedule C – Services Catalog.

2 Architectural Design Service, sample

2.A Design and build the IT infrastructure architecture to support the Services required by the Commonwealth. Design will provide as much interoperability and open standards as possible. All designs must be approved by the Commonwealth

As described in Schedule F, Section 3.2.1.5 Technical Architecture, Unisys had two governing principles in the service design for the Commonwealth: first, standardization of the compute environment, as much as possible, in each of the hardware towers, and second, to leverage technology that can be redeployed rapidly to other purposes. The Unisys Team believes that from a server perspective, this is the easiest way to achieve the Commonwealth's goal of interoperability.

The infrastructure architecture services rely on the interoperability in the service design to provide uniform tools to manage and monitor the infrastructure services. The Unisys suite of infrastructure monitoring tools includes the Nagios collectors which use open standard SNMP protocols to monitor hardware and service components. The tool suite also includes the [redacted] tool, which provides storage management by relying on the open standard "Storage Management Initiative – Specification" SMI-S storage management protocol established by the Storage Network Industry Association.

While not technically an open standard the [redacted] provides a means of managing components across many vendor product lines and report on availability, capacity, and performance.

The Unisys Infrastructure Architecture uses an online Real-time Dashboard to provide the Commonwealth with access to automated data collection, visualization of graphical results, and focus on high-impact critical application components.

The Infrastructure Architecture relies upon hardware components that present opportunities for interoperability. The [redacted] for instance supports Windows, Linux, and AIX in virtual or physical instances. The proposed SAN solution provides interoperability between storage provided by many vendors and to all provided servers and tape drives.

By maintaining an architectural governance process which includes the Commonwealth's approval, the Unisys Team provides transparency into the overall architecture and design activities. The overall approach for architecture development including the Commonwealth's approval is in Section 3.2.1.5 Technical Architecture and the types of service requests are described in Section 3.2.1.1.5 Additional Planning Services.

2.B Provide the design in a Visio format to the Commonwealth for review and approval prior to execution. This diagram will be dated and maintained as Services are altered for the duration of the engagement.

As a part of the overall solution documentation, the Agency Infrastructure Architect will create a Visio diagram that provides a view of the solution's topology for review and approval prior to implementation. This diagram will be maintained in the Services Portal with version control to reflect any subsequent changes to the configuration.

2.C Offeror must describe its methodology and approach to infrastructure architecture design Services.

The Unisys Team uses a design methodology which covers activities from the initial requirements gathering to the final approval by the Commonwealth to maintain the consistency in the designs and service development.

The infrastructure architecture design services flow from the ITIL V3 Service Design process described in Schedule F, Section 3.2.1.5 Technical Architecture Requirement 2.

2.D Offeror must describe the documentation requirements, timelines for both normal requests and emergency situations.

Offeror must provide representative sample of infrastructure design documentation.

As the Commonwealth's business needs change, different types of requests may be submitted to the Unisys team for various solutions and activities. These requests can go from activities to perform regular pre-approved functions to complex solution development or investigations supporting Agency projects or plans.

The Unisys Enterprise Architecture group follows ITIL-based Service Design processes to gather, formalize, and deliver Infrastructure Architecture to meet the Commonwealth's strategic business initiatives.

The timeline to deliver the Infrastructure Architecture design solutions depend on a number of factors, including the type of request, the scope of request, urgency and the complexity. For example, Unisys expects to develop and present a solution within 2-4 weeks on average for a service request of an average complexity within one functional area. Additional details and guidelines are outlined in Schedule F, Section 3.2.1.1.5 Additional Planning Services.

The Enterprise Architecture uses standard documentation to capture Commonwealth and Agency requirements within Unisys Architecture templates that are build out to become infrastructure design documents. See **Attachment F-3 – AMOS Enterprise Architecture Project SOW** and **Attachment F-4 Technical Architecture Deliverable Guide** for two sample architecture template documents that are used to guide Unisys architects in the design of infrastructure architecture.

3 CJIS and CHRIA Examples

3.A Address CJIS and Criminal History Record Information Act (CHRIA) requirements for agency application infrastructure designs where required.

As part of the Transition planning and solution request activities, Unisys will work with the Commonwealth agencies to identify the regulatory requirements, including CJIS and CHRIA, which must be supported within the infrastructure architecture to deploy the agency applications on Unisys supported infrastructure. The Commonwealth's regulatory interpretations are an important part of how Unisys will identify and recommend the appropriate solution to meet and maintain the Commonwealth's regulatory compliance.

Unisys has included several options, including data in motion and data at rest encryption, to protect regulated data. As Pennsylvania State Police (PSP) and other agencies with CJIS or CHRIA requirements are migrated to Unisys supported infrastructure, the requirements from Exhibit G.7 (Summary of CJIS Requirements) will be used as the initial requirements to begin identifying CJIS and CHRIA regulatory requirements with designated agency participants including the Chief Information Security Officers (CISOs) of the Commonwealth and individual agencies.

Proposed solutions supporting regulatory requirements will go through a solution review and approval within the Unisys team and subsequently with the Commonwealth review boards and agency CISO before being implemented.

Unisys currently supports Commonwealth solutions with CJIS or CHRIA regulations. Unisys provides support for the infrastructure, including networks, servers, and storage, supporting PSP's CCHRI, CLEAN, Megan's Law and PATCH applications. Unisys works with PSP to maintain the infrastructure to PSP's facility and physical requirements for CJIS and CHRIA. Unisys also provides support for PSP during audits and develops solutions to update the infrastructure or physical environment's processes or implementation to maintain compliance.

In addition, Unisys has provided and continues to provide support for the CCHRI, CLEAN and PATCH applications themselves, including collaborating with PSP on defining the infrastructure requirements to meet CJIS and CHRIA requirements. [redacted] the proposed Unisys Security Manager, is part of the application support team and was responsible for meeting the CJIS and CHRIA requirements in the recently completed CLEAN upgrade.

3.B Offeror must provide examples of its experience in designing infrastructures that adhere to CJIS and CHRIA requirements

Apart from the Commonwealth experience referenced in 3A above, the Unisys Team designed a data and records management system for the Alabama Criminal Justice Information Center that was also required to meet the CJIS and CHRIA requirements.

The Alabama Criminal Justice Information Center (ACJIC) is a state agency providing local, state, and federal criminal justice agencies with the information needed to provide citizen safety.

ACJIC realized that gaps in its information technology were hindering communications and business continuity. It needed to more efficiently deliver critical information from its network and systems.

Maury Mitchell, Director of ACJIC explains, "We're connected to the FBI's National Crime Information Center, and we're in sync with all 50 states via the National Law Enforcement Telecommunication System. As such, our web applications handle about 18 million transactions a month. We were leasing space and time on the state's mainframe for data storage – a system we don't own – performing backups on tape and manually delivering them to a site a few blocks away for disaster recovery. We needed our own scalable, reliable, cost-effective system that would grow with our needs and provide hot failover."

ACJIC decided to change the way it was doing business. Jim Walker, Homeland Security Director for the State of Alabama, comments, "We had an opportunity to build redundancy into our system and improve the availability and use of information. We needed a solution that would build trust and deliver value to our user population."

ACJIC explored several solutions and solution providers before choosing Unisys to help establish an IT infrastructure specifically designed to address the agency's requirements.

Enhancing officer and citizen safety while building trust among constituents – by re-engineering the IT infrastructure to improve communications and business continuity.

By implementing a solution based on Unisys ES7000/one and SafeGuard 30m technology, the Alabama Criminal Justice Information Center created a dependable, cost-effective system that delivers real-time information to end users, supports future growth, and provides robust, reliable operations.

Results: Unified Law Enforcement through a Real-Time Infrastructure. The center's more powerful and resilient IT infrastructure has improved real-time communications among multiple levels of criminal justice agencies – enabling greater collaboration, and ultimately, a better response to criminal activities and other security concerns.

Metrics

- **Better Security:** Reduced downtime and risk – 24x7 availability with failover in less than one minute from the primary site to the disaster recovery site
- **Reduced Costs:** Lowered costs while processing some 18 million transactions monthly
- **Improved Satisfaction:** Enhanced citizen and officer safety by ensuring a constant flow of real-time information
- **Better Productivity:** Enabled one-to-two-second searches for up to 40 million records in the Law Enforcement Tactical System

4 SAP Design Examples

4.A The Offeror's proposed target infrastructure design for the Commonwealth's SAP environments must include a certified SAP sizing report prior to migration of the systems

A SAP sizing report is an important element of developing solutions to implement, upgrade or migrate SAP environments. As part of the Transition planning to migrate the SAP environments and during requirements gathering for solution requests, Unisys will work with the Commonwealth to identify the requirements and the product vendors to generate the SAP sizing report and other component recommendations.

Proposed solutions supporting the SAP implementations go through a solution review and approval within the Unisys team and subsequently with the Commonwealth review boards before being implemented.

During the data gathering phase, the IBM Insight for SAP utility program will be installed and run on the SAP systems of interest. The IBM Insight for SAP utility program and its subsequent reporting and analysis process provide a convenient, high-level, workload analysis for in-production SAP system landscapes. The analysis includes actual active user counts, machine utilizations, user/module load distributions, dialog counts, information about batch and reporting usage, system information and database information.

Output from the IBM Insight for SAP utility program and other information gained during the Due Diligence process will be used to perform SAP sizing.

4.B Offeror must provide examples of its experience in sizing and design of SAP infrastructures. All designs must be approved by the Commonwealth.

The Unisys Team has a global network of more than 35 SAP Competence and Excellence Centers including the flagship IBM SAP International Competence Center (ISICC) near SAP headquarters in Walldorf, Germany, which opened in 1993, that will support this process. The Commonwealth has utilized this process for successful sizing since the initial sizing for IES in 2001.

See **Attachment F-5 – Sample SAP Sizing Estimate**, for a recent sizing report.

The Unisys Team supports the Commonwealth's SAP initiatives through collaboration between the Commonwealth stakeholders and technology vendors as indicated in the following examples.

A large German multinational, technology-based group of manufacturers and developers of glass, special glass, specialty materials, components, and systems to improve how people live and work had a 5-year full outsourcing contract with an outsource vendor who competes with Unisys and who also held a managed services contract to operate all of the customer's business critical SAP systems and infrastructure.

In the course of a data center move, the customer began to have severe doubts about the incumbent's migration plan to move their global ERP system to a new German site. The customer lacked confidence in the provider's sizing and design of the new infrastructure and the transition plan overall.

In this case SAP recommended Unisys as a transition partner to the customer. Unisys was able to identify critical issues in the migration plan which the incumbent vendor recognized and corrected. As a result of this effort Unisys was hired to safeguard the ERP transition over Christmas.

As part of the Unisys on call support, the Unisys SAP team received calls on issues which they were able solve within 30 minutes resulting in a successful transition. As a result of this activity the customer has indicated a desire to bring Unisys expertise into future SAP projects.

In another example, a world market leader in special steels with approximately 350 subsidiaries and about 550 employees were undertaking a strategic effort to deploy SAP at their largest subsidiary.

Due to past project work, the Unisys SAP team was highly recommended by the SAP Chief

Infrastructure Architect and the Head of Operations. An internal business unit pushed the operation team into deploying IBM Power/AIX platform for the new SAP environment. This platform represented a break from their standard x86 computing resources.

The Unisys SAP team:

- Provided Sizing and Design for the new infrastructure
- Mentored the existing operations team in preparation for the IBM implementations with Unisys experience drawn from quite similar industries
- Tailored an implementation plan avoid some potential landmines e.g. using the processor clock speed as major decision criteria
- Opened a flood gate of access to Unisys expertise and access to key individuals with access to the Unisys real-world knowledge of SAP infrastructure environments together with the help of [redacted]´s and Intel´s development centers Led the operations team to strategic and vendor independent assessments to manage expectations for their internal business customers

As a result of this effort the customer continues to engage the Unisys SAP project team in cases where new projects reach beyond operations team's common skill sets.

5 Wide Area Net Connectivity

5.A Provide connectivity from the data center to the Commonwealth Network. Redundant network links are required.

The Unisys solution for intra-data center connections provides redundant and diverse connections. The Unisys Enterprise Services Catalog also includes methods by which the Commonwealth can expand bandwidth services as Agencies take advantage of replication services and disaster recovery services for critical applications.

For more details on the Network Architecture see Schedule F, Section 3.1.2.

5.B Offeror must describe its capabilities to connect to and manage the requisite connections

The fiber purchased from the telecommunication providers will terminate directly into [redacted] Nexus switches, allowing the deployment of [redacted] "[redacted] technology across the three sites. Using [redacted] a Layer 2 multipath network will be built without the Spanning Tree Protocol (STP) being deployed. This new network design is particularly suitable for large virtualization deployments, private clouds, and high-performance computing (HPC) environments.

The Unisys solution integrates SolarWinds with Nagios collectors to provide monitoring and management of the required circuits.

For more details on the Network Architecture see Schedule F, Section 3.1.2.

5.C Explain ongoing network support Services to manage these links including the ability to increase capacity as needed to support changes in the application infrastructure requirements.

The design is flexible enough that the solution can be adapted to higher capacity requirements if this becomes necessary as the Commonwealth's needs increase significantly.

The Commonwealth can request changes to the network capacity through the Enterprise Services Catalog to meet changing application bandwidth requirements. The Enterprise Services Catalog requests initiate the process flows to manage request fulfillment. The Enterprise Services Catalog request also initiates supplements to the bandwidth monitoring, reporting, and management infrastructures.

The ongoing network support is provided through the integration of network tools and components with the Nagios collectors. The Nagios collectors feed data concerning any service anomalies into the ITSM monitoring and incident infrastructure which is described in detail in Schedule F, Section 3.2.3.2 Site Operations.

6 Test, Acceptance Test Plan

6.A Prior to migrating each of the current application workloads to the new target infrastructure, the Offeror will work with each Commonwealth Agency to develop a mutually agreed to Acceptance Test Plan that includes the testing of application infrastructure performance characteristics.

Unisys will support each Agency migration team during the Transition planning cycle to develop an acceptance test plan to validate that supporting infrastructure required for the application has been successfully readied for normal operations. The Unisys Team will review and support the Commonwealth plan to designate groups of application support resources and the durations for each portion of the test. The test plan will be included in the overall migration plan and tracked as a project milestone. For detailed descriptions of the transition processes and procedures that will be followed to develop a mutually agreed to Acceptance Test plan for infrastructure that supports applications see Schedule F, Section 3.3 Transition Services.

6.B Offeror must discuss its proposed approach to systems acceptance testing and include the approach to performance testing.

Unisys recommends that the Commonwealth tests their applications using the available service level test infrastructure to validate that the application will operate and meet the requirements for the service level the Agency requests for each application.

The acceptance test plan will include the following elements at a minimum:

- Connectivity testing – Can the systems be reached from the required locations?
- Data Flow testing - Can the components of the application reach each other and other required applications?
- Failure testing – If a part of the system goes offline (e.g. web server), does the rest of the system compensate in the same manner as it did in the original environment?

For detailed descriptions of the transition processes and procedures that will be to the Commonwealth and its Agencies to validate systems acceptance testing for infrastructure that supports applications, see Schedule F, Section 3.3 Transition Services.

7 Test, Acceptance Testing

7.A The Offeror must conduct system acceptance testing, and provide the Commonwealth with written verification prior to declaring the system is fit for use. This acceptance test must include validation of infrastructure performance against system performance characteristics agreed to by both parties

The Unisys Team will include validation of infrastructure performance against system performance characteristics agreed to by the Commonwealth and provide written verification prior to declaring the system is fit for use. Unisys will work with manufacturers to obtain scripts or routines that can be executed to determine system level performance prior to application installation. Any system performance issues identified prior to application installation will be escalated to the vendor prior to declaring the system fit for use.

7.B Offeror must discuss its proposed approach to systems acceptance testing.

The following list represents the services the Unisys Team will perform for acceptance testing and support:

- System build – A joint Commonwealth and Unisys Team activity that provides the hardware and software environment for baseline test, development, quality assurance, and production environments. The baseline and development environments will need to be in place in time to support the start of the baseline testing stage. The Unisys Team is responsible for management and configuration of the operating system and associated components provided through the Enterprise Services Catalog.
- Baseline testing stage including test scripts – existing environment – This activity is performed by the Commonwealth with Unisys assistance to produce valid acceptance criteria along with test plans and accompanying data prior to the start of migration.
- Baseline testing stage including test scripts – new environment – The Unisys Team will run the previously specified acceptance tests developed during baseline testing on the incumbent systems against the ported applications running on the target platforms. This is done until the applications meet the success criteria defined by the acceptance test criteria developed during baseline testing. Once Unisys has validated that the base operating system functions to expected specifications Unisys will support the Commonwealth's application team efforts to test the application. At the Commonwealth's convenience the application can be moved to the appropriate compute resource on production-ready systems for final acceptance and consolidation testing.

8 Ready for Use Certification

8.A Offeror must provide the Commonwealth with written verification prior to declaring the Service is ready for use. The Service will not be considered ready for use until written acceptance is obtained from the Commonwealth.

As Unisys deploys a new service or technology, a written ready for use verification of the results of the system acceptance tests and met service requirements will be submitted to the Commonwealth for its acceptance. The customer services will not be migrated onto the new service or technology until the Commonwealth provides a written acceptance of the ready for use verification.

9 Test, User Acceptance Testing

9.A Offeror must support the Commonwealth's user acceptance testing.

The following list represents the services the Unisys Team will perform for the acceptance testing and support:

- Manage support for the Commonwealth testing and User Acceptance Runs (UARs) in collaboration with changes made to base operating system, operating system subsystems, software, database subsystems, data communications subsystems, compilers, programming languages, or operational/support tools.
- Support diagnostic and recovery tools.

9.B The Commonwealth shall not be charged for Services until written acceptance is obtained from the Commonwealth."

The Commonwealth will not be charged for services until Commonwealth written acceptance is obtained by the Unisys Team.

10 Application infrastructure Environment

10.A Provide non-production and production environments for each of the application computing platforms. The non-production environments will be used for testing new technologies and applications, updates and upgrades, prior to production implementations.

The Unisys Team understands the need to leverage a non-production environment to test updates and upgrades prior to production implementation. The Unisys solution includes the availability of computing platforms for test environments with servers for each of the configurations specified in the Schedule I, Volumetrics. As required, these can be provisioned via the Enterprise Services Catalog with storage quantities that match average storage quantities for servers based on the total server and storage counts in the Schedule I, Volumetrics.

10.B Offeror must describe its approach to the design and management of multiple application infrastructures.

Unisys manages multiple application infrastructures by embedding the logical application relationships to physical and virtual components within the sophisticated CMDB that provides the service mapping between applications and the supporting physical and virtual compute assets and services.

The selection of services and components from the Enterprise Services Catalog to support applications initiates the processes to update these selections with the appropriate application identifications within the CMDB.

The Unisys solution relies upon the CMDB process to audit and manage the multiple application infrastructures. The Commonwealth can define infrastructure bundles to track to specific application infrastructure. The Unisys ITSM infrastructure uses the CMDB and incident tickets logs to provide measurement and monitoring at the overall application layer.

More details descriptions of this process are available in Schedule F, Section 3.2.3.2 Site

Operations.

10.C Identify proposed solution to individual or consolidated non-production environments for agencies.

The Unisys solution provides extensive service options through the Enterprise Services Catalog to enable the Commonwealth to build individual or consolidated non-production environments to a variety of agency specifications.

11 Service Lifecycle

11.A Provide the infrastructure design for the Services and platforms to be offered.

Every service and associated technology and infrastructure proceeds through a lifecycle from concept to retirement. The actual lifecycle of individual services will be based upon several factors including ongoing business need, availability of technical components, and availability of replacement services. To support the Commonwealth's ongoing and changing business requirements, the Unisys team has developed the data center managed services with long and flexible lifecycles. In addition to the Technology Refresh Plan recommendation to upgrade or replace the technology deployments supporting many of these services, other elements of the service will be adjusted and updated over time through the continuous improvement process.

The enterprise architecture team will use Commonwealth requirements, portfolio offering, manufacturer updates, and industry trends to identify potential new service or technology offerings. In addition, the Commonwealth may request the Unisys team to review services or technologies by submitting a service request for a technical opinion, conceptualization, or cost-benefit analysis.

11.B Provide ongoing evaluation and recommend new technologies to enhance, improve, and reduce the cost of Services

All new or modified services and supporting technologies will follow the same activities before being implemented and made available for use within the Commonwealth environment.

- Requirements collected, reviewed and approved
- Solution documented
- Solution reviewed and approved by the Unisys Solution and Architecture Review Board
- Solution reviewed and approved by the Commonwealth Solution and Architecture Review Board
- Solution deployed and testing using an approved System Acceptance Test
- Approved by the Commonwealth for service implementation and requests.

Unisys will continue to provide Innovation Workshops for the Commonwealth. Unisys views these as essential to provide the opportunity for collaboration, technical information exchanges, and forums that will address issues, needs, and interests of the Commonwealth team. These Innovation Workshops are a key component of our overall Continuous Improvement Program. These Innovation Workshops also provide a forum by which Commonwealth leaders and the Unisys Enterprise Architecture team can establish baseline strategies and requirements to guide

the Unisys ITIL V3-based Service Design process described in Schedule F, Section 3.2.1.5 Technical Architecture.

11.C Offeror must describe its approach to provide service lifecycle design for all Commonwealth computing platforms and associated infrastructures.

The Unisys Program Management Office manages service lifecycle design through the ITIL V3-based Service Design processes described in Schedule F, Section 3.2.1.5 Technical Architecture, Section 3A. As outlined in this section, Unisys follows a ITIL-based governance process that engages the Commonwealth through the Senior Infrastructure Architect in the Unisys Program Management Office.

Unisys provides a Continuous Improvement goal that increases the value of the Unisys Service Design methodology. This value-add goal tends to push mature services to the forefront of the Service Design process because these tend to provide the easiest targets for Return-on-Investment discussions that provided a two-fold win for the Commonwealth: steady introduction of appropriate new technology to achieve strategic goals and a continuous refinement to ever more cost effective services.

11.D Offeror must provide the Commonwealth and its agencies the ability to request new technologies to be available.

The architects in 11.C plan to meet with Agency managers and directors regularly to present opportunities to introduce new technologies where these will provide value to the Commonwealth. The Agencies can also engage architects directly through the Unisys Program Management Offices.

The Unisys Enterprise architects will also use the Innovation Workshops described above as a forum to refine and detail requirements for services that take advantage of the strategic value that new technologies might provide the Commonwealth.

12 Staff, Technical Support

12.A Offeror must list Offeror's support staff levels required to plan, manage, and operate the IT infrastructure, based on the various service levels offered.

The Unisys Team has the required qualified and certified staff to plan, manage, and operate the infrastructure technology services provided to the Commonwealth. Details of the proposed staffing plan including staff levels are included in Section 5.0 Personnel.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,
- Improve client satisfaction,
- Provide service transparency, and

- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery
- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

13 CI Service Risk

13.A Relative to the service in question, Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks

The Commonwealth's State Police force and the Australian NSW Police Force share a near absolute aversion to the risk of data leakage given that this could put the lives of police officers at risk. Unisys deployed a secure imagery management system and forensic-grade storage solution to enable the NSW Police Force to store and manage digital images and video. The system allows police officers to manage digital evidence and streamlines the process of managing, sharing and accessing imagery, saving critical time in criminal investigations.

The NSW Police Force is the first police force in Australia to implement a digital imagery system of this scale – a solution able to manage and securely archive a large volume of images in a searchable central repository, making them quickly accessible for law enforcement purposes.

Challenge
Deploy a system that enables the NSW Police Force to securely store and share images to support police investigations.

Solution
A new digital imagery management system – installed, configured, deployed and managed by Unisys – that enables officers to quickly and easily categorize, archive, search and distribute

digital photographs, images and video. The system was built using a range of Microsoft technologies and runs on a combination of Unisys and EMC infrastructure.

Results
Provided the NSW Police Force with a secure, central repository for the storage and management of digital images taken by forensic teams, General Duties and Investigators during the course of investigations and by members of the general public. The system saves critical time in the law enforcement process and eliminates the risk of images and videos being accessed by unauthorized staff.

Metrics

- **Efficiency:** Reduced the time it took to process and deliver images from a crime scene from two to three weeks to less than three hours
- **Security:** Enabled police to secure images in a repository so they can't be accessed by unauthorized staff
- **Control:** Made it easier for police to demonstrate a 'chain of custody' that shows the date an original image was collected to eliminate the risk that the evidence could be misrepresented in court
- **Speed:** Allowed police to quickly and easily use images to create an electronic brief of evidence
- **Collaboration:** Made it easier for information to be shared across investigations so that the full value of digital imagery can be realized.

Unisys deployed a secure imagery management system and forensic-grade storage solution to enable the NSW Police Force to store and manage digital images and video. The system allows police officers to manage digital evidence and streamlines the process of managing, sharing and accessing imagery, saving critical time in criminal investigations.

The NSW Police Force is the first police force in Australia to implement a digital imagery system of this scale – a solution able to manage and securely archive a large volume of images in a searchable central repository, making them quickly accessible for law enforcement purposes.

14 CI Service Quality

14.A Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.

Multisourcing Services Integration Helps Australian National Audit Office Control Costs and Improve IT Service Quality

The ANAO is a cornerstone of government accountability in Australia, providing Parliament with independent assessments of areas of public administration and assurance about public sector financial reporting. Each year, the ANAO conducts financial statement audits of approximately 300 government-controlled bodies and issues a range of financial statement audit opinions and performance audit reports, better practice guides, and newsletters.

Challenge
Optimizing the delivery of services to the business and developing highly efficient and collaborative partnerships in a multi-sourced environment.

Solution
By implementing Information Technology Infrastructure Library (ITIL) based service delivery policies and practices, building a robust IT governance framework and appointing Unisys as its Multisourcing Services Integrator (MSI) to manage its complex service provider environment, the Australian National Audit Office (ANAO) is achieving cost reductions, an improved end user experience and better support for business systems.

Results
Since the commencement of its current contract with Unisys, the ANAO is experiencing reduced costs, improved service provision to the business, a more productive multi-sourced environment, and a better overall end-user experience.

Metrics

- **Cost:** Achieved 10 percent reduction in baseline costs to the ANAO, surpassing its Gershon Review savings requirements, an independent review of the Australian Government's use and management of Information and Communication Technology (ICT)
- **Efficiency:** Improved incident and resolution times to more than 94 percent, reduced the number of incidents logged monthly by 30 percent and cut problem resolution from 28 days to eight days
- **Productivity:** Improved employee satisfaction and client account satisfaction ratings beyond optimal ratings for the IT department through enhanced delivery quality and increased network and business system availability to 99.99 percent

Solution at a Glance
In addition to IT Managed Services under the original contract, Unisys now provides:

- ITIL practices including:
  - Problem Management
  - Configuration Management
  - Capacity Management
- Enterprise Architecture Services
- Project Management Services
- Security Services
- Multisourcing Services Integration that drives:
  - Procurement Services
  - Relationship Management
  - Performance Management

For more details see: http://www.unisys.com/unisys/ri/cs/detail.jsp?id=1120000970016010172

15 CI Client Satisfaction

15.A Offeror must provide examples of previous Offeror initiatives aimed at continually improving client

satisfaction.

Breakthrough: A New Policy and Core Business Component-based Platform for Nationale-Nederlanden, ING.

Increasing sales by improving customer satisfaction and product innovation, and reducing costs.

Nationale-Nederlanden, a division of ING, and Unisys built a common component-based insurance platform that resulted in 80% straight-through processing and acceptance, faster time to market for new product introductions, and flexible pricing — realizing a 25% cost reduction.

Results:
A new policy and core business component-based platform.

Metrics

- Web-based extranet for intermediaries to gain immediate access to the back-office to obtain quotes, process contracts, and make changes
- 80% straight-through processing
- Three-tier global sourcing model which involved UK, The Netherlands, and India
- A service-oriented architecture that enables Nationale-Nederlanden to centralize back-offices on an international scale
- Reusable components to enable Nationale-Nederlanden to easily deploy additional solutions
- An industrialized methodology for product design and software development.

Business Challenge: Increasing Productivity and Efficiency

In today's highly competitive insurance market, customer satisfaction, product innovation, and cost reduction are not only key for running daily business operations, but also for competing with other insurers and complying with ever changing regulations.

"In our market, visibility is one of the key factors. Not only for running our daily business operations, but also to help us compete and comply. We have been able to realize this visibility through the choice we made in the development of brand new software solutions for policy processing, which have made a big difference for us," says Age Miedema, chief operations officer, Nationale-Nederlanden. As part of a new IT strategy, the Dutch-based insurer decided to contract Unisys to support the innovation of its application landscape. Nationale-Nederlanden now uses new component-based solutions for its life and general insurance business administrations. "We have made a giant step," says Miedema.

The Relationship: A Shared Vision and a Commitment to Execution
"Both parties invested extensively in the working relationship and talked a lot about the way the insurance market is developing," says Miedema. "Unisys proved to have a clear vision on the future of the financial services industry, and had an in-depth understanding of our business. We were able to combine these thoughts."

For more details see: http://www.unisys.com/unisys/common/download.jsp?d_id=17500019.

16 CI Service Transparency

16.A Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.

Creating a Transparent and Nimble Environment with Unisys Secure Private Cloud

For enterprises with large IT shops that are struggling to meet the demands of the users they serve in a timely manner while managing the growing complexity and cost of their IT infrastructure, Unisys Secure Private Cloud is a pre-integrated, internal private cloud solution that transforms data center operations into an agile, efficient and highly automated infrastructure.

Deploying Unisys Secure Private Cloud in your data center will increase transparency and agility, enabling you to deliver "just in time" services and reduce the wait time for resources from weeks down to minutes while lowering both capital and operating expenses.

What does Unisys Secure Private Cloud do for you?

- **Increase Productivity:** Manage 5 times or more virtual machines with existing staff
- **Improve Efficiency:** Increase utilization of resources up to 60% or more
- **Shorten Response Times:** Reduce provisioning times from weeks to minutes
  Reduce Costs: Eliminate manual processes and save operating expenses

Why Unisys?

- **Security:** Protects mission critical communication between virtual machines and enables the most secure multi-tenant environment.
- **Automation:** Leverages Unisyss experience in building and managing clouds to provide full compliance with existing best practices.
- **Open and Adaptable:** Seamlessly integrates with existing and new environments and management processes.
- **Transparency:** Usage monitoring and oversight of cloud resources enables show-back or a pay-per-use service model.
- **Holistic Approach:** Efficiently aligns IT to business objectives and provides best fit and function.

For more details see:
http://www.unisys.com/unisys/landingPages/index.jsp?id=1120000970017610154

An example:

TravelSky Chooses Unisys Secure Private Cloud Solution 2.1 to Meet Growing Transaction Volumes for China's Travel Agencies

TravelSky, the leading provider of information technology solutions for China's air travel and tourism industry, has renewed its services and technology relationship with Unisys China to further its cloud computing strategy. As a result, TravelSky will implement release 2.1 of the Unisys Secure Private Cloud Solution.

TravelSky Vice President Mr. Rong Gang said: "We have used the Unisys private cloud management software in our test and development environment to gain the flexible operational benefits of cloud computing within the security of our own data center. Now we are ready to apply it to a core production system. The Unisys solution provides highly automated operations and self-service provisioning of IT resources as needed so that we can quickly meet fluctuating business demand."

In the first phase of the private cloud implementation TravelSky built a test and development environment using release 1.4 of the Unisys Secure Private Cloud Solution.

In the second phase of the rollout, TravelSky will create a production private cloud environment based on release 2.1 of Unisys Secure Private Cloud Solution. This release features a new dashboard capability that gives administrators a single, integrated view of all cloud resources. The enhanced dashboard capability streamlines management of critical IT infrastructure and helps reduce overhead costs by making it easier to commission and decommission resources as needed.

The TravelSky production cloud will connect travel agencies and reservation systems via the Unisys Open Message Switching Engine (OMSE), a communications front end that allows travel agencies, airline reservation offices and external systems to communicate with the mission-critical TravelSky systems.

TravelSky also plans to use the enhanced user interface and automation capabilities of Unisys Secure Private Cloud Solution release 2.1 to customize the private cloud to offer the OMSE Gateway as software as a service (SaaS) to its partners and agents.

In addition, TravelSky aims to reduce its data center requirements and operational costs by migrating the OMSE onto a virtualized environment running on a Unisys ES7000 Model 7600R G3 Enterprise Server, which can consolidate up to 24 virtual servers onto a single machine.

"TravelSky's business involves many critical processes spanning the passenger, cargo, airline and airport aviation business, so they need a highly secure, scalable, and flexible IT infrastructure to meet changing demands in logistics, passenger services and other core applications," said Sue Carter, vice president, Technology Consulting and Integration Solutions, Unisys Asia Pacific. "The Unisys Secure Private Cloud Solution supports this by delivering the same attributes as a public cloud except from within TravelSky's own data center, providing cost-efficient access to 'just in time' resources that can be shared among user communities in a common infrastructure model but remain secure and isolated from each other."

Unisys has more than 45 years' experience providing advanced, mission-critical IT solutions to the aviation industry. Nineteen of the top 25 airlines – and more than 200 worldwide – rely on Unisys solutions. Asia Pacific aviation industry clients include Beijing Capital International Airport and Guangzhou International Baiyun Airport in China, Delhi International Airport Ltd and

Air New Zealand.

17 CI Service Sustainability

17.A Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.

The California State University system has been a long-time customer of Unisys and has expanded services over the years. Prior to the last contract renewal CSU was struggling to find cost reductions due to budget pressures in California. Unisys recommended that rather than refresh their aging storage infrastructure with new hardware purchases, CSU should migrate their data onto the Unisys Managed Storage Platform. This helped CSU avoid hundreds of thousands of dollars in capital expense and changed the entire nature of CSU infrastructure agility. During the migration process CSU was able to locate stale or seldom used data stores and eliminate these "just in case" storage allocations. Now when DBAs need short term access to storage for testing or development they can draw upon the "pay-when-you-need-it" Shared Storage pool and retired the storage and the associated costs when their project concludes.

18 CI Improve or Reduce Cost

18.A Offeror must provide examples of previous technology initiatives implemented by Offeror that achieved reduced costs of Services and that met or exceeded ROI (Return on Investment) analysis projections.

The Unisys Team is very proud to close out this section by reminding the Commonwealth of the journey and successes that we embarked on in 1999 and the early successes that may have faded from memory.

Business Challenge: Building a Framework for the Future
In 1999, the Commonwealth of Pennsylvania's IT landscape amounted to a disparate collection of systems and software that were "independently owned and operated" by the state's agencies, boards, and commissions.

With more than 20 mainframe-based agency data centers using duplicate equipment and staff to deliver similar services, the Commonwealth decided to centralize and consolidate its resources so it could achieve a 24/7 mission-critical operating environment and economies of scale, improve efficiencies, and redirect cost savings toward strategic initiatives.

Challenge
Consolidate a widely distributed technology landscape, centralize common services, standardize technology and processes, improve security, reduce costs, improve collaboration, and free up resources for strategic initiatives.

Solution
The Commonwealth of Pennsylvania has changed its approach to IT management through the Shared Infrastructure Services (SIS) initiative, which centralized governance, procurement, and management of IT hosting services. Supporting the Commonwealth SIS strategy is a shared

hosting services approach, which includes two data center environments – the Data PowerHouse (DPH) and Enterprise Server Farm (ESF). The DPH allowed the Commonwealth to consolidate 17 agencies' data centers into one and is a key component of the shared hosting services approach.

The ESF consolidated operational and technical support services for web hosting and messaging services for some 45 agencies and support for 90,000 email boxes.

Results: Cost Avoidance, Savings, and Agility
With a shared services model and consolidated IT infrastructure, the Commonwealth of Pennsylvania has already achieved extensive cost avoidance and savings that will continue to grow in the future as it further embraces a more mature services model, persists in enhancing shared hosting services, implements virtualization, and increases efficiencies across the agencies.

Metrics

- Cost: Achieved $317 million in cost savings via resource consolidation and increased efficiencies and anticipates an additional $240 million in savings and cost avoidance over the next five years
- Agility: Enhanced efficiency, security, availability, and disaster recovery via virtualized and dynamic server allocation capabilities that enable IT infrastructures to adapt to fluctuating workloads and maintain uptime in the event of an emergency
- Productivity: Improved ability to focus agency resources on core business activities.

The Unisys was again doubly proud in 2008 when the Unisys team was able to provide the Commonwealth with $240 million in savings through a mutually favorable contract extension.

Unisys Team Experience

The examples in the Continual Improvement sections showcase the Unisys team experiences and the values that Unisys has brought to customers and strives to bring again to the Commonwealth.

Benefits to the Commonwealth

As an over-arching organization principle for IT Services Management and Infrastructure Services, the Unisys Infrastructure Architecture services create the "factory" by which all other operations values, cost efficiencies, and improved services are delivered to the Commonwealth.

The primary competitive value that Unisys provides to the Commonwealth and its customers are the cost savings and service improvements that it builds by continuously focusing on how to achieve labor efficiencies in the monitoring and technical support of Infrastructure Architecture services.

The Commonwealth will realize cost efficiencies over time for Infrastructure Services because Unisys uses Six Sigma analytics driven by the Service Excellence Organization (SEO) within the Unisys Program Management Office (PMO) to refine steady state services and remove variability from expected outcomes.

The rich field of metrics and analytics provided to the Commonwealth through the real-time dashboard and the Services Portal will allow the Commonwealth sufficient transparency to be able to review services for anomalies in service or plateaus in service improvements. This

unprecedented depth of analytics will allow the Commonwealth to set directions on service changes and improvements that will provide the highest strategic value to the Commonwealth. In effect, the Commonwealth can steer the Unisys IT infrastructure to its preferred course of strategic achievements without having to focus on how Unisys manages the manipulation of the rudders to change course incrementally and cost effectively.

The Unisys provided ITIL V3-based Infrastructure Architecture services coupled with a deep reservoir of monitoring tools reduces risks for the Commonwealth because these processes and tools lay a foundation for proactive actions to avoid service interruptions. Unlike other vendors who might propose a base level of services to monitor equipment, the Unisys Team's proposal including the dashboards and analytics enables us to be proactive and focus on the course to strategic innovative initiatives.

3.2.2.3 Capacity Management

The Capacity Management activity focuses on the planning and scheduling of the Commonwealth's infrastructure capacity and growth. Capacity planning includes consideration of data communications, networking, processing, storage, and other environmental variables. The Offeror must issue periodic reports showing usage, trends, capacity forecasts, and recommendations for upgrades.

Processor capacity planning focuses on estimating, measuring, and reporting on the central processing unit (CPU) and memory usage, including peak usage and average usage over time.

Forecasting of each agency's application-based processor and memory usage will be determined using projected transaction and user volumes supplied by the Commonwealth. The Offeror must track application-based processor and memory usage and report the usage and trends to the Commonwealth. The Offeror must make periodic recommendations for upgrading existing server capacity.

Data storage capacity planning focuses on estimating, measuring, and reporting on data storage used per application over time.

Forecasting of application-based data storage usage will be provided by the Commonwealth. The Offeror must track current data storage usages and report the usage and trends to the Commonwealth. The Offeror must make periodic recommendations for upgrading existing data storage capacity.

New application infrastructure capacity planning focuses on estimating, measuring, and reporting on network, server, and data storage usage over time per application. New processing requirements will be established during testing in test environments. The Offeror must track application-based infrastructure usage. The Offeror must make monthly recommendations for upgrading existing infrastructure capacity.

The following list identifies but does not limit the roles and responsibilities that the Offeror must

perform:

- Establish comprehensive Capacity Management planning process
- Identify future business Commonwealth requirements that will alter capacity requirements
- Assess capacity impacts when adding, removing or modifying applications
- Capture trending information and forecast future agency infrastructure capacity requirements based on agency defined thresholds
- Recommend changes to capacity to improve service performance
- Assess impact/risk and any cost of capacity changes with agencies
- Maintain capacity levels to optimize use of existing IT resources and minimize agency costs
- Ensure adequate capacity exists within the IT environments

Reference Documentation

Schedule H - Commonwealth Computing Procedures Manual (CCPM)

	Requirements	Describe Compliance
1.	Working with each agency, develop the initial Capacity Management Plan based on an inventory and review of each of the agency applications and associated managed infrastructure. Develop the initial Capacity Management Plan and provide quarterly updates to the plan.	Offeror must discuss its approach to Capacity Management and provide a sample of a Capacity Management Plan.
2.	Meet with the Commonwealth and agency representatives on a monthly basis to assess the future datacenter resource requirements; processors, storage space, network (LAN & WAN), selected application transactions, and number of users, etc.	Offeror must discuss its approach to support the current and future needs of Commonwealth agencies. Offeror must provide a sample of a Capacity Management report that includes processor, storage, network and application metrics.
3.	Produce an annual datacenter Capacity Plan and Trend Analysis.	Offeror must discuss its approach to meet this requirement. Provide a sample Capacity Management Plan and Trend Analysis.

4.	Produce a monthly planned vs. actual resource usage report.	Offeror must discuss its approach. Provide a sample resource usage report.
5.	Recommend methods for reducing hardware “footprints”, e.g., replacing server storage with network attached storage and aggressive server virtualization.	Offeror must discuss its approach.
6.	Allow emergency or temporary orders for additional Services or capacity without a minimum service commitment.	Offeror must discuss its approach.
Continual Service Improvement		
7.	Reduce service risks.	Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.
8.	Improve service quality.	Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.
9.	Improve client satisfaction.	Offeror must describe methods to continually improve client satisfaction.
10.	Provide service transparency.	Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.
11.	Ensure service sustainability.	Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.
12.	Improve/reduce cost of service.	Offeror must provide examples of previous capacity initiatives implemented that achieved reduced costs of Services and that met or exceeded ROI (Return on Investment) analysis

		projections. If costs of Services increased due to increased required capabilities, so identify.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Unisys will provide the Commonwealth with a Capacity Management System including the process, people, and industry leading technology to provide the Capacity Management planning and scheduling of the supporting infrastructure. Capacity planning includes data communications, networking, processing, storage, and other environmental variables. Unisys will provide periodic reports showing usage, trends, capacity forecasts, and recommendations.

We will provide processor capacity planning focused on estimating, measuring, and reporting on the central processing unit (CPU) and memory usage, including peak usage and average usage over time.

Unisys will provide Enterprise Services Catalog items that the Commonwealth/ agencies can select to provide the following capacity related analyses for supporting each Commonwealth/agency application selected. These services include:

- Forecasting workload of an agency's application infrastructure including server processor and memory usage using projected workload transaction and user volumes supplied by the Commonwealth.
- Tracking application-based processor and memory usage and reporting the usage and trends to the Commonwealth.
- Providing data storage capacity planning by estimating, measuring, and reporting on data storage used for supporting Commonwealth applications.
- Utilizing storage forecasts for each application provided by the Commonwealth to make periodic recommendations for upgrading or consolidating data storage capacity.
- Supporting capacity planning for new application infrastructure availability focused on estimating, measuring, and reporting on network, server, and data storage usage over time for each application. Unisys will track application-based infrastructure usage.
- Making recommendations for upgrading existing infrastructure capacity.

Unisys performs the following roles and responsibilities for Capacity Management:

- Establish the Capacity Management planning process
- Work with the Commonwealth to review future business requirements that will alter capacity requirements
- Assess capacity requirements and impacts when adding, removing or modifying

applications

- Capture trending information and forecast future agency infrastructure capacity requirements based on agency defined thresholds
- Recommend changes to capacity to improve service performance
- Assess impact/risk and any cost of capacity changes with agencies
- Maintain capacity levels to optimize use of existing IT resources and minimize agency costs
- Help to confirm adequate capacity exists within the IT environments for business requirements

1 Capacity Management Approach

1.A Working with each agency, develop the initial Capacity Management Plan based on an inventory and review of each of the agency applications and associated managed infrastructure.

Unisys follows the process framework shown in **Figure 3.2.2.3-1** below to complete a Capacity Management Plan that is developed annually and reviewed quarterly with the Commonwealth agencies. The initial plan will be developed during the transition phase working with the agencies.

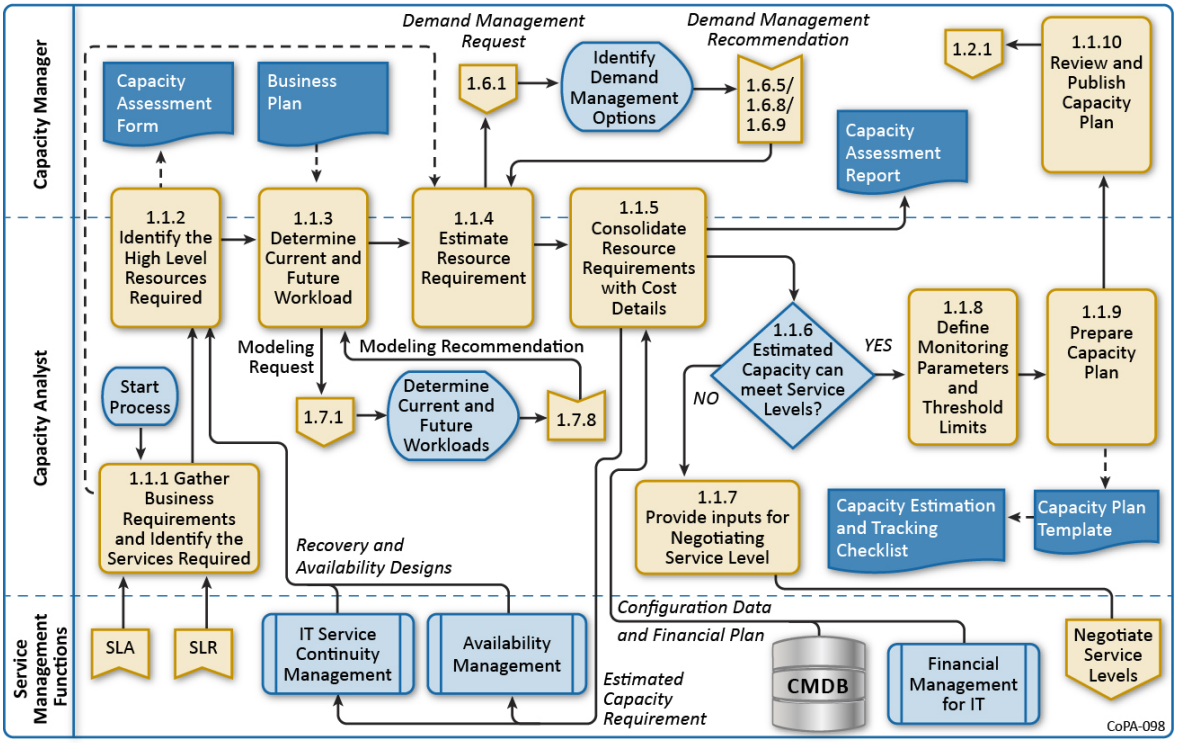

Figure 3.2.2.3-1 - Capacity Management Process

The Capacity Management Process consists of the following key activities:

1.1.1 Gather Business Requirements and Identify the Services Required

The Capacity Manager will review the SLAs for gathering the capacity requirements to meet the service targets, and for analyzing their impact on the existing SLAs.

The following details are identified from the SLA:

- The list of services including the Shared Services
- Dependency of each service with other services
- Service requirements and targets.

1.1.2 Identify the High-Level Resources Required for each Identified Service

The recovery design and the availability design from the IT service continuity management and availability management processes respectively are used for assessing the required resources. The resources include the infrastructure components to support the availability of an application.

Determining the high-level resource requirements refers to identifying the different type of infrastructure resources required for providing the service. The number of resources required is identified later during the resource estimation stage. The high-level resource requirements are captured in the capacity assessment form.

1.1.3 Determine Current and Future Workload (Optional Catalog Service for each Application infrastructure Capacity Plan)

The Commonwealth provided current workloads and future business requirements are assessed to predict the behavior of the services and to confirm that the adequate capacity is made available to meet the future demands. The Business Plan is created to identify the forecasted future business requirements.

For the existing services, the following information is gathered:

- Details of the resources supporting the service: type of resources, number of resources, and their role in providing the service (for example, primary/backup)
- Maximum usable capacity for each identified resource
- Different sources utilizing the resource (for example, source includes applications, project group, other resources)
- Utilization details of each resource for a defined period and for each source
- Current business volumetric/throughput for each service.

The current workload and future business requirement details help in understanding the following:

- Usage trend
- Predicting the future demands
- Risk and cause

For new services, data from similar services can be used for analyzing and predicting. The data

can also be gathered from the organization in similar service lines, international standards, or based on experience.

Analyzing the current workload and predicting the future demands will be done for each resource.

The modeling techniques such as trending, analytics, and simulation can be used to predict the workload behavior of the services and resources. The choice of modeling technique and the depth to which the data needs to be analyzed depends on the business need and criticality of the services.

The current and future workload details are captured in the capacity assessment form.

1.1.4 Estimate Resource Requirement (Optional Catalog Service to support Application Infrastructure Availability)

The resource estimation is done for identifying the right resources to meet the current and future needs of the business. The estimation should also cover the timeline by which the resource should be available. This helps in avoiding early investment and provides that the resources are available when needed.

The workload details and the identified high-level resources are assessed to estimate the number and capacity of the resources. Resource estimation also specifies the appropriate configuration for hardware resources, software versions and skillset requirements.

The resilience factors suggested by the availability management and recovery options from IT service continuity management should be taken into consideration while estimating the resources.

Different scenarios can be analyzed in order to provide the resource estimation at an optimal cost. To derive different scenarios, demand management options such as sharing the workload across different timelines and the splitting of workload with multiple resources can be considered.

The detailed resource requirements are captured in the capacity assessment form.

1.1.5 Consolidate Resource Requirements with Cost Details

The capacity estimates from various domains such as network, server, and storage resources are consolidated to identify the need for new resources and the use of existing resources.

The consolidated resource requirements are captured in the capacity assessment report.

1.1.6 Estimated Capacity Can Meet Service Level

The following are analyzed to determine if expected service targets can be met with estimated capacity

- SLA
- Workload
- Capacity requirement

1.1.7 Provide Inputs for Establishing Service Levels

The Capacity Analyst provides the inputs for establishing SLA's including:

- Estimated capacity
- Limitations and capability of the proposed technology

1.1.8 Define Monitoring Parameters and Threshold Limits

Defining the monitoring parameters and thresholds are necessary to proactively manage the capacity of the resources and to avoid over-utilization of the resources. Over-utilization of resources impacts the performance of the resources and can lead to the unavailability of the resources.

Appropriate monitoring parameters are identified based on the following:

- Resource type, purpose and its capabilities
- Projected workload
- Expected service targets.

Appropriate threshold limits are defined based on the following:

- Capacity of the resource
- Current peak and off-peak usages
- Timeline to resolve the threshold breaches
- Available solutions to fix breaches
- Expected service targets.

Also, the frequency in which these parameters need to be monitored has to be determined. Frequency refers to the time interval in which the parameters need to be monitored. These intervals must have enough granularity to capture transient peaks, e.g., backups impacting network traffic, batch processes impact online performance, etc.

1.1.9 Prepare Capacity Plan

The Capacity Plan is one of the key outputs of the Capacity Management process. The Capacity Plan has to be prepared at least annually and is reviewed, published quarterly or in line with the business or budgetary lifecycle.

The Capacity Plan describes the business capacity requirements and the planned service and restores capacity to meet the business requirements.

The Capacity Plan is prepared using the Capacity Plan template and includes the following details:

- Current and recent service provision
- Service forecasts

- Resource utilization
- Resource forecasts
- Business scenarios and key business events (e.g., year-end financials, retail sales periods, maintenance periods, etc., as appropriate)
- Monitoring parameters and threshold limits

1.1.10 Review & Publish Capacity Plan

The Capacity Plan is reviewed for its details of coverage and its accuracy.

The approved Capacity Plan is uploaded in the capacity database (CDB) and published after review with the relevant agency stakeholders.

The information from CDB is used to prepare the capacity management reports. This data is also utilized to generate capacity forecasts and to plan for future capacity requirements.

The Capacity Plan is one of the key outputs of the capacity management process shown in the process above. The Capacity Plan is prepared annually and is reviewed, updated, and published quarterly or in line with the Commonwealth budgetary lifecycle.

1.B Develop the initial Capacity Management Plan and provide quarterly updates to the plan.

Unisys will work with Commonwealth agencies to develop the initial capacity management plan and provide quarterly updates to the plan. Please refer to 1.A for the development of the Annual Capacity Plan and quarterly update process.

1.C Offeror must discuss its approach to Capacity Management and provide a sample of a Capacity Management Plan.

The end result of the above Capacity Management Planning Process is the Commonwealth Capacity Plan that follows the outline below:

- Introduction
- Scope
- Method
- Assumption and Constraints
- Business Scenarios
- Resource Capacity Summary
- Current Resource Usage
- Forecast Resource Usage
- Opportunities for Improvement
- Monitoring Standards

- Standards for Parameters and Thresholds
- Standards for Frequency and Data Retention
- Standards for Alerts and Escalation
- Recommendations

See Attachment F-6 for a sample capacity management plan.

2 Capacity Management Report Sample

2.A Meet with the Commonwealth and agency representatives on a monthly basis to assess the future datacenter resource requirements; processors, storage space, network (LAN & WAN), selected application transactions, and number of users, etc.

Offeror must discuss its approach to support the current and future needs of Commonwealth agencies.

Unisys will meet with the Commonwealth and agency representatives on a monthly basis to assess the future data center resource requirements including processors, storage space, network (LAN), selected application transactions, and number of users and other capacity management factors.

Current

Unisys will meet the current needs of Commonwealth agencies by performing daily, weekly and monthly reporting and perform the following capacity management tasks including:

- Review of current activity, including performance and capacity trend exceptions for significant service configuration items (CI's) for servers, storage and network CI's
- Review of significant Requests for Change (RFC) that impact capacity and performance. Determine if there is an impact on capacity workload for new or modified CIs and the potential impact on the performance of a service.
- Review of any significant incident tickets that have had an impact on service performance and SLA's to determine what action should be taken working with the Problem Manager and various stakeholders to process capacity management changes to rectify capacity related problems.
- Prepare recommendations

Future

The Commonwealth should request a capacity planning services in the Enterprise Services Catalog for each application it wants to have future infrastructure workload capacity analysis scenarios completed.

Unisys will complete the following types of activities utilizing the [redacted] t when these services are selected:

- Model estimated workload scenarios with application transaction estimates, usage estimates, and service projection data provided from the Commonwealth

- Setup capacity monitoring to track application infrastructure usage during testing and production
- Report application usage of infrastructure with trends reporting by application
- Review monitoring parameters and threshold limits
- Review application capacity usage trends on a quarterly basis with the Commonwealth
- Prepare recommendations for future capacity utilization

The Unisys capacity management team will identify under-utilized or over-utilized servers; accurately plan, implement, and support the Commonwealth's virtualization and cloud computing initiatives; and support optimizing data center resources.

2.C Offeror must provide a sample of a Capacity Management report that includes processor, storage, network and application metrics

See Attachment F-7 for a sample Capacity Planning report, that includes metrics in support of the Commonwealth Integrated Enterprise System (IES) SAP application environment.

3 Capacity Plan and Trend Analysis Report Sample

3.A Produce an annual datacenter Capacity Plan and Trend Analysis.

Offeror must discuss its approach to meet this requirement

The Unisys Capacity Management Team approach to meeting the requirement for an annual Capacity Management Plan is discussed in detail in response to 1 above. The Unisys Capacity Management Team will produce a monthly Capacity usage report for infrastructure CI's for the Commonwealth. The report will show trends against projected baselines and offer recommendations for review and action with the Commonwealth agencies.

3.B Provide a sample Capacity Management Plan and Trend Analysis.

Sample trend analysis is included in the Capacity Management Plan sample referenced in 1.C above. Additionally, see Attachment F-8, *Sample Monthly Server Capacity Report* and see Figure below for samples of monthly capacity usage report. The actual format will be determined with the Commonwealth during transition.

Figure Data Center Summary Report

4 Resource Usage Report Sample

4.A Produce a monthly planned vs. actual resource usage report.

The Unisys Capacity Management Team will produce a monthly capacity usage report for the Commonwealth. The report will show trends against projected baselines and offer recommendations for review and action with the Commonwealth/agencies.

4.B Offeror must discuss its approach

Unisys will produce standard monthly reports. It is the intention to automate this process where feasible, so that the Unisys Capacity Team can focus on exceptions, analysis and

recommendations for improving utilization of the infrastructure.

4.C Provide a sample resource usage report.

See Attachment F-8, Sample Monthly Server Capacity Report for a sample of this monthly capacity usage report.

5 Hardware footprint reduction

5.A Recommend methods for reducing hardware "footprints", e.g., replacing server storage with network attached storage and aggressive server virtualization.

The Unisys capacity management team working with Commonwealth agencies will recommend reducing hardware "footprints", e.g., replacing server storage with network attached storage and aggressive server virtualization. Please refer to Schedule F, Section 3.2.1.1.6 "Continuous Service Improvement" for the recommended approach to how Unisys improves overall operations. Additionally, the Capacity Manager utilizes enterprise capacity management toolset to actively pursue reducing hardware "footprints" for all Unisys managed infrastructure.

Also, please refer to the continuous improvement examples below for some examples of where Unisys has done this for the Commonwealth in past performance.

5.B Offeror must discuss its approach.

The Unisys capacity management team will utilize industry leading capacity management tool, [redacted] to model the Commonwealth application server virtualization, network and storage models to provide the Commonwealth with improved costs for service levels. The [redacted] tool supports using cost, service levels, server, network and storage policies, forecasts and historic performance data to forecast and model various alternatives to support Commonwealth applications and requirements.

6 Temporary or emergency service orders

6.A Allow emergency or temporary orders for additional Services or capacity without a minimum service commitment.

The Unisys Team will provide Capacity on Demand (COD) for Infrastructure as a Service (IaaS) servers and storage that the Commonwealth can order through the Enterprise Services Catalog. These services deliver to the Commonwealth infrastructure as COD that will support emergency, temporary, ad-hoc or unplanned capacity requirements for the Commonwealth agencies without a minimum service commitment.

6.B Offeror must discuss its approach

Unisys will have the ability to handle Enterprise Services Catalog requests for COD IaaS servers, storage and related network infrastructure through various technologies and processes to support provisioning servers and storage on demand.

Please refer to Schedule F, Section 3.2.5.1 "Server Capacity on Demand" and Section 3.2.5.2 "Storage Capacity on Demand" for a complete description of how server and storage COD IaaS

services will be approached for delivery to the Commonwealth without a minimum service commitment.

7 CI Service Risk

7.A Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,
- Improve client satisfaction,
- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery
- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk

assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

8 CI Service Quality

8.A Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

9 CI Client Satisfaction

9.A Improve client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

10 CI Service Transparency

10.A Provide service transparency.

Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access

to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

11 CI Service Sustainability

11.A Ensure service Sustainability.

Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.

Service sustainability will be provided by integrating any new agencies, customers, or services into our standard operational and quality processes and methodologies. Leveraging ITIL processes, creating quality project plans, utilizing industry accepted measurement and monitoring tools, analyzing trending reports and providing proactive continuous service improvement throughout the IT lifecycle will enable new Commonwealth services to experience and sustain best in class IT services and client satisfaction.

12 CI Reduce Cost of Service

12.A Improve/reduce cost of service.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

Unisys examples of continuous improvement A few examples of capacity management continuous service improvement that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections are outlined below:

1. Server Virtualization:
   The Unisys account management team has spearheaded cost savings for the Commonwealth by aggressively pursuing server virtualization efforts.

2. Storage Capacity Management:
   As part of the DPH's continuing improvements in its backup infrastructure, the DPH has improved the successful recovery an 8TB database archive for IES from 10.7 hours down to nearly 4 hours by improving the bandwidth from .75Tb/hour to 2TB/hour. The DPH accomplished this by bypassing the AIX VIO Shared Ethernet Adapter (SEA) built in restrictions and optimizing throughput between the media servers and the data domain.

3. Capacity Management – Secure private cloud:
   Unisys established a secure private cloud environment for the Commonwealth in a proof of concept. Four agencies participated in the pilot. The pilot provided the agencies

with access to a portal where they could provision servers with pre-determined configurations. Then they could stand up servers in 7 minutes through the portal, use them for a specific purpose, and then tear them down in minutes through the portal. The Commonwealth Department of State participated in the pilot and provisioned servers to test a production issue after receiving a call from operations. They fixed the application issue and tested it on the temporary servers and reduced the time to resolve the issue to minutes. These same concepts and types of technology will be utilized to provide the Commonwealth with Capacity on Demand.

4. Capacity Management - z10 Migration to z196 Processor:
The Commonwealth Department of Labor and Industry required services for much longer duration on the DPH mainframe platform than originally planned. The DPH team brought forth a solution to replace the z10 processor with a z196 processor. This offered a number of benefits to the Commonwealth including additional processor capacity, a boost in the integrated facility for Linux (IFL). The system also offered improved performance and increased processor speed with optimizations for DB2 and WebSphere, since this processor offered more capacity.

5. Capacity Management - IBM Business Class Mainframe processor MIPS
The z10 processor utilization rates were projected to exceed the capacity of the z10 mainframe within the year 2011 due to increases in unemployment compensation transaction workload and delays in the mainframe application modernization efforts. The Unisys Team was able to locate an IBM Business Class processor in excess inventory through our subcontractor IBM. This machine was equipped with the capacity required to support the Department of Corrections (DOC). At no additional cost to the Commonwealth, we seamlessly migrated DOC workload from the z10 mainframe system to the business class processor, providing 180 MIPS of capacity relief on the z10.

Unisys Team Experience

Unisys has many customers where the Unisys Capacity Management Team(s) are actively managing capacity for the infrastructure supporting critical business applications. Some of the customers here in the United States include:

- American Red Cross
- City of Santa Clara
- SMS800
- City of Minneapolis
- The Commonwealth of Pennsylvania

The Unisys Team has a history of improving capacity management with the Commonwealth as evidenced by the samples of continuous improvement provided above.

Benefits to the Commonwealth

The Unisys Capacity Management Solution provides a platform for the Unisys Team to manage capacity in support of Commonwealth agency applications and provide:

- Improved utilization of server and storage infrastructure
- Improved capacity services with ROI's that are compelling
- Capacity on Demand for emergencies, ad-hoc and unplanned requirements.

3.2.2.4 DR Planning & Testing

The DR Planning & Testing service ensures that the Offeror provides expert assistance in developing, documenting, deploying, and testing tiered datacenter recovery strategies that includes access for Commonwealth end users. This service will protect the identified applications processing at the datacenters, Commonwealth employees and constituents who utilize the application.

The Commonwealth will provide the Offeror with a list of agency applications that require a DR solution and related DR plan after contract is awarded. The Offeror is expected to provide DR Planning and Testing Services for agency applications that require DR Services. For Commonwealth agency applications that do not currently have DR plans, these Services will be provided in the event the Commonwealth elects to order DR services for these applications.

Reference Documentation

Exhibit B.5 - DPH - Agency Disaster Recovery Matrix

Schedule J.1 - Datacenter Service Level Management

Requirements		Describe Compliance
1.	Meet with the Commonwealth and agency representatives on an annual basis and upon request to assess its DR requirements. Post contract award, Offeror must document the Tiered DR plans in an online software program that will be available to Commonwealth and Offeror staff. The documented plans must be made available at the time each individual critical application is transitioned to the Offeror's managed Services.	Offeror must discuss its approach to providing a Tiered DR service offering to meet the needs of the agencies. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the DR needs of the Commonwealth. Offeror must discuss the DR capabilities that are included in its proposed Architecture.

2.	Review and update Disaster Recovery Plans (DRPs) - Offeror must review existing Disaster Recovery Plans (DRPs) to determine gaps in existing or future DR Services, within the first 120 days after the Effective Date. The Offeror must at least annually review and update the disaster recovery plans. Assist the Commonwealth in identifying dependencies/limitations to DR testing due to non-Offeror infrastructure.	Offeror must describe an approach to perform a gap analysis of the existing Disaster Recovery Plans (DRPs). Offeror must include a description of the process it will use to track and resolve all identified gaps.
3.	Provide the Commonwealth and agency representatives with access to an online DR planning tool.	Offeror must discuss its approach to meet this requirement. Identify and describe the proposed online DR planning tool.
4.	Provide the Commonwealth and agency representatives with access to an automated emergency notification system. This would be invoked on the occasion of a disaster or other emergency.	Offeror must discuss its approach to meet this requirement. Identify and describe the proposed emergency notification system that could be used to invoke a DR event.
5.	Assist the Commonwealth and agency representatives as requested to review agency identified critical business applications and related IT applications and infrastructure.	Offeror must discuss its approach to meet this requirement.
6.	Assist the Commonwealth and agency representatives as requested in developing, documenting, deploying, and exercising its tiered disaster recovery plans.	Offeror must discuss its approach and optional service offering. Offeror must describe its approach to perform a successful recovery test within 6 months of transition to the Offeror's Managed Service.
7.	Assist the Commonwealth and agency representatives as requested in coordinating disaster recovery	Offeror must discuss its approach and optional service offering.

	exercises. Frequency of DR exercises will be at the discretion of the Commonwealth. The Offeror must every six (6) months test the operability of the disaster recovery plan then in effect.	
8.	Assist the Commonwealth and agency representatives as requested in developing, documenting, deploying, and exercising its continuity of operations (COOP) and continuity of government (COG) plans.	Offeror must discuss its approach.
9.	Assist the Commonwealth and agency representatives as requested in integrating its disaster recovery plans into its COOP and COG plans.	Offeror must discuss its approach.
10.	As requested by the Commonwealth, evaluate the efficiency of business partner disaster recovery and/or business continuity plans.	Offeror must discuss its approach.
11.	In concert with the Commonwealth and agency representatives, lead the recovery operations as requested in the event of a disaster or other major disruption.	Offeror must discuss its approach and optional service offerings.
12.	Conduct disaster recovery planning and activities in accordance with the Business Continuity Institute Good Practice Guideline or similar standard.	Offeror must identify the standard and describe its approach to meet this requirement.
13.	Ensure DR Planning & Testing Services are documented in the Service Catalog.	Offeror must provide a prototype of this section of the Service Catalog.

Continual Service Improvement		
14.	Reduce service risks.	Relative to the service in question, Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.
15.	Improve service quality.	Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.
16.	Improve client satisfaction.	Offeror must describe methods to continually improve client satisfaction.
17.	Provide service transparency.	Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.
18.	Ensure service sustainability.	Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.
19.	Validate business case for cost of the service.	Offeror will provide examples to validate the projected cost savings or cost avoidance projected versus the cost of using this service.
20.	Improve/reduce cost of service.	Offeror must provide examples of previous disaster recovery initiatives implemented that achieved reduced costs of Services and that met or exceeded ROI (Return on Investment) analysis projections. If costs of Services increased due to increased required capabilities, so identify.
Deliverables		
Deliverables are defined in **Schedule K – Key Program Deliverable**		
Offeror Response		

Introduction

Over the years the Commonwealth has experienced continually improving data protection through the Unisys practice of providing regular tests of the Disaster Recovery Plans for Commonwealth agencies that already subscribe to these services.

In the new solution this practice of continual improvement through regular testing, remediation, refinement and capacity growth continues. The Unisys Disaster Recovery Team will provide a more diverse range of Disaster Recovery tiers for the Commonwealth and its agencies as described below.

1 DR, Annual DR Review, Example (experience)

1.A Meet with the Commonwealth and agency representatives on an annual basis and upon request to assess its DR requirements

Unisys has deep experience supporting current DPH disaster recovery plans. By choosing Unisys as a partner the Commonwealth benefits from this experience as well as the Unisys-implemented [redacted] Living Disaster Recovery Planning System (LDRPS) which will meet the Commonwealth's need for an online disaster recovery planning tool.

Commonwealth agencies also benefit from the implementation of the LDRPS infrastructure because the IT Risk Manager and DR coordinators in the Unisys team's Program Management Office will use the tool to import existing Agency DR plans as well as maintain updates to the plans on an annual basis as well as upon Agency request.

Unisys will meet with the Commonwealth and agency representatives on an annual basis and upon request to assess its DR requirements.

1.B Post contract award, Offeror must document the Tiered DR plans in an online software program that will be available to Commonwealth and Offeror staff. The documented plans must be made available at the time each individual critical application is transitioned to the Offeror's managed Services.

LDRPS will be populated with the Tiered DR Services described below and will be populated in conjunction with critical application migration to the Managed Services offered by the Unisys team.

1.C Offeror must discuss its approach to providing a Tiered DR service offering to meet the needs of the agencies.

The Commonwealth has specified two distinct RPOs for open systems servers in the Schedule I "Volumetrics" based on restore from backups. The Enterprise Services Catalog will also include costs for replication of disk-based backups from production to the DR facility as well as mainframe storage replication. These latter two tiers provide like-to-like services that exist in the current DPH infrastructure but are not called out in the RFP.

1.D Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the DR needs of the Commonwealth.

The California State University (CSU) system recently renewed its long-term contract with

Unisys after a competitive bid that showed the value of the Unisys solution versus market alternatives. CSU was impressed with the Unisys managed services offering and opted to increase the Unisys scope to include a tiered Disaster Recovery system. Like the Commonwealth, CSU has critical applications that run on both physical and virtual instances of Windows and Unix operating systems.

1.E Offeror must discuss the DR capabilities that are included in its proposed Architecture

The capabilities are described in 1.C above.

2 DR, Review and Update DR plan, DR Plan Gap Analysis and Tracking

2A Review and update Disaster Recovery Plans (DRPs) - Offeror must review existing Disaster Recovery Plans (DRPs) to determine gaps in existing or future DR Services, within the first 120 days after the Effective Date.

The IT Risk Manager and DR coordinators will maintain a focus on maintenance and review of the Agency DRPs. Unisys expects, over time, that these will likely coalesce into a broadly comprehensive Disaster Recovery strategy that utilizes the Unisys multi-data center architecture and tiers of DR services.

As part of the transition, the IT Risk Manager will review the existing Disaster Recovery Plans to determine gaps within the first 120 days.

2.B The Offeror must at least annually review and update the disaster recovery plans.

Assist the Commonwealth in identifying dependencies/limitations to DR testing due to non-Offeror infrastructure.

Unisys IT Risk Manager will work with the agencies to review and update the DRPs on at least an annual basis.

For agencies with current subscriptions to Unisys-provided testing and services, Unisys already meets regularly to address recovery gaps and to review and examine recovery time and recovery point objectives based on the criticality of the application platforms. Thus tailored plans already exist for these Agencies and that will reduce the time needed by Unisys to integrate all agency DRPs within the Unisys-provided online disaster recovery tool and incorporate all DRPs under review and management by the Unisys Program Management Office.

For Agencies that do not currently use Unisys services, Unisys expects that the Commonwealth is currently served by a wide variety of Disaster Recovery plans maintained by each agency. On average Unisys expects that many agencies have adequate plans but within the variety Unisys expects to discover under-funded plans with significant gaps and over-funded plans that likely protect non-critical assets. Unisys has deep experience supporting current DPH disaster recovery plans. By choosing Unisys as a partner the Commonwealth benefits both from this experience as well as the Unisys-implemented [redacted] Living Disaster Recovery Planning System (LDRPS). Unisys seeks to bring all Agency DRPs within the proposed LDRPS framework so that Unisys can help the Commonwealth arrive at standardization in the Agency approaches to DR, coverage of the significant gaps and cost efficiencies through coverage appropriate to an

asset's criticality.

2.C Offeror must describe an approach to perform a gap analysis of the existing Disaster Recovery Plans (DRPs).

As described in 1.B, the IT Risk Manager will meet with directors on an agency-by-agency basis during transition to review existing DRPs and bring them into the Unisys-provided LDRPS online tool.

2.D Offeror must include a description of the process it will use to track and resolve all identified gaps.

The Unisys IT Risk Manager and members of the Unisys architecture team will meet with directors on an Agency-by-Agency basis to identify critical applications and the required Recovery Time Objectives and Recovery Point Objectives for these applications so they can be mapped to DR tiers in the Unisys-managed data centers. Any gaps identified in the DR plan will have solutions developed to close the gaps. To do this we will use the process described in this proposal to develop solutions for the Commonwealth moving forward.

3 Portal, Online DR Planning Tool

3.A Provide the Commonwealth and agency representatives with access to an online DR planning tool.

Offeror must discuss its approach to meet this requirement. Identify and describe the proposed online DR planning tool.

The Commonwealth seeks an easy-to-use online disaster recovery tool that will allow all agencies to maintain their diverse DRPs within a single tool.

Unisys proposes to leverage the [redacted] (LDRPS) to meet this requirement. This is the same tool which is currently in place to manage the DRP related to IBM mainframe services and the [redacted] facility. Unisys will exploit the full capabilities of the tool to build strong

- Crisis management plans to fit each agency's operational structure.
- Technology recovery plans delineating Unisys and Commonwealth responsibilities, including dependency mapping for the infrastructure supporting Commonwealth-managed applications. The matrix management will allow the Commonwealth oversight to how the Unisys DR teams manage a diverse set of critical and separate application groups within concurrent work streams and deliver to the required RPOs.
- Critical application recovery plans to smoothly interface with your infrastructure recovery plans.
- Process or departmental recovery plans to support your planning decisions and strategies and to identify dependencies between critical business processes.
- Site event management plans to document how to deal with a specific incident at a particular business location.

This proposed tool reduces the time needed to train users by providing step-by-step guidance

to plan builders. Agency planners are shown Unisys DR tiered offerings as well as [redacted] best practices and methodology while building customized DRPs.

4 DR, Emergency Notification System

4.A Provide the Commonwealth and agency representatives with access to an automated emergency notification system. This would be invoked on the occasion of a disaster or other emergency.

The Commonwealth seeks a common emergency notification tool that can be used to notify key agency personnel of any emergency situations that require immediate escalations and notifications.

The Commonwealth benefits from a partnership between Unisys and Everbridge to deliver a powerful, reliable and responsive Auto-Notification system. Furthermore through Incident Management on the Unisys ITSM we have the ability to automatically notify individuals of outages and escalate to right resources immediately for resolution.

4.B Offeror must discuss its approach to meet this requirement. Identify and describe the proposed emergency notification system that could be used to invoke a DR event.

Gartner Inc. has named Everbridge a leader in its 2012 Magic Quadrant for U.S. Emergency / Mass Notification Services (EMNS), which assesses vendors on their completeness of vision and ability to execute that vision.

Everbridge empowers better decisions with interactive communications throughout the incident lifecycle to protect your most important assets. Everbridge helps more than 30 million people communicate in a crisis and connect on a daily basis.

The company's notification platform is widely regarded for its:

- Elastic Infrastructure Model that delivers near infinite scale
- Advanced mobile connectivity
- Real-time reporting and analytics

Unisys will work with the Commonwealth to determine the proper list of key personnel to include on any auto-notification and the specific scope of notifications that the Commonwealth seeks.

5 Application Review, Critical

5.A Assist the Commonwealth and agency representatives as requested to review agency identified critical business applications and related IT applications and infrastructure

The Commonwealth seeks regular reviews of the Agency DRPs and critical business applications and aligns these to critical infrastructure. Unisys expects, over time, that these will likely coalesce into a broadly comprehensive Disaster Recovery strategy that utilizes the Unisys-maintained Disaster Recovery site with Tiers of DR services. This review process will confirm that DRPs are changed when changes to the application infrastructure occur.

5.B Offeror must discuss its approach to meet this requirement.

The Unisys Disaster Recovery Services function is responsible for the management of the Disaster Recovery Infrastructure On Demand service offering that verifies the availability of Disaster Recovery infrastructure; servers, storage systems, networking capabilities. The infrastructure provided will enable Commonwealth data centers to recover critical business applications and data in the event of a disaster. This function is performed by a complementary blend of resources from Unisys and IBM Global Services who possess comprehensive experience developing Disaster Recovery Plans and conducting routine testing exercises with agency participation across all platforms supported in the data center.

- **Disaster Recovery Planning*:*** The disaster recovery planning function provides that the Commonwealth receives expert assistance in developing, documenting, and deploying tiered data center recovery strategies that include access to the planning tool for Commonwealth end-users.

- **Disaster Recovery Testing*:*** The disaster recovery testing function provides assistance to the Commonwealth and agency representatives with exercising its tiered disaster recovery plans, which will occur on an annual or semi-annual basis.

Reporting to the Security Manager is the IT Risk Manager who is responsible for oversight of IT Continuity functions including Unisys business continuity planning and disaster recovery including coordinating required staff and resources to execute regular Unisys business continuity and disaster recovery testing and improvements. The IT Risk Manager, Kevin Gemmell, has worked in the capacity of this role on the Data PowerHouse contract for the past four years, identifying risk areas and establishing plans to mitigate them.

Unisys places high priority in establishing Disaster Recovery (DR) capabilities and aligning them with the Commonwealth's Business Continuity plans. We consider that our state government must successfully survive disasters that disrupt equipment, data, buildings and key personnel. Unisys assists organizations to carefully plan, prepare and test for such eventualities.

Unisys, as part of its overall Governance, will assist the Commonwealth in creating or revising its enterprise business continuity planning and business continuity management strategy.

Unisys believes this will complete the gap between the technical and business strategies enabling a complete holistic end to end approach for the Commonwealth's business continuity requirements.

As part of the on-going business continuity planning, Unisys assigns a Disaster Recovery Planner to continually keep the required documentation about the servers and services, communication plans and the operational procedures updated. In cooperation with the Commonwealth disaster recovery tests are conducted twice per year to verify the documentation, communication plans and operational procedures are working and that the operational personnel is trained for an emergency.

6 Test, Recurring Disaster Recovery

6.A Assist the Commonwealth and agency representatives as requested in developing, documenting,

deploying, and exercising its tiered disaster recovery plans

Unisys IT Risk Manager assists the Commonwealth and the agencies in bringing the Unisys DR capabilities to bear on the Commonwealth's business continuity and disaster recovery objectives. The IT Risk Manager consults and collaborates on how the various DR tiers meet the Commonwealth's requirements and on special solutions that need to be implemented.

6.B Offeror must discuss its approach and optional service offering.

The Unisys-provided testing will utilize Enterprise Services Catalog DR resources selected by the Commonwealth to meet DR RTO/RPO targets. Unisys plans for two tests per year for critical applications.

Prior to conducting the test, Unisys and the agency formulate recovery goals associated with each test. During the DR test, Unisys staff recovers the application infrastructure following the DRP. Once the application infrastructure has been recovered, the agency can begin its application testing. The DR coordinator provides overall management of the test and acts as the point of escalation for the Unisys Team and the agency participants. The coordinator records the timing and completion of all activities of the DR plan. Any problems encountered are recorded on an issues register to be escalated and addressed by the appropriate owning organization.

Unisys uses every DR test as a learning experience. We document issues, delays, and process efficiencies so that after-the-fact we can follow-up with process improvements and lessons learned that are implemented prior to the next test. A post-test review is conducted with the agency to verify that findings are appropriately documented, and follow-up actions have been assigned and completed. From there the report is created that documents the activity.

6.C Offeror must describe its approach to perform a successful recovery test within 6 months of transition to the Offeror's Managed Service

The Commonwealth seeks to begin DR testing within 6 months of transition to the new Unisys Managed Services contract. A DR Coordinator will coordinate testing activity with each agency as workload transitions into the managed service. The Commonwealth will be provided a single point of contact with whom to review the Unisys progress toward the specified date.

7 Exercise, DR

7.A Assist the Commonwealth and agency representatives as requested in coordinating disaster recovery exercises.

Unisys DR coordinator acts as a single point of contact for coordinating disaster recovery exercises. The Commonwealth uses the Unisys managed disaster recovery facilities in the new contract and has 24x7 access to the facilities versus the current [redacted] subscription-based access that adheres to tight schedules aligned to [redacted] priorities. This makes it much easier for the Commonwealth to choose or change the frequency of DR exercises at its discretion.

Unisys will apply its normal monitoring and management tools to the Disaster Recovery data

center equipment. So, unlike the existing [redacted] contract, the majority of the network infrastructure need not be specially built for the testing or for actual DR. The equipment is maintained in a "warm" status.

7.B The Offeror must every six (6) months test the operability of the disaster recovery plan then in effect

The Unisys Team has determined the labor required for this testing frequency and included this within the Enterprise Services Catalog offering for DR testing. The Unisys Team is able to provide this service based on our experience working with Commonwealth disaster recovery exercises.

7.C Offeror must discuss its approach and optional service offering

The Commonwealth benefits from more flexible test schedules and ready availability of DR assets within each Agency's DRP. The earlier tests performed with [redacted] needed to be squeezed into specific 72- to 96-hr slots because [redacted] scheduled continuous tests across its large customer base. This limited the Commonwealth's access to extensive tests across agencies. No such limitation exists with the Unisys-managed facilities.

Unisys is also able to make use of the LDRPS tool to monitor the capacity of the Unisys Disaster Recovery data center and advise Agencies on the need for capacity increases to match critical application capacities in Production.

8 Exercise for COOP, Continuity of Government (COG) Exercise

8.A Assist the Commonwealth and agency representatives as requested in developing, documenting, deploying, and exercising its continuity of operations (COOP) and continuity of government (COG) plans. Offeror must discuss its approach.

The Commonwealth is right to call out the distinction between its continuity of operations (COOP) and continuity of government (COG) plans. The Unisys IT Risk Manager will assist with both the continuity plans at the COOP and COG levels. He relies upon the LDRPS tool to assess gaps between agency plans and will schedule cross-agency meetings with the appropriate Agency Risk/Continuity Officers to stage table-top walkthroughs to simulate DR sequencing and identify gaps in sequencing and dependencies between agencies.

9 Integration, DR integrated into COOP and COG

9.A Assist the Commonwealth and agency representatives as requested in integrating its disaster recovery plans into its COOP and COG plans. Offeror must discuss its approach.

The Commonwealth recognizes that a cross-agency review of existing Disaster Recovery Plans (DRPs) will likely reveal gaps as well as over-spends. Unisys has proposed a cost-effective Disaster Recovery infrastructure as part of this proposal and can use this in discussions with agencies to benchmark existing plans. Furthermore, the Agencies can make cost-case comparisons as Unisys works with each agency to input the current DRPs into LDPRS.

10 DR, Business Partner Evaluation

10.A As requested by the Commonwealth, evaluate the efficiency of business partner disaster recovery

and/or business continuity plans. Offeror must discuss its approach.

At the request of the Commonwealth through the Enterprise Services Catalog, Unisys will evaluate the efficiency of business partner disaster recovery and business continuity plans.

11 DR, Recovery Operations Leadership

11.A In concert with the Commonwealth and agency representatives, lead the recovery operations as requested in the event of a disaster or other major disruption. Offeror must discuss its approach and optional service offerings.

The Commonwealth seeks a partner to lead the recovery operations in the event of a disaster or other major operations. In the event of a disaster, Unisys will take a leadership role, as requested by the Commonwealth and coordinate the execution of the Disaster Recovery Plan in coordination with the agency representatives.

By virtue of continuing DR testing across the Unisys customer base, the Unisys DR team develops overall best practices that are shared with the Unisys DR team dedicated to Commonwealth DR testing.

The Unisys Team has provided continuously improving Disaster Recovery services throughout the current DPH contract. We continuously apply lessons learned to refine processes to be incorporated in future tests or leveraged in the event of an actual disaster.

12 DR Planning Standards

12.A Conduct disaster recovery planning and activities in accordance with the Business Continuity Institute Good Practice Guideline or similar standard.

12.B Offeror must identify the standard and describe its approach to meet this requirement.

The Commonwealth cites the Business Continuity Institute Good Practice Guidelines in reference to business continuity standards. Unisys proposes an alternate and more targeted Good Practice guideline, namely the Unisys CSIIP program applied annually to the Commonwealth DR testing in conjunction with the [redacted] online LDRPS tool. Unisys notes that the BCI standard offers certification for its members for a very general and broad level of expertise with a certificate that is now based on 2010 practices. In contrast the Unisys CSIIP DR program applied to the Commonwealth provides metrics to measure the Commonwealth DRPs as well as providing proposals to continuously improve upon DR plans and approaches.

Unisys assesses itself through the newly developed ISO 22301-2003 standard and maintains a Certified Business Continuity Professional (CBCP) on staff who is trained in the 10 Professional Practices for Business Continuity Management offered by the Disaster Recovery Institute. This practice continues in the new contract.

13 Test, DR Planning and Testing Services

13.A Ensure DR Planning & Testing Services are documented in the Service Catalog.

13.B Offeror must provide a prototype of this section of the Service Catalog.

The Enterprise Services Catalog offering includes these DR Tiers:

- Tier 1: Recovery from backup tapes within reasonable time frame.

- Tier 2: Recovery from a backup tapes within an accelerated period.
- Tier 3: Recovery from backups and replicated data to DR via the [redacted] infrastructure.
- Tier 4: Recovery through asynchronous data replication for Open Systems SAN storage removing the need for data recovery.
- Tier 5: Data and O/S level replication for virtual Windows/Linux instances removing the need for data recovery.
- Tier 6: With Agency approval the Tier 5 offering can be utilized to provide an automatic failover capability.

These tiers benefit from the Unisys data center solution that has the added characteristic of geographically dispersed locations. With DR that requires geographically dispersed nodes, the [redacted] site enables the placement of systems in separate metrological and metropolitan regions and different seismic zones.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,
- Improve client satisfaction,
- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery
- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of

Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

14 CI Service Risk

14.A Relative to the service in question, Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

15 CI Service Quality

15.A Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

16 CI Client Satisfaction

16.A Offeror must describe methods to continually improve client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional

details in this area.

17 CI Service Transparency

17.A Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

18 CI Service Sustainability

18.A Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.

Service will be sustained by integrating any new agencies, customers, or services into our standard operational and quality processes and methodologies. We leverage ITIL processes, create quality project plans, utilize industry accepted measurement and monitoring tools, analyze trending reports and provide proactive continuous service improvement throughout the IT lifecycle. This enables new Commonwealth services to experience and sustain IT services and client satisfaction.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

19 CI Business Case Validation

19.A Offeror will provide examples to validate the projected cost savings or cost avoidance projected versus the cost of using this service.

The Catalog of Services approach to provisioning DR services provides the Commonwealth with significant opportunities for cost savings. Most organizations approach Disaster Recovery as a Like-to-Like issue and sometimes build out a DR site that is identical in computer power as the Production data center. With the Catalog of Services the Commonwealth could better manage the cost of Disaster Recovery to the likely risks of an actual disaster. For instance, when Unisys crafted the Disaster Recovery plan for the California State University system (CSU) they were reluctant to incur the cost of an identical compute power for a DR plan that they hoped never to use. Unisys presented two options to reduce cost:

1. For virtual servers the computer power was provisioned at a less than 100% of that available for production. CSU was willing to accept a diminished level of service immediately following an actual data center disaster and Unisys was able to propose a reasonable delivery date to augment the DR facility if an actual disaster occurred. The difference between the current computer power in the DR site and that of the

Production data center delivers a monthly savings for CSU.

2. Unisys also provided a means for CSU to utilize assets provisioned for their DR plan as Test and QA/Development servers under the agreement that if an actual disaster occurred then these services would be suspended so that these assets could be pulled into use as the Production infrastructure at the DR site. This allowed CSU to leverage the compute power of the DR site at relatively little risk.

The agencies in the Commonwealth can, working with IT Risk Manager, select servers and storage in the DR facility that would provide a diminished services in the event of an actual disaster. Given the very unlikely chance of an actual disaster this would allow the Agencies to better balance the full cost of a Like-to-Like DR solution against the risk of occurrence of an actual disaster.

20 CI Improve or Reduce Cost

20.A Offeror must provide examples of previous disaster recovery initiatives implemented that achieved reduced costs of Services and that met or exceeded ROI (Return on Investment) analysis projections. If costs of Services increased due to increased required capabilities, so identify.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

Unisys examples of continuous improvement

Examples of continuous service improvement have been included below under Unisys Team Experience.

Disaster Recovery – Cost Reduction:

The VM replication improved the Recovery Point Objective of our NetBackup master servers from 24 hours down to approximately 6 hours. The reduction in effort resulted in lower labor costs to execute this first step in the DR process.

Disaster Recovery – File Replication Improvement:

The DPH has implemented Distributed File Systems (DFS) to replicate our DPH File Server down to [redacted] In the event of a true disaster, files to perform our duties during and after the DR will be available. Data replication occurs in real time and is de-duplicated over the wire thus saving bandwidth on the WAN link. This confirms that our documentation, recovery scripts and procedures are current and accessible at all times to support Commonwealth agencies during disaster recovery drill and in the event of an actual disaster. By avoiding having to ship tapes containing this information to [redacted] and having to restore them,

Unisys has improved the recovery time objective for disaster drills and disaster events.

Disaster Recovery – NetBackup improvement:

VM replication was implemented to improve the Recovery Point Objective of our NetBackup master servers from 24 hours down to approximately 6 hours. This change will also lower the time it takes to recover the NetBackup server in the DR environment from 2.5 hours to around 30 minutes expediting the start of DR database recovery efforts by almost 80 percent.

Disaster Recovery – recovery time improvement:

To improve disaster recovery times, we converted AIX mksysb to ISO images to facilitate a much faster server recovery time. Prior to this change, we used CD images or mksysb restores from tape. This resulted in an 85% improvement in recovery times.

Storage Replication improvement:

Storage replication solutions have been implemented for several agencies using the latest disk to disk replication technology. These solutions have enabled a reduced dependency on tape media and drives for backup while providing a disk to disk update to offsite data supporting both data backup as well as disaster recovery requirements. Ongoing research and trials are conducted in conjunction with product support organizations to confirm proper configuration and optimal performance for the technology supporting this critical managed service.

PSP VDI improvement:

The State Police was impacted when one of its barracks was closed down due to a mold infestation and they were unable to access computers and have staff in that location for weeks. They were interested in a business continuity plan that would enable them to have access to their files and applications from a remote location. We worked with them to establish a VDI proof of concept at the DPH. Using the Virtual Desktop Interface, they were able to access their information from iPads from any location.

Unisys Team Experience

The Continual Service Improvement sections above provide details of the Unisys Team's rich experience and the value that they have brought to the Commonwealth and its Agencies over the past many years. But the Commonwealth is likely unaware of the breadth of Unisys experience in providing reliable Disaster Recovery operations that provide significant value to customers.

Setting Customers on a course to DR

Unisys provides a service in the market called the Unisys Disaster Recovery

Architecture Service. As part of this service, the Unisys team conducts a comprehensive 2-day seminar to provide customers with a solid foundation on which to build an end-to-end application and data disaster recovery capabilities. This service mirrors the embedded service provided to the Commonwealth in this proposal and managed by the Unisys IT Risk Manager on

an agency-by-agency basis. For instance the Unisys Disaster Recovery Architecture Services provides:

- Reduction of costs through
  - The deployment of mature recovery services management
  - The collective disaster recovery architectures and processes financially rationalized against explicit, business-driven recovery targets
- Mitigated risk through
  - Knowledge transfer that allows each IT function to understand its specific role within the overall, end-to-end recovery process
  - Institution of proven and formalized recovery services management that yields reliable, disaster recovery capabilities
- Restored quality of service as shown by
  - Disaster recovery, service performance reviews that build confidence through "proof of delivery capability" reports - Actual disaster recovery costs that become transparent to the business

Saving Money with efficient DR

Solution

JMC Steel Group worked with Unisys to design and execute a sizeable data center migration and modernization initiative, which standardized the SAP infrastructures at two key data centers on a common hardware platform – and provided the bullet-proof disaster recovery capabilities these critical environments demand.

Results

Carrying out its data center transformation strategy enabled JMC Steel to better support the operations of two major manufacturing facilities. Plus, by making a robust disaster recovery capability a key component of the project, the company greatly improved its ability to avoid the numerous harmful effects of both planned and unexpected downtime.

Metrics

- **Resiliency:** 15-minute recovery time objective (RTO) established and confirmed via testing of automated backup and failover capabilities.
- **Performance:** 300 percent increase in hardware performance and 50 percent reduction in response times.
- **Cost avoidance:** $250,000 in lost revenue per four hours of downtime avoided.

Protecting Alabama State citizens through improved DR

The Alabama Criminal Justice Information Center (ACJIC) is a state agency providing local, state, and federal criminal justice agencies with the information needed to provide citizen safety. ACJIC realized that gaps in its information technology were hindering communications and business continuity. It needed to more efficiently deliver critical information from its network

and systems.

Unisys provided a real–time infrastructure with improved disaster recovery and business continuity through a turnkey solution comprising an ES7000/one enterprise server platform, Unisys SafeGuard 30m, and EMC SAN technology.

By implementing the system, ACJIC now has a dependable, cost–effective system that delivers real–time information to end users, supports future growth, and provides robust, reliable operations. It also provides system patches and updates with extreme ease and supports failover requirements. The result is enhanced officer and citizen safety while building trust among constituents.

Metrics

- **Better Security:** Reduced downtime and risk – 24x7 availability with failover in less than one minute from the primary site to the disaster recovery site
- **Reduced Costs:** Lowered costs while processing some 18 million transactions monthly
- **Improved Satisfaction:** Enhanced citizen and officer safety by ensuring a constant flow of real–time information
- **Better Productivity:** Enabled one–to–two–second searches for up to 40 million records in the Law Enforcement Tactical System

Protecting Workers' Compensation through improved IT and DR

EMC Insurance Companies has grown from a provider of workers' compensation coverage to one of the Iowa's largest property and casualty insurance providers – with over 20 branch locations and assets in excess of $3 billion.

A key factor catalyzing nearly 100 years of steady expansion has been EMC's commitment to cultivating successful, lasting relationships with independent agency partners. Yet, as these partnerships grow, so too do the demands for speedy, personalized service that is available around the clock.

With Unisys technology driving its consolidation, virtualization, and business continuity processes, EMC has established an environment that promotes responsiveness and agility across the organization. As a result, the company is better equipped to deliver and support the services that its wide network of branch locations and independent agents demand 24x7.

Metrics

- **Cost:** Consolidated and virtualized 150 existing servers down to 50.
- **Efficiency:** Streamlined disaster recovery procedures, including an 80% reduction in documented processes
- **Service:** Implemented platforms that keep mission-critical systems and applications available at all times

De Beers UK Streamlines and Strengthens IT Processes and DR

De Beers UK contracted Unisys to outsource and manage the full scope of its IT data center operations – from hosting critical applications to deploying business continuity measures to

providing technical and end-user support services.

The fully managed data center environment Unisys provided De Beers has enabled the company to improve the flexibility with which it can meet both current and future business and IT demands, eliminated the need to allocate in-house resources to routine IT management tasks, and provided the disaster recovery measures required to verify the company's infrastructure remains resilient and resistant to failure. What's more, the end-user support capabilities extended the company's resiliency gains to its employees, helping them remain productive and make positive contributions to important initiatives.

Challenge

Minimize the risk of an interruption to global operations, and better support the efforts of end users – without adding complexity or increasing management burden.

Solution

De Beers UK contracted Unisys to outsource and manage the full scope of its IT data center operations – from hosting critical applications to deploying business continuity measures to providing technical and end-user support services.

Results

The fully managed data center environment Unisys provided De Beers has enabled the company to improve the flexibility with which it can meet both current and future business and IT demands, eliminated the need to allocate in-house resources to routine IT management tasks, and provided the disaster recovery measures required to verify the company's infrastructure remains resilient and resistant to failure. What's more, the end-user support capabilities extended the company's resiliency gains to its employees, helping them remain productive and make positive contributions to important initiatives.

Metrics

- **Manageability:** Provisioned a new business intelligence application in four weeks
- **Recoverability:** Confirmed the resiliency of the new infrastructure via a full disaster recovery test

Benefits to the Commonwealth

The Unisys proposed Online Disaster Recovery Tool provides an opportunity for more cost effective Disaster Recovery services for the Commonwealth. Following transition when the Unisys IT Risk Manager had integrated Agency DR plans into the tool, the IT Risk Manager will be able to present the Office of Administration, a first-ever comprehensive and comparative view of the various Agency DR Plans. This will allow the Office of Administration (OA) to focus on those plans which appear to be paying for very high risk mitigation DR plans and review the cost efficiency on these outliers.

The Unisys proposed Online Disaster Recovery Tool will lead to far more consistent quality for Disaster Recovery services for the Commonwealth. This comprehensive and comparative view of the various Agency DR Plans also allows the OA to focus on those outlier Agencies who appear to have underfunded DR plans and are likely carrying much higher risks than might be appropriate.

The Unisys Team has consistently used lessons learned from Disaster Recovery tests to remediate existing DR plans to improve the overall quality of each DR plan. The Unisys Team

has also used these tests to propose Service Design changes that have reduced the costs of services by inserting reliable tools and processes to replace the sort of frenzied high-labor processes that would likely impede service recovery if a disaster actually occurred.

3.2.2.5 Security Management

The Security Management service must ensure the confidentiality, integrity and availability of Commonwealth information and infrastructure systems. All support and implementation activities must be conducted in accordance with, but not limited to, leading industry and Commonwealth standards, which include, but are not limited to, ISO 27001:2005 and ISO 27002:2005. The Offeror must support all related system audits at the Offeror's expense. The Offeror must maintain current security ISO 27001, ISO 9001 and ISO/IEC 20000 certifications.

The Offeror must comply with Commonwealth IT policies and directives as well as federal and Commonwealth laws, regulations and policies, including but not limited to the Criminal History Record Information Act (CHRIA), Health Insurance Portability and Accountability Act (HIPAA), Criminal Justice Information Services (CJIS) regulations, The United States Social Security Administration (SSA)regulations, IRS (Internal Revenue Service) Publications, Commonwealth Information Technology Bulletins (ITBs) and the Payment Card Industry (PCI) standards. The Offeror must work with each agency to understand and ensure compliance with all laws, regulations, and policies as they pertain to each individual agency.

Reference Documentation

Exhibit J.1 through J.3 - Commonwealth Security and Compliance Requirements

Exhibit G.6 - PSP - CJIS Security Policy

Exhibit G.9 - PSP – CCHRI

Exhibit G.7 - PSP - Summary of CJIS Requirements

Exhibit G.12 - PSP - CHRIA Handbook

Requirements		Describe Compliance
1.	Develop an annual Security Management Plan.	Offeror must describe its approach to Security Management and provide a sample of a Security Management Plan. Highlight how stated security objectives align with Commonwealth business goals, IT policies, and regulatory requirements.
2.	Deploy complement of network security systems. Implement at minimum: spam filtering, anti-virus, malware protection, firewall (web, application), intrusion prevention and detection,	Offeror must describe its proposed solution including the following: • Processes and Procedures • Tools / Applications • End User Reports

	web content filtering, virtual private network, and data loss prevention systems.	o Standard o Custom • Escalation Procedures Offeror must describe its prior experience relative to providing datacenter management and support of CJIS, CCHRI, HIPAA and PCI systems.
3.	Perform quarterly (at the Offeror's expense) Vulnerability Analyses (VA) and penetration testing to identify new or emerging information security threats. Perform penetration testing (at the Offeror's expense) and present the results of each VA on a quarterly basis. Should exposures be identified, plan and remediate the exposure in accordance with Commonwealth IT policy guidelines. Report results to the Commonwealth within the time set out in an applicable SLA. The above requirement will be for all systems/subsystems that the Offeror is responsible for including managed servers/virtual servers, network devices, security devices including , but not limited to, the following: • Performing web application firewall administration and securing web applications behind it. • Ensuring and maintaining PCI level 1 compliance. • Implementing DLP for the data center server assets to avoid a breach. • Implementing Database Firewall to secure database assets from breach.	Offeror must describe its capabilities and approach to performing vulnerability analysis and penetrating testing on a quarterly basis. Provide sample reports for each.

4.	Review network and other security logs for evidence of attacks. Utilize enterprise grade intrusion detection tool(s) to systematically identify, stop, and report security threats. Produce a monthly Security Log Analysis as part of the monthly status reports as described in RFP section IV-5 Reports and Project Control.	Offeror must describe its solution and approach.
5.	Apply operating system and other security patches. Implement a Patch Management Program to ensure the timely application of security updates on all infrastructure platforms in accordance with Commonwealth IT policy guidelines. The Patch Management Program must adhere to the Change Management process that includes Commonwealth approvals.	Offeror must describe its proposed Patch Management program.
6.	Restrict physical access to all network systems and equipment with biometric or other second factor access control systems.	Offeror must describe solution and approach to meet this requirement.
7.	Restrict access to all data in the Commonwealth network infrastructure. Restrict and control all data access right, groups and special permissions based on the data security program designed by the Commonwealth security team and/or specified by the agencies. Access level changes and	Offeror must describe solution and approach to meet this requirement.

	exceptions will be executed only when approved paperwork is complete and approved. A file of all access changes will be maintained by the Offeror for audit purposes. Offeror must support Commonwealth initiated security audits.	
8.	Evaluate the security standing of network-connected subcontractors. Conduct information security audits of prominent subcontractors on an annual basis.	Offeror must describe solution and approach to meet this requirement.
Continual Service Improvement		
9.	Reduce service risks.	Relative to the service in question, Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.
10.	Improve service quality.	Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.
11.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
12.	Provide service transparency.	Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.
13.	Ensure service sustainability.	Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.
14.	Improve/reduce cost of service.	Offeror will provide examples of Security Management initiatives that have been

		implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Unisys Team understands the vital importance of ensuring the confidentiality, integrity, and availability of Commonwealth data, applications, and critical systems. The security of the Commonwealth will be managed by the Unisys team in accordance with agency requirements for compliance with leading industry and Commonwealth standards such as ISO 27001:2005 and ISO 27002:2005 and Commonwealth IT policies and directives and federal and Commonwealth laws, regulations and policies. Unisys will work with each agency within the Commonwealth to understand their compliance requirements and verifies each agency meets applicable laws, regulations, and policies. These policies, directives, laws, and regulations include the Criminal History Record Information Act (CHRIA), Health Insurance Portability and Accountability Act (HIPAA), Criminal Justice Information Services (CJIS) regulations, the United States Social Security Administration (SSA) regulations, IRS (Internal Revenue Service) Publications, Commonwealth ITBs and the Payment Card Industry (PCI) standards. Unisys currently maintains current security ISO 27001, ISO 9001 and ISO/IEC 20000 certifications.

Security Management Organization

The Unisys security team will be organized as follows as depicted in **Figure 3.2.2.5-1**:

The Information Security function oversees the project to verify compliance with security standards and requirements and develops policies and provides periodic audits of processes and data to confirm compliance. The purpose of information security management is to align IT security with business security needs and verifies that the confidentiality, integrity and availability of the assets, information, data and services match the needs of the Commonwealth.

Information Security

Figure 3.2.2.5-1 - Information Security– Functional Overview

The IT Risk Management function is responsible for leading efforts associated with continuity of Unisys business and disaster recovery. This function also confirms that the required audits are conducted on an annual basis and that the Unisys Team participates as needed and Commonwealth audits.

The Audit and Regulatory Compliance function has accountability for Unisys Team compliance with Commonwealth IT policies and directives, and at the agency's direction federal and Commonwealth laws, regulations and policies, including the Criminal History Record Information Act (CHRIA), Health Insurance Portability and Accountability Act (HIPAA), Criminal Justice Information Services (CJIS) regulations, the United States Social Security Administration (SSA)regulations, IRS (Internal Revenue Service) Publications, Commonwealth ITBs and the Payment Card Industry (PCI) standards. This function works under the guidance of each agency to understand and verify compliance with laws, regulations, and policies as it pertain to each individual agency. The responsibility for conducting contractually required audits or arranging for participation in agency audits falls under this function.

The IT Continuity function is responsible for strategy and planning associated with continuity of our business as well as Commonwealth disaster recovery. This function leverages a disaster recovery planning tool that is shared with the Commonwealth to document disaster recovery and business continuity plans.

The Security Strategy function is responsible for development of the security plan and roadmap in collaboration with Commonwealth agencies.

The Security Policy, Planning and Governance function will meet with the Commonwealth's Security teams (OA & Agency) to participate in creating a comprehensive Security Program strategy. The Offeror and the Commonwealth Security teams will develop security awareness training content consisting of the Offeror's Security Plan documentation, Commonwealth OA and agency security policy guidelines. This function verifies the Unisys Team compliance with policy.

The Security Operations function is responsible for overseeing operational security functions including physical security and operational network security.

The Network Security function provides hosting and operational support services for security products and firewalls located at the data centers. These security devices and services protect the equipment and applications in the data centers from malicious attempts to penetrate the computing environment with worms, phishing, Trojan horse malware, and unlawful data access.

The Physical Security function provides robust physical security, including biometric access control, video surveillance, and routine security officer patrols ensuring Commonwealth and vendor assets are protected at all times.

The Information Security function oversees the project to provide compliance with security standards and requirements and develops policies and verifies periodic audits of processes and data to confirm compliance. The purpose of information security management is to align IT security with business security needs and confirms that the confidentiality, integrity and availability of the assets, information, data and services match the needs of the Commonwealth. Within this function, IT Risk Management, Information Security, IT Continuity, and ongoing audits are addressed.

The organization is led by the Security Manager. The Security Manager is the Unisys security leader who will observe all project activities to mitigate interference with the effectiveness of the Commonwealth's core operational business and to confirm that security policies and procedures are followed.

The Unisys Security Manager, [redacted] is a results-oriented leader with more than 15 years of experience supporting security product implementations, developing security strategy with Commonwealth CIOs. Mike is a seasoned professional with exceptional understanding of federal security regulations and compliance requirements. He is tasked with confirming Commonwealth regulatory compliance on this engagement and providing leadership on client projects by developing workable plans, limiting risk, and management of resources.

Reporting to the Security Manager is the IT Risk Manager who is responsible for oversight of disaster recovery including coordinating required staff and resources to execute regular Disaster Recovery testing and improvements. This individual also has dotted line responsibility for oversight of security operational staff which consists of three security-focused Network Design Engineers. The IT Risk Manager also manages SSAE-16 audits and arranges participation from the Unisys Team in agency audits. The IT Risk Manager, Kevin Gemmell, has worked in the capacity of this role on the Data PowerHouse contract for the past four years, identifying risk areas and establishing plans to mitigate them.

The Security Management service provides the technical capability to protect the confidentiality, availability and integrity of Unisys service enabling infrastructure, applications, and data as well as the Commonwealth's workloads and data. The Network and Infrastructure Security Technical Service provides building blocks and applications that instantiate and enforce security policy, protects data in motion and at rest, enables secure remote access, and identifies anomalous traffic and potentially malicious activities.

The service allows for the following:

- Management of security devices with in the data center infrastructure
- Establishing secure connections for data migration over VPN tunnels
- Implementation of internal firewalls to support a secure infrastructure
- Management and enforcement of security policies within the network.
- Surveillance, detection and prevention of anomalous traffic and potentially malicious activity.
- Secure data in motion and secure data at rest.
- Secure remote access connections into and out of the network.

1 Security Management Plan, Sample (example)

Develop an annual Security Management Plan. Offeror must describe its approach to Security Management. Provide a sample of a Security Management Plan. Highlight how stated security objectives align with Commonwealth business goals, IT policies, and regulatory requirements.

Security Management Process

Our security management process includes the following components:

Develop an Annual Security Management Plan

We will review and update the security management plan on an annual basis. **Figure 3.2.2.5-2** below illustrates our four step process to develop/enhance the security management plan:

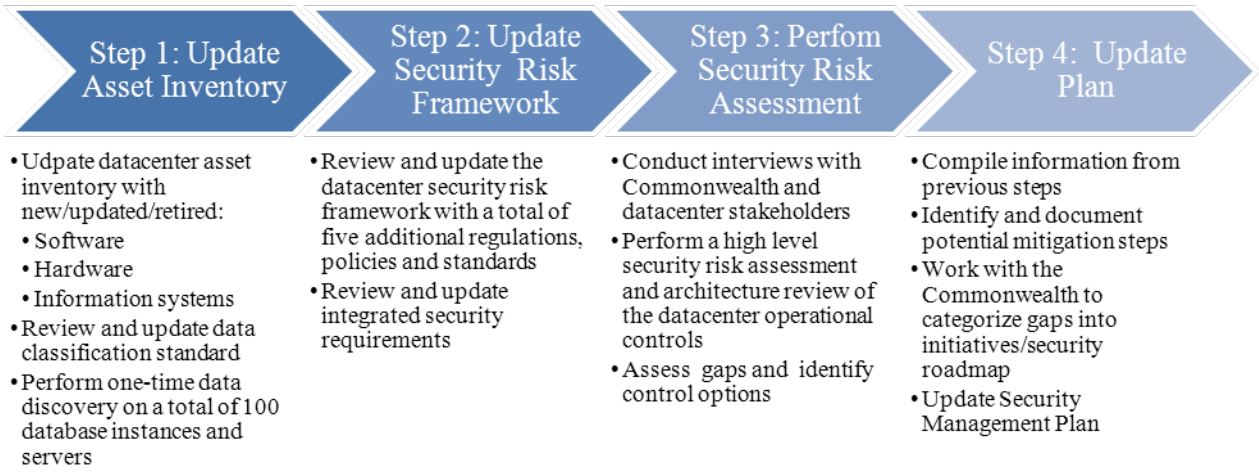

Figure 3.2.2.5-2 Security Management Plan Process

Each of the above illustrated steps are described below:

Step1 – Update data center asset inventory and perform data discovery. We will perform an annual review of the data center asset inventory and update the inventory with the new, updated and retired versions of software, hardware and information systems in addition to appropriate system owners. As part of this step, we work with the Commonwealth stakeholders to review and update the data center data classification standard. As part of this process, we review and update the current mapping of the data elements and their appropriate data classification categories in addition to data sensitivity levels.

We perform a one-time assessment using the Symantec Data Loss Prevention (DLP) solution's data discovery tool on the Commonwealth's data center infrastructure (a total of 100 servers and database instances) to identify the PII data at rest. We perform the following tasks as part of this activity:

- Document the results of the data discovery assessment in the IT asset inventory
- Identify appropriate data encryption requirements using the data center security risk framework to appropriately protect the PII data and meet the relevant regulations, policies and standards.

Step 2 – Update Security Risk Framework. We will review and augment the data center security risk framework with five additional security regulations and Commonwealth policies/standards that include revisions to:

- Commonwealth Information Technology Bulletins (ITBs)
- Federal security regulations such as Internal Revenue Services (IRS) publication 1075, Criminal Justice Information Services (CJIS), Health Information Portability and

Accountability Act (HIPAA) and United States Social Security Administration (SSA)

- Commonwealth regulations such as Criminal History Record Information Act (CHRIA)
- Industry standards and regulations such as Payment Card Industry (PCI) Data Security Standards (DSS) and National Institute of Standards and Technology (NIST) Special Publication (SP) 800-53.

These additionally identified requirements are then integrated with the data center security risk framework to identify additional data protection controls to meet the relevant regulations and business requirements.

Step 3 – Perform Security Risk Assessment and IT Architecture Review. We use the updated data center security risk framework to conduct a high level security risk assessment of the data center operational controls. In addition, we perform the IT security architecture review that includes specific components such as,

- Trust Zone Architecture.
- User Role Design.
- Authentication and Authorization.
- Data Protection.
- Security Audit Logs and SIEM.
- Data Privacy.

Step 4 – Update Plan. We will perform an annual update to the data centers' initial security plan with the results obtained through steps 1, 2 and 3. We will assess the gaps, and identify and document appropriate mitigation controls in the deliverable D-07.05 Security Management Plan. As part of this step, we will work with the Commonwealth stakeholders, conducting up to two meetings, to categorize gaps into appropriate initiatives, identify current posture and integrate the results with the security roadmap.

See Attachment F-9 for a sample Security Management Plan, entitled, "Commonwealth of Pennsylvania – Office of Information Technology Enterprise Data Center Security Management Plan".

2 Network Security System Architecture, Experience

2.A Implement at minimum: spam filtering, anti-virus, malware protection, firewall (web, application), intrusion prevention and detection, web content filtering, virtual private network, and data loss prevention systems.

2.B Offeror must describe its proposed solution including the following:
Processes and Procedures
Tools / Applications
End User Reports
Standard
Custom
Escalation Procedures

The Commonwealth is protected through the deployment of the following devices at all Internet

ingress points: Web & Application Firewall, Anti-Malware, IPS, Content Filter, VPN Concentrator and DLP, Processes and Procedures to address Acceptable Use, Physical & Logical Access Reviews and the applicable Commonwealth ITBs.

Web and database application firewalls will use the Imperva SecureSphere platform for proactive, real-time alerting and blocking of potential application threats. Data loss prevention (DLP), anti-virus, anti-malware, and spam filtering will be provided by Symantec Endpoint Protection, Data Insight Enterprise, and Network prevent platforms. Traditional network firewall, virtual private network (VPN), and Intrusion Prevention Services (IPS) services will utilize the [redacted] enterprise platform, with separate instances for each service to reduce maintenance downtime and impact.

All firewalls will be implemented using the least privilege policy per agency, blocking all traffic by default. Modification to the policy is accomplished via the change management process and requires agency approval. Unisys initially uses vendor standard security policies/configurations on the anti-virus and DLP platforms and works with the agencies and OA's Security Office to modify these as appropriate to meet Commonwealth security requirements.

Reporting will be provided from the individual tools, in addition to an aggregate view from the enterprise SIEM system. Examples of standard reports include: anti-virus compliance and auditing per system, dropped and suspicious firewall events, overall top enterprise threats from the SIEM, threat trending per month/quarter/etc. Custom reports may also be requested via the Enterprise Services Catalog and will be developed by working with the Commonwealth security staff to identify required information, trending, formatting, etc. from the individual tools as well as the enterprise SIEM.

There are well established and tested escalation processes in place to address incidents. Escalation processes are described in Schedule F, Section 3.2.1.4 "Service Desk". For security incidents, Commonwealth IT Security Incident Reporting Policy will also be followed.

2.C Offeror must describe its prior experience relative to providing datacenter management and support of CJIS, CCHRI, HIPAA and PCI systems.

Unisys currently supports agencies such as the Department of Public Welfare, Liquor Control Board, Department of Revenue, the Department of Health, and the Pennsylvania State Police in the DPH required to adhere to and be audited on the security standards of CJIS, CCHRI, HIPAA, PCI, NIST, FISMA and IRS. As required, Unisys supports Commonwealth agencies in complying with these stated security requirements by ensuring the appropriate complement of network security devices are implemented for each agency.

The Unisys Team has provided data center management in support of other government agencies in support of CJIS, CCHRI, HIPAA, and PCI systems. As an example, Unisys designed a data and records management system for the Alabama Criminal Justice Information Center that meets CJIS and CHRIA requirements. The Alabama Criminal Justice Information Center (ACJIC) is a state agency providing local, state, and federal criminal justice agencies with the information needed to provide citizen safety. ACJIC realized that gaps in its information technology were hindering communications and business continuity. It needed to more efficiently deliver critical information from its network and systems. ACJIC explored several solutions and solution providers before choosing Unisys to help establish an IT infrastructure specifically designed to address the agency's requirements.

3 Security, Quarterly Vulnerability Assessment, Penetration Testing

3.A Perform quarterly (at the Offeror's expense) Vulnerability Analyses (VA) and penetration testing to identify new or emerging information security threats

3.B Perform penetration testing (at the Offeror's expense) and present the results of each VA on a quarterly basis. Should exposures be identified, plan and remediate the exposure in accordance with Commonwealth IT policy guidelines. Report results to the Commonwealth within the time set out in an applicable SLA.

3.C The above requirement will be for all systems/subsystems that the Offeror is responsible for including managed servers/virtual servers, network devices, security devices including , but not limited to, the following:

Performing web application firewall administration and securing web applications behind it.

Ensuring and maintaining PCI level 1 compliance

Implementing DLP for the data center server assets to avoid a breach.

Implementing Database Firewall to secure database assets from breach.

Offeror must describe its capabilities and approach to performing vulnerability analysis and penetrating testing on a quarterly basis. Provide sample reports for each.

Perform Quarterly Vulnerability Analyses and Penetration Testing

Quarterly Vulnerability Assessment and Penetration Testing: The Unisys Team uses our demonstrated methodology and our deep experience in serving multiple agencies of Commonwealth and other public sector clients to perform the baseline security risk and vulnerability assessment. Our methodology has been well-honed to provide PCI level 1 compliance. We use our experience in delivering security risk and vulnerability assessment projects for several public sector clients including the Commonwealth to deliver this assessment. Using state-of-the-art tools that are consistent with leading industry practices such as National Institute of Standards and Technology (NIST) standard, Open Web Application Security Project (OWASP) and System Administration, Audit, Network, Security (SANS) guidelines, we tailor our assessment to meet the Commonwealth timelines and deliverable milestones.

We perform the following steps as part of the quarterly vulnerability assessment and penetration testing of the data center's IT infrastructure:

Steps	Unisys team performs the following activities to identify potential security risks and vulnerabilities within the data center infrastructure
Scope and Plan	Conduct one meeting with the data center stakeholders and the Commonwealth's "Trusted Agent" to • Document project requirements, scope and objectives • Identify Commonwealth's point of Contact ("Trusted Agent"). • Identify and document the time frame for conducting baseline security risk and vulnerability assessment.
Conduct vulnerability assessment	• Identify the Commonwealth's target IT and application infrastructure using passive scanning (from public resources such as Search Engines) • Work with the Commonwealth's stakeholders to understand the architecture, business logic/functionality, external dependencies, user roles and privileges within the target IT infrastructure and application • Identify, using passive scanning techniques, the technology and infrastructure dependencies • Perform active reconnaissance and identify network protocols present on the target infrastructure

	and web applications using network discovery (SolarWinds, Ping and Xprobe2) • Identify well-known open TCP ports and services present on the target infrastructure using leading port scanning tools (Nmap and SuperScan) • Perform infrastructure vulnerability tests using automated vulnerability scanning tools (Tenable Nessus and Rapid 7 Nexpose) on Commonwealth selected IT infrastructure. The tests will include performing vulnerability scans to meet the Payment Card Industry (PCI) Data Security Standard (DSS) vulnerability scanning requirements • Perform database vulnerability testing, using automated database vulnerability scanners (AppDetectivePro) on a total of Commonwealth selected standard database instances of Oracle, Microsoft SQL Server, MySQL and IBM DB2 • Conduct manual assimilation of the vulnerability scan results to identify false positives and manually verify the vulnerabilities identified by the vulnerability scanning tools.
Perform Penetration Testing	• Analyze the vulnerabilities in order to identify the penetration testing steps that can be performed – based on the identified hosts with vulnerabilities • Research, develop and prepare custom penetration test scripts/methods for the in-scope systems/vulnerabilities • Communicate the penetration test activity with the trusted agent and obtain the confirmation before performing the tests on the target environment • Support the Commonwealth to select the IT infrastructure to perform the penetration testing. The selected IT infrastructure for further analysis will help provide a representative view of the data center IT environment (e.g., different server OS levels, HW vendors, and server functions). We will document and discuss the appropriate exploitation steps with the Commonwealth before performing the tests • Perform the controlled penetration testing on Commonwealth selected IT infrastructure to exploit the identified vulnerabilities. We will use Rapid7 Metasploit to perform the penetration tests Note: The Unisys Team performs the vulnerability assessment and penetration testing on Commonwealth selected data center's IT network infrastructure. The vulnerability assessment and penetration testing does not include web application vulnerability testing and social engineering assessment
Perform Security Configuration Risk Review	• Perform security configuration risk review using the IRS 1075 based Safeguard Computer Security Evaluation Matrix (SCSEM) on Commonwealth selected IT infrastructure handling Federal Taxpayer Information (FTI). We will work with the Commonwealth to select the IT infrastructure that includes a representative view of the information technology environment of the data center such as • Web servers • Application servers • Database instances • Standard operating systems (SCO UNIX,Tru64 UNIX, HP-UX, IBM AIX, Linux – Red Hat, SUSE, Microsoft Windows 2000, 2003 and 2008) • Boundary protection devices: perimeter firewalls, Intrusion Prevention System (IPS), routers and switches.
Document Results and develop mitigation plan	• Notify immediately to the Commonwealth's "Trusted Agent" if high risk vulnerabilities are identified during the test window • Detailed description of test scripts used and steps followed to identify or exploit critical and high risk vulnerabilities • Document and submit the results of the quarterly vulnerability analysis and penetration testing as part of Deliverable #D-07.03 (Security Management Plan) • Work with the Commonwealth to prioritize the vulnerabilities identified and develop a mitigation plan.

Quarterly Cyber Threat Intelligence (CTI) diagnostic: To adapt to the growing

sophistication of detecting security threats, the Unisys team augments our quarterly vulnerability assessment with an emerging service – Cyber threat intelligence diagnostic. This service is a key differentiator where we help the Commonwealth stay abreast of advances in persistent security threats, help identify and reduce risks from emerging information security threats within the Commonwealth's data center infrastructure. As part of this service, we will perform the following activities

- ***Activity 1 – Intranet cyber compromise analysis:*** Through this activity, the Unisys team will identify potential Commonwealth data center servers that may be compromised and are attempting to communicate with known adversary controlled devices on the Internet. We perform this activity by analyzing Commonwealth's security audit logs from domain name server (DNS) logs, firewall logs and remote access logs of devices supporting critical data center servers. We will work with the Commonwealth's "Trusted Agent" prior to the start of the analysis to select the audit log time frame and document the scope of the analysis.
- ***Activity 2 – Rogue device discovery diagnostic****:* The Unisys Team will analyze the behavior of data center devices (IT infrastructure) to determine if the devices exhibit rogue or stealth-like characteristics. We will analyze the Network Dynamic Host Configuration Protocol (DHCP) and Address Resolution Protocol (ARP)/Content Addressable Memory (CAM) data from the data center's core network switches supporting critical data center servers. We will work with the Commonwealth's "Trusted Agent" prior to the start of the analysis to select the audit log time frame and document the scope of the analysis.

At the end of the quarterly diagnostic, we will work with the Commonwealth to prioritize the vulnerabilities identified and develop a mitigation plan.

Monthly CTI program diagnostic report: In addition to performing a quarterly CTI diagnostic, the Unisys team augments our approach with a monthly program diagnostic. Through this diagnostic, the Unisys team will analyze the data center servers to identify presence of potentially unwanted programs, malicious files, and unknown binaries. We will work with the Commonwealth's "Trusted Agent" prior to the start of the analysis to select the audit log time frame and document the scope of the analysis. At the end of this diagnostic, we will work with the Commonwealth to prioritize the vulnerabilities identified and develop a mitigation plan.

Unisys team's collaborative approach to work with the Commonwealth to perform this assessment

We work with the Commonwealth to identify a "Trusted Agent" to help facilitate the security risk and vulnerability assessment. The Trusted Agent is responsible to:

- Define scope, identify and prioritize the IT assets for the assessment
- Make decisions to proceed with applicable testing
- Coordinate the testing activity with stakeholders like IT infrastructure, application and data center service providers
- Coordinate with other commonwealth agencies (if applicable) during the testing activities
- Review the vulnerability reports and owns limited "as needed" distribution of the reports. The sensitive nature of information contained in the reports requires a specific

stakeholder being responsible for managing the communication aspects

- Identify mission critical systems of the Commonwealth, business partners or affiliates, and third parties, as applicable
- Identify the time period for communication to the appropriate stakeholders for high severity security vulnerabilities identified in production environment
- Coordinate and authorize the vulnerability assessment team access to the Commonwealth data center's information technology components considered for vulnerability assessment. In order to avoid interruptions, we recommend running many of the assessment tasks during non-business hours. At the Trusted Agent's direction, we execute as many of these tasks as practical during non-business hours
- Select the servers for the baseline security risk and vulnerability assessment based on business and security criticality
- Identify and provide the appropriate audit logs and data for performing the quarterly and monthly CTI diagnostic assessments.

We will facilitate with the Commonwealth and the data center stakeholders a backup of data and servers for the environments in addition to performing recovery procedures of systems, servers and applications in scope for this assessment.

In addition, we use leading industry vulnerability scanning tools that supports PCI scanning – Tenable Nessus and Rapid 7 Nexpose in addition to using Rapid 7 Metasploit to perform penetration test. We use AppDetectivePro to perform database security vulnerability assessment in addition to performing a security configuration review using leading industry standards such as IRS defined SCSEMs.

Our approach includes defining a mitigation plan and performing the appropriate mitigation steps/establish mitigation controls for the vulnerabilities identified.

The Unisys Team will use the Imperva SecureSphere platform as Web and database application firewalls for proactive, real-time alerting and blocking of potential application threats. Our approach for implementing DLP and Database Firewall to avoid breaches is detailed in Schedule F, Section 2.3.4 "Data Protection". Sample quarterly Vulnerability Analyses (VA) and penetration testing report, entitled, "Sample Security Assessment Report" is provided in Appendix F-10.

4 Security Attack and Threat Assessment

4.A Review network and other security logs for evidence of attack. Utilize enterprise grade intrusion detection tool(s) to systematically identify, stop, and report security threats. Produce a monthly Security Log Analysis as part of the monthly status reports as described in RFP section IV-5 Reports and Project Control.Offeror must describe its solution and approach

Review Network and Other Security Logs

Unisys will implement a security information and event management (SIEM) system that allows for proactive analysis of security logs from all security, network and system platforms. The SIEM collects, aggregates, analyzes, and correlates system logs to identify suspected security

incidents and confirms that the full path of attack is identified. The Unisys SIEM reviews logs from all sources and identifies immediate threats as well as perform historical analysis on previous events for trending and lower severity or persistent attacks. Suspected risks and threats immediately go through the incident management process for remediation, and follow up reporting are provided in standard formatting, with custom reporting also available.

The [redacted] intrusion prevention system (IPS) sends its logs to the SIEM for real time analysis and correlation with other device logs to determine possible malicious activity. This is accomplished with a signature based system capable of protocol and traffic anomaly detection, zero day protection, and application awareness. Suspected intrusions are blocked based upon the vendor recommended security rating and continually tuned for more accurate detection and less false positives.

The Commonwealth will receive a monthly security report detailing all security incidents, which will be provided to appropriate agency and OA security administration. See item 3 above for additional details on reports.

5 Patch Management

5.A Apply operating system and other security patches. Implement a Patch Management Program to ensure the timely application of security updates on all infrastructure platforms in accordance with Commonwealth IT policy guidelines. The Patch Management Program must adhere to the Change Management process that includes Commonwealth approvals. Offeror must describe its proposed Patch Management program.

Apply Operating System and Other Security Patches

Unisys will implement a complete Patch Management Process for the Commonwealth in accordance with OA ITBs, ITIL Change Management Process and vendor best practice recommendations. The Unisys technical support team will work with the Commonwealth Agencies to determine patch policies that should be applied to Configuration Items (CIs) supporting applications including OS, network, databases and middleware (CIs). The Patch Management Process will address policies, processes, procedures for the following:

- Sources of patches (how to obtain them from the OEMs)
- Toolsets that are employed to stage patches for possible deployment
- Change management procedures supporting the Change Management Process to identify, approve and manage deployment of patches
- Compliance procedures to include utilization of the toolsets to run compliance audits and identify out of compliance CI's with patch policies and approved changes
- Process and procedures to bring out of compliance CI's back into compliance

Unisys will follow the Change Management Process for applying patches to all IT infrastructure CI's with the Commonwealth's approval. This process will maintain the change record in the Unisys ITSM platform and also update the CMDB configuration management file after completion of the patch release and deployment process. The Unisys ITSM change record will be related to the CI's in the CMDB as an audit trail for patch changes upon the completion of the Release and Deployment Process.

The distributed IT infrastructure toolset to support the automation of patch release and deployment is [redacted] for Server and Network Administration. Unisys will maintain in this toolset the appropriate patch policies for determining patch deployment and compliance. The [redacted] Suite will be maintained with the current patches supplied by the OEM's and will be used to manage the distributed IT CI's.

Unisys approach to testing and validating updates to the all CI's is to follow the Release and Deployment Process for all changes into all production environments. The Release Process includes:

- Change ticket approvals
- Test planning and accepted test results
- Release and deployment planning including release back out plans
- Release testing for risky deployments
- Early life cycle support to help provide a successful deployment
- Release blackout for failed releases

6 Network Physical Access Restrictions

6.A Restrict physical access to all network systems and equipment with biometric or other second factor access control systems. Offeror must describe solution and approach to meet this requirement

Unisys takes a layered approach to security. Each facility has both physical and logical security in place. Managing access to systems starts with physically securing all network systems and equipment to prevent unauthorized personnel from gaining access. Perimeter security is maintained by camera and an active physical security presence. All facilities include guard-controlled access to interior spaces. Access control systems include access to and within the facilities in all data centers. Access control is achieved through a combination of identity management tools, namely keycard, keypad and biometric devices. Unisys will install badge reader systems and biometric or similar second-factor access control systems in a double-entry configuration. Additional rack-based key or biometric controls will be implemented as required. In this way, two factor access control is used to restrict physical network access. In addition, access control systems including keypad and biometric authentication capabilities are available for added security.

Unisys Security Operations Center (SOC) is comprised of security support staff and a suite of automated tools that provide comprehensive 24x7x365 monitoring, alerting, and response to security events.

7. Network Data Access Restrictions

7.A Restrict access to all data in the Commonwealth network infrastructure. Restrict and control all data access right, groups and special permissions based on the data security program designed by the Commonwealth security team and/or specified by the agencies. Access level changes and exceptions will be executed only when approved paperwork is complete and approved. A file of all access changes will be maintained by the Offeror for audit purposes. Offeror must support Commonwealth initiated security audits. Offeror must describe solution and approach to meet this requirement

Unisys will implement a "need to know" and "least privilege" policy in accordance with Commonwealth logical and data access policies. System administrators will set up user accounts with appropriate levels of data access to restrict and control the access rights of system users based on their role and group designations as specified by the Commonwealth or specific Commonwealth agencies. Changes and exceptions will only be made by Unisys upon the receipt of approved documentation from the Commonwealth or Commonwealth agency management. Unisys will perform monthly reviews of logical access changes and will support and fully participate in all Commonwealth initiated security audits. Unisys will maintain a log of all access changes for audit and review at the Commonwealth's request.

8 PMO, Subcontractor Security, Security Audits

8.A Evaluate the security standing of network-connected subcontractors. Conduct information security audits of prominent subcontractors on an annual basis. Offeror must describe solution and approach to meet this requirement.

The Commonwealth benefits from Unisys compliance with the ISO27001 standard where auditing of all third parties on an annual basis is a requirement. The number of network connected subcontractors will be very limited and third-party personnel will be required to pass a security background check based on the FBI CJIS policy or applicable security standard based on the specific system or data access. All subcontractors will be listed in the administrative database that tracks on-board and off-board activities for project resources. Monthly access checks will be matched against a list of subcontractors with local or remote access and login passwords will be required to be changed every 90 days. Unisys tracks any deviations from this standard in its Corrective Action Plan (CAP) registry that will be reviewed by a Security Working Group every 30 days. Subcontractors who attempt to circumvent these controls will have their access removed indefinitely.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,
- Improve client satisfaction,
- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery

- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

9 CI Service Risk

9.A Relative to the service in question, Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

In order to proactively identify possible network security risks, the Data PowerHouse implemented intrusion detection services in 2010 for all COPANET/MAN connections. This technology, coupled with the [redacted] MARS logging analysis platform, allows Unisys to identify and correlate IDS, firewall, and network switch/router logs for additional protection against the growing number of network based security threats. Suspected events are investigated and reported to the OA's Security Office, which allows the Commonwealth to gain even greater insight into potential risks of their hosted systems and eliminate or mitigate those service risks.

Unisys currently performs physical (with DGS) and logical access reviews in conjunction with agencies and OA.

10 CI Service Quality

10.A Offeror must provide examples of previous Offeror initiatives aimed at improving service quality

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL

lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

11 CI Client Satisfaction

11.A Offeror must provide examples of previous Offeror initiatives aimed at improving service quality

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

In late 2009 Unisys began offering vulnerability scanning for nearly all agencies in the Data PowerHouse in order to expose potential security vulnerabilities and confirm that Commonwealth mission critical systems are patched accordingly. This incremental service provides scheduled reports on a quarterly basis that the DPH service delivery staff review with the agency to confirm they are able to continuously improve their security posture and reduce overall risk.

Unisys created a baseline security policy and quarterly access review with IES to improve logical access reviews.

12 CI Service Transparency

12.A Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

The Unisys Data PowerHouse began offering self-service firewall log review to selected agencies that requested this feature in 2012. This allows hosted agencies such as IES and the PA State Police to review the firewall logs that pertain to their managed systems for dropped or accepted packets, reducing their troubleshooting times and expediting the overall firewall

change process for them. Agencies with self service capability have praised Unisys for this ability to get a glimpse into their operational network security policy, ensuring that when they are troubleshooting application issues, or deploying new services, they are able to identify and/or anticipate what changes will need to be implemented on the DPH firewalls.

Unisys will produce quarterly vulnerability reports and submit them directly to agency personnel for review and discussion.

13 CI Service Sustainability

13.A Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.

Service will be sustained by integrating any new agencies, customers, or services into our standard operational and quality processes and methodologies. We leverage ITIL processes, create quality project plans, utilize industry accepted measurement and monitoring tools, analyze trending reports and provide proactive continuous service improvement throughout the IT lifecycle. This enables new Commonwealth services to experience and sustain IT services and client satisfaction.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

14 CI Improve or Reduce Cost

14.A Offeror will provide examples of Security Management initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

As a part of the 2008 contract extension to the Data PowerHouse, Unisys began a firewall consolidation initiative tied to the increasing use of shared infrastructure components and firewall virtualization. Prior to this, agencies in the DPH used separate physical Check Point firewalls. These were consolidated onto a shared [redacted] firewall service module (FWSM) platform, with each agency retaining a logical firewall partition with distinct security policy and configurations. This allowed for a significantly less complex hardware environment and reduced maintenance and licensing costs.

Unisys requested and was granted quarterly meetings with the Commonwealth Security Manager to discuss audit, compliance and IT risk issues. Through these meetings, Unisys has been able to gain better insight into ITB updates, statewide security initiatives and emerging threats, and, as a result, avoided the need to enter the RFS process for security improvements.

Unisys has also taken advantage of state contract licensing for anti-malware software providing the Commonwealth with lower license costs.

Unisys Team Experience

City of Minneapolis IT Support

In January 2003, the City of Minneapolis awarded Unisys Corporation a 7-year IT outsourcing contract to manage the City's complete IT infrastructure, from the data center to desktops and mobile devices. Under the contract, Unisys supports multiple city agencies, including the Mayor's Office, City Council, Police and Fire Departments, and the Office of Public Works.

The scope of services includes providing:

- Data center administration and management;
- Network and systems monitoring and management;
- Desktop support services, including desktops, laptops, peripherals; iPads
- Service Desk services;
- Security Analytics and vulnerability services
- Disaster Recovery services; and
- Technology refresh of laptops, desktops, servers,

Technologies supported include, Windows, UNIX, Unisys, EMC, Oracle, and the Windows Office Suite. Unisys took ownership of the City's existing servers, storage, PCs and printers. The servers and storage were moved to the Unisys IT Outsourcing Service Centers in [redacted] Minnesota and Roseville, Minnesota. This hardened data center facility provides 24x7x365 availability and application support in a secure, high performance, highly-scalable environment. This transition was accomplished in a record 10 months instead of the projected 18-24 months.

Today, Unisys manages and supports over 200 servers and 3,000 desktops for the City. Included among the systems being hosted are the servers supporting the City's Web development and client-facing production Web services servers. Unisys provides full managed hosting services for these servers.

Federal Security Operations Center Support

Unisys has provided decades of mission-critical enterprise security experience with large-scale deployments including Federal agencies. For example, Unisys collaborated with the USDA Agriculture Security Operations Center, 14 product vendors, and 7 technology vendors to implement a forward-thinking security solution to enhance proactive identification and defensive response to cyber security threats at strategic USDA locations throughout the United States.

The implementation of the USDA Security Sensor Array (SSA) was achieved by integrating and incorporating a comprehensive, consolidated, top-down security toolset of seven COTS products and several technologies—the first solution of its kind to be deployed throughout a cabinet-level department in the Federal Government. Within SSA site implementations, seven strategic security technologies were integrated to provide real-time security awareness and understanding of existing and future threats against the USDA assets.

Each SSA includes Security Information and Event Management (SIEM), Intrusion Detection/Prevention System (IDPS), Malware Detection/Prevention System (MDPS), Network Behavior Analysis (NBA), Secure Socket Layer (SSL) Decryption, Packet Analysis, and Data Loss Prevention (DLP). In addition to enterprise visibility and control, the solution provides local visibility and the capability to resolve Inspector General, OMB, and other security audit findings. SSA delivers the needed protections for USDA. This solution protects 250,000 network nodes at 5,000 locations throughout the United States.

Benefits to the Commonwealth

The Unisys Team, through its extensive security operations expertise, will provide the Commonwealth with:

- Low risk data center transition to a secure environment
- Proven security analytics, vulnerability assessments, and mitigation strategies.
- Advanced cyber situational awareness and intelligence analysis capability
- Leveraged security strategic planning and design, integrating current tools and organizational structures.
- Operational efficiencies from streamlined incident management
- Accelerated system development, integration, and deployment, with decreased implementation and operational risks.
- Assurance of a secure operational cyber environment through an integrated approach to risk management.

3.2.2.6 Performance Monitoring & Management

The Performance Monitoring & Management Service of the infrastructure components, databases, and applications provide the critical input for meeting service level commitments. Performance monitoring is a proactive method to identify and respond to system database, processor utilization, or environmental problems that may affect the Services, or might negatively affect Services in the near future. The selected performance monitoring tools will also provide one of the key inputs for calculating SLAs, and the associated monthly evaluation and reporting needs.

The Offeror must collect performance information and report on infrastructure and application

performance status on a daily basis using performance management and monitoring tools.

All tracked performance information must be reported daily, including processing performance, network (LAN / WAN) performance, and storage performance data. The Offeror must determine trends in conjunction with the Commonwealth, and all trends will be reported to address, if necessary, any changes from an established baseline. Forecasts of future usage will be determined based on expected growth in application transaction volume and expected deployment of future applications.

The Offeror must provide a base level of performance monitoring for key infrastructure components such as server, storage, network, and security. Additional Performance Monitoring Services such as database and application monitoring will be offered to the Commonwealth as an additional level of service.

Agency applications may require additional application level monitoring provided and managed by the Commonwealth Agencies. The Offeror must allow additional Commonwealth based monitors to be installed and managed by individual Commonwealth Agencies.

Reference Documentation

Schedule J.3 - Datacenter SLA Definitions

	Requirements	Describe Compliance
1.	Identify the performance monitor software tool(s) that will be used to monitor selected infrastructure Services. The selected infrastructure service will be presented to the Commonwealth for approval.	Offeror must describe its proposed performance management toolset.
2.	Create and maintain performance monitoring procedures for each platform to ensure each system is monitored in a consistent manner. All identified systems will be monitored under the parameters established in the CCPM.	Offeror must describe its approach to monitoring performance across multiple platforms and environments including the following: • Process and Procedures • Tools / Applications • End User Reports o Standard o Custom • Escalation Procedures

3.	Performance information reporting - Collect and report on the performance data on a monthly basis. Offeror must utilize these reports to ensure SLA's are being achieved. A monthly report will be created to provide a review of how well the systems are performing. Also, provide daily reporting. Recommend system changes to correct over and under system utilization, as well as system upgrades as appropriate. These reports and recommendations will be shared with the Commonwealth. Daily performance reports summarizing incidents for the past 24-hours and immediate reports of incidents and routine status reports of incidents in progress for resolution such as a network or server outage that impacts Commonwealth Services. Examples of automated notifications include, but are not limited to, drive full (Warning, critical), unscheduled reboots, server instability, etc. and to be defined in the CCPM. Offeror must have to ability to provide performance information on a daily, weekly, and monthly basis.	Offeror must provide sample performance monitoring reports and approach to supporting daily, weekly and monthly reporting. Offeror must describe its approach to provide Commonwealth the ability to utilize Offeror's monitors (tools) as well as adding its own.
4.	Support the load testing of applications by providing additional targeted performance monitoring Services during the testing period. This service will be made available as an additional service. Provide load-testing performance monitoring as an add-on service.	Offeror must describe its monitoring capabilities and tools to support load-testing performance.

5.	Performance Monitoring training - Provide the Commonwealth with training on the use of performance management tools and reporting.	Offeror must describe its training approach to provide this training to Commonwealth users.
6.	Support for agency level monitors - agency applications may require additional application level monitoring to be provided and managed by the Commonwealth agencies. Support synthetic transactions in applications to create a “dashboard” view that applications are working properly. The Offeror must allow additional agency based monitors to be installed and managed by individual Commonwealth Agencies.	Offeror must describe its approach to meet these requirements.
Continual Service Improvement		
7.	Reduce service risks.	Relative to the service in question, Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.
8.	Improve service quality.	Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.
9.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
10.	Provide service transparency.	Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.

11.	Ensure service sustainability.	Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.
12.	Improve/reduce cost of service.	Offeror must provide examples of Performance Monitoring and Management initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Unisys will provide a comprehensive Performance Monitoring and Management Service to support the Commonwealth/agency services, applications and supporting infrastructure components. Unisys will provide a base level of performance monitoring and management for the following infrastructure Configuration Item's in support of availability and performance SLA's defined in Schedule I, represented by the Enterprise Services Catalog:

- Servers (Mainframes and distributed servers)
- Network (LAN and security devices (e.g., firewalls)
- Storage

In addition to the base level of performance monitoring for the Unisys Team managed infrastructure, the following additional services will be optionally provided to the Commonwealth/Agencies and are available to be order via the Enterprise Services Catalog:

- AppDynamics Infrastructure Performance Monitoring
- Application infrastructure capacity planning
- Commonwealth databases management

The Unisys Team will utilize the proposed Unisys ITSM Centralized Event and Performance Management Toolset to receive and manage performance events from the various IT event management performance monitors for the infrastructure CI's.

A comprehensive set of processes and procedures will be established to support service design processes including performance management and service level management (SLAs) specifically. During service design, SLAs will be tested for achievability before releasing a new

or modified service into the production environment.

Service Operations processes identify performance issues through monitoring performance events and the creation of incidents following the Incident and Problem Management Processes. Well-defined escalation procedures will be implemented to help provide performance incident resolution according to their SLA requirements.

Unisys will provide standard daily performance reports and monthly performance trend reports for base level performance management. The Commonwealth can request custom reports via the Enterprise Services Catalog.

1 Monitor Performance Toolset

1.A Identify the performance monitor software tool(s) that will be used to monitor selected infrastructure Services

Unisys will utilize the [redacted] platform depicted in **Figure 3.2.2.6-1** to monitor and manage performance across services, applications, databases, security, environmental and infrastructure supporting Commonwealth Agency applications.

Unisys will utilize [redacted] to proactively manage and optimize infrastructure performance by avoiding costly outages, solving issues before service levels are impacted, accelerating mean-time-to-repair (MTTR), and extending mean-time-between-failure (MTBF). This reduces customer impact through predictive analytics and drives preventative automation across a single platform.

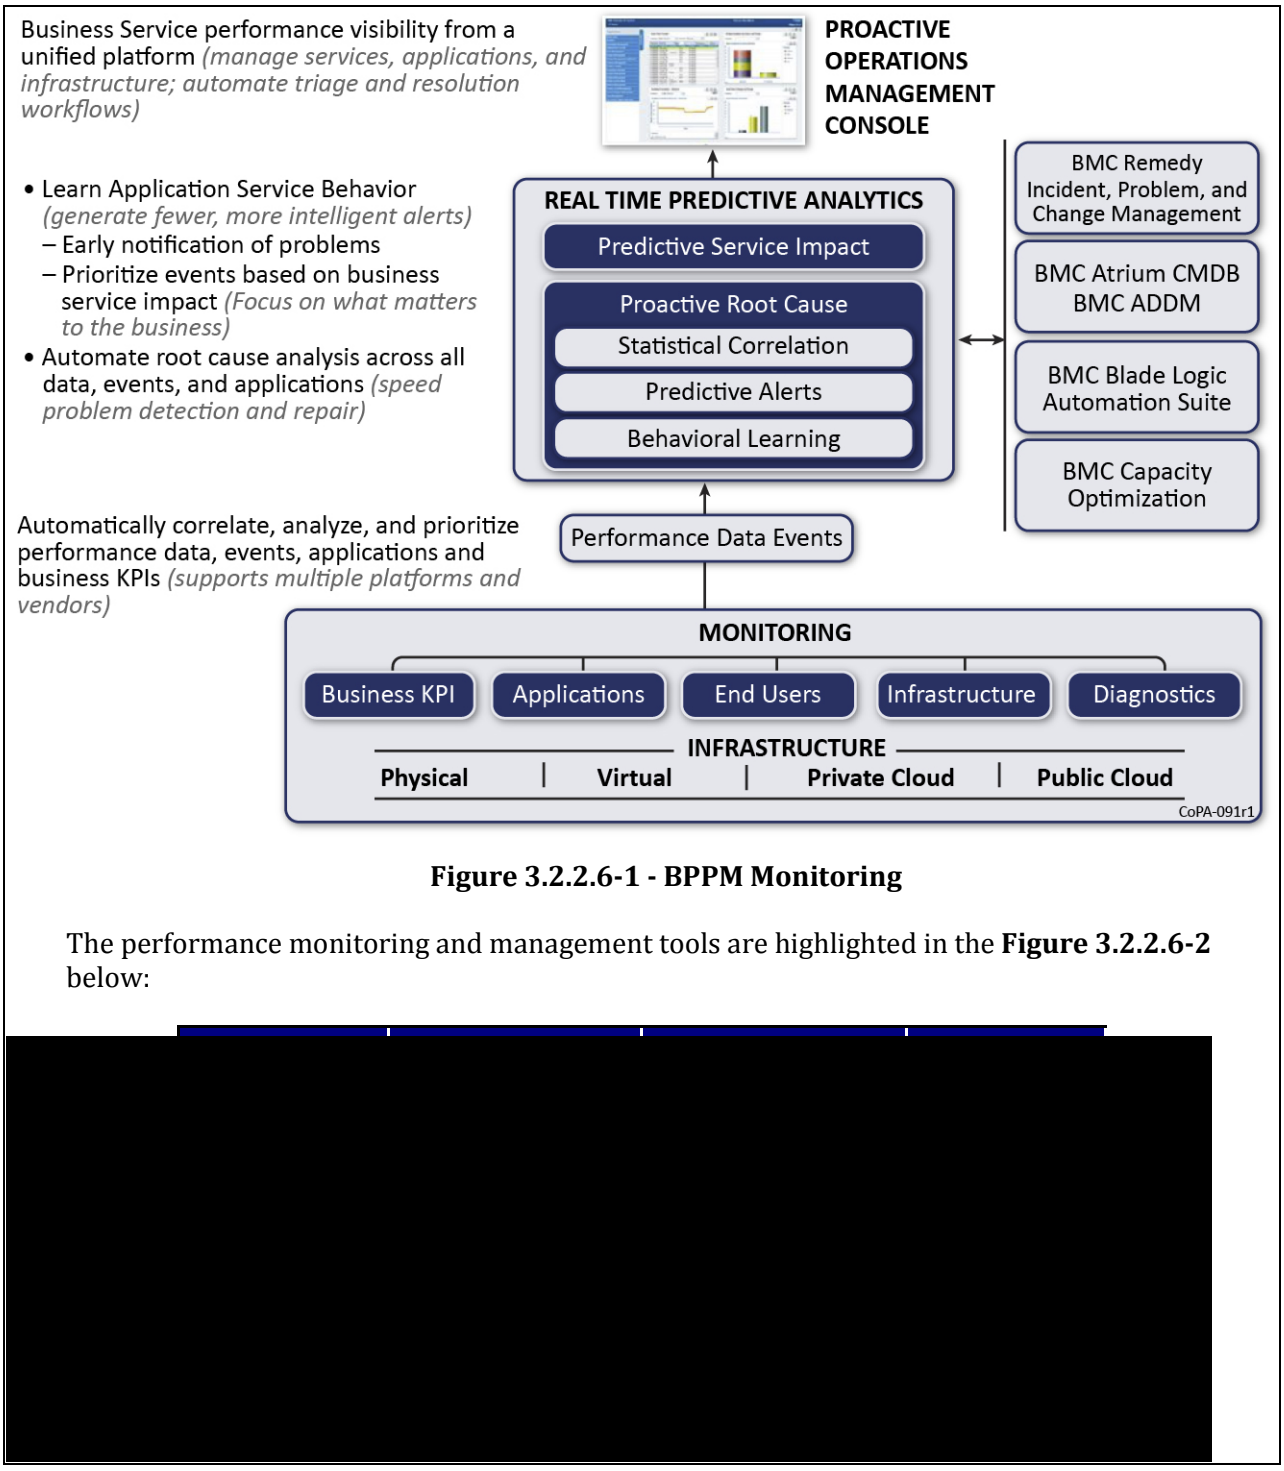

Figure 3.2.2.6-1 - BPPM Monitoring

The performance monitoring and management tools are highlighted in the **Figure 3.2.2.6-2** below:

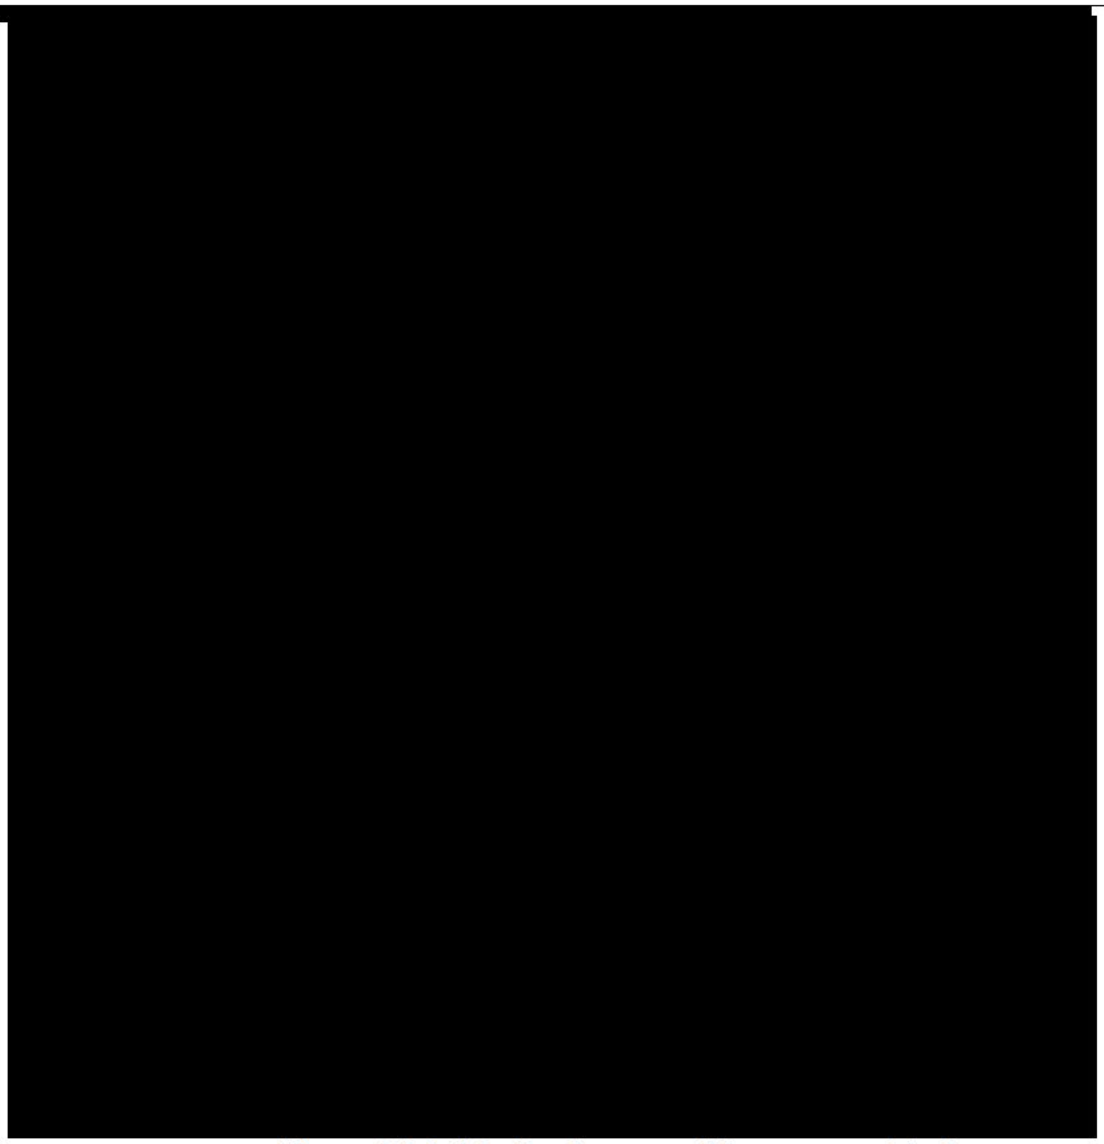

Figure 3.2.2.6-2 - Performance Management Tools

[redacted] automatically discovers and learns the behavioral and performance trends for each of the monitored infrastructure components; identifying normal and abnormal behavior. Unlike threshold-based monitoring systems, the [redacted] analytics engine only generates events when there is significantly abnormal behavior. Based on these learned trends, the Commonwealth realizes significant reductions in the number of false events generated by reactive, threshold-based performance monitoring approaches with fewer, more intelligent events. Unisys supports the Commonwealth by pinpointing and prioritizing the most critical business performance issues.

[redacted] applies real-time, predictive root cause analytics and continuously sifts through events and abnormalities collected from the infrastructure components that support the Commonwealth applications and business services, identifying a prioritized set of the most likely problem causes. The solution applies predictive correlation and filtering techniques that leverage real-time service relationships in the [redacted]

and configuration changes collected from [redacted] (or any other change sources), along with additional detailed diagnostic data. This information provides continuous visibility into problems as they develop; allowing Unisys support personnel to diagnose intermittent performance issues on-demand without requiring the effort to reproduce a problem. As a result, Unisys personnel can remediate problems quickly and efficiently.

For virtualized and cloud services, [redacted] provides monitoring and analysis of virtual and cloud components and their mapping to physical resources. It learns and keeps continuous track of the behavior of physical, virtual, and cloud components and their relationships with one another, and recognizes unique features of these environments, such as clustering and motion. This provides complete visibility, eliminates gaps in root cause, detects potential capacity issues, and eliminates pointless events that can be generated when dynamic changes occur that have no impact on actual performance or availability. As a result, the Unisys and Commonwealth agency application support teams can virtualize and cloud-enable more production applications with this reliable performance monitoring toolset

1.B The selected infrastructure service will be presented to the Commonwealth for approval

The performance monitoring toolsets for the infrastructure service will be reviewed with the Commonwealth for approval.

1.C Offeror must describe its proposed performance management toolset.

Please refer to the performance management toolsets described in 1.A above.

2 Monitor Performance across multiple platforms

2.A Create and maintain performance monitoring procedures for each platform to ensure each system is monitored in a consistent manner. All identified systems will be monitored under the parameters established in the CCPM.

The Unisys Team will create and maintain performance monitoring process and procedures for each platform to help confirm each system is monitored in a consistent manner.

The Unisys Team will review with the Commonwealth stakeholders the performance monitoring thresholds for each platform and the detailed procedures for handling performance events during transition for Commonwealth agency review and approval. The agreed upon procedures for each platform will be made available in the CCPM. The CCPM will accessible to authorized Unisys and Commonwealth users through the Unisys Portal and knowledge management capability.

2.B Offeror must describe its approach to monitoring performance across multiple platforms and environments including the following:

Process and Procedures

Unisys will provide the Commonwealth with a complete Performance Management Process and industry leading technology to manage the performance of infrastructure that the Unisys Team is responsible for in the support of the Commonwealth's services and applications. Performance Management includes consideration of data communications, networking, processing, storage, and other environmental variables. Unisys will provide periodic reports showing performance trends. The Unisys Team and the agencies will utilize these performance trend reports to make recommendations for change.

The Performance Management Process is to help confirm that service performance achievements meet or exceed all of their agreed performance SLA's.

The Unisys Performance Management Process is shown in **Figure 3.2.2.6-3** below:

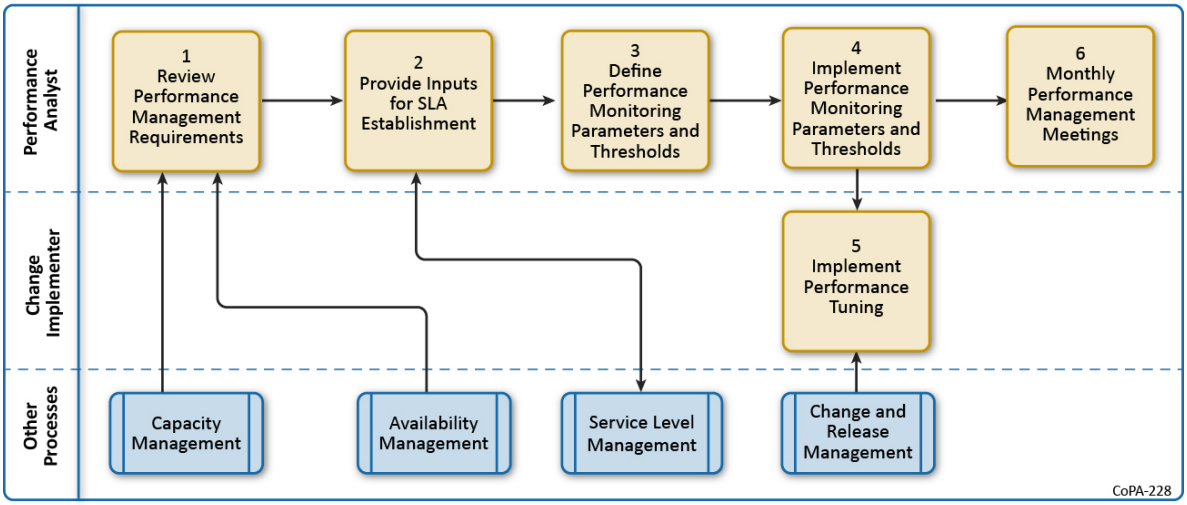

Figure 3.2.2.6-3 - Performance Management Process

Unisys will meet with agency representatives on a monthly basis to review performance requirements and trends for processors, storage, and network (LAN) Configuration Items (CIs).

Tasks required to meet the needs of Commonwealth Agencies daily, weekly and monthly performance management include:

1. Review Performance Management Requirements

Review of the following current and future performance management impacts:

- Review Capacity Plan
- Review Availability Plan and SLA's
- Review current RFC's with performance management impacts

2. Provide inputs for SLA establishment

- Provide data to the Unisys and Commonwealth PMO regarding performance management requirements affecting availability SLA attainment
- Adjust performance management requirements based on results from SLA adjustments

3. Define Performance Monitoring Parameters and Thresholds

The monitoring parameters and thresholds will be identified, which will help in proactively supporting availability and performance SLA requirements. This is also help in proactively managing the capacity of the resources and avoiding over-utilization of resources. Over-utilization of resources impacts the performance of the resources and can lead to the unavailability.

Appropriate monitoring parameters are identified based on the following:

- Resource type, purpose and its capabilities
- Projected workload
- Expected service targets

Appropriate threshold limits are defined based on the following:

- Capacity of the resource
- Current peak and off-peak usages
- Timeline to resolve the threshold breaches
- Available solutions to fix breaches
- Expected service targets

In addition, the frequency in which these parameters need to be monitored has to be determined. Frequency refers to the time interval in which the parameters need to be monitored. These intervals must have enough granularities to capture transient peaks, e.g., backups impacting network traffic, batch processes impact online performance, etc.

4. Implement Performance Thresholds and Monitoring

The Unisys Team will implement the Performance Management Thresholds and Monitor using the Performance and Event Management Platform described in Section 1.A above. The Unisys Team will monitor performance and make recommendations for tuning infrastructure CI's.

5. Implement Performance Tuning

A Unisys Team managed CI needs to be tuned for optimal usage during the implementation, transition of a new or changed service to handle the predicted workload

When a service breach occurs due to poor performance, the tuning options will be defined according to the standard solutions available with the respective product documentation, Problem Management knowledgebase, and technical reference books/articles or newly developed solutions to fine-tune the performance.

6. Monthly Performance Management Meetings

Monthly Performance Management Meetings are held with the Commonwealth/Agencies to:

- Review Requests for Change (RFC's) impacting service performance and capacity

- Review incidents and problems impacting service performance
- Review change requests to improve or tune service performance on managed infrastructure
- Review performance trends of the existing significant service components (CI's) for network (LAN), Server, and Storage.

Tools and Applications

Please refer to requirement 1.A above.

End User Reports (Standard and Custom)

Please refer to Schedule F, Section 3.2.2 "Technical Services" for standard reports.

Custom reports are available via the Enterprise Services Catalog.

Escalation Procedures

Please refer to Schedule F, Section 3.2.3.2 "Site Operations" for detailed Escalation Procedures.

3 Monitor Performance, Reporting

3.A Performance information reporting - Collect and report on the performance data on a monthly basis. Offeror must utilize these reports to ensure SLA's are being achieved. A monthly report will be created to provide a review of how well the systems are performing

Unisys will collect and report on the performance data for infrastructure supporting Commonwealth applications on a daily, weekly and monthly basis. The specifics will be agreed to during transition. These performance reports will be leveraged in support of SLA achievement.

Unisys will review performance reports, SLA reports and the cycle for making these reports available in the Services Portal during transition. Unisys will obtain the Commonwealth's approval for the reports and reporting cycle.

Please refer to Schedule F, Section 3.2.2 "Technical Services", for standard performance, availability and SLA reports.

3.B Also, provide daily reporting. Recommend system changes to correct over and under system utilization, as well as system upgrades as appropriate. These reports and recommendations will be shared with the Commonwealth.

The daily reports will be shared with the Commonwealth via the Services Portal. The Unisys capacity manager and performance analysts provide recommendations for system changes to correct over and under system utilization including upgrades based on the performance

reports.

3.C Daily performance reports summarizing incidents for the past 24-hours and immediate reports of incidents and routine status reports of incidents in progress for resolution such as a network or server outage that impacts Commonwealth Services.

Incident reports summarized by incident category will be provided to the Commonwealth on a daily basis. This includes performance related incidents as a separate category.

Incidents with critical service impact will be reported in the Unisys Portal in a dashboard format. Routine incident reports including performance related items will be reported with status on resolution.

3.D Examples of automated notifications include, but are not limited to, drive full (Warning, critical), unscheduled reboots, server instability, etc. and to be defined in the CCPM.

The Unisys Team has a standard set of monitoring thresholds and alerts for infrastructure CI's utilizing the proposed monitoring tools. Unisys Team will review these thresholds with the Commonwealth and will document the threshold and alerts in the CCPM. Automated incidents will be created for specific alerts. The following are a few examples of performance related alerts.

1. Alert: Available Megabytes of Memory is too low

   Source: Microsoft Windows Server 2008 R2 Enterprise

   Path: Server Name

   Alert description: The threshold for the Memory\Available MBytes performance counter has been exceeded. The value that exceeded the threshold is: 94.333333333333329.

2. Alert Severity: 1

   Alert: High CPU Process List Alert.

   Source: Server Name

   Path: xxxxxx

   Alert description: Event Description: The processes using greater than 90% CPU at present are:

   ArcMap (13528): 98%

3.E Offeror must have to ability to provide performance information on a daily, weekly, and monthly basis.

See 3.A above.

3.F Offeror must provide sample performance monitoring reports and approach to supporting daily, weekly and monthly reporting.

Unisys will collect and report on the performance data for infrastructure supporting Commonwealth applications on a daily, weekly and monthly basis. The specifics will be agreed to during Transition. Reports will be posted to the Services Portal for Commonwealth review.

Unisys will review standard reports for performance monitoring during transition and agree to the cycle of reporting for daily, weekly and monthly reports. Sample performance reports are in Attachment F-11.

3.G Offeror must describe its approach to provide Commonwealth the ability to utilize Offeror's monitors (tools) as well as adding its own.

Unisys will support the Commonwealth agency application owners by providing dashboard views of performance monitoring for the infrastructure supporting agency applications. The agency application owners also have access to all performance reports through the Services Portal. This should satisfy performance management and monitoring requirements for the agencies' application owners. When more in depth performance monitoring is required this can be accomplished in several ways:

- A Change Request to the PMO Governance following the development of performance standards during transition.
- Services Catalog Requests for more in-depth performance management and monitoring.

4 Monitoring Capabilities, Load Testing Performance

4.A Support the load testing of applications by providing additional targeted performance monitoring Services during the testing period. This service will be made available as an additional service.

Unisys will support the load testing of applications by providing targeted performance monitoring Services during the testing period.

This service is provided when the Commonwealth requests infrastructure with SLA's for availability and performance. Therefore, monitoring for these performance requirements to support SLA's is provided in the test environment. Unisys will provide the performance management tools to support availability and performance monitoring on these servers during load testing. Standard performance reporting is provided during load testing for the Commonwealth. Additional targeted performance monitoring and reporting during load testing periods can be requested through the Enterprise Services Catalog.

4.B Provide load-testing performance monitoring as an add-on service.

Please refer to 4.A above.

4.C Offeror must describe its monitoring capabilities and tools to support load-testing performance.

Please refer to the performance monitoring tools outlined in 1.A above.

5 Training, Performance Monitoring

5.A Provide the Commonwealth with training on the use of performance management tools and reporting

Offeror must describe its training approach to provide this training to Commonwealth users.

Unisys will provide training to Commonwealth agency users on how to utilize the standard performance monitoring dashboard views and reports. This can be accomplished during transition and performed thereafter on an as needed basis.

6 Monitor Agency Application

6.A Support for agency level monitors - agency applications may require additional application level monitoring to be provided and managed by the Commonwealth agencies.

Please refer to 3.G above.

6.B Support synthetic transactions in applications to create a "dashboard" view that applications are working properly.

Please refer to 3.G above.

6.C The Offeror must allow additional agency based monitors to be installed and managed by individual Commonwealth Agencies

Please refer to 3.G above.

6.D Examples of automated notifications include, but are not limited to, drive full (Warning, critical), unscheduled reboots, server instability, etc. and to be defined in the CCPM.

Please refer to examples shown in 3.D above for examples of notification.

Continual Process Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,
- Improve client satisfaction,
- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery
- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

7 CI Service Risk

7.A Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives, the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

8 CI Service Quality

8.A Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.

The quality approach begins with the Service Excellence Office. The SEO function provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

9 CI Client Satisfaction

9.A Improve client satisfaction.

Offeror must describe methods to continually improve client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

10 CI Service Transparency

10.A Provide service transparency.

Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process

The service organizations will use standardized ITSM services processes, IT monitoring & automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

11 CI Service Sustainability

11.A Ensure service Sustainability.

Offeror must provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.

Service is sustainable by integrating any new agencies, customers, or services into our standard operational and quality processes and methodologies. This will be accomplished by leveraging ITIL processes, creating quality project plans, utilizing industry accepted measurement and monitoring tools, analyzing trending reports and providing proactive continuous service improvement throughout the IT lifecycle will enable new Commonwealth services to experience and sustain IT services and client satisfaction.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional

details in this area.

12 CI Reduce Cost of Service

12.A Improve/reduce cost of service.

Offeror must provide examples of previous capacity initiatives implemented that achieved reduced costs of Services and that met or exceeded ROI (Return on Investment) analysis projections. If costs of Services increased due to increased required capabilities, so identify.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

Unisys examples of continuous improvement

A few examples of continuous service improvement have been included below under Unisys Team Experience.

Unisys Team Experience

A few examples of Performance Monitoring & Management Continuous Service Improvements, that have been implemented or can be utilized to achieve reduced costs of services and to meet or exceeded ROI (Return on Investment) analysis projections are outlined below:

Leveraging of the DPH to support [redacted] for remote monitoring:

The Unisys DPH Team was leveraged to provide remote support to the 3000+ servers supported by the [redacted] By leveraging the DPH 24x7 Level 1 staff, this has allowed [redacted] staff to focus more on the overall support of these environments. DPH staff monitors, troubleshoots and escalates to [redacted] staff based on alerts received from the SCOM monitoring tool running in the [redacted]

Reporting - IES Performance Management Reporting:

Since the introduction of IES to the DPH, the IES Monthly Performance Reporting has evolved. At the request of IES, a number of requested modifications were made to the standard Monthly Performance Reports. Through the leveraging of several monitoring tools, SCOM being the most significant, we are providing the Bureau with enhanced reporting. These modifications allow the Bureau greater in-sight to their current performance and usage. At the request of IES management, beginning in March 2013, we improved the reporting again by developing and adding an Executive Management Summary Dashboard to be included in each month's reporting. This allows IES senior management a quick look at their overall performance indicators focusing on exceptions without the need to scrutinize the entire report.

Tools - Monitoring:

In order to proactively monitor potential performance issues in the shared XIV Storage

environment, the Unisys DPH Team has implemented threshold policies through SCOM monitoring to report XIV storage latency time. This logic notifies us early on of an internal XIV failure and the repercussions on connected hosts.

Unisys currently provides IT Service Management Services to more than 150 customers worldwide. Unisys is a leading provider of Managed Services utilizing an integrated suite of ITIL V3, ISO 20000 certified management processes and leading ITSM tools to provide outstanding service IT services to our customers. Unisys currently successfully manages Performance Monitoring and Management for many of these customers.

Unisys has been managing Performance Management and Monitoring for the Commonwealth DPH and [redacted] since 1999.

Benefits to the Commonwealth

The Unisys value proposition for performance monitoring and management to the Commonwealth is simple, for the Unisys Team to provide reliability of infrastructure to support applications and services for the Commonwealth.

The Unisys Team focuses on providing reliable infrastructure that performs to meet SLAs for so the Commonwealth Application Owners can depend on this infrastructure to provide reliable services to application users.

The Commonwealth agencies can depend on Unisys to provide reliable services.

3.2.3 Facilities Management

3.2.3.1 Facilities Architecture / Maintenance

The Facilities Architecture and Maintenance service will provide and staff a minimum of two fully operational datacenter facilities in a multi datacenter mode. This service will require the integration and alignment of the non-core Services, including those relating to the premises, required to operate and maintain a datacenter that will fully support the core objectives of this project.

These datacenters will be geographically dispersed to provide protection from regional disruptions such as weather, power or other emergencies. The process of locating and managing these physical environments will include defining the physical site requirements, selecting appropriate facilities, and designing effective processes for monitoring and maintaining environmental Services and managing physical access. Effective management of the physical environment reduces the possibility of service interruptions due to unauthorized access and damage to computing equipment and personnel. Please review Exhibit D.7 - [redacted] Facility Summary for information regarding the [redacted] facilities.

Facilities Management includes all aspects of providing and managing the physical environment. For example, power and power distribution, cooling and ventilation, fire detection and suppression, building security and access control, and environmental monitoring are all required. Listed below are the basic Services required, but not inclusive of all Services needed, to manage an enterprise class datacenters required by the Commonwealth.

Reference Documentation

Exhibit D.7 - [redacted] Facility Summary

	Requirements	Describe Compliance
1.	Safe and secure datacenter. Two layers of authentication and appropriate clearances will be required. Provide datacenter environments which are secured to ensure that only authorized personal have physical access to the buildings, systems and all levels of data. This includes data storage within networked storage devices, servers, tapes, diskettes, optical and paper formats.	Offeror must describe its proposed facilities security program.

	Comply with the security requirements of the Commonwealth. Immediately inform the Commonwealth of any vulnerability or weakness in the Services, and recommend a solution or mitigation. Offeror must assess the [redacted] facilities and provide a report to the Commonwealth as it pertains to required security upgrades.	
2.	Provide fully redundant environmental Services. To include, but not limited to, HVAC, UPS conditioned power and distribution, generator backup, automated transfer switch, fire suppression system. Offeror must integrate its Facilities Management process with Service Management processes, especially Change Management, Incident Management, Service Continuity Management and Availability Management. Offeror must confirm its ability to provide, manage, maintain and operate multiple Tier 3 equivalent facilities. Offeror must assess the [redacted] facilities and provide a report to the Commonwealth as it pertains to required HVAC and power upgrades.	Offeror must describe solution and approach to meet this requirement. Offeror must provide details and supporting documentation on its proposed facilities and tier rating.
3.	Staff the datacenters with appropriate operational and management levels of personnel 24/7/365. Critical engineering and management staff will be available to the Commonwealth Monday through Friday, between 8am – 5pm Eastern time excluding Commonwealth observed	Offeror must describe its proposed facilities staffing approach, including its staffing approach related to the [redacted]

	holidays. Access to operational staff will be available 24/7/365. Video surveillance system will be utilized at all entry points and throughout the datacenter and tape storage areas. Datacenter Staff will be required to adhere to the Commonwealth requirements for background checks and security clearances. Offeror shall be required to monitor the status of staff and to take appropriate action for staff found to subsequently have violated prescribed legal or ethical standards as described in **Schedule G –Staffing Plan and Key Positions**. Such violations shall be immediately reported and appropriate actions taken. Commonwealth verification of the requirements will be necessary prior to staff working on Commonwealth related systems.	
4.	Procurement Planning - Provide program and processes to alter the datacenter environment and to refresh the environmental Services at end-of-life, and as additional Services are needed.	Offeror must describe its facilities management processes, including those related to the [redacted]
5.	Physical Access to Facilities- Coordinate with the Commonwealth to provide for physical access and facilitate inspections by government authorities (including the Commonwealth) for auditing the conduct of government business. Offeror must assess the [redacted] facilities and provide a report to the Commonwealth as it pertains to required physical access to the [redacted] facility.	Offeror must describe its facilities access policies and procedures.

6.	SLA Reporting - Identify and create environmental service level objectives in the form of SLAs, and report on the service availability, problems, and corrective actions on a monthly basis. Offeror must assess the [redacted] facilities and provide a report to the Commonwealth as it pertains to monitoring, maintain and reporting on [redacted] SLAs.	Offeror must describe how it monitors and manages facility availability.
7.	The facilities must be designed and operated with environmentally friendly equipment and techniques, and be SSAE 16 compliant. Offeror must assess the [redacted] facilities and provide a report to the Commonwealth as it pertains to monitoring, maintaining and reporting on [redacted] SLAs.	Offeror must list all compliance ratings achieved at the proposed datacenters. Offeror must provide copies of annual SSAE 16 audits for all datacenters used to service the Commonwealth (and its agencies) at the Offeror's expense.
8.	Offeror must schedule (at its expense) a SSAE 16 audit of the [redacted] datacenter no more than 12 months after the effective date of the contract.	Offeror must provide proof of a valid (updated) SSAE16 certification in the form of audit findings report prior to implementing any Commonwealth service in any other proposed datacenter.
Continual Service Improvement		
9.	Reduce service risks.	Offeror must provide methods to eliminate or mitigate service risks.
10.	Improve service quality.	On a quarterly basis, Offeror must recommend to the Commonwealth team any facility changes that would be appropriate to maintained or improve SLA commitments.
11.	Improve client satisfaction.	Offeror must provide examples of previous

		Offeror initiatives aimed at continually improving client satisfaction.
12.	Ensure service transparency.	Offeror must provide methods and practice to ensure service transparency, providing visibility into service execution.
13.	Improve/reduce cost of service.	Offeror must provide examples of Facilities Management initiatives have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Facilities Management is critical to the overall success of the Unisys Team and the Commonwealth. Management of the [redacted] Data Center Facility will be performed in a manner similar to that of the Data PowerHouse, and integrated with the operations at Unisys [redacted] These operations are performed to adhere to OSHA and SSAE-16 audit requirements. Unisys as the tenant at the [redacted] will perform management functions on behalf of the Commonwealth to include general maintenance, improvements and housekeeping for the data center. The Unisys Facilities Procedures Plan provides a proven framework for all facility-related work performed at the facilities. All facility management work detailed will be subject to the Change Management process.

The Facilities Management Plan provides job requirements for facility-related work such as electrical, mechanical, and general construction installations, furniture installations, or other services within the [redacted] facility. Specific requirements are established for all contractors, equipment installations and deliveries, equipment de-installation and shipping. These procedures are specific and must be followed as described in the plan.

In addition, the procedures in this plan include the framework to coordinate all contractor work for the [redacted] facility and the facilities. Procedures are included which pertain to all contractor work requirements for the following:

- Computer Room Work Requirements
- Lockout/Tagout
- Hot Work, Cutting, and Welding
- Raised Floor Maintenance

- Fire Suppression Shutdown
- Environmental, Safety & Health

1 Facility Security Program

1.A Safe and secure datacenter. Two layers of authentication and appropriate clearances will be required.

Each facility has both physical and logical security in place and ready to deploy down to the rack level if requested. Perimeter security is maintained by camera and an active physical security presence. All facilities include guard-controlled access to interior spaces. In each case, guard-controlled access to segregated data hall areas can be incorporated upon request.

Access control systems include access to and within the facilities in all data centers. Access control is through a combination of keycard, keypad and biometric devices. In addition, access control systems including keypad and biometric authentication capabilities are available for the raised floor on areas segregated from portions of the Commonwealth's service area. The Commonwealth can request these services including security caging, security cabinets, and cabinet or cage-level monitoring (camera or access) down to the rack level from the Enterprise Services Catalog.

Unisys Security Operations Center (SOC) is comprised of security support staff and a suite of automated tools that provide comprehensive 24x7x365 monitoring, alerting, and response to security events. Personnel follow specific instructions to mitigate issues according to the Security Incident Procedure (SIP) policy.

See Schedule F, Section 3.1.1 "Multi Datacenter Environment (2+ Architecture)" for additional, related material on the Unisys Data Center Architecture's Security approaches.

1.B Provide datacenter environments which are secured to ensure that only authorized personal have physical access to the buildings, systems and all levels of data. This includes data storage within networked storage devices, servers, tapes, diskettes, optical and paper formats.

Unisys data center architecture provides secure physical and logical separation from any adjacent facility or campus occupants, including an ability to provide similar segregation within the Commonwealth's IT services area. The Commonwealth's IT environment is secure physically and logically from other potential occupants of the facilities supporting it.

Unisys data center architecture provides optional physical and logical segregation within the Commonwealth's physical and logical data center spaces. Within the Commonwealth colocation space, security partitions can optionally be used to separate different agency environments and systems as required. The Unisys Team would work with the Commonwealth to determine the exact requirements for caged partitions within the already physically and logically separate Commonwealth/Unisys "data center vault." In anticipation of this requirement, Unisys has included a number of standard cages that can be deployed within the sites.

1.C Comply with the security requirements of the Commonwealth.

Unisys complies. Please see Schedule F, Section 3.1.1 "Multi Datacenter Environment (2+ Architecture)" for additional details.

1.D Immediately inform the Commonwealth of any vulnerability or weakness in the Services, and recommend a solution or mitigation.

Unisys Security Operations Center (SOC) is comprised of security support staff and a suite of automated tools that provide comprehensive 24x7x365 monitoring, alerting, and response to security events. The Unisys ITSM event management systems provide monitoring, alerting and triggers to response for infrastructure events including events sourced within the facilities' infrastructure. This includes automated notification to designated commonwealth representatives as required

Events that are caused by operational or physical design weakness are addressed immediately with any required coverage. This is done pending long-term changes initially addressed by Unisys Facilities Management and the Unisys architecture team and agreed upon with the Commonwealth. This process is managed through the change management and architectural governance processes.

1.E Offeror must assess the [redacted] facilities and provide a report to the Commonwealth as it pertains to required security upgrades.

The [redacted] Assessment project planned for the transition period evaluates the [redacted] facility and provides a report that meets the requirements of key deliverable D-01.01 as described in Schedule K. The physical and logical security assessment of the facility identifies required [redacted] facility security upgrades.

1.F Offeror must describe its proposed facilities security program.

Unisys data centers' architecture incorporates the latest in physical and operational security approaches.

Unisys [redacted] has deployed a centralized, electronic access control system that provides alarm monitoring points on all personnel and equipment doors, as well as intrusion detection throughout the facility. Photo ID badges with unique personal identification numbers, as well as biometric iris scanners, provide multiple levels of electronic access control, and provide individual accountability throughout the facility. The site's security systems control physical and electronic access to the building, the data center floor, and each client's caged area or module. 3-factor authentication is required to access the data floor. A fourth layer is required to access a client cage or module.

Both Unisys [redacted] and Unisys [redacted] have physical and logical security in place and ready to deploy down to the rack level if requested. Perimeter security is maintained by camera and an active physical security presence. In all cases, guard-controlled access to segregated data hall areas can be incorporated upon request.

Security within the [redacted] Data Center includes 24-hour guard protection, a proximity badge access control system, interior and exterior video surveillance consisting of cameras and recorders with some having motion detection sensors. Access within the facility to restricted or sensitive areas is controlled by the badge control system and is limited to individuals on a "need to have" basis.

Access control on the raised floors is through a combination of keycard, keypad and biometric devices. In addition, access control systems including keypad and biometric authentication

capabilities are available for the raised floor on areas segregated for the entire or within for a portion of the Commonwealth's service area. Security systems whether access control, monitoring, or alarming are incorporated into the Unisys operational model and ITSM tools permitting event correlation, logging and management alerting at all appropriate levels in the Unisys delivery team.

Building and Access Control is performed at the [redacted] through the use of building access cards maintained by the Commonwealth and augmented with the use of established Bio-Metric scanning devices. Building and Access Control for initial access into Unisys facilities is through the use of Security Guards to verify authorized access based on badge access or authorized visitor access. Badge readers or biometric scanning devices are used at access points throughout the facilities to allow deeper access only to those individuals requiring access to specific resources. The access levels are reviewed on a monthly basis by the Unisys Security Manager, Commonwealth Facilities Manager and Unisys Facility Manager for accuracy and updates.

2 Environmental Services Redundancy

2.A Provide fully redundant environmental Services. To include, but not limited to, HVAC, UPS conditioned power and distribution, generator backup, automated transfer switch, fire suppression system.

Unisys facilities were selected for the Commonwealth with an ability to meet and exploit the environment extremes common to their location. Steel and concrete construction was required along with interior floor loading characteristics that permit the variety of the Commonwealth's IT equipment.

Each facility has been selected for its ability to provide continuous, efficient, cost-effective power and environmental conditions. The Unisys team facilities provide between 2N+1 and 2N+2 redundancy. In addition, we have selected facilities with the capacity to grow to and beyond an estimate of the full requirement that the Commonwealth IT estate may have. The considerations include a review of the ability of local utilities to deliver electricity and the cost to meet and grow with the Commonwealth's use of each location.

Unisys data center facilities meet or exceed the Uptime Institute Tier III standard for concurrently maintainable data center site and infrastructure. The overall facility UPS topology is a distributed redundant configuration. Unisys [redacted] uses a patented, maintenance, bypass isolation feature. This feature enables our [redacted] facilities to exceed Uptime Tier 4 standards for data centers to be concurrently maintainable or fault tolerant. Because of this technology, the facility is concurrently maintainable and fault tolerant, with a simultaneous utility outage. This innovative level of critical infrastructure redundancy has been termed 2N+2: two completely separate power paths from the power utility to the customer rack (2N) and all of the critical components in those two independent power paths have (at least) two extras for backup (N+2).

[redacted] fire suppression system utilizes a multi-zone, dual-interlock, pre-action, dry pipe fire suppression system with intelligent smoke and thermal detectors which require both sensors in the same zone to detect an alarm condition in order to admit water into the pipes inside a critical area. Sprinkler heads are also fitted with a high-temperature fusible head in order to preclude admitting water into a computer room area where no fire is present. The fire

suppression and alarm system is integrated into the Network Operations Center and security office monitoring systems. In the event of a fire, all fire rated doors automatically close but still allow for egress.

Non-critical environments are protected by wet sprinkler systems with protection/notification as required by local ordinances/codes.

At [redacted] fire and smoke detection is provided by a Fenwal Vesda HSSD air sampling system. Fire suppression is provided by a wet pipe sprinkler system. These approaches meet NAFP standards, and they are augmented by a PAL under-floor water detection system.

2.B Offeror must integrate its Facilities Management process with Service Management processes, especially Change Management, Incident Management, Service Continuity Management and Availability Management.

Each of the Unisys facilities' Building Management Systems including their power and environmental control systems will be linked to the Unisys ITSM environment. This integration will permit monitoring integration and correlation giving a holistic view – utility to application infrastructure – view of all facets of the IT environment. With this linkage, security, power, and environmentals become measurable elements of the heartbeat of the Commonwealth's IT estate. The result is that the buildings become active members in the incident, service continuity and availability management processes.

In addition, a common Data Center Infrastructure Management (DCIM) system using the [redacted] family of tools integrates with the ITSM environment. The system along with Unisys facilities staff and space planners enables the environment of the facilities to become managed components of the Commonwealth environment and participants in the policy and processes enabled ITSM for change, release, asset, and configuration management.

Finally, it is Unisys plan to integrate the [redacted] into the ITSM environment with integration of its BMS into the Unisys ITSM environment and extend the Unisys DCIM system to cover the [redacted] its systems, floor space, and cable management.

2.C Offeror must confirm its ability to provide, manage, maintain and operate multiple Tier 3 equivalent facilities.

The Unisys Team currently manages over 400 of its own data centers for its clients globally including the Commonwealth's Data PowerHouse. A majority of these locations are at or above an equivalent Tier 3 rating. These facilities include the Unisys [redacted] and the [redacted] sites proposed here for the Commonwealth.

2.D Offeror must assess the [redacted] facilities and provide a report to the Commonwealth as it pertains to required HVAC and power upgrades.

2.E Offeror must describe solution and approach to meet this requirement.

The [redacted] Assessment in deliverable D-01.01 includes the power and HVAC systems. These are evaluated for alignment with contract requirements and facility objectives. In addition, the

assessment evaluates on the ability of and requirements for the facility to meet, to have monitored, to operate and to maintain the installed infrastructure and [redacted] SLAs. Finally, the assessment anticipates a statement of direction and objectives for the [redacted] in the Data Center Architecture Plan and Roadmap's Implementation section.

2.F Offeror must provide details and supporting documentation on its proposed facilities and tier rating.

Please see **Schedule E: Data Center Locations** for additional information on the proposed facilities. In addition, Unisys would like to extend an offer to the Commonwealth to visit our proposed facilities and meet our facilities management team.

3 Staff, Facility Staffing Approach, [redacted] Staffing Approach

3.A Staff the datacenters with appropriate operational and management levels of personnel 24/7/365. Critical engineering and management staff will be available to the Commonwealth Monday through Friday, between 8am – 5pm Eastern time excluding Commonwealth observed holidays. Access to operational staff will be available 24/7/365. Video surveillance system will be utilized at all entry points and throughout the datacenter and tape storage areas.

Each facility maintains an active staff 24x7; in addition, engineering and management staff is always available to the Commonwealth during regular business hours. However, the Commonwealth has 24x7 access to operational staff via the service desk and access to the facilities can be arranged as needed within the security parameters established in the CCPM and consistent with both Unisys and Commonwealth policy.

Video surveillance includes both exterior and interior surveillance at all Unisys-managed facilities. For more detailed information please refer to Schedule F, Section 3.1.1 "Multi Datacenter Environment (2+ Architecture)".

3.B Datacenter Staff will be required to adhere to the Commonwealth requirements for background checks and security clearances. Offeror shall be required to monitor the status of staff and to take appropriate action for staff found to subsequently have violated prescribed legal or ethical standards as described in Schedule G –Staffing Plan and Key Positions. Such violations shall be immediately reported and appropriate actions taken. Commonwealth verification of the requirements will be necessary prior to staff working on Commonwealth related systems.

All Unisys staff who has physical or logical access to the data center will adhere to the Commonwealth ITBs related to background checks and security clearances. This includes initial checks prior to hire as well as annual checks. Documentation related to the background checks will be shared with the Commonwealth to enable verification prior to staff working on Commonwealth systems.

The Unisys team will comply with the legal and ethical standards as described in Schedule G. Any violations will be immediately reported and appropriate actions taken per requirements.

3.C Offeror must describe its proposed facilities staffing approach, including its staffing approach

related to the [redacted]

The Facilities Management function is responsible for management of the Commonwealth's Enterprise Data Center and Unisys Tier 3+ equivalent facilities from which services are provided. Services include Computer Operations, Systems Monitoring, Batch and Media Management. This function is staffed with a qualified on-site support team 24 hours a day, seven days a week. The team uses an extensive suite of automation tools ensuring consistency and accuracy of services provided, and expeditious alerting of changes to the facility and systems environments.

The services provided by the on-site team for each facility including the [redacted] provide security management, media management and facilities management. In addition, the Unisys Team includes staff for computer operations and monitoring, and batch services that are operating out of the Unisys Harrisburg Operations Center and in continuous communication with each facility's on-site personnel.

For details on the staffing approach for the facilities and their operations, please refer to Section 5.0 "Staffing Plan" for facilities and operations.

4 Facility Management Approach, [redacted] Management Approach

Facilities Management is critical to the overall success of the Commonwealth. Management of the [redacted] Data Center Facility will be performed in a manner similar to that of Unisys management of the Data PowerHouse. Furthermore, the [redacted] facility management will be integrated with that for Unisys [redacted] and Unisys [redacted] and be performed to adhere to OSHA and SSAE 16 audit requirements. Unisys as the tenant will perform management functions on behalf of the Commonwealth to include general maintenance, improvements and housekeeping. The Unisys Facility Procedures Plan provides a proven framework for facility-related work performed at the [redacted] facility. All facility management work detailed is subject to the Change Management process and supported by the Unisys ITSM tools.

4.A Procurement Planning - Provide program and processes to alter the datacenter environment and to refresh the environmental Services at end-of-life, and as additional Services are needed.

The Unisys solution manages data center upgrades and new technologies through ITIL V3 processes within Service Design, which manages new services and changes to services to meet the Commonwealth's strategy to improve services and cost efficiencies. The Service Design process described in Schedule F, Section 3.2.1.5 "Technical Architecture" also manages the requirements and capacity needed within the Infrastructure Architecture Services framework as described in Schedule F, Section 3.2.2.2 "Infrastructure Architecture".

This approach includes lifecycle management of facilities infrastructure and capacity.

4.B Offeror must describe its facilities management processes, including those related to the [redacted]

The Facility Management Plan provides job requirements for facility-related work such as electrical, mechanical, and general construction installations, furniture installations, or other services within the [redacted] or Unisys facilities.

Specific requirements are established for all contractors, equipment installations and deliveries, equipment de-installation and shipping. The procedures in this plan include the framework to coordinate all contractor work for the [redacted] facility and the Unisys facilities. Procedures are

included which pertain to contractor work requirements for the following:

- Computer Room Work Requirements
- Lockout/Tagout
- Hot Work, Cutting, and Welding
- Raised Floor Maintenance
- Fire Suppression Shutdown
- Environmental, Safety & Health

Contractor performing facility-related work such as electrical, mechanical and general construction installations, furniture installations, or other services affecting the [redacted] facility and the Unisys facilities must follow the work rules. Non-conformance to these work rules is grounds for contractor removal from the [redacted] facility and the Unisys facilities. These rules include:

- Contractor activity must be coordinated through the Unisys facility manager.
- A Work Coordination Form must be completed by the Unisys project manager and submitted to the Unisys Operations Manager and Data Center Manager not less than seven days before commencement of work for major projects or 2 days for minor work.
- Work activities requiring Commonwealth management or [redacted] Facility approval will require additional time for approval.
- Unisys project managers may not schedule contractor work without prior approval.
- Contractors arriving for work that are not pre-authorized are not granted admission to the facility.
- As necessary, the Unisys project manager and contractor representative will be requested to attend a pre-work coordination meeting.
- All contractors must conform to Unisys Environmental, Health, and Safety rules.
- All contractors must conform to Unisys Security procedures.
- All contractors must either be escorted or obtain a visitor's pass.

For detail on when these work rules are engaged in the support of facility infrastructure refresh see Schedule F, Section 3.2.3.2 "Site Operations."

Unisys is committed to responsible environmental management. We take a proactive role in maintaining a safe and healthy workplace, operating our facilities in an environmentally sound manner, and promoting programs that support environmental stewards. It means conducting business in a responsible manner, with respect and concern for the environment. It is a matter of strictly adhering to local, national, and international laws governing environmental protection and offering environmentally responsible services. On a regular basis, regulatory compliance validation reviews are performed at Unisys locations to evaluate conformity with location-specific environmental regulations and established Unisys best practices.

Third-party assessments are performed independent of internal reviews to add objectivity to the evaluation process. Unisys has not received a notice of violation or a fine for non-

compliance of environmentally related matters in the past three or more years. To foster this commitment, Unisys has assembled a staff of qualified professionals possessing extensive experience. These skilled professionals are responsible for identifying and resolving environmental, safety, and health issues in a timely, cost-effective and technically sound manner. Environmental Programs that Unisys currently manages are:

- ISO 14001 Environmental Management Systems
- Carbon Footprint
- Pollution Prevention
- Solid Waste Recycling
- Vital Resource Conservation
- Energy Conservation
- Green Lights Partner
- End of Life Product Disposition Program
- Product reuse and recycling programs
- Lithium Batteries Recycling Program
- Printer cartridge recycle program
- Environmentally safe packaging
- Clean Air Program
- Travel Reduction
- Ozone Depleting Substances (ODS) Management
- Design for the Environment Product Program
- Supply Chain Information
- Environmentally-Safe Packaging
- Community Commitments & Concerns
- Employee Health and Safety
- Health and Safety Program Management
- Management of Injuries and Illnesses
- Hardware Dismantling and Selective Treatment
- WEEE-Compliant Instructions for Hardware Disassembly
- Environmental Recognitions and Awards

5 Facility Access Policies and Procedures

5.A Physical Access to Facilities- Coordinate with the Commonwealth to provide for physical access and facilitate inspections by government authorities (including the Commonwealth) for auditing the conduct of government business.

Unisys welcomes the Commonwealth to visit facilities supporting the Commonwealth's IT

services. However, to maintain the security and operational posture Unisys requests that designated Commonwealth individuals provide at least 24-hours' notice to their Unisys Agency Account manager, if possible, who will contact the Unisys Team's Data Center and Facility Manager. This advance notice allows Unisys to prepare for the potential interruption that the visit may incur in the regular operation of the facilities. If warning is not possible, Unisys requests patience while we arrange access and facility escort.

For longer periods of access such as for lengthy audit processes or a series of recurring visits, Unisys requests 2 weeks' notice to include times of access and names of those needing entry, which must come from designated Commonwealth individuals given the express authority to make such requests. This form of request provides Unisys sufficient time to prepare security arrangements that may include verification of the request with proper Commonwealth authorities and security staff and the scheduling of Unisys security personnel to be present, to escort and enable access and to monitor the area and visitors.

In the event that circumstances require sudden and unanticipated access to the facility by authorized Commonwealth representatives, the Unisys Data Center and Facilities Manager will contact his Commonwealth counterpart to alert them to the circumstances and consult on the appropriate course. In such instances, Unisys requests the Commonwealth's patience. Unisys does not allow visitors into facilities under its management without a Unisys facilities team member who has the express authority to escort. When presented with the access request, Unisys places that team member at the disposal of the visitor as expeditiously as possible and per the Commonwealth's instruction.

Ultimately, Unisys objective is to maintain the security and operational standing of the facilities and maintain Unisys responsibility to the Commonwealth for facilities dedicated to the Commonwealth's IT services while permitting, to the degree possible, the proper exercise of government.

5.B Offeror must assess the [redacted] facilities and provide a report to the Commonwealth as it pertains to required physical access to the [redacted] facility.

The [redacted] Assessment in deliverable D-01.01 includes security, power and HVAC systems. These are evaluated for alignment with contract requirements and facility objectives. In addition, the assessment evaluates on the ability of the facility to meet, to have monitored, to operate and to maintain the installed infrastructure and [redacted] SLAs.

The [redacted] Assessment's findings are interpreted with respect to the Commonwealth's SLAs for the contract. Recommendations are then developed on the gaps that the current [redacted] facility has in meeting the SLAs. This interpretation includes consideration of the integration of the facility's BMS system into the Unisys ITSM service management tooling and the implementation of the common facilities DCIM system based on [redacted]

Finally, the assessment is anticipatory to a statement of direction and objectives for the [redacted] within the evolving Data Center Architecture Plan and Roadmap's Implementation Roadmap section. These objectives will reflect the recommendations derived from findings in the areas of electric power systems, HVAC systems, fire detection and suppression systems, building and access control processes and systems and environment management.

5.C Offeror must describe its facilities access policies and procedures.

Unisys owned or managed facilities are secured with physical surveillance including a security guard force that provides security and safety, access control systems on both exterior and interior points to control access to only authorized individuals, and 24x7 video surveillance systems that monitor and digitally record onsite activities.

Employee clearance includes background verification, Unisys confidentiality agreements, ethics training with annual certification, and information security training with annual certification.

Procedures for employees and vendors to access data centers include:

- Data Center Safety and Work Rules Certification prior to granting unescorted access.
- All employees must have a valid Smart Card to gain access into the building using the badge reader system.
- All non-Unisys personnel must check in and gain authorization for entry into the building through the security guard. Must be certified for unescorted access.
- There are 3 levels of data center access security:
  1. General access into the building
  2. Data floor
  3. Secure Cages on the data floor
- Multiple levels of approval are required to gain approval for access to the Data Floor areas.

6 SLA Reporting, Facilities Availability

6.A SLA Reporting - Identify and create environmental service level objectives in the form of SLAs, and report on the service availability, problems, and corrective actions on a monthly basis.

Unisys measures its facilities management against key performance indicators such as the availability of its major infrastructure equipment such as the components of the electrical power systems, or the response to change and problem management activities within the facility. Unisys data center SLAs can incorporate the [redacted] to provide both individual site and an overall view of the environment supporting the Commonwealth's IT systems.

As a starting point, Unisys proposes to incorporate an SLA reflecting uptime availability. As an example, please see the availability report shown for the [redacted] data center in **Schedule E "Data Center Locations".**

With the completion of deliverable D-08 "Facilities Management Plan" D-08.01, Unisys can recommend additional SLAs that may offer other views for the data centers separately and as a combined environment. The SLAs to be recommended may include SLAs for the availability of power from generators or UPS. Upon completion of the [redacted] SSAE-16 audit, deliverable D-08.02, a review of the SLAs offered for the facilities can occur to determine if additional SLAs are appropriate, at what levels and with what remediation upon an SLA miss.

6.B Offeror must assess the [redacted] facilities and provide a report to the Commonwealth as it pertains to monitoring, maintaining and reporting on [redacted] SLAs.

The Unisys operations of the [redacted] are integrated into the range of SLA monitoring and reporting processes and tools implemented for the services provided. These include reporting on SLAs and availability of the [redacted] To accomplish this integration, Unisys intends to integrate the [redacted]

building management system into the Unisys ITSM environment.

6.C Offeror must describe how it monitors and manages facility availability.

Unisys [redacted] uses a number of tools for the monitoring and management of the facility's availability including:

- GE iFIX for monitoring of the overall electrical plant.
- Schneider Citect for monitoring of the mechanical plant.
- TrendPoint for branch circuit breaker monitoring.
- Intellibatt for battery monitoring.
- SynapSense for data center environmental monitoring

Unisys [redacted] is monitored through a sophisticated and integrated Building Monitoring System, where over 2000 points are monitored on the system. Raised Floor support equipment is monitored with a Liebert SiteScan System with monitor and trending capability. Computer Room Air Conditioners (CRAC) unit return air temperatures are monitored and trended, any CRAC alarms are sent to the Siemens Building Management System (BMS) and are responded to by two teams – security guards and BMS mechanics. These two 7x24 on-site teams double check to verify that each alarm is addressed. Other important parameters monitored are Data Center Efficiency and Power Utilization Effectiveness (PUE), PDU kilowatt load, UPS kilowatt load, utility and generator loads and status. Virtually any alarm available on a device is tracked and responded to with the BMS system.

The [redacted] Data Center Infrastructure Management (DCIM) tool is used to track all IT equipment installed in the facilities including the [redacted] Rack level monitoring of planned and actual (where available) racks loads are tracked to anticipate circuit loading or cooling hot spot issues prior to installation of equipment. All cable connections are tracked in [redacted] if Unisys installs the equipment.

Ultimately, the management and monitoring systems and processes of [redacted] are tied into the Unisys ITSM system to provide a single environment from which to manage the data centers. Alerts and alarms from the facility systems are integrated into the Unisys ITSM including those available from the [redacted] BMS. Unisys solution includes the implementation of the [redacted] DCIM tool for the space and cable management of the [redacted] as a member of the Unisys facilities solution for the Commonwealth.

7 Compliance Ratings, SSAE 16 Audits

7.A The facilities must be designed and operated with environmentally friendly equipment and techniques, and be SSAE 16 compliant.

Unisys complies. Please refer to Schedule F, Section 3.1.1 "Multi Datacenter Environment (2+ Architecture)" items 5A and 6A for additional details.

7.B Offeror must assess the [redacted] facilities and provide a report to the Commonwealth as it pertains to monitoring, maintaining and reporting on [redacted] SLAs.

The [redacted] Assessment in deliverable D-01.01 includes security, power and HVAC systems. These are evaluated for alignment with contract requirements and facility objectives. In addition, the

assessment evaluates on the ability of and requirements for the facility to meet, to have monitored, to operate and to maintain the installed infrastructure and [redacted] SLAs.

The [redacted] Assessment's findings will be interpreted with respect to the Commonwealth's SLAs for the contract. Recommendations will be developed on the gaps that the current [redacted] facility has in meeting the SLAs. This interpretation includes consideration of the integration of the facility's BMS system into the Unisys ITSM service management tooling and the implementation of the common facilities DCIM system based on [redacted]

Finally, the assessment is anticipatory to a statement of direction and objectives for the [redacted] within the evolving Data Center Architecture Plan and Roadmap's Implementation Roadmap section. These objectives will reflect the recommendations derived from findings in the areas of electric power systems, HVAC systems, fire detection and suppression systems, building and access control processes and systems and environment management.

7.C Offeror must list all compliance ratings achieved at the proposed datacenters.

Please see Schedule E for documentation of recent certifications achieved at Unisys [redacted] and Unisys [redacted] In addition Schedule F, Section 3.1.1 "Multi Datacenter Environment (2+ Architecture)" item 6A.

7.D Offeror must provide copies of annual SSAE 16 audits for all datacenters used to service the Commonwealth (and its agencies) at the Offeror's expense.

Please see Schedule E for copies of reports from recent SSAE 16 audits for Unisys [redacted] and Unisys [redacted] Annual SSAE 16 audits will be conducted for the Unisys data centers and [redacted] and copy of these reports will be provided to the Commonwealth. For more information see Schedule F, Section 3.1.1 "Multi Datacenter Environment (2+ Architecture)" item 6A.

8 SSAE 16 Audits

8.A Offeror must schedule (at its expense) a SSAE 16 audit of the [redacted] datacenter no more than 12 months after the effective date of the contract.

An SSAE 16 audit is planned for the [redacted] within the first 12 months of the contract start date. In addition, this audit will become an element of similar annual audits for Unisys [redacted] and Unisys [redacted] Please see Schedule E for recent SSAE 16 audit reports for those sites. Additional information is in Schedule F, Section 3.1.1 "Multi Datacenter Environment (2+ Architecture)" item 6A.

8.B Offeror must provide proof of a valid (updated) SSAE16 certification in the form of audit findings report prior to implementing any Commonwealth service in any other proposed datacenter.

Please see Schedule E for copies of the current SSAE 16 audits for Unisys [redacted] data centers.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,
- Improve client satisfaction,

- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery
- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

9 CI Service Risk

9.A Offeror must provide methods to eliminate or mitigate service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives, and the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

10 CI Service Quality

10.A On a quarterly basis, Offeror must recommend to the Commonwealth team any facility changes that would be appropriate to maintained or improve SLA commitments.

The quality approach begins with the Service Excellence Office. The SEO function provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of

processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

11 CI Client Satisfaction

11.A Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

12 CI Service Transparancy

12.A Offeror must provide methods and practice to ensure service transparency, providing visibility into service execution.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

13 CI Improve or Reduce Cost

13.A Offeror must provide examples of Facilities Management initiatives have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manages quality, continuous service

improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

Unisys examples of continuous improvement

Examples of continuous service improvement have been included below under Unisys Team Experience.

Unisys Team Experience

Throughout the contract, Unisys has provided all facilities related maintenance and upkeep of the Commonwealth Data PowerHouse. In early 2011, Unisys undertook an internal initiative to be more "green". A complete analysis was performed and through numerous projects, we have reduced the overall Power Usage Effectiveness (PUE) rating from 1.8 to 1.5. Additionally, we had doubled the under floor pressure within the data center creating a more efficient airflow. There is also a current initiative for the replacement of the T-12 fluorescent lighting with the more energy efficient T-8 fluorescent lighting. While the IT energy load has increased with the addition of new hardware, our overall energy efficiency has improved.

Benefits to the Commonwealth

The Commonwealth benefits with Unisys oversight of its facilities by having an experienced company that makes its living keeping IT running. Failing to do so is like a bank failing to keep enough in the vaults – customers will not come back. Unisys has been operating Commonwealth facilities for 14 years and is now offering to place the Commonwealth in its own primary locations that benefit from the best and latest approaches that IT service providers provide to customers and that keeps them returning to solid, efficient, secure, flexible and scalable facilities that provide cost effective bases for our client's IT home.

3.2.3.2 Site Operations

The Site Operation service will provide datacenter operations staff and management to operate and monitor the IT computing equipment and Services being provided. The staff will interface with Commonwealth staff to institute best practice datacenter Services. Datacenter operations include, but are not limited to, management of the computing platforms, storage, local area networking, security firewall, tape backup, and offsite tape rotation systems.

Reference Documentation

Exhibit – D.7 - EDC Facility Summary

Exhibit G.6 - PSP - CJIS Security Policy

Exhibit G.9 - PSP – CCHRI

Exhibit G.7 - PSP - Summary of CJIS Requirements

Requirements		Describe Compliance
1.	Monitor and operate the various computer systems, network, network and local disk storage and firewall security systems. Provide datacenter operations staff to monitor the computer system platforms, associated disk systems, networking Services and firewall and security systems. Ensure proper equipment operations, timely batch jobs processing and appropriate response to any abnormal end and error conditions. The Offeror will support application specific operations as determined by the application owner. This includes executing the troubleshooting procedures required by the application owners as detailed within the CCPM. This may include operational activities and initial troubleshooting steps, contact and escalation lists (aka “Run Book”). This information will be maintained by the Offeror on an application by application basis and will be hosted within the Knowledge Management Portal. A daily operations batch schedule report will be created and used to log normal / abnormal conditions. Abnormal conditions will be investigated for problem	Offeror must describe its facilities site operations including monitoring and general upkeep of the facilities including the following: • Processes and Procedures • Tools / Applications • End User Reports o Standard o Custom • Escalation Procedures

	determination and rerun. Any abnormal condition that cannot be corrected will be referred to technical support staff for resolution. Properly clean and maintain equipment to minimize problems and outages, at intervals established with the Commonwealth or in compliance with stated and written specifications. Offeror must assess the EDC facilities and provide a report to the Commonwealth as it pertains to monitoring, maintaining and operating the installed infrastructure.	
2.	For the systems that utilize tape backup Services, Offeror must provide a structured tape management approach. For systems that utilize disk-2-disk backup approach Offeror must provide a structured disk-2-disk approach. Manage and maintain the tape backup system and Services. Rotate designated tapes to, and returned from approved offsite storage location. Maintain detailed audit log of tape movement. Some agency applications fall under additional CJIS and CCHRI security requirements for tape backups. Provide datacenter operations staff to manage and maintain the tape management system. Tapes will be rotated to, and returned from an approved offsite vaulting subcontractor. An automated software process will be utilized to report the completion status of backup processing, with electronic notification	Offeror must describe its tape management approach and describe the process to work with the Commonwealth Agencies to provide a classification and categorize tapes per the type of data contained on the tapes. Offeror must describe its disk-2-disk backup approach. Offeror must assess the EDC tape backup facilities and provide a report to the Commonwealth as it pertains to manage and operated the installed tape backup systems and media operations.

	of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action. Provide the facilities to Retrieve External Storage Media from on-site and off-site storage as requested by the Commonwealth or as required in an emergency. Wipe or erase the data and configuration information resident on the media prior to disposal or re-use, and in accordance with Commonwealth standards. Dispose of retired media in an environmentally sound manner after purging any Commonwealth data using Commonwealth, and/or Federal guidelines/policies prior to disposing of media. Operate media libraries and library management systems as required to provide the Services. Maintain an existing inventory control system to properly manage External Storage Media in storage and prepare them for shipment to the contingency site.	
3.	Monitor physical access and security of the datacenter. Video surveillance is required. Staff the datacenter with appropriate level of staff and management 24/7/365. The Offeror must monitor physical access to the datacenter and respond to security incidents in a consistent and auditable manner. All breaches will be reported to the	Offeror must describe its physical access and security monitoring approach for proposed Offeror datacenters including staff roles, responsibilities and background check process. Offeror must assess the EDC current physical access and security plan and provide a report to the Commonwealth as it

	Commonwealth for review and follow up action as required. Monitoring of the video system for all entry points and throughout the datacenter and tape storage areas will be included in this responsibility. Offeror will be required to adhere to the Commonwealth requirements for background checks and security clearances. Commonwealth verification that the requirements have been met will be necessary prior to Offeror working on Commonwealth related systems.	pertains to any required upgrades.
4.	Manage and maintain equipment configuration inventory system. Provide staff to create and maintain a configuration record for all hardware and software components in the datacenter. This must be an accurate record of all software, computing, disk storage, tape, network, racking, cables, and environmental equipment.	Offeror must describe the proposed approach to managing the support of its datacenter technology.
5.	Provide programs and processes to alter the operational environment, and to refresh the Services at asset end-of-life or implementation of new technology Services, as these Services are needed.	Offeror must describe solution and approach to meet this requirement.
6.	Identify and create service objectives for the site operational Services in the form of SLAs, and report on the service availability, problems, and corrective actions on a monthly basis.	Offeror must describe how it monitors and manages facility operations to meet/exceed the agreed to availability service levels.
Continual Service Improvement		
7.	Reduce service risks.	Offeror must provide methods to eliminate

		or mitigate service risks.
8.	Improve service quality.	On a quarterly basis, Offeror must also recommend to the Commonwealth team any site operational changes that would be appropriate to maintained or improve SLA commitments.
9.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
10.	Ensure service transparency.	Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.
11.	Integrate Continuous Improvement Program processes into Availability Management and Service Level Management.	Offeror must describe offering in this area including the projected impacts/benefits.
12.	Improve/reduce cost of service.	Offeror must provide examples of Site Operations initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

To support facilities site operations including monitoring and general upkeep of the facilities that support the computing platforms Unisys developed a component-based compute support model as depicted in **Figure 3.2.3.2-1.** This model provides the site operations model to support the requirements in the RFP and puts them in a logical view that the Commonwealth can easily visualize.

Figure 3.2.3.2-1 - Component Based Operating Model

The Component Based Operating Model is broken down into the following components to support the requirements within the RFP:

1. **Program Management Office –** Establish a local and dedicated Program Management and Service Excellence Office that provides a focus on governance, a drive toward continued value, and cost savings by deploying Lean Six Sigma practices based on studies of cycle time and defect analysis from events that are extracted from the IT Service Management platform. By removing cycle time waste and defects of the operating environment, Unisys will provide the Commonwealth with continued cost savings and a higher quality IT compute environment. This same office is responsible for the ongoing governance of driving continuous service improvement and innovation.

2. **Service Portal –** Create an enterprise services portal, enterprise services catalog, and real-time dashboard to provide a single interface to all agencies to interact, provision, and be able to determine the performance of the IT operating environment in near real time. Each agency will have its own personality that is configurable, being able to develop a look and feel of its own when coming to the services portal to provide each agency with personalization and autonomy. Each agency can determine the services it wants to publish or offer, provision, and report on, in near real-time, while still having access to the overall view of the enterprise.

3. **IT Service Management –** Deliver an enterprise IT Service Management platform based on ITIL V3 best practices and Lean Six Sigma that drives the maturity of the IT operating model with a goal of achieving an efficiency gain of approximately 5 percent year over year. Of significant importance is the development of an enterprise wide Configuration Management Database (CMDB) that defines the service that IT delivers to the Commonwealth. The creation of services in the CMDB will allow the Commonwealth to proactively determine business impact by determining a fault before it occurs and allowing maximum use of IT resources to reduce ongoing cost. Each agency will have its own instance in the service management environment to provide operating autonomy; Unisys will provide a federated service management environment to the OA so it has the overall view of the total IT operating environment at the Commonwealth. The Commonwealth can be comfortable knowing that Unisys supports a multitude of IT Service Management Systems, including [redacted] and [redacted] Our Component-based Operating model can be enabled with any one of the named IT Service Management Platforms.

4. **Managed Hosting Services and Capacity on Demand –** Enable an adaptive, flexible, and secure hardware compute environment that is based on a consumptive utility model with a "no volume commit" attribute that provides the agencies with the autonomy to perform their IT functions and meet their business requirements. In the Unisys compute model, there is fundamentally no difference between Managed Hosting Services and Capacity on Demand because they are served from the same hardware platforms and managed by the same ITSM management platform. As an innovation effort, and to make sure the Commonwealth is aligned with market trends, the Unisys Team includes optional Virtual Private Cloud offerings from Microsoft and [redacted] in the Enterprise Services Catalog. From Microsoft, we included Azure, Office 365, and Dynamics. From [redacted] we included its new offering in the marketplace for virtual private cloud capacity for Windows.

5. **Service Broker –** Unisys will provide the Commonwealth with a consolidated, optimized, and centralized multitenant compute environment in which the agencies will not have to compromise their control by being able to self-provision workloads using an Enterprise Services Catalog. Once ordered from the Enterprise Services Catalog, the request will be processed through ITSM for change approval. When the request is approved, the Service Broker will invoke an automated runbook to execute the provisioning effort. Once the provisioning effort is complete, the runbook will update the Configuration Management Database. Agencies will be able to maintain a very real level of control over their compute environment required to meet the business need. As an innovation effort, the Enterprise Services Catalog and Service Broker will be an integrated pair to provision not only capacity from the private cloud environment we are providing the Commonwealth, but also services from partners such as IBM, Microsoft, and [redacted] Our vision for the Enterprise Services Catalog and Service Broker is you can provision any service from any provider at anytime with "no commit" that is then managed by the Component Based Compute Model provided in this RFP. One provisioning model and one management model will unify the compute model for the Commonwealth and provide the business flexibility and optimized compute environment the Commonwealth is looking for.

6. **Technical Services –** Unisys will provide a set of selectable services that can be procured from the Enterprise Services Catalog to manage given applications in the Commonwealth agencies. These technical services can be people- or management-based services and can be procured in a consumption-based approach.

7. **Security Services –** Achieve and maintain a robust and comprehensive security

environment that meets the IT Security policies set forth by the Commonwealth. This security environment will be managed by Deloitte, which has years of experience working with the Commonwealth to create, implement, and manage security policies.

8. **Facility Management –** Provide the ongoing management for all data centers whether Unisys or Commonwealth owned facilities.

9. **Service Desk –** The Service Desk will take calls from IT support staff to log incidents that were not automatically generated from the event monitoring system. The Service Desk will use knowledge management to try to resolve an event within an agreed time. If the event cannot be resolved in the agreed time, it will be escalated to Level 1 Support. During normal business hours, this team will be located in Harrisburg.

10. **Level 1 Support –** Level 1 Support manages all events that are automatically generated from the hardware and application environments as well as resolving incidents that are received from the Service Desk. Level 1 will use various tools, runbooks, and knowledge management to resolve incidents. If the incident is not resolved within a given time, it will be escalated to Level 2 Support. During normal business hours, this team will be located in Harrisburg.

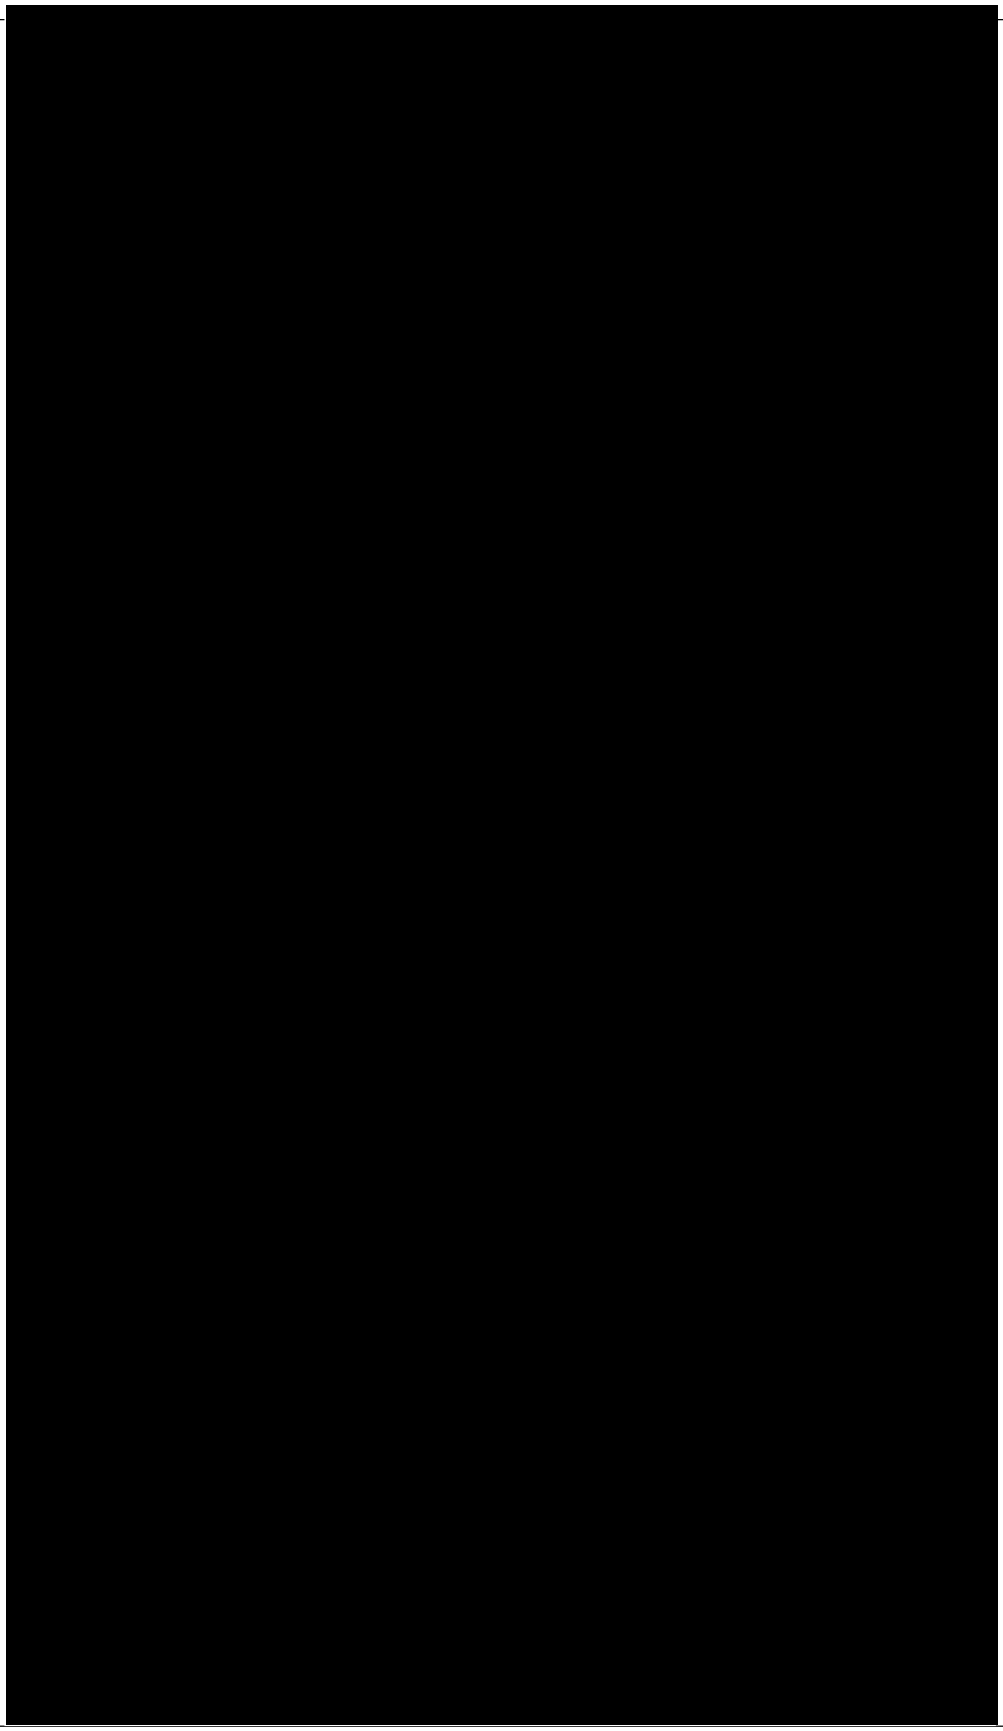
11. **Level 2 Support –** Level 2 Support is a team of very knowledgeable resources who can solve a wide array of Commonwealth application compute issues. This team largely knows the individuals in the agencies and has an ongoing relationship with them. When Level 2 Support believes it cannot resolve the incident in a timely way, it will pull in Level 3 Support resources. During normal business hours, this team will be located in Harrisburg.

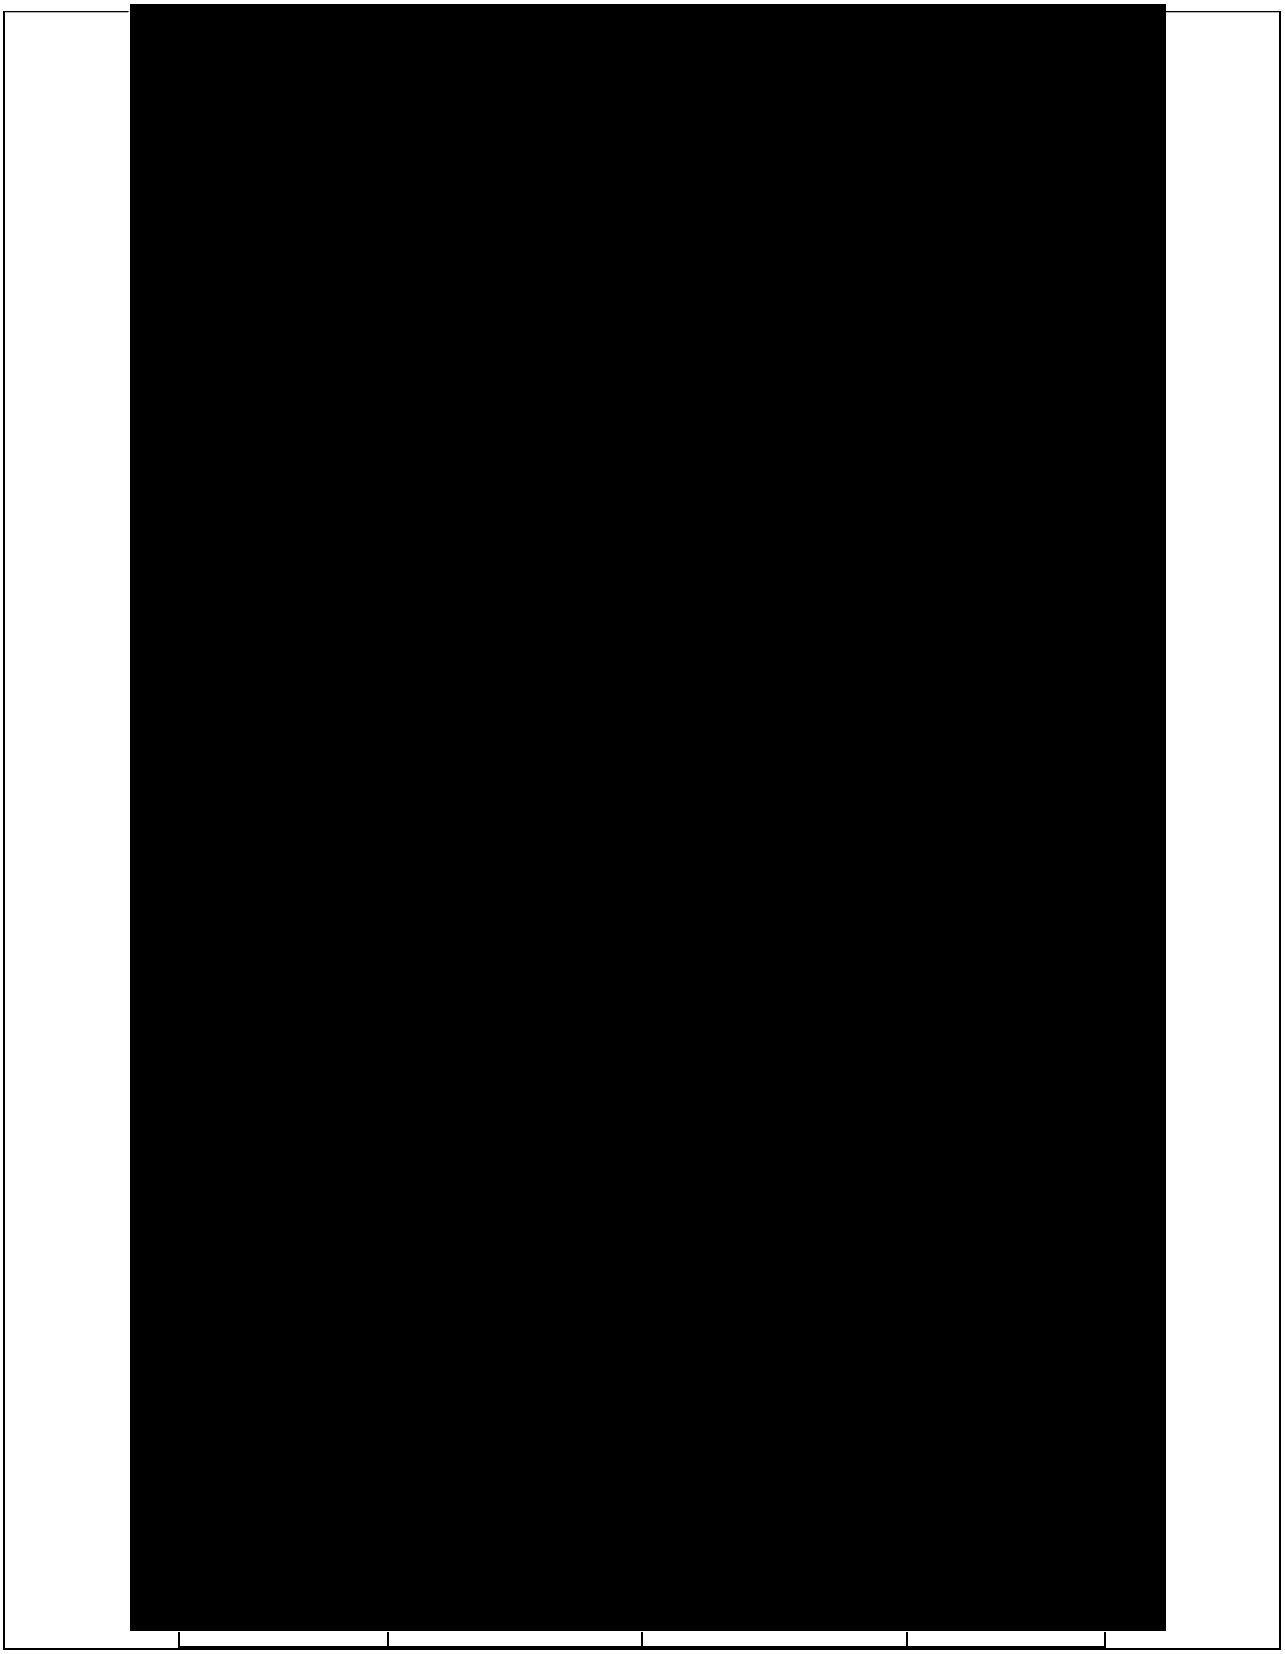
12. **Level 3 Support –** Level 3 Support is a team of architecture experts that deeply understands the compute architecture that supports the Commonwealth applications. This team is also an integral part of driving continuous improvement plan by identifying inefficiencies in the compute architecture. During normal business hours, this team will be located in Harrisburg.

To enable this Component Based Operating Model Unisys plans to implements, operate, and support a comprehensive and integrated Information Technology Service Management (ITSM) platform based on ITIL V3 and Enterprise Systems Management (ESM) platform dedicated to the cross-functional process support for services provided to the Commonwealth for this contract. The proposed ITSM and ESM Architecture, shown in **Figure 3.2.3.2-2**, provides an effective and efficient operational platform to support the Commonwealth's agencies application environments.

Figure 3.2.3.2-2 - Unisys ITSM and ESM Integrated Architecture.

To enable the Component Based Operations Model it takes a great number of tools that are seamlessly integrated as a whole. These tools are summarized below in the **Figure 3.2.3.2-3.**





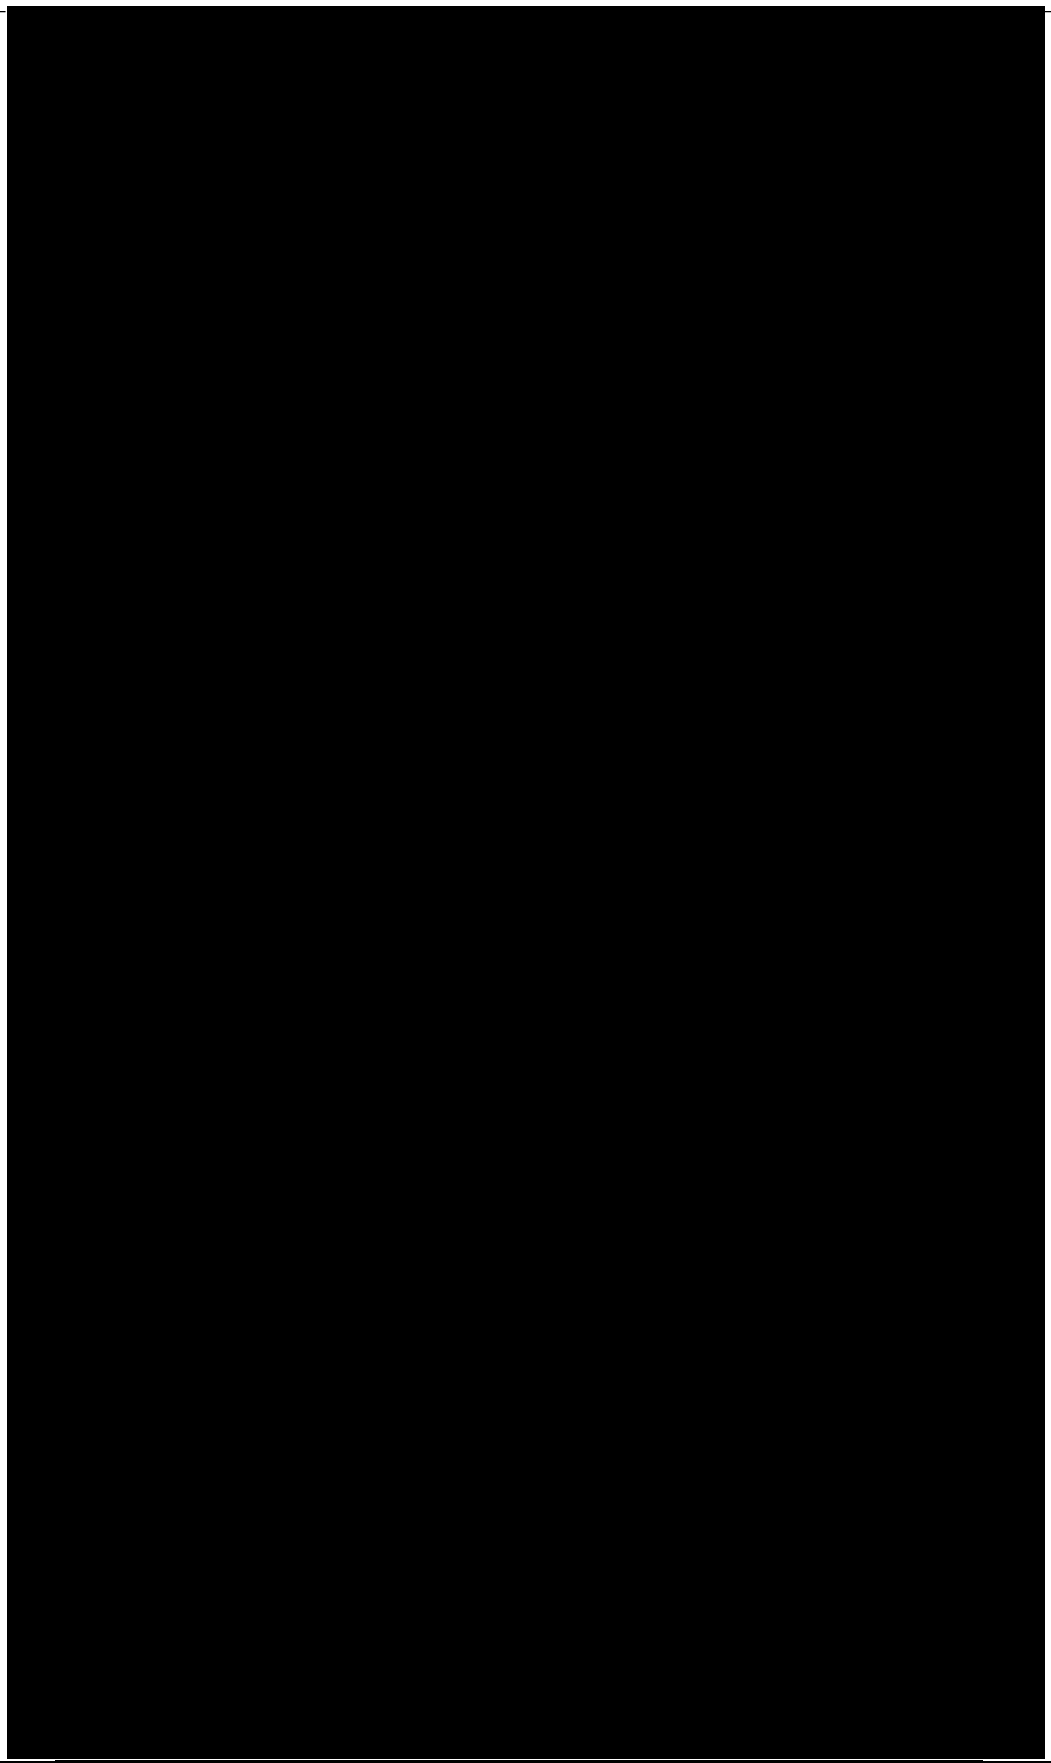


Figure 3.2.3.2-3 - Unisys ITSM and ESM Tools

1 Site Operations and Maintenance

1.A Monitor and operate the various computer systems, network, network and local disk storage and firewall security systems.

See the overview in the introduction provided above for an explanation on providing monitoring and operation to support the computing platforms required in this RFP. For detailed information on each platform refer to each compute platform section for an in depth explanation of how they will be monitored and operated.

1.B Provide datacenter operations staff to monitor the computer system platforms, associated disk systems, networking Services and firewall and security systems

The Unisys Team will provide an operations staff that is largely located in the primarily support center in Harrisburg, PA; however to support all computing facilities and off hours business support Unisys will have a small amount of supplemental support staff located in [redacted]

1.C Ensure proper equipment operations, timely batch jobs processing and appropriate response to any abnormal end and error conditions.

The Unisys Service Delivery Team verifies proper equipment operations. The Unisys Service Delivery Team confirms timely batch job processing and response to abnormal error conditions. Any abnormal end and error condition will generate an event in the event management system and will automatically generate an incident ticket that the operations staff will receive address and resolve.

1.D The Offeror will support application specific operations as determined by the application owner. This includes executing the troubleshooting procedures required by the application owners as detailed within the CCPM. This may include operational activities and initial troubleshooting steps, contact and escalation lists (aka "Run Book").

The Unisys Service Delivery Team will have an extensive set of run books to support the infrastructure for application owners. During transition, these run books will be augmented with run books reviewed and approved from the Commonwealth and will be stored in the Knowledge Management Portal (KMP) CCPM procedures and run books. These runbooks will be available within the KMP that is located within the Services Portal.

1.E This information will be maintained by the Offeror on an application by application basis and will be hosted within the Knowledge Management Portal.

Unisys complies. See 1.D above.

1.F A daily operations batch schedule report will be created and used to log normal / abnormal conditions

Unisys will create a daily operations batch schedule report that logs normal/abnormal conditions with a focus on exceptions.

1.G Abnormal conditions will be investigated for problem determination and rerun. Any abnormal condition that cannot be corrected will be referred to technical support staff for resolution.

Abnormal error conditions in batch jobs will be investigated, workarounds determined and rerun. Incident tickets will be opened following the incident management process to determine a resolution and eliminate defects from the batch job.

1.H Properly clean and maintain equipment to minimize problems and outages, at intervals established with the Commonwealth or in compliance with stated and written specifications

The Unisys Service Delivery Team defines and executes preventative maintenance for all supported facilities and infrastructure. These preventative maintenance procedures will be reviewed and approved during Transition and stored in the CCPM on the KMP.

1.I Offeror must assess the [redacted] facilities and provide a report to the Commonwealth as it pertains to monitoring, maintaining and operating the installed infrastructure.

Unisys complies. Refer to Schedule F, Section 3.1.1 "Multi Datacenter Environment (2+ Architecture)" and Section 3.2.3.1 "Facilities Management" for more information.

1.J Offeror must describe its facilities site operations including monitoring and general upkeep of the facilities including the following:

Processes and Procedures

Please refer to the introduction this section above for an explanation on facilities site operations.

Tools / Applications

The tools for site operations are provided in the introduction section above.

End User Reports (Standard and Custom)

Standard End user Reports are summarized in Section 3.3.2 Standard Reports. Custom reports are available via the Enterprise Services Catalog.

Escalation Procedures

Escalation Procedures are described in the Incident Management Process, which can be found in detail in the Service Desk section 3.2.1.4 of this document.

2 Structured Tape Management Approach

2.A For the systems that utilize tape backup Services, Offeror must provide a structured tape management approach.

The media management function provides a structured tape management approach for all systems that utilize tape backup services. This function manages and maintains the tape backup system and services rotating designated tapes to and from approved off-site storage locations tracking all tape movement in a detailed audit log. Practices under this function meet CJIS and CCHRI security requirements for media management and proper disposal.

Based on the differing operating environments supported there will be various software used in the Tape Management areas. These differing operating environments include:

- Unisys IX Mainframe
- Unisys NX Mainframe
- IBM Mainframe
- Open Systems

Management and maintaining of the tape backup system is a key factor in the overall availability and recoverability of any given environment. Working with the individual agencies, tape library staff establish retention periods for the given tape media based on the cycle of the backup being created. All movement of media to the approved offsite storage location is electronically documented in the software associated with the operating environment and with the approved offsite vendor. All media identified for shipment to the approved offsite storage location is picked based on the automated software, scanned and packaged in separate agency containers. Agency applications that fall under additional CJIS, CCHRI and IRS security requirements are loaded and secured in locked containers.

The media management team provides professional handling of all Commonwealth data residing on tape media. Media Management responsibilities include:

- Through a structured tape management approach, media is inventoried and prepared for shipment off-site to a secure storage vault where can be accessed in the event of a facility disaster
- Management and maintenance of the tape backup system and Services
- Rotation of designated tapes to, and from approved offsite storage location maintaining a detailed audit log of tape movement
- Wiping or erasing the data and configuration information resident on the media prior to disposal or re-use, and in accordance with Commonwealth standards
- Disposal of retired media in an environmentally sound manner after purging any Commonwealth data using Commonwealth, and/or Federal guidelines/policies prior to disposing of media

- Maintaining an existing inventory control system to properly manage External Storage Media in storage and prepare them for shipment to the contingency site.

Standard scheduled rotation of tape media occurs daily.

2.B For systems that utilize disk-2-disk backup approach Offeror must provide a structured disk-2-disk approach.

The Unisys solution includes the [redacted] infrastructure that has worked well for the Commonwealth since Unisys brought forward this innovation as part of the existing service design process. The Commonwealth agencies order capacity via the Enterprise Services Catalog, which initiates the provisioning processes.

2.C Manage and maintain the tape backup system and Services. Rotate designated tapes to, and returned from approved offsite storage location.

As described above in 2.A rotations occur daily and comply with Commonwealth requirements.

2.D Maintain detailed audit log of tape movement. Some agency applications fall under additional CJIS and CCHRI security requirements for tape backups.

The Unisys solution provides for physical encryption of all media and includes detailed audits of tape movement from Unisys-managed data centers to the [redacted] facilities which provide offsite storage in the Unisys solution. These Unisys tape movement logs are compared with the [redacted] receipt logs for tape media movement as part of the detailed audit process.

2.E Provide datacenter operations staff to manage and maintain the tape management system. Tapes will be rotated to, and returned from an approved offsite vaulting subcontractor. An automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.

Unisys complies. The [redacted] software manages the reporting of completion status of backup processing. The [redacted] is integrated with the [redacted] in the IT Service Management (ITSM) infrastructure to provide automated escalation processes including, as desired by the Commonwealth, notification to Commonwealth staff. Unisys IT Service Management will also manage direct escalation to Commonwealth technical staff when required for resolution of incidents.

2.F Provide the facilities to Retrieve External Storage Media from on-site and off-site storage as requested by the Commonwealth or as required in an emergency.

As and when restores are required, detailed processes and procedures will be defined in CCPM to request and retrieve media. The ITSM team also manages to emergency requirements using processes agreed upon with the Commonwealth.

2.G Wipe or erase the data and configuration information resident on the media prior to disposal or re-use, and in accordance with Commonwealth standards.

As described above in 2.A, the Media Management team manages re-use of media or degaussing and media disposal as required.

2.H Dispose of retired media in an environmentally sound manner after purging any Commonwealth data using Commonwealth, and/or Federal guidelines/policies prior to disposing of media.

The Unisys solution includes degaussing equipment to purge data and destroy media prior to disposal following environmentally sound processes. Agencies may request additional security precautions for tapes containing highly sensitive data. These measures include overwriting all areas on the tape - three times, or degaussing. These measures will be documented and noted on the inventory sheet when the tape is placed in the box. The wiping of tape media prior to re-use is handled with the use of a DOD rated tape degausser.

2.I Operate media libraries and library management systems as required to provide the Services.

Unisys complies.

2.J Maintain an existing inventory control system to properly manage External Storage Media in storage and prepare them for shipment to the contingency site.

The Unisys Team requires no additional transition efforts to manage the existing inventory and can prepare them for shipment to contingency sites as determined during data gathering activity.

2.K Offeror must describe its tape management approach and describe the process to work with the Commonwealth Agencies to provide a classification and categorize tapes per the type of data contained on the tapes.

The Unisys Team provides these tape management approaches for the current Commonwealth and proposes to rely on these processes within this new solution's Service Design. Additional specifics are included in 2.A through 2.K above. Agencies may request additional security precautions for tapes containing highly sensitive data.

2.L Offeror must describe its disk-2-disk backup approach.

As described above, the Unisys solution includes the proven [redacted] infrastructure that has worked well for the Commonwealth since Unisys brought forward this innovation as part of the existing Service Design process.

In the new Capacity-on-Demand solution, the Commonwealth agencies order capacity via the Enterprise Services Catalog, which initiates the provisioning processes.

2.M Offeror must assess the [redacted] tape backup facilities and provide a report to the Commonwealth as it pertains to manage and operated the installed tape backup systems and media operations

The Unisys Team can provide this assessment and report within the first 12 months.

3 Monitor, Physical Access and Security Monitoring Approach

The Unisys facilities used in this configuration will be staffed with on-site personnel 24 hours a day seven days a week who monitors physical access and security of the data center. Each site has its own complement of physical security guards who make regular premises rounds, log their inspections, and escort all data center visitors. This team will monitor physical access to the data center and respond to security incidents in a consistent and auditable manner. All breaches will be reported to the Commonwealth for review and follow up action as required. Monitoring of the video system for all entry points and throughout the data center and tape storage areas is included in this responsibility.

3.A Monitor physical access and security of the datacenter. Video surveillance is required.

Video surveillance includes both exterior and interior surveillance at all Unisys-managed facilities. For more detailed information please refer to Schedule F, Section 3.1.1 "Multi Datacenter Environment (2+ Architecture)".

3.B Staff the datacenter with appropriate level of staff and management 24/7/365.

The Unisys solution includes the staff to meet this requirement. Details are provided in the overall Staffing Plan in Section 5 Personnel.

3.C The Offeror must monitor physical access to the datacenter and respond to security incidents in a consistent and auditable manner. All breaches will be reported to the Commonwealth for review and follow up action as required. Monitoring of the video system for all entry points and throughout the datacenter and tape storage areas will be included in this responsibility.

The Unisys Team will continue to comply with this requirement.

3.D Offeror will be required to adhere to the Commonwealth requirements for background checks and security clearances. Commonwealth verification that the requirements have been met will be necessary prior to Offeror working on Commonwealth related systems.

All Unisys staff who has physical or logical access to the data center will adhere to the Commonwealth ITBs related to background checks and security clearances. This includes initial checks prior to hire as well as annual checks. Documentation related to the background checks will be shared with the Commonwealth to enable verification prior to staff working on Commonwealth systems.

3.E Offeror must describe its physical access and security monitoring approach for proposed Offeror datacenters including staff roles, responsibilities and background check process.

The Unisys Team will continue to comply with this requirement by providing interior and

exterior video surveillance for Unisys-managed facilities. The Unisys Security Manager in the Program Management Office oversees the implementation of background check, security policies, and appropriate security audit processes to manage staff security.

For more details, see Schedule F, Section 3.5.4.7 "Security Management Plan".

3.F Offeror must assess the [redacted] current physical access and security plan and provide a report to the Commonwealth as it pertains to any required upgrades.

The Unisys Team can provide this assessment and report within the first 12 months.

4. Datacenter Configuration Management

4.A Manage and maintain equipment configuration inventory system.

Please refer to 4.B below. All components in the data center will be stored in the Unisys ITSM Configuration Management Database and will be marked as an asset.

4.B Provide staff to create and maintain a configuration record for all hardware and software components in the datacenter. This must be an accurate record of all software, computing, disk storage, tape, network, racking, cables, and environmental equipment.

The Unisys solution includes the [redacted] software solution from [redacted], a sophisticated Software as a Service (SaaS) solution for modeling critical data center physical infrastructure. With a data-driven model behind its powerful graphical capabilities, it effectively addresses the important issues of people, power, and space that occur in managing IT infrastructure.

The Unisys Team has supplemented this sophisticated tracking, monitoring, and reporting software suite with an integrated system of hand-held devices that allow scans of racks of hardware components for auditing, inputting, and reporting. The tool is also integrated with the Microsoft Visio product so that the Commonwealth will have access to sophisticated and detailed data center Visio drawings generated automatically from these scans. Other vendors might not include this feature but promise to provide staff to produce these artifacts. Sadly, under this approach, it is nearly impossible to hire enough staff to compete with the Unisys automation and thus the alternate labor-based proposals are vastly inferior.

4.C Offeror must describe the proposed approach to managing the support of its datacenter technology.

The Unisys solution manages data center support within the Infrastructure Architecture Services framework as described in Schedule F, Section 3.2.2.2 "Infrastructure Architecture". This approach includes lifecycle management of facilities infrastructure and capacity.

5. Datacenter Upgrade and New Technology Approach

5.A Provide programs and processes to alter the operational environment, and to refresh the Services at asset end-of-life or implementation of new technology Services, as these Services are needed.

The Unisys solution manages data center upgrades and new technologies through ITIL V3 processes within Service Design, which manage new services and changes to services to meet

the Commonwealth's strategy to improve services and cost efficiencies. The Service Design process describes in Schedule F, Section 3.2.1.5 "Technical Architecture" also manages the requirements and capacity needed within the Infrastructure Architecture Services framework as described in Schedule F, Section 3.2.2.2 "Infrastructure Architecture".

This approach includes lifecycle management of facilities infrastructure and capacity.

5.B Offeror must describe solution and approach to meet this requirement.

As described above, Unisys follows ITIL V3-based processes to manage data center upgrades and new technologies as part of service design to improve operations with new technology or to introduce new services. Using the standard ITIL V3 service design process, Unisys adds a requirement of continual service improvement to drive a more active approach to continual improvements.

6. Monitor, Facility Operations Monitoring Approach

6.A Identify and create service objectives for the site operational Services in the form of SLAs, and report on the service availability, problems, and corrective actions on a monthly basis.

The Unisys solution provides Facilities Operations and Monitoring to support the Application Infrastructure Availability SLAs specified by the Commonwealth and includes monthly reporting to support the SLA achievements.

6.B Offeror must describe how it monitors and manages facility operations to meet/exceed the agreed to availability service levels.

The [redacted] solution described in Section 5 includes monitoring and management of facilities operations and components and is integrated within the [redacted] collectors and incident/escalation processes in order to meet/exceed the agreed to availability service levels.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,
- Improve client satisfaction,
- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery
- Industry standard frameworks and methodologies: ITIL, ISO, SSL

- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

7 CI Service Risk

7.A Offeror must provide methods to eliminate or mitigate service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives to adhere to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

8 CI Service Quality

8.A On a quarterly basis, Offeror must also recommend to the Commonwealth team any site operational changes that would be appropriate to maintained or improve SLA commitments.

The quality approach begins with the Service Excellence Office. The SEO function provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

9 CI Client Satisfaction

9.A Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

10 CI Service Transparency

10.A Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

11 Integration, CI Service Integration into Availability Management

11.A Offeror must describe offering in this area including the projected impacts/benefits.

Service will be sustained by integrating any new agencies, customers, or services into our standard operational and quality processes and methodologies leveraging ITIL processes. This includes creating quality project plans, utilizing industry accepted measurement and monitoring tools, analyzing trending reports and providing proactive continuous service improvement throughout the IT lifecycle. This will enable new Commonwealth services to experience and sustain IT services and client satisfaction.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

12 CI Improve or Reduce Cost

12.A Offeror must provide examples of Site Operations initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manages quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive

quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

Unisys examples of continuous improvement

Examples of continuous service improvement have been included below under Unisys Team Experience.

Unisys Team Experience

Data Center

Throughout the contract, Unisys has provided all facilities related maintenance and upkeep of the Commonwealth Data PowerHouse. In early 2011, Unisys undertook an internal initiative to be more "green". A complete analysis was performed and through numerous projects where we have reduced the overall Power Usage Effectiveness (PUE) rating from 1.8 to 1.5. Additionally, we had doubled the under floor pressure within the data center creating a more efficient airflow. There is also a current initiative for the replacement of the T-12 fluorescent lighting with the more energy efficient T-8 fluorescent lighting. While the IT energy load has increased with the addition of new hardware, our overall energy efficiency has improved.

Unisys Facility Environmental Management

Unisys is committed to Responsible Environmental Management. At Unisys, we believe we must take a proactive role in maintaining a safe and healthy workplace, operating our facilities in an environmentally sound manner, and promoting programs that support environmental stewards. It means conducting business in a responsible manner, with respect and concern for the environment. It is a matter of strictly adhering to local, national, and international laws governing environmental protection and offering environmentally responsible products. On a regular basis, regulatory compliance validation reviews are performed at Unisys locations to evaluate conformity with country-specific environmental regulations and established Unisys best practices. Third party assessments are performed independent of internal reviews to add objectivity to the evaluation process. Unisys has not received a notice of violation or a fine for non-compliance of environmentally related matters in the past three or more years. To foster this commitment, Unisys has assembled a staff of qualified professionals possessing extensive experience. These skilled professionals are responsible for identifying and resolving environmental, safety, and health issues in a timely, cost-effective and technically sound manner. Environmental Programs that Unisys currently manages are:

- ISO 14001 Environmental Management Systems
- Carbon Footprint
- Pollution Prevention
  - Solid Waste Recycling
- Vital Resource Conservation

- Energy Conservation
- Green Lights Partner
- End of Life Product Disposition Program
- Product reuse and recycling programs
- Lithium Batteries Recycling Program
- Printer cartridge recycle program
- Environmentally safe packaging
- Clean Air Program
- Travel Reduction
- Ozone Depleting Substances (ODS) Management
- Design for the Environment Product Program
- Supply Chain Information
- Environmentally-Safe Packaging
- Community Commitments & Concerns
- Employee Health and Safety
- Health and Safety Program Management
- Management of Injuries and Illnesses
- Hardware Dismantling and Selective Treatment
- WEEE-Compliant Instructions for Hardware Disassembly
- **Environmental Recognitions and Awards**
  - Unisys Mission Viejo facility was selected by the State of California as one of the winners of the "Flex Your Power Energy Award" for exceptional leadership and contributions to promoting energy conservation. In addition, the Mission Viejo site received certificates of appreciation from the South Coast Air Quality Management District (SCAQMD) for achieving the On Road Motor Vehicle Mitigation Options Emission Reduction Target.
  - In 2009, Unisys was named in the Black Book of Outsourcing as one of the top 50 "green" outsourcing providers in the world
  - Honored at the 2008 Computerworld Green IT Symposium in Washington, D.C. as one of the top five companies in the category of Green IT facilities for the Unisys Data Center in [redacted] Minnesota.

Benefits to the Commonwealth

The Unisys Team's expansive experience managing data centers globally will continue to reduce costs of data center management for the Commonwealth. Unisys applies the same standardization of ITIL V3 services processes to managing data centers within the Infrastructure Architecture framework as Unisys does for all components within the data center. This standardization of management process across all Unisys Managed facilities

depicted in **Figure 3.2.3.2-4** below means that when data center management innovations are refined in, say, Sydney, Australia, the new service practice comes before the Unisys/Commonwealth Service Design reviews to explain and implement the benefits for the Commonwealth.

Figure 3.2.3.2-4 - Unisys Managed Data Centers

The Unisys Team reduces the risks that other vendors will bring to the transition. The Unisys Team has deep expertise in delivering services and support to critical Commonwealth applications. The Unisys Team will utilize this expertise to provide recommendations on data center locations for infrastructure architecture componentry.

The Unisys Team further reduces transition risks because we clearly understand that transition requires moving your applications and data not simply replacing hardware and shuffling people. The Unisys Team has already has conducted 2 major and very successful transitions in the last 12 years. This deep knowledge will be invaluable to the Commonwealth and the Office of Administration as individual Agencies seek expertise guidance in transition and migration.

3.2.4 Managed Hosting Services

For all Managed Hosting Services, the Offeror must actively monitor the daily operations of the infrastructure used to provide the services. The Offeror must execute the troubleshooting procedures required by the application owners as detailed within the CCPM. This may include operational activities and initial troubleshooting steps, contact and escalation lists (aka “Run Book”). This information will be maintained by the Offeror on an application by application basis and will be hosted within the Knowledge Management Portal.

3.2.4.1 Windows Support

This service will provide hosting, operations and support Services for Microsoft Windows based servers (physical and virtual) located at the central datacenters. Offeror must support various hardware systems and various versions of the Microsoft operating systems, and support service software. The Offeror must provide support for both physical and virtual servers. Currently the Commonwealth utilizes virtualization technology from [redacted] and Microsoft's Hyper-V. See attached Exhibits for hardware and software details. The number and level of support staff members required to perform the below listed tasks will be determined by the Offeror, based on number of Commonwealth clients, hardware, software, and operating systems being serviced.

Listed below are the basic Services required, but not inclusive of all Services needed, to manage an enterprise class datacenter required by the Commonwealth. Offeror must include these Services within the base level of Services in this Offering. Change requests will be approved and authorized using the change management process.

Requirements		Describe Compliance

1.	Monitor local operations, troubleshoot and resolve operational issues.
	
	Actively monitor the daily operations of all MS Windows servers. Maintain a log for each server detailing hardware / software configuration and critical service operations. Document review of the system logs on a weekly basis to ensure critical system Services are processing without errors. Complete weekly server log indicating which logs were reviewed, date and initial the log.
		Offeror must describe its approach to supporting Windows based server environment including the following:
		
		• Processes and Procedures
		• Tools / Applications
		• End User Reports
		  o Standard
		  o Custom
		• Tiered Service/Support Levels
		• Escalation Procedures

2.	Monitor system backup processing on a daily basis. Review daily backup log for successful completion. Note failures, and correct the problems. Create problem record for any abnormal condition and any repairs that have been made, re-execute as appropriate. An automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.	Offeror must describe its approach to performing an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives. Offeror must describe its approach to identify gaps and potential risks, and how those gaps and risks will be resolved. Offeror must describe how the authorized Commonwealth users will have online access to backup logs.
3.	Provide Microsoft Hyper-V and [redacted] trained staff holding manufacturer recognized certifications for hardware and software technical support. Post award; provide the Commonwealth a resume or CV for each operational staff member	Offeror must submit a representative sample of staff resumes typically provided for these positions detailing their experience, education, and certifications.

	assigned to this engagement. A copy will be maintained on Offeror file including verified background clearances as required.	
4.	Provide cost effective operational and technical support for the Windows computing platform. Provide platform level operational and technical support for the computing platform. Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users. Provide a tiered level of support Services (e.g. Gold, Silver, and Bronze). Provide technical advice and support to the Application Development and Maintenance (ADM) and Database Administration (DBA) staffs, as required. Post award; provide Commonwealth with a resume or CV for each operational staff member assigned to this engagement. A copy will be maintained on Offeror file.	Offeror must describe its approach to providing and maintaining different tiered levels (i.e. Level 2 & Level 3 Technical Support) of support. Offeror must provide a representative sample of available tiered service support Services.
5.	Ensure network connectivity and consistent system response times. Utilize automated system management tool(s) to ensure real- time monitoring and notification of server availability and response times. Stop / Start times of servers will be a source of input for SLA measurements. Identify tool set(s).	Offeror must describe its real-time monitoring approach and its toolset for providing and maintaining network availability and performance. Offeror must identify tools it uses to support network availability and performance.
6.	Ensure server operating systems are	Offeror must describe its approach to patch

	maintained with the current patch level, based on the Services provided by the server. Analyze monthly service patches and determine which need to be applied, by server type. Create a change record, log the update in the server log, install based on server maintenance schedule and update the server configuration record. Notify impacted Commonwealth users immediately of any unscheduled service interruptions via email/web. The Offeror must be document normal work hours and holiday schedules with each agency to determine the contact method and escalation process of each Commonwealth agency.	management. Offeror must identify tools it uses to manage system patches. Offeror must describe its approach to testing and validating updates to the OS and 3rd Party software that it supports. Offeror must describe its approach to communicate unscheduled and scheduled outages, including escalation process.
7.	Provide a review and analysis of system performance/capacity to determine if current performance/capacities are sufficient to support the needs of the stakeholders.	Offeror must perform an initial review and audit of the current usage, procedures and reports and provide an analysis of the current usage, processes and reports currently being supported. Offeror must document its review and audit findings and recommendations.
8.	User Account Management - Provide certified operating system administration staff to create and maintain the registration of profiles, associated groups, and the security permissions required to service the approved client base of the operating systems.	Offeror must describe its approach to managing user accounts.
9.	Procurement Planning Provide program and processes to refresh the hardware at asset end-of-life, and as upgrades are needed to	Offeror must describe its programs and processes for procuring new or upgraded systems.

	meet anticipated growth in utilization.	
10.	SLA Reporting Collect actual system availability, utilization and response time data. On a monthly basis, Offeror must create a Service Level Agreement report for the Commonwealth team.	Offeror must describe processes and toolsets it uses for monitoring and maintaining service levels. Offeror must provide a representative sample of an SLA report.
11.	Installation of Windows updates/patches must be coordinated by Agency. For IES, windows version upgrades must be SAP certified. Coordinate at an agency level and account for any required patching as technology upgrades require.	Offeror must describe its programs and processes for applying system updates/patches.
12.	The Offeror must provide Software License Management.	Offeror must describe solution and approach to meet this requirement.
Continual Service Improvement		
13.	Reduce service risks.	Offeror must provide methods to eliminate or mitigate service risks.
14.	Improve service quality.	On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.
15.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
16.	Ensure service transparency.	Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.
17.	Improve/reduce cost of service.	Offeror must provide examples of Windows Support initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or

		exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Windows is a key server platform for the Commonwealth of Pennsylvania's application hosting platform. With the aggressive move to standardization and virtualization the Commonwealth lays out in the Volumetrics tab of Schedule I, it's clear that Windows as both a physical and virtual platform will continue to be an important part of the Commonwealth's application strategy well into the future. Unisys has proven, over the course of the current contract we can meet and exceed the needs of the Commonwealth. The response to this RFP is meant to show that Unisys, in cooperation with the Commonwealth, can take support for this, and other platforms, to the next level to provide the Commonwealth with the next generation of application infrastructure. Such an infrastructure is one that includes unified server management tools, closely aligned processes and automation to deploy new capacity, and patch servers to deliver proper maintenance and security levels, and remediate common issues.

1 Server Environment Operations Approach, MS Windows

1.A Monitor local operations, troubleshoot and resolve operational issues.

Unisys will provide hosting and operation support services to the Commonwealth of Pennsylvania for required versions of Windows systems at the Commonwealth [redacted] and Unisys data centers. Staffing required to perform the operational tasks listed below will be located on-site in Harrisburg with off hours support located in Salt Lake [redacted] Our monitoring and troubleshooting operations are detailed further in paragraph 1.B of this response.

1.B Actively monitor the daily operations of all MS Windows servers.

Offeror must describe its approach to supporting Windows based server environment including the following:

process and procedures

tools/ applications

end user reports (standard and custom)

tiered Service / support Levels

escalation procedures

Processes and Procedures

Our goal is to confirm that all services are managed in a structured, process-oriented way so the Commonwealth can see measurable improvements in the quality of the services delivered. The processes and procedures for providing Windows infrastructure managed services will be

documented in the CCPM which will be reviewed and approved by the Commonwealth. The scope of these processes and procedures will be based on the ITIL V3 framework as well as technology best practices for support of the Commonwealth Windows platform.

Processes and procedures will be developed for the following areas:

- Server technology support – build and maintain for hardware, software, connectivity
- Vendor management – technical support, maintenance coverage, and remote access capabilities
- Platform specific procedures – customer notification, technical support escalations patching process/schedule, security monitoring, and log reviews

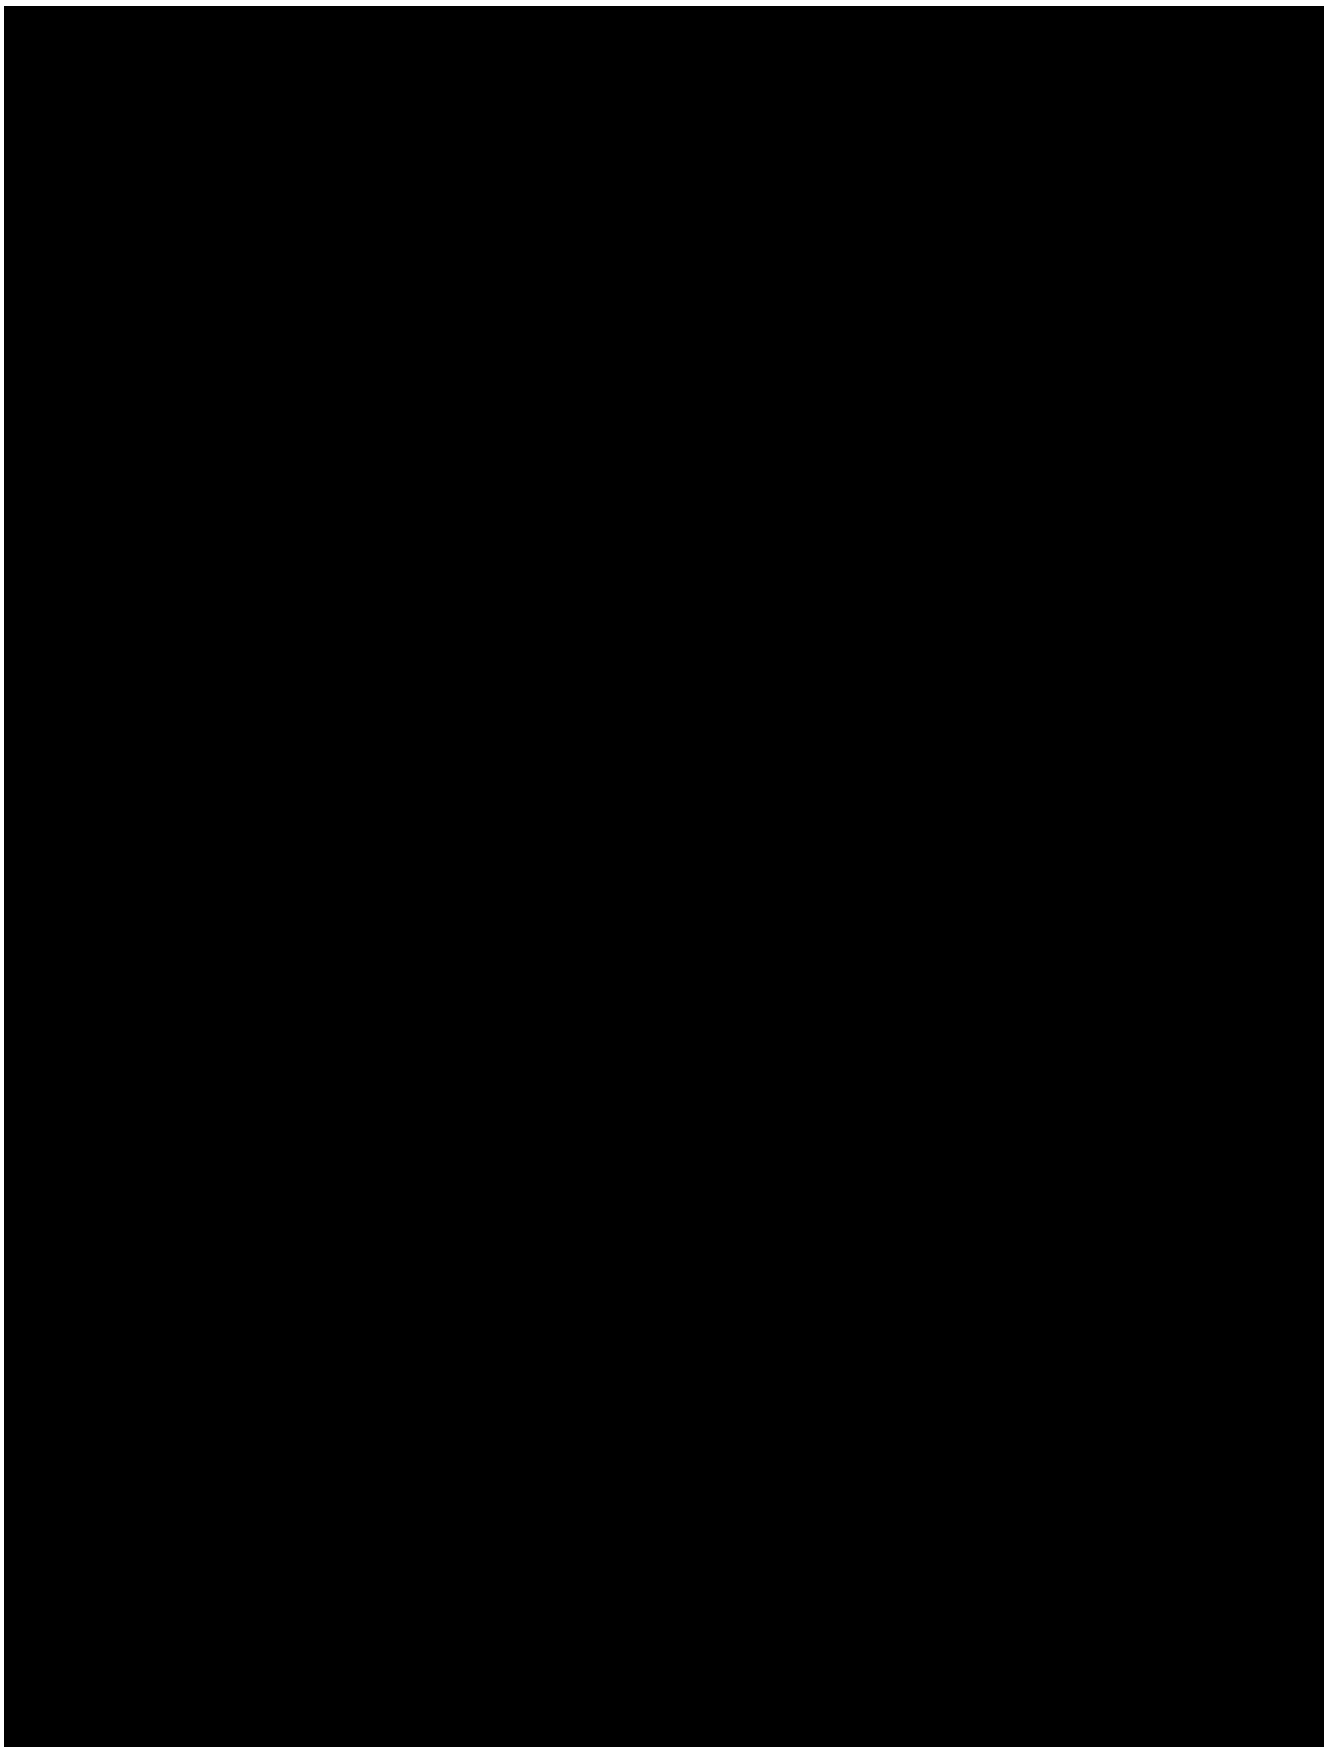
Tools/Applications

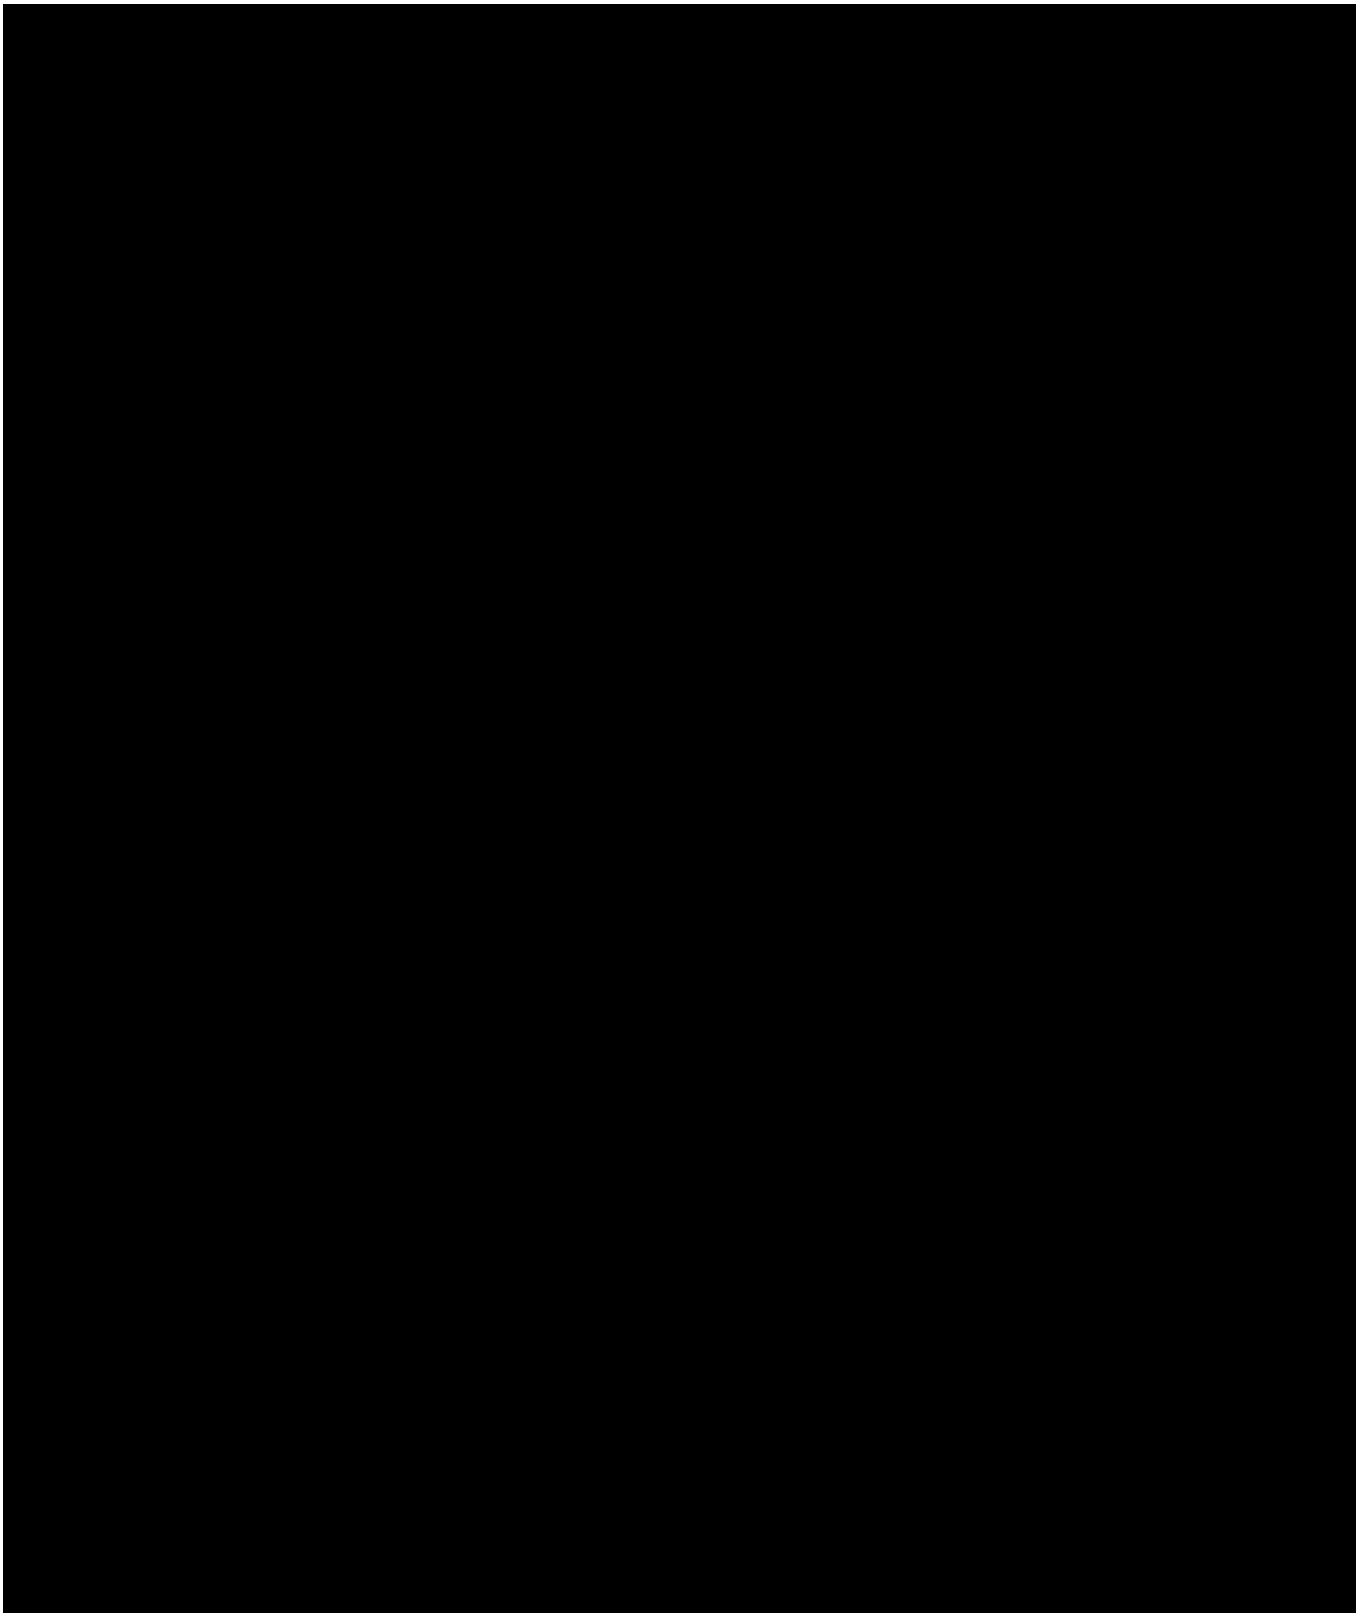
Unisys has outlined the approach to monitoring operations and supporting automated remediation over time from a common enterprise infrastructure platform across all technical towers for the Commonwealth in F3.2.3.2 Site Operations. The following is an overview of how all platforms, including the Windows environment, will be monitored and managed.

Unisys will implement, support, and operate a comprehensive and integrated Information Technology Service Management (ITSM) Architecture dedicated to the cross functional process support for all services provided to the Commonwealth for this contract. The proposed ITSM Architecture, shown in **Figure 3.2.4.1-1**, will provide an effective and efficient operational platform to support the Commonwealth's agencies application infrastructure for the following ITIL V3 (Information Technology Infrastructure Library) Service Management Processes.

Figure 3.2.4.1-1 - Proposed Unisys ITSM Integrated Architecture

The Integrated ITSM Management Platform software tools are summarized in the **Figure 3.2.4.1-2**.





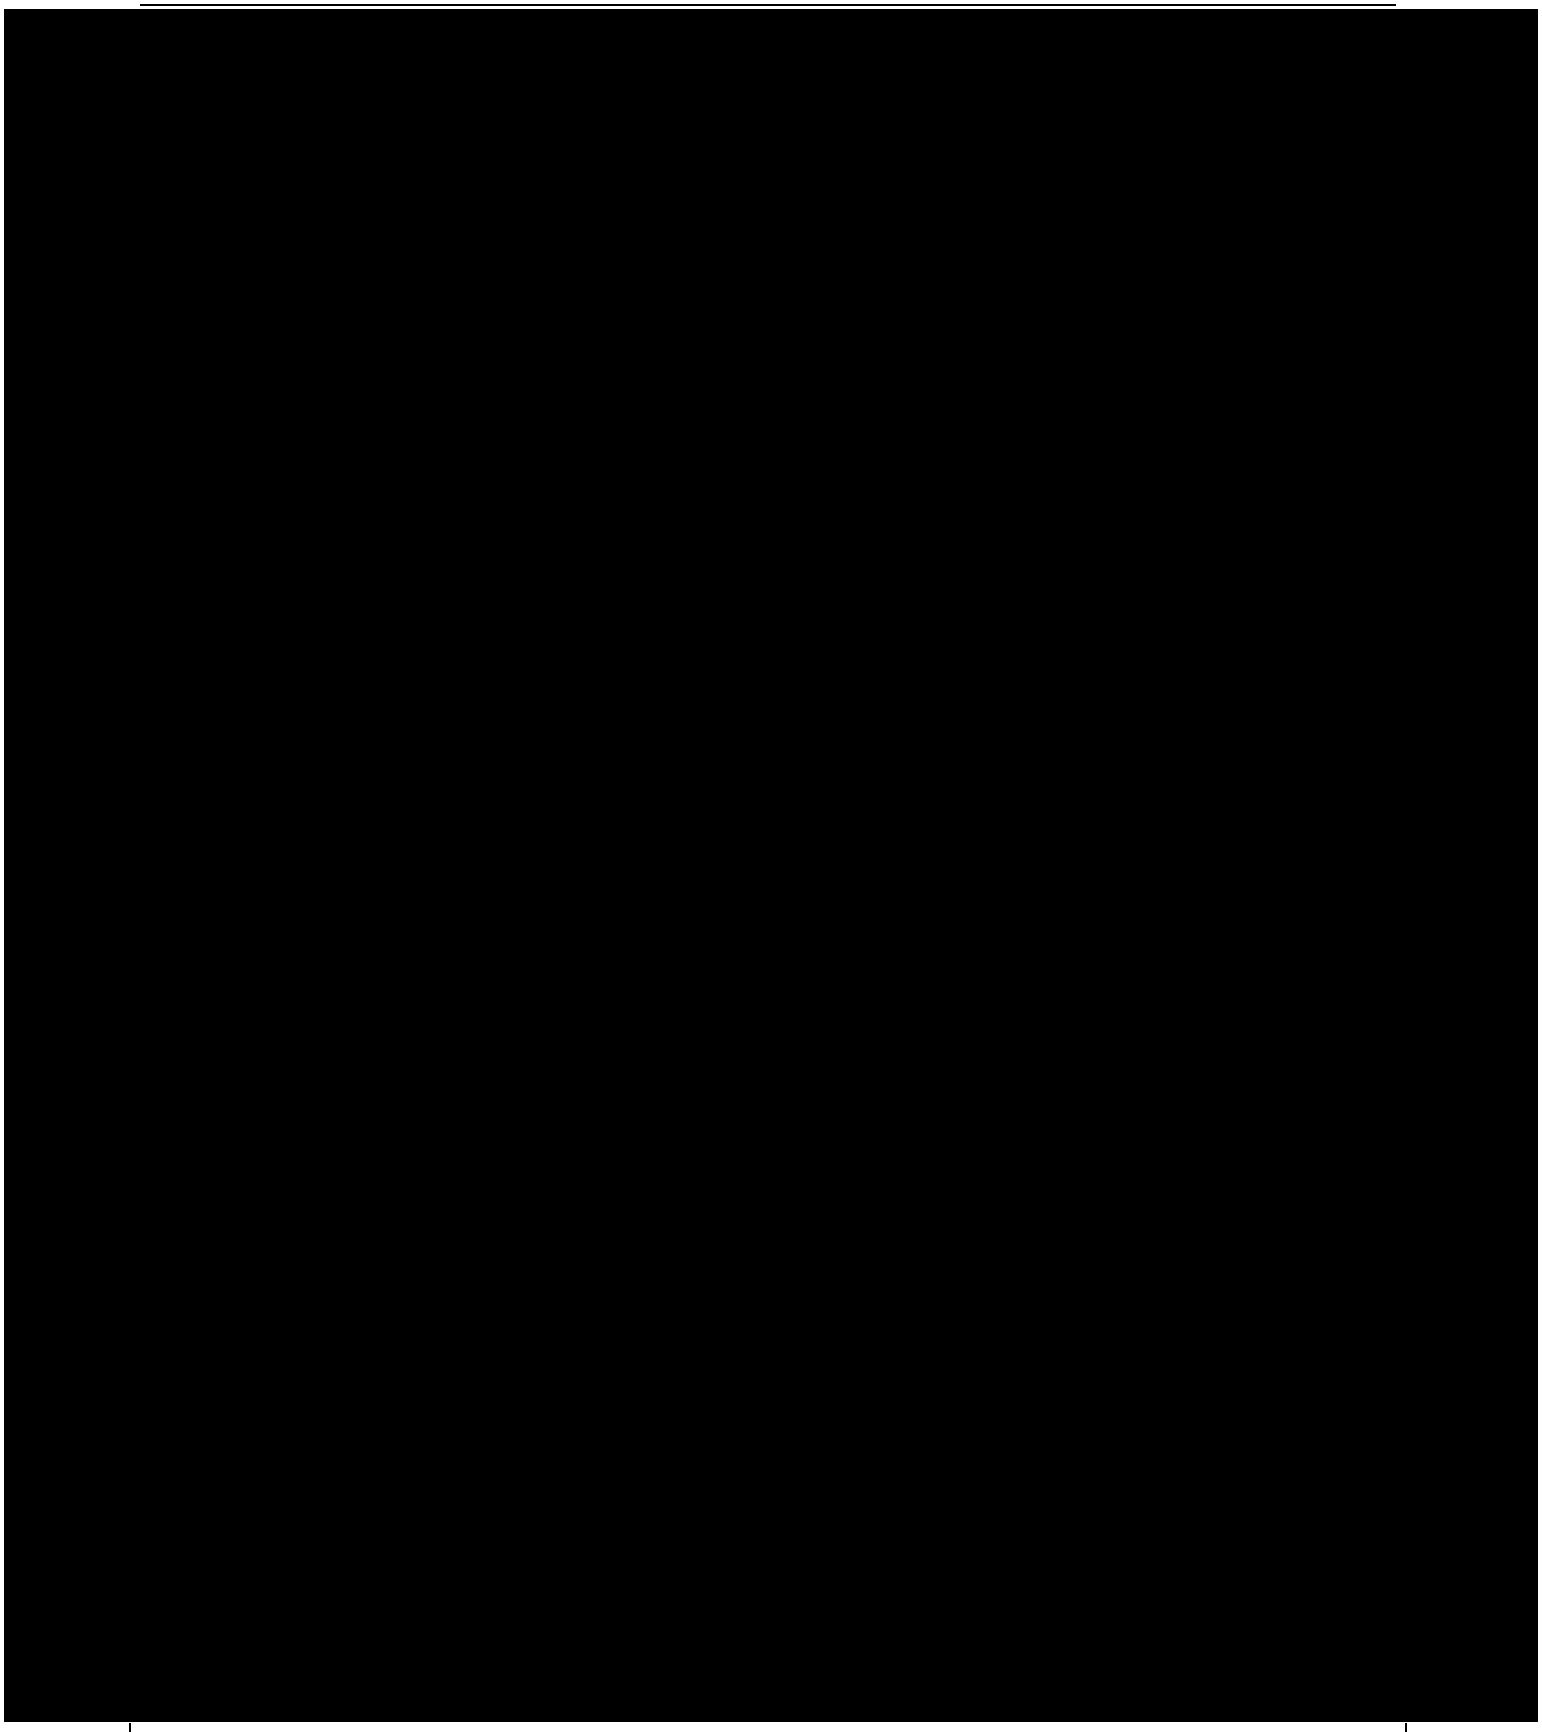


Figure 3.2.4.1-2 - Unisys ITSM Tools

Unisys will assess the Commonwealth's current ITSM toolsets during transition. Assessment results determine which tools will be supported within this overall target ITSM proposed architecture, replaced, or eventually migrated to the target environment ITSM tools shown in **Figure 3.2.4.1-2**. Some of the tools that will be evaluated and assessed during transition include:

- MS SCOM
- MS SCCM

The resulting architectural decisions will be reviewed and approved by the Commonwealth's agencies. Some identified tools will continue to offer the functionality they currently providing, but will be integrated into the overall ITSM proposed architecture.

End User Reports

- Standard Reports are summarized in 3.3.2.
- Custom Reports are offered by Unisys as a Catalog Service

Tiered Service/Support Levels

The Commonwealth of Pennsylvania has indicated in Schedule J.2 - Datacenter Service Level Matrix the desired service tiers/support levels. In the design of the Services and the infrastructure needed to deliver those Service to the Commonwealth, the Unisys Team defined the Service Tiers to align to those requirements. A fuller explanation and representative sample of all the Services provided in this structure can be found in the response to Schedule F, Section 3.2.1.5, sub-requirement 1. The service tiers in the Unisys solution are as follows:

Tiered Support Level	Description
Platinum	• Provides 99.999% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB with relationships • Requires 3 servers load balanced and geographically dispersed
Gold	• Provides 99.99% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB with relationships • Requires 2 servers load balanced
Silver	• Provides 99.9% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB with relationships
Bronze	• Provides 99.4% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services

	• Asset Tracked In CMDB with relationships
Basic	• Provides 98.5 % Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB with relationships

Escalation Procedures.

Escalation procedures are part of the Incident Management Process described in F3.2.1.4 Service Desk. Escalation procedures will be configured with the [redacted] to support meeting SLA's proactively with automated escalations when incidents are approaching SLA violations. Also, there is a proactive escalation process for incident tickets supported by the Unisys service desk which manages all escalations for normal operations. The Unisys PMO will be involved with any critical escalations as a senior Account Manager will be managing the technical response team and Service Desk communications for critical Priority 1incidents. This includes well defined communications and notifications, status updates, and procedures to support restoring services effectively and efficiently.

For additional details please see Schedule F, Section 3.2.3.2 Site Operations.

1.C Maintain a log for each server detailing hardware / software configuration and critical service operations.

The Unisys Team will maintain a log for each server detailing hardware/software configuration and critical service operations using the Configuration Management Database (CMDB) and automated discovery and dependency tool. By maintaining the log for each server as an entry within the CMDB, the Commonwealth and the Unisys Team's Systems Administrators have access detailing all pertinent server information, including but not limited to hardware/software configuration, critical service operations, past errors that impact critical system Services, and major outage information. Reports from the CMDB are available to the Commonwealth via the online Real-time Dashboard.

1.D Document review of the system logs on a weekly basis to ensure critical system Services are processing without errors.

The Unisys Team will collect each server's system logs and using the log management tool's report management functions, validate that critical system services are operating correctly on a weekly basis. In addition to the weekly review, the log management tool is integrated with the Enterprise System Management (ESM) toolset to automate notification of errors and events identified within the logs. As part of the notification, for system services operating with errors, an incident ticket will be created.

1.E Complete weekly server log indicating which logs were reviewed, date and initial the log.

The Unisys Service Delivery Manager will complete a weekly server log indicating which logs were reviewed, date and initial the log. A copy of this log will be made available to the Commonwealth on the Real-time Dashboard for review. These logs will be retained for one

year.

2 System Backup Policy Review and Audit

The full details of the innovative backup service provided to meet the Commonwealth's data protection needs are included in the F.3.2.4.2 Storage Management.

2.A Offeror must describe its approach to performing an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives.

The Unisys Team will conduct an initial review and audit of the backup policies, procedures and reports, to verify the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives. The detailed process for conducting this audit, and how the audit findings will be communicated back to the Commonwealth can be found in Schedule F, Section 3.2.4.2, subsection 4.

2.B Offeror must describe its approach to identify gaps and potential risks, and how those gaps and risks will be resolved.

During transition and transformation, the Unisys solution includes an extended onsite presence of a CommVault technical manager who will aid the Unisys Team in the search for existing gaps and risks, along with potential improvements to the backup systems during the transition phase of the solution. This technical expert has extensive experience in implementations and in identifying value-add opportunities. The skills of this technical expert are married to the Unisys Team's extensive expertise around current backup operations. Jointly they will lead the transition to a more cost effective CommVault backup infrastructure. The Unisys Team, working with the CommVault technical manager, will manage the review and audit of backup clients that move from the legacy system into the CommVault system. During transition a like-to-like set of backup policies, procedures, reports, schedules, retention periods, target directories, and recovery point objectives are built out. The Unisys Team can then present the Commonwealth with for opportunities to further optimize the infrastructure to improve the quality of services or provide better cost efficiencies for the same services.

The Unisys Backup team will compare the backup inventory of clients and policies to the CMDB inventory to locate "negative" gaps in case a server or critical data set is introduced into the Fully Managed environment and, through unlikely process failures, was not also protected with sufficient backup resources. The Unisys governance processes and the processes generated by the Unisys solution's Enterprise Services Catalog are designed to remove such failures. Additionally, a compare of Backup infrastructure inventory from the backup tools perspective with the CMDB can locate a gap should one occur as an additional level of protection.

The activities to perform the gap analysis are described in F.3.2.4.2, Requirement 4.

2.C Monitor system backup processing on a daily basis.

Unisys has a proven automated approach to monitoring daily backups, eliminating the need to maintain staff to watch the nightly progress of backups. In most cases simply re-starting a backup results in a successful backup because needed resources are tied up during peak times but become available a short time later. Unisys automates the restart process to occur

automatically. If the restarted backup fails then incident tickets are created to alert the team. With this approach, critical issues get right to Level 2 and Level 3 support personnel without ever involving Level 1 support staff. Unisys will produce daily reports of backup successes.

2.D Review daily backup log for successful completion. Offeror must describe how the authorized Commonwealth users will have online access to backup logs.

The Commonwealth benefits from the Unisys approach to automated monitoring of backup success rates as detailed above.

This automation of incident ticketing provides the Commonwealth with another advantage. During service delivery reviews the Commonwealth can review response times to failures that might put critical applications at greater risk. Through the incident severity rating processes Unisys has the ability to adjust severity levels so that incidents that are closer to critical applications can receive prioritized support responses.

The Commonwealth will have the ability to designate application owners who require read access to the backup management console so that these individuals have ready access to monitor both the success and failure rates for backups as well as the backup content. As often happens, some applications require specific bundles of directory backups and this access provides application owners a means of validating that any customized backups have been implemented properly and are running correctly.

2.E Note failures, and correct the problems.

If automated restart fails, the failed backups automatically create incident tickets which are escalated from Level 2 through Level 3 support groups as necessary until resolved.

2.F Create problem record for any abnormal condition and any repairs that have been made, re-execute as appropriate.

Incident tickets are created automatically and create a record of abnormal conditions. Following ITIL V3 based processes Level2 and Level3 will review incidents for root causes that create multiple tickets. This identification of problems allows the team to establish workarounds and request architecture reviews as necessary. Repairs are driven by incident tickets that are automatically generated by the Nagios collectors which review system logs for hardware.

2.G An automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.

The backup software produces daily, weekly, and monthly reports like the one shown below. The Nagios collectors in the ITSM infrastructure will create tickets automatically upon a failure of a backup for action by Level2, and Level3 support as necessary. The Commonwealth can elect as many personnel as they wish to receive notifications of these incident tickets, their status, and their resolution.

3 Staff, MS Hyper-V and [redacted] Resumes

3.A Provide Microsoft Hyper-V and [redacted] trained staff holding manufacturer recognized certifications for hardware and software technical support.

Offeror must submit a representative sample of staff resumes typically provided for these positions detailing their experience, education, and certifications.

The Unisys Team will include qualified and certified Hyper-V and [redacted] resources. Representative resumes for personnel providing Hyper-V and [redacted] Services are located in the tab marked Rep-Resumes in Section 5.0 Personnel.

3.B Post award; provide the Commonwealth a resume or CV for each operational staff member assigned to this engagement.

Post award, Unisys will provide to the Commonwealth the applicable resumes of operational staff that perform Hyper-V and [redacted] support for systems on which Commonwealth applications reside. Representative resumes for personnel providing Hyper-V and [redacted] Services are located in the tab marked Rep-Resumes in Section 5.0 Personnel.

3.C A copy will be maintained on Offeror file including verified background clearances as required.

Unisys will maintain a copy of all background clearances, resumes on file, either electronically or via paper copy.

4 Service Desk, Tiered Support

The proposed solution includes a robust technical support staff with the necessary skills to provide the managed services requested by the Commonwealth of Pennsylvania in this RFP. The staffing levels are determined based on key performance indicators which specify the expected number of devices to be supported by each member of the technical team. The team will be staffed with junior and senior positions to provide coverage for Level 2 and Level 3 technical support requirements.

4.A Provide cost effective operational and technical support for the Windows computing platform.

The Commonwealth of Pennsylvania has included in this RFP all the elements needed to achieve measurable and ongoing cost effective operational and technical support for the Windows platform. Unisys will realize these cost efficiencies by properly integrating these pieces into a unified Enterprise Service Management Solution. Included in the response to this RFP are tool sets that align closely existing process, reducing the risk of adopting new processes and tools. Unisys will also deploy additional automation that will server to realize further efficiencies. Finally, Unisys unique Continual Service Improvement Implementation Program will drive efficiency into the enterprise by continually reviewing outages, incidents, and other operational data to make specific recommendations to the Commonwealth to enable further efficiency.

The Unisys Team has included the cost efficiencies gained through adoption of the IT Service Management platform, ITIL V3 aligned processes utilization of a common server platform and through the deployment of automation into the solution.

4.B Provide platform level operational and technical support for the computing platform.

In addition to providing the required resources, the Unisys Team will be focused on proper work allocation and skills development. The Unisys ITSM system will be the primary tool used to allocate work across the various service towers providing communications and control capabilities for delivering the services. Skills development will be provided with formalized training programs and peer mentoring assignments to allow for on the job training opportunities.

4.C Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.

Offeror must describe its approach to providing and maintaining different tiered levels (i.e. Level 2 & Level 3 Technical Support) of support.

The proposed solution includes a robust technical support staff with the necessary skills to provide the managed services requested by the Commonwealth of Pennsylvania in this RFP. The staffing levels are determined based on key performance indicators which specify the expected number of devices to be supported by each member of the technical team. The team will be staffed with junior and senior positions to provide coverage for Level 2 and Level 3 technical support requirements. Human resource actions including writing position descriptions, development plans, and funding for certifications are all targeted and provides that the technical support resources are prepared to support the managed services.

To support the operational and technical needs of the Commonwealth, the Unisys Team will deploy incident, problem and change management processes that define the flow of support from the Service Desk up through Level 3 support. These processes are closely aligned to the common IT Service Delivery platform. For more detailed information on these processes, please refer to Schedule F, Section 3.2.3.2.

4.D Provide a tiered level of support Services (e.g. Gold, Silver, and Bronze).

Offeror must provide a representative sample of available tiered service support Services.

In order to provide customization and flexibility to Commonwealth agencies, the Unisys Team offers tiered levels of managed services for Capacity on Demand servers. These tiers offer various levels of administrator experience, on-site coverage and responsiveness SLA's. The tiers are designed to allow for flexibility to manage mission critical as well as development or demonstration environments.

The following table highlights the available tiers and associated descriptions.

Tiered Support Level	Description
Platinum	• Provides 99.999% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB **with relationships** • Requires 3 servers load balanced and geographically dispersed
Gold	• Provides 99.99% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services

	• Asset Tracked In CMDB with relationships • Requires 2 servers load balanced
Silver	• Provides 99.9% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB with relationships
Bronze	• Provides 99.4% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB with relationships
Basic	• Provides 98.5 % Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB with relationships

4.E Provide technical advice and support to the Application Development and Maintenance (ADM) and Database Administration (DBA) staffs, as required.

Unisys will have a team of technical architects dedicated to the Commonwealth of Pennsylvania and Commonwealth agencies whose responsibilities will include providing technical consultation and advice to the Commonwealth's ADM and DBA groups.

4.F Post award; provide Commonwealth with a resume or CV for each operational staff member assigned to this engagement. A copy will be maintained on Offeror file.

Post award, Unisys will provide to the Commonwealth the applicable resumes of operational staff.

5 Monitor Network Connectivity

5.A Ensure network connectivity and consistent system response times.

Offeror must describe its real-time monitoring approach and its toolset for providing and maintaining network availability and performance.

Offeror must identify tools it uses to support network availability and performance.

Unisys will deploy the SolarWinds tool to monitor the Commonwealth network. SolarWinds provides network availability and performance monitoring and network traffic bandwidth throughput monitoring. From a server perspective, Nagios will be used to confirm server availability on the network. When either of these tools detects an event, an event is sent to the Event Management system, where the event is correlated, and an intelligent ticket is opened with the proper resolver group. For a complete understanding of how this subset of Event Management Tools supports enterprise Event Management please refer to 3.2.3.2 Site Operations.

5.B Utilize automated system management tool(s) to ensure real- time monitoring and notification of

server availability and response times. Stop / Start times of servers will be a source of input for SLA measurements. Identify tool set(s).

Unisys will provide event management solutions to help provide network connectivity and consistent windows systems response times. Unisys will utilize the Unisys ITSM applications to record incidents tickets that are generated from windows monitoring tools to provide real- time monitoring and notification of server availability and response times including the stop and start times of servers to support SLA availability measurements. SLA availability measurements are measured in the Unisys ITSM Service Level Management Application and displayed in the Real-time Dashboard available to Commonwealth agency personnel. The following tools are the major toolsets to support network and system event management and monitoring.

Monitoring Software	Managed Configuration Items (CIs)	Monitoring and Management Functionality
SolarWinds	LAN Devices including: • Switches • Routers • Load Balancers • Firewalls	Provides deep network device availability and performance monitoring , DNS, IP address management, network configuration management, and network traffic bandwidth throughput monitoring
Nagios	• Microsoft servers • Databases • Network Devices • Storage Hardware	Provides a standard set of availability, performance and critical service monitors developed by Unisys for monitoring across infrastructure items including: • Servers • Network devices (switches, routers, etc.)) • Storage devices Middleware • Applications (e.g., Exchange, Citrix XenApp)

6 Patch Management

6.A Offeror must describe its approach to patch management.

The Unisys Team will follow the Commonwealth of Pennsylvania's ITB for patch policy, "ITB-SYM006 - Desktop and Server Software Patching Policy" for patching of Windows servers.

The Unisys Team will follow the Change Management Process for applying patches to the production windows environment. This process will maintain the change record in the [redacted] and also update the CMDB configuration management file upon deployment for windows server environment Configuration Items (CIs). The Change Record will be related to the CI's in the CMDB as an audit trail for changes to Windows CI's upon the completion of the Release and Deployment Process for changes.

6.B Offeror must identify tools it uses to manage system patches.

The toolset to support the automation of patch release and deployment is [redacted]

[redacted] Unisys will maintain in this toolset the appropriate patch policies for determining patch deployment and compliance. The [redacted] will be maintained with all the current patches supplied by the OEM's and will be used to manage the production state of patch deployment in the windows environment. The following table shows all tools utilized in the management of system patches.

[redacted]	Functionality
	Maintains all current patches released by Microsoft for the Windows operating system. Performs the patching of systems.
	Provides the following functionality related to patching: • Incident management • Change management
	Configuration Items (CI) are automatically updated as needed post patching.
	Updates the CMDB with any needed additions to the CI

6.C Offeror must describe its approach to testing and validating updates to the OS and 3rd Party software that it supports.

Unisys approach to testing and validating updates to the Windows OS and 3rd party software in the Windows environment is to follow the Release Process for all changes into all production environments. The Release Process includes:

- Change ticket approvals
- Test planning and accepted test results
- Release and deployment planning including release back-out plans
- Release testing for risky deployments
- Early life cycle support to help deliver a successful deployment
- Release back-out for failed releases

6.D Ensure server operating systems are maintained with the current patch level, based on the Services provided by the server.

The performance of Windows system administration covers the following services related to maintaining the patch levels of Windows systems:

- Installation/maintenance of OS/OS patches/OS utilities.
- Problem determination/resolution for OS/OS patches/OS utilities.
- Review/recommend new OS/OS patches/OS utilities versions/patches.
- Install/upgrade OS/OS patches/OS utilities.

- The Unisys Team will setup and perform backup/recovery of OS and OS utility files prior to the patching activities
- Participate in the Change Management and Problem Management processes.

Unisys complies with the requirement.

6.E Analyze monthly service patches and determine which need to be applied, by server type.

The Unisys Team will analyze monthly patches to determine which need to be applied, taking into account those cases when multiple agencies utilize shared infrastructure.

The Unisys Team will then make recommendations to the Commonwealth on which systems need patching, and a recommended schedule for deploying the patches. Unisys will then work through the Change Management process to coordinate with each agency the deployment of system patches.

6.F Create a change record, log the update in the server log, install based on server maintenance schedule and update the server configuration record.

Unisys will follow the Change Management Process for applying patches to the production windows environment. This process will maintain the change record in the [redacted] platform and also update the CMDB configuration management file upon deployment for windows server environment Configuration Items (CIs). The Change Record will be related to the CIs in the CMDB as an audit trail for changes to Windows CI's upon the completion of the Release and Deployment Process for changes.

6.G Notify impacted Commonwealth users immediately of any unscheduled service interruptions via email/web.

Offeror must describe its approach to communicate unscheduled and scheduled outages, including escalation process.

Unisys approach to communicating unscheduled outages is to send notifications to key stakeholders for the Commonwealth/Agencies/Unisys/Third Parties depending on the outage. This will be through email, voice, Services Portal and Remedy broadcast capabilities. The same communications will be used for scheduled outages with additional communications in forward schedules of change reports.

Escalations for unscheduled outages are handled through the standard processes for managing incidents. Unisys service desk will manage all incidents and confirm that proper escalation communications to key Commonwealth/Unisys/Third Parties personnel are managed. The [redacted] application will also be configured to escalate incident tickets based on incident priorities and SLAs to verify that incidents tickets are being managed to SLA times for incident response and resolution.

To support the operational and technical support needs of the Commonwealth, the Unisys Team will deploy incident, problem and change management processes that define the flow of support from the Help Desk up through Level 3 support. These processes are closely aligned to

the common IT Service Delivery platform. For more detailed information on these processes, please refer to Schedule F, Section 3.2.3.2.

6.H The Offeror must be document normal work hours and holiday schedules with each agency to determine the contact method and escalation process of each Commonwealth agency.

Unisys will document and update yearly normal work hours and holiday schedules for each agency. This documentation will be used as a data feed into the operational documentation listing escalation processes and contact methods Unisys is to use when contacting agency personnel.

7 System Performance and Capacity Assessment

The initial review and audit of the current usage of the Commonwealth's compute infrastructure will be performed in two phases, aligned to the sub-requirements of this Section (7.A, 7.B, and 7.C).

7.A Provide a review and analysis of system performance/capacity to determine if current performance/capacities are sufficient to support the needs of the stakeholders.

The first phase will be accomplished as Unisys prepares to migrate the existing workload from each of the existing Commonwealth data centers into the new data centers. During this time, Unisys will deploy tools to collect and analyze all aspects of the Commonwealths current compute usage. Analysis of these workloads will be used to determine the optimal method for migrating these servers. This analysis will also serve as a baseline against which future capacity planning can be compared.

The second phase will occur when Unisys deploys the new Capacity planning process and tools into the Commonwealth compute environment. This phase will perform two functions…it will cover those servers not covered in phase one, and will perform a new audit once the workloads have been deployed in the new data centers.

7.B Offeror must perform an initial review and audit of the current usage, procedures and reports and provide an analysis of the current usage, processes and reports currently being supported.

As part of transition, and as each Commonwealth agency is migrated to the new services, the Unisys Team will gather and review all current Commonwealth usage, procedures, and reports, and perform a gap analysis against the planned usage, procedures and reports presented throughout this solution. Once the gap analysis has been completed, the Unisys Team will review all findings with the Commonwealth team.

7.C Offeror must document its review and audit findings and recommendations.

The final audit findings and recommendations will be presented to the Commonwealth by the Unisys Enterprise Architecture Team.

8 User Account Management

8.A Provide certified operating system administration staff to create and maintain the registration of profiles, associated groups, and the security permissions required to service the approved client base of the operating systems.

Offeror must describe its approach to managing user accounts.

Unisys Windows support team will provide user profile, group and security permission management on individual Windows servers. For servers operating on an Active Directory domain, Unisys will work with Commonwealth Active Directory support team to request changes in the Active Directory environment to support user, profile, group or security permissions changes. All changes for user account management will be initiated through the service request and change management process and will require an approved change record for implementation. The process for user account management will be documented within the CCPM.

9 Procurement Planning

9.A Provide program and processes to refresh the hardware at asset end-of-life, and as upgrades are needed to meet anticipated growth in utilization

Offeror must describe its programs and processes for procuring new or upgraded systems.

Procurement management is defined by the Unisys as Technology Refresh and as Capacity Management and Forecasting. These two are further defined as follows:

a. Technology Refresh Plan

i. As part of the overall architecture support, the Commonwealth's environment will be reviewed on a quarterly basis to identify technology, services or components which require replacement to maintain the Commonwealth's business needs and associated service levels. The review will include the following activities. The overall technology refresh plan will be documented in Key Deliverable D-03. This plan will be used for all Unisys supported environments including the Commonwealth Windows systems.

1. Using the data within the Asset Management and Configuration Management databases, identify the technical components within the Windows system environment which require replacement within the next 18 month period based upon the a 60 month replacement cycle.
2. Review End of Sales and Service Life notices from the Manufacturers to validate if a component has been discontinued or has available ongoing maintenance options.
3. Review ongoing Capacity and Performance reports to identify any components with a refresh requirement which have additional needs driving a requirement or opportunity to change the component's classification to a different component to maintain the functionality and service levels.
4. Identify replacement technical components based upon the current Enterprise Services Catalog offerings
5. Validate replacement technical components meet the current requirements for the impacted Commonwealth applications.

6. Identify risk and impact for the Commonwealth environment to replace existing technical components or services.

7. Create technology refresh recommendations, impact statements, and high level implementation plan.

8. Present the technology refresh plan to the Commonwealth using the solution architecture review process.

9. Upon approval of the refresh plan, open service requests for each migration group and develop the detailed project plan for the migration plans.

b. Capacity Management and Forecasting

ii. The Commonwealth Windows systems will be monitored and reported from the Event Management Platform ([redacted]) [redacted] and from the [redacted] toolset to support the windows Capacity Management requirements. As part of the Capacity and Performance Management processes, , the performance and capacity reports will be generated and reviewed with the Commonwealth on a regular basis.

iii. During transition the windows environment capacity requirements will be assessed as part of the establishment of the Performance and Capacity Management Processes described in Schedule F, Section 3.2.2.6 and 3.2.2.2. The assessments will be used to generate capacity and performance management recommendations and plans. . The Unisys Capacity Manager and Performance Analyst will work with the Commonwealth/Agencies to forecast windows workload requirements in order to support the current and forecasted workload, as well as establish the monitoring requirements to support the ongoing daily assessment of the workload performance on the windows platform in total and by agency. Any recommendations to increase, modify or decrease windows capacity will be processed through the Change Process after reviewing recommendations with Commonwealth Stakeholders in the Capacity and Performance regularly scheduled meetings where trends, issues and forecasts are discussed and reviewed.

iv. As part of the annual Capacity and Forecast planning activity, Unisys will work with the Commonwealth to identify what changes in growth are expected and provide recommendations on additional upgrades.

v. In addition to the Commonwealth's growth forecasting information, Unisys will use the data within the Capacity Management, Asset Management and Configuration Management databases and identify the technical components within ERP system environment which require upgrades or additional infrastructure to support the forecasted growth requirements.

vi. Identify replacement or upgrade technical components based upon the current Enterprise Services Catalog offerings and the vendor's available products.

vii. Validate that the identified upgrades or additional components meet the current and forecasted requirements for the impacted Commonwealth ERP system.

viii. Identify risk and impact for the Commonwealth Windows systems to upgrade or add additional components.

ix. Create the capacity upgrade recommendations, impact statements, and high level implementation plan.

x. Present the capacity upgrade plan to the Commonwealth using the solution architecture review process.

xi. Upon approval of the capacity upgrade plan, open service requests for upgrade project and develop the detailed project plan.

The overall approach to technology refresh is described in Section 3.2.1.5.1 Technology Refresh.

10 SLA Reporting

10.A Collect actual system availability, utilization and response time data. On a monthly basis, Offeror must create a Service Level Agreement report for the Commonwealth team.

Offeror must describe processes and toolsets it uses for monitoring and maintaining service levels.

Unisys will establish an SLA process and technical architecture to support all SLA's for this contract. See the overview in F3.2.1.2 Availability/SLM. Level 1 of the SLM process is outlined in **Figure 3.2.4.1-3** below:

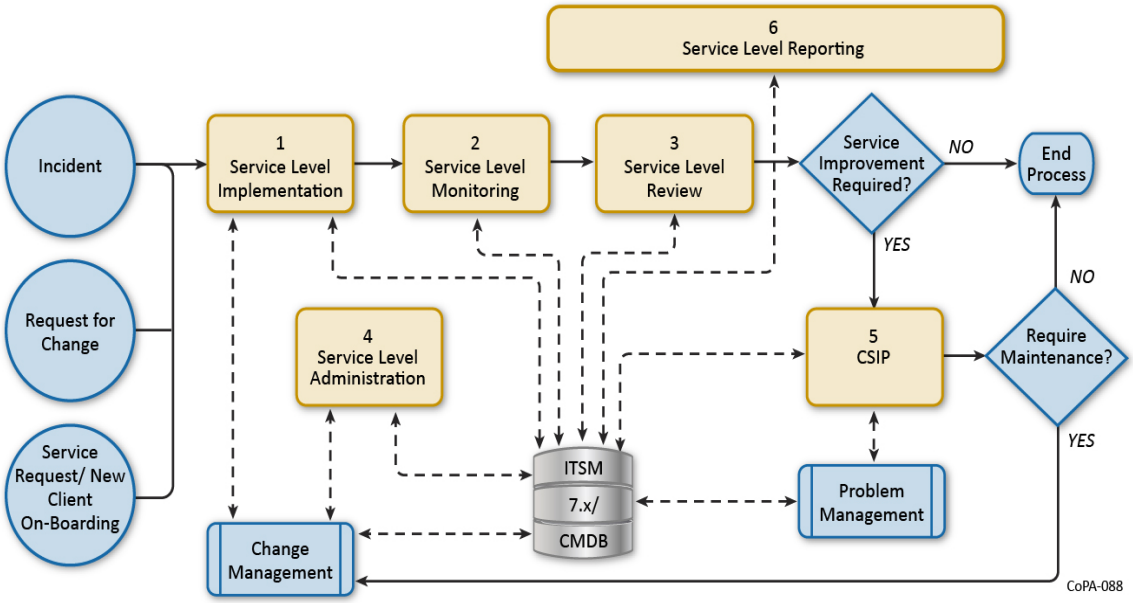

Figure 3.2.4.1-3 - Service Level Management Process

Unisys will provide a detailed set of processes and procedures to support Service Level Management during transition of this contract. The process and procedures will support this top level view of the process which includes:

1. Service Level Implementation
2. Service Level Monitoring
3. Service Level Review
4. Service Level Administration
5. Service Level Improvements (CSIP)
6. Service Level Reporting

Unisys will provide the technical architecture and toolsets to support monitoring and maintaining service levels for the windows platform. The Unisys ITSM Service Level Management (SLM) Application provide by [redacted] will be used as the single unified platform to manage Service Level Agreements for Commonwealth agencies. The Unisys ITSM Service Level Management provides a continuous real-time platform for defining, measuring, monitoring, reporting, and reviewing the performance of SLA's (per J1 – J3) for windows services to make sure that adequate levels of service are delivered in alignment with the Commonwealth's objectives for service delivery. The business contract will contain agreements in which the levels of service are specified. These agreements consist of individual service targets or goals that are used to evaluate whether the agreement is in compliance.

The Service Level Management Application uses all the other Unisys ITSM modules as inputs to determining if an SLA is in compliance. The Unisys ITSM modules used for transaction inputs to determine if service level targets and goals are in compliance include:

- Incident Management
- Problem Management
- Change Management
- Asset/Configuration Management
- Performance/Capacity Management

The [redacted] Application and in some unique cases other tools as described in F3.2.1.2 will be used to push near real time SLA reporting into the Real-time Dashboard reporting tool.

Offeror must provide a representative sample of an SLA report.

See figure below, a Sample Application Infastructure SLA report and **Figure 3.2.4.1-4** sample Real-time Dashboard screenshot.

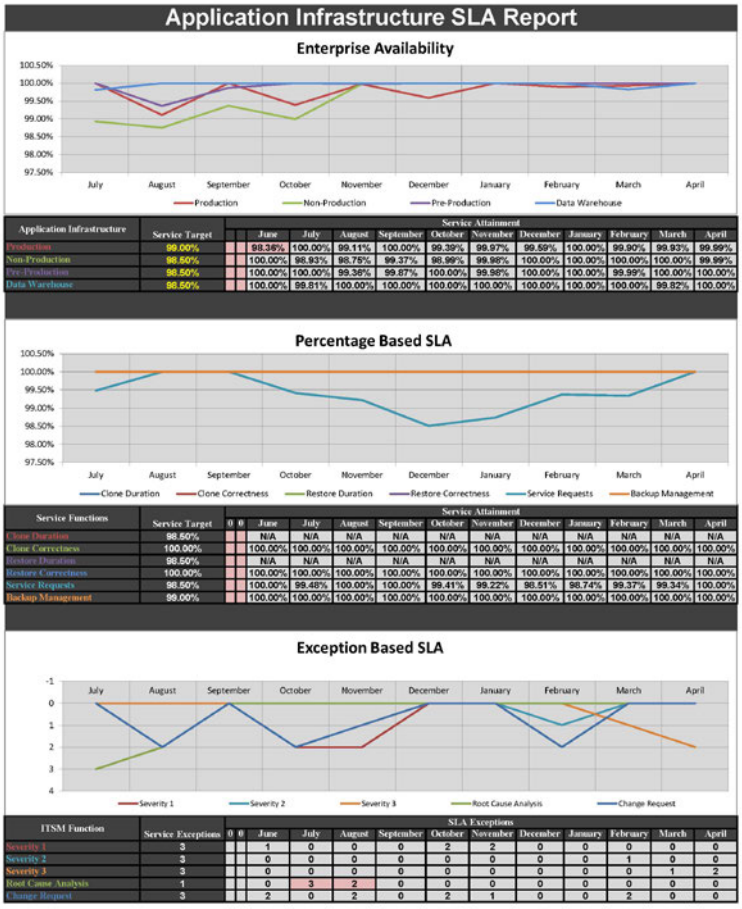

Figure Sample Application Infastructure SLA report

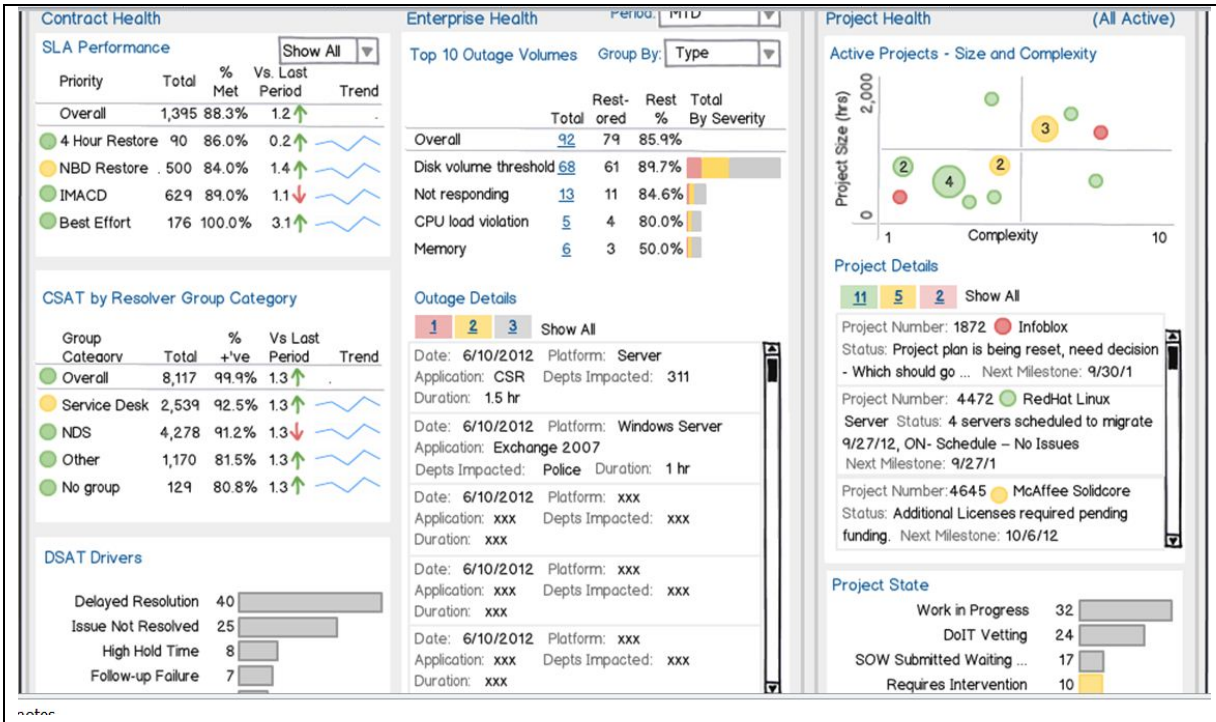

Figure 3.2.4.1-4 - Sample Real-time Dashboard Screenshot

11 Patch, Installation of Windows Updates and Patches

11.A Offeror must describe its programs and processes for applying system updates/patches.

Unisys has a solid track record working with the Commonwealth to adapt processes such as our patch management process to a multi-tenant infrastructure, including the coordination of patches with all agencies on the infrastructure being updated. Please see the response to requirement 6 immediately above for details on Unisys programs and processes for applying system updates/patches.

11.B Coordinate at an agency level and account for any required patching as technology upgrades require

Installation of Windows updates/patches must be coordinated by Agency.

As described in sub-requirement 6 above, Unisys will work with the Commonwealth to adapt its patch management process to a multi-tenant infrastructure, including coordination of patches with all agencies on the infrastructure being patched.

11.C For IES, windows version upgrades must be SAP certified.

The Unisys Team will work with Microsoft to verify that version upgrades applied to IES Windows servers are SAP certified, and include a statement of SAP certification in the change request prior to submission to the Change Advisory Board.

12 Software License Management

12.A The Offeror must provide Software License Management.

Offeror must describe solution and approach to meet this requirement.

Unisys will provide Software License Management for all infrastructure including windows

platforms. Unisys will provide 3rd Party License Management service for the Commonwealth and Unisys provided infrastructure software products. Unisys will be solely responsible for the management of all infrastructure software license products provided through this contract. The goals of this service are to:

- Confirm software contract compliance (to avoid non-compliance legal issues and expenses)
- Manage costs of software inventory by matching requirements for use to needs
- Verify software maintenance contracts are maintained on schedule through early notifications

Unisys will coordinate with the Commonwealth to verify compatibility between Commonwealth provided applications related software, and Unisys provided infrastructure software. The following is the approach Unisys will execute during transition and as an ongoing process to provide 3rd party software license inventory and tracking per agency related infrastructure.

a) Load all Unisys and Commonwealth software asset license contract information into the [redacted]

b) Load all software license certificate , license type, entitlements, manufacturer, and product information into the [redacted] for the Software License Contract

c) Run discovery through [redacted] tools to identify all software installations

d) Run the [redacted] software to build relationships between the discovered software CI's recorded in the [redacted] and the license certificates

e) Run the [redacted] to identify noncompliant licenses and inventory for the Unisys and Commonwealth Asset Managers to audit the completeness and accuracy of the information

f) Identify discrepancies in the information and make corrections

g) Rerun Compliance Reports and 3Rd party software license inventory reports to get signoff from the Commonwealth and Unisys Asset managers that inventory is properly linked to license certificates in the production environment and the information is complete and accurate

h) Provide notifications to Commonwealth/Agencies/Unisys and other Commonwealth service providers when there are software compliance issues or requirements for licenses to be purchased or retired from analysis of license inventory.

13 CI Reduce Service Risk

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,

- Improve client satisfaction,
- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery
- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

13.A Reduce service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

14 CI Service Quality

14.A Improve service quality.

On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service

Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

15 CI Client Satisfaction

15.A Improve client satisfaction.

Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

16 CI Service Transparency

16.A Ensure service transparency.

Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

17 CI Improve or Reduce Cost

17.A Improve/reduce cost of service.

Offeror must provide examples of Windows Support initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manages quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key

differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

Unisys Team Experience

The Unisys Team has a vast experience supporting Windows systems at the Commonwealth and a number of our other customers for a number of years. Some specific examples related to the Commonwealth are listed below.

- **Windows Terminal Server optimization for DOS (Department of State) SURE Voter Registration Environment.** The Unisys Team tweaked, tuned, and optimized the Windows operating systems and terminal server's environment. This improvement and optimization allowed the agency to get more user sessions per servers and provided faster logon and logoff times, more smooth operations using their applications. Currently we are able to get 35 user sessions per server which is an achievement beyond expectations for an application server given the amount of resource allocation.
- **MSSQL Server replication and high availability for an International Logistics Company.** The enterprise environment consisted of many warehouses, car factories, and distribution centers around the nation. Each location had dedicated infrastructure services such as, MSSQL, AD, and TS environment. Challenge was to create a high available SQL server environment in the main office and setup MSSQL server's replication from remote sites to the main office. This provided;
  a. High availability for remote sites.
  b. Almost real time data replication.
  c. Elimination of excessive backup solutions in remote locations.
  d. Significantly reduce SLA penalties. (In car factories, stopping the production line due to IT problem for even a few minutes can result in high SLA penalties. In case of a local site failure, this logic enabled the site to point the systems to the main office in a very short period of time avoiding SLA penalties.)
     - Prior to 2002 at DPW, the first 2 Unisys ES7000/100 systems were used to host application testing environments such as Integration and Systems Acceptance Testing of human services applications as well as other partitions for FTP, SMS and other testing such as Oracle database. Eventually these 2 systems were upgraded via a hardware upgrade to /200 systems. In the summer of 2002, DPW migrated its production HCSIS and Compass human services applications, followed shortly by MCI, from the mainframe over to open systems running on 2 Unisys ES7000/230 systems. The web applications ran in a Microsoft NLB cluster across the 2 ES7000/230 systems. The operating system at the time was Windows 2000 Datacenter Edition. The use of OpenTi by DPW also provided additional benefit and aided in the migration of applications from the mainframe to open systems. OpenTi provided DPW the capability to access both open systems and mainframe databases from the same application program. Never before did they have this capability. All of this paved the way for application migration from the

mainframes to open systems and eventually into the DPH.

- Also around July 2002, DPW began to migrate their Oracle Databases off a Sun 15k system to Unisys ES7000/420 Itanium systems in the DPH. This was the first time DPW utilized Itanium systems and eventually led to the elimination the Sun system and was a first for DPW running Oracle on Windows.

Benefits to the Commonwealth

The Unisys Team's Windows infrastructure design was designed to deliver value to the Commonwealth through the following attributes:

- Standardization – by standardizing on IBM's Flex System platform for Windows, Linux, AIX and Capacity on Demand, the Unisys brings a powerful, cross platform capability to the Commonwealth that simplifies management and provisioning moving forward.
- Efficiency – Utilizing IBM Flex System across multiple platforms drives efficiency into all process, from patch management to service delivery, resulting in year over year efficiency gains that benefit the Commonwealth throughout the length of the contract.
- Manageability – The common IT Service Management platform is leveraged across all hardware platforms, allowing for even more efficiency at the service delivery level. The capability to manage and maintain the full breath of the Commonwealth enterprise in a single, highly integrated toolset will allow the Unisys Team to offer new services in the future to meet changing demands.
- Optimization – Through a rigorous capacity management process and toolset, the Unisys Team will aggressively optimize existing capacity, and allow us to make timely, specific virtualization and consolidation recommendations to the Commonwealth to meet its goal of increased virtualization and to prevent virtual sprawl.
- Automation – The Unisys Team will use the same Enterprise Services Catalog and automated run books to provision and manage Windows systems as all other systems. The tools being deployed allow for increased automation across the enterprise in ways that will directly benefit the Commonwealth.
- Agility – With all the standardization being done, it would be very easy to lose sight of the need for an agile infrastructure. By utilizing a Real-time Dashboard for Windows, Linux and AIX, the Commonwealth will have the ability to quickly reconfigure systems due to changing regulatory frameworks, even down to the ability to isolate workloads on AIX, Windows and Linux within the same chassis, a capability unique in the marketplace. In short, the server infrastructure can be rapidly changed as need to meet challenges in the future.

3.2.4.2 Storage Management

The Storage Management service will provide hosting and operational support Services for storage management systems. Storage management systems must be maintained at current support levels for optimal performance, recoverability, and secure operations. Systems will be located in the Offeror's datacenters. The Offeror must support the hardware and software components of these systems.

The proposed storage management service and solution must address adherence to multiple security and compliance requirements relating to the storage and management of multiple types of data assets (e.g. CHRIA law, criminal history).

Requirements		Describe Compliance
1.	Monitor local operations, troubleshoot and resolve operational issues. Monitor system backup processing on a daily basis. Actively monitor the daily operations of all storage units. Maintain a log for each storage unit. Complete weekly service logs indicating the frequency logs are reviewed, and the status of the daily backup process. Create problem records for any abnormal condition and any repairs that have been made.	Offeror must describe proposed storage management Services. Offeror must identify tools it uses to support data backups including the following: • Processes and Procedures • Tools / Applications • End User Reports o Standard o Custom • Tiered Service/Support Levels • Escalation Procedures
2.	Provide appropriately trained staff that hold current manufacturer certifications for hardware and software technical support (where available). Staff will interact with vendor support Services as needed. Provide Commonwealth with a resume or CV for each operational staff member assigned to this engagement. A copy will be maintained on Offeror file including required background checks and clearances as required.	Offeror must submit a representative sample of staff resumes typically provided for these positions detailing their experience, education, and certifications.
3.	Provide platform level operational and technical support for the computing platform. Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users. Provide a tiered level of support Services (e.g. Gold, Silver, Bronze)	Offeror must describe its approach to providing and maintaining different tiered levels of support. Offeror must provide a representative sample of available tiered service support Services.

4.	Monitor system backup processing on a daily basis. Review daily backup log for successful completion. Note failures, and correct the problem. Create problem record for any abnormal condition and any repairs that have been made. An automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to identified Commonwealth staff and Offeror technical support for follow up and corrective action.	Offeror must describe its approach to perform an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives. Offeror must describe its approach to identifying gaps and potential risks, and how those gaps and risks will be resolved.
5.	Ensure network connectivity, and consistent system response times. Identify automated system management tool(s) to ensure storage system availability and expected response times. Stop / Start time records will be a source of input for SLA measurements. Identify tool set(s).	Offeror must describe its real-time monitoring approach and toolset to provide and maintain network availability and performance. Offeror must identify tools it uses to support network availability and performance.
6.	Ensure storage device operating systems are maintained with the current system patch level, including firmware upgrades. Analyze monthly service patches and determine which patches need to be applied. Create a change record, log the update in the storage system log, and install based on maintenance schedule. Notify impacted Commonwealth users immediately of any unscheduled service interruptions via email/web.	Offeror must describe its approach to patch management. Offeror must identify tools used to manage system patches. Offeror must describe its approach for testing and validating updates to the OS and 3rd Party software that it supports. Offeror must describe its approach to communicating unscheduled and scheduled outages, including escalation process.

	The Offeror must document normal work hours and holiday schedules with each agency to determine the contact method and escalation process of each Commonwealth agency. Coordinate at an agency level and account for any required patching as technology upgrades require.	
7.	Utilize data storage conservation techniques such as data de-duplication or other industry standards, to reduce the overall footprint of the data.	Offeror must describe approach and toolset to meet this requirement. Offeror must describe data retention options/Services to store data for extended periods.
8.	Propose options/solutions for self-provisioning or limited self-management of storage as a service.	Offeror must describe approach and toolset to meet this requirement.
Continual Service Improvement		
9.	Reduce service risks.	Offeror must provide methods to eliminate or mitigate service risks.
10.	Improve service quality.	On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.
11.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
12.	Ensure service transparency.	Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.
13.	Improve/reduce cost of service.	Offeror must provide examples of Storage Management initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or

		exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Unisys solution provides Storage Management through both EMC and IBM storage tools as well as Mainframe-based tools for storage dedicated to the Mainframes. These tools provide Unisys with the means to monitor and manage storage to the Commonwealth's requirements.

The Unisys solution includes the introduction of a highly cost effective Backup software infrastructure from CommVault. CommVault also provides the Commonwealth with a means to integrate the movement of Backup data into Archive storage manageable by the Commonwealth's Records Managers in order to meet regulatory compliance for Records retention.

1 Storage Management Services

1.A Offeror must describe proposed storage management Services.

The Unisys solution provides Storage Management Services within the framework of the Infrastructure Architecture services described in Schedule F, Section 3.2.2.2 (Infrastructure Architecture). The storage tools and components within the Storage Management Services are integrated into the Unisys Nagios collectors. Events within these tools and components will create log events that the Nagios collectors continuously monitor. This integration provides the tight link between Storage Management tools and ITSM monitoring systems. The Nagios collectors will forward events to an event correlation engine that will try to determine the root event and then automatically open an incident ticket. These incidents are tracked and escalated until resolution occurs.

The Commonwealth has benefitted over the years from the innovations and tuning around backup and storage monitoring and managements. Unisys has delivered high availability and access to storage through its innovative methods of using common open source storage monitoring tools such as the SMI-S standard created by the Storage Networking Industry Association, for the Unisys Nagios collectors as well as with proprietary vendor management systems. Unisys is able to use these systems to create proactive alerts through the Unisys incident ticketing system. Unisys uses this method to review logs proactively for incidents and to respond to these before any outages occur. This process lowers the cost of storage management for the Commonwealth because Unisys monitoring systems are continuously tied to events in the system logs rather than relying on a weekly, perhaps perfunctory review of logs by staff. By automating the analysis of exception-based logs Unisys support staff is pulled in quickly as soon as a problem arises.

1.B Offeror must identify tools it uses to support data backups including the following:

Processes and Procedures,

Tools / Applications,

End User Reports (standard and custom), and

Tiered Service/Support Levels

The Unisys solution includes the CommVault Simpana tool to automate the data backup services. This tool is integrated into the Unisys Nagios collectors within the ITSM Services so that abnormal events and backup failures result in incident tickets which are managed to resolution.

The CommVault Simpana tool also produces detailed reporting metrics on data backup activity. This reporting mechanism is integrated to the Real-time Dashboard maintained and managed by ITSM Services. This integration provides deep-level backup reporting to the Services Portals available to Commonwealth service managers and staff who can access these dashboards for up-to-date reporting on the Service Level metrics that roll up into the Commonwealth SLAs for Backups and Restores.

The Unisys solution manages Backup services within the Infrastructure Architecture framework described in F.3.2.2.2 (Infrastructure Architecture).

The available ITSM Capacity, Tiered Service Levels, Tools, and End User Reports that are integrated into the Backup Service components are described in detail in Section 1 of Schedule F, Section 3.2.3.2 (Site Operations).

These are the additional tools provided in the Enterprise Services Catalog for replication services within and between data center locations.

[redacted]

The diagram below illustrates a feature available in the Enterprise Services Catalog that is alluded to in the Commonwealth's Disaster Recovery and Business Continuity requirements: the ability to have 3 copies of synchronized data across various data centers. The Unisys solution assumes that the platinum application availability is achieved by building upon application-based data replication that the application can manage to failover in clustered configurations.

The [redacted] product is proposed to manage the requirements for triple data copies. This configuration shown in **Figure 3.2.4.2-1** can be ordered from the Enterprise Services Catalog and then tested to the Commonwealth's most critical application's failover requirements.

The [redacted] can already provide seamless failovers at the server/host layer for Windows and Linux servers running on [redacted] As the Commonwealth might expect [redacted] puts a high priority on integration testing with all of the product lines from its subsidiary [redacted] and this strategic partnership remains part of the [redacted] long-term strategy of providing increased value in the server and application layers.

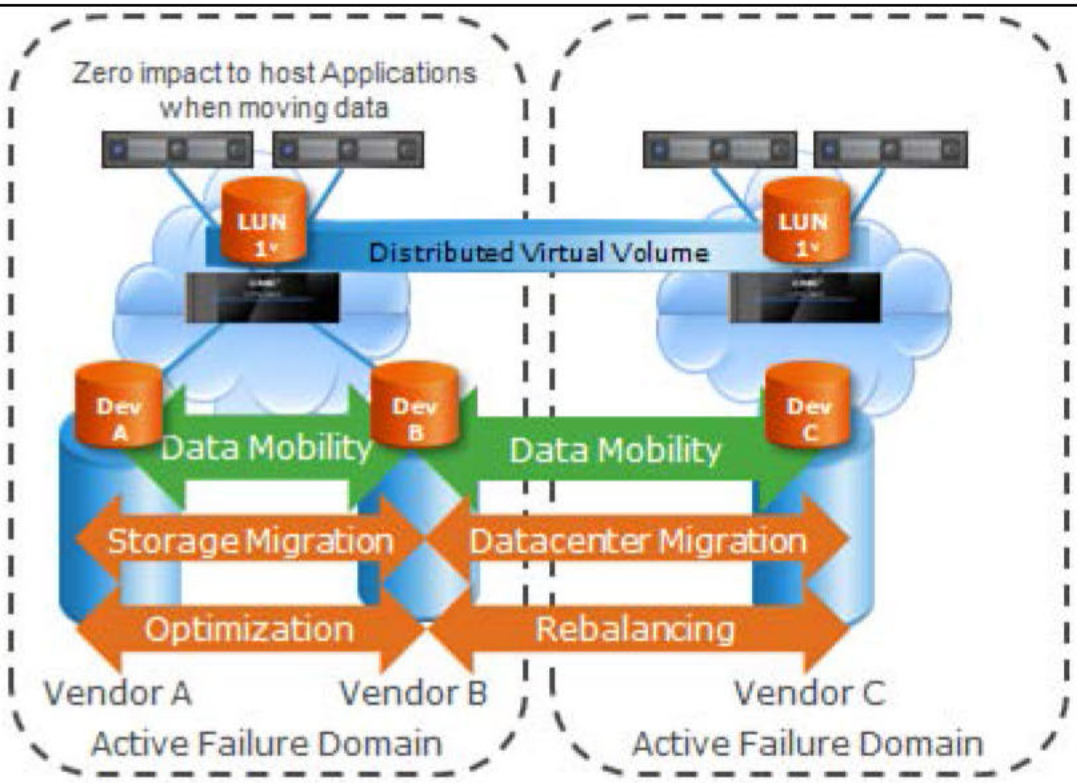

Figure 3.2.4.2-1 - [redacted] Triple Copy

[redacted]: Storage Virtualization and Data Protection

Figure 3.2.4.2-2 illustrates how the [redacted] product will allow the Unisys Team to provide value across heterogeneous storage environments. The Commonwealth can select the [redacted] solution in the Enterprise Services Catalog as well as the [redacted] solution so that Agencies can migrate data into the Unisys-managed data centers and leverage existing storage assets until the end of their service life.

The [redacted] configuration is also the means by which Unisys is able to offer the very fast Recover Time Objectives as well as Recovery Point Objectives that can offer near-zero data loss in the event of a disaster. These offerings are summarized below in Section 5.B as the Tier 5 and Tier 6 Disaster Recovery service offerings.

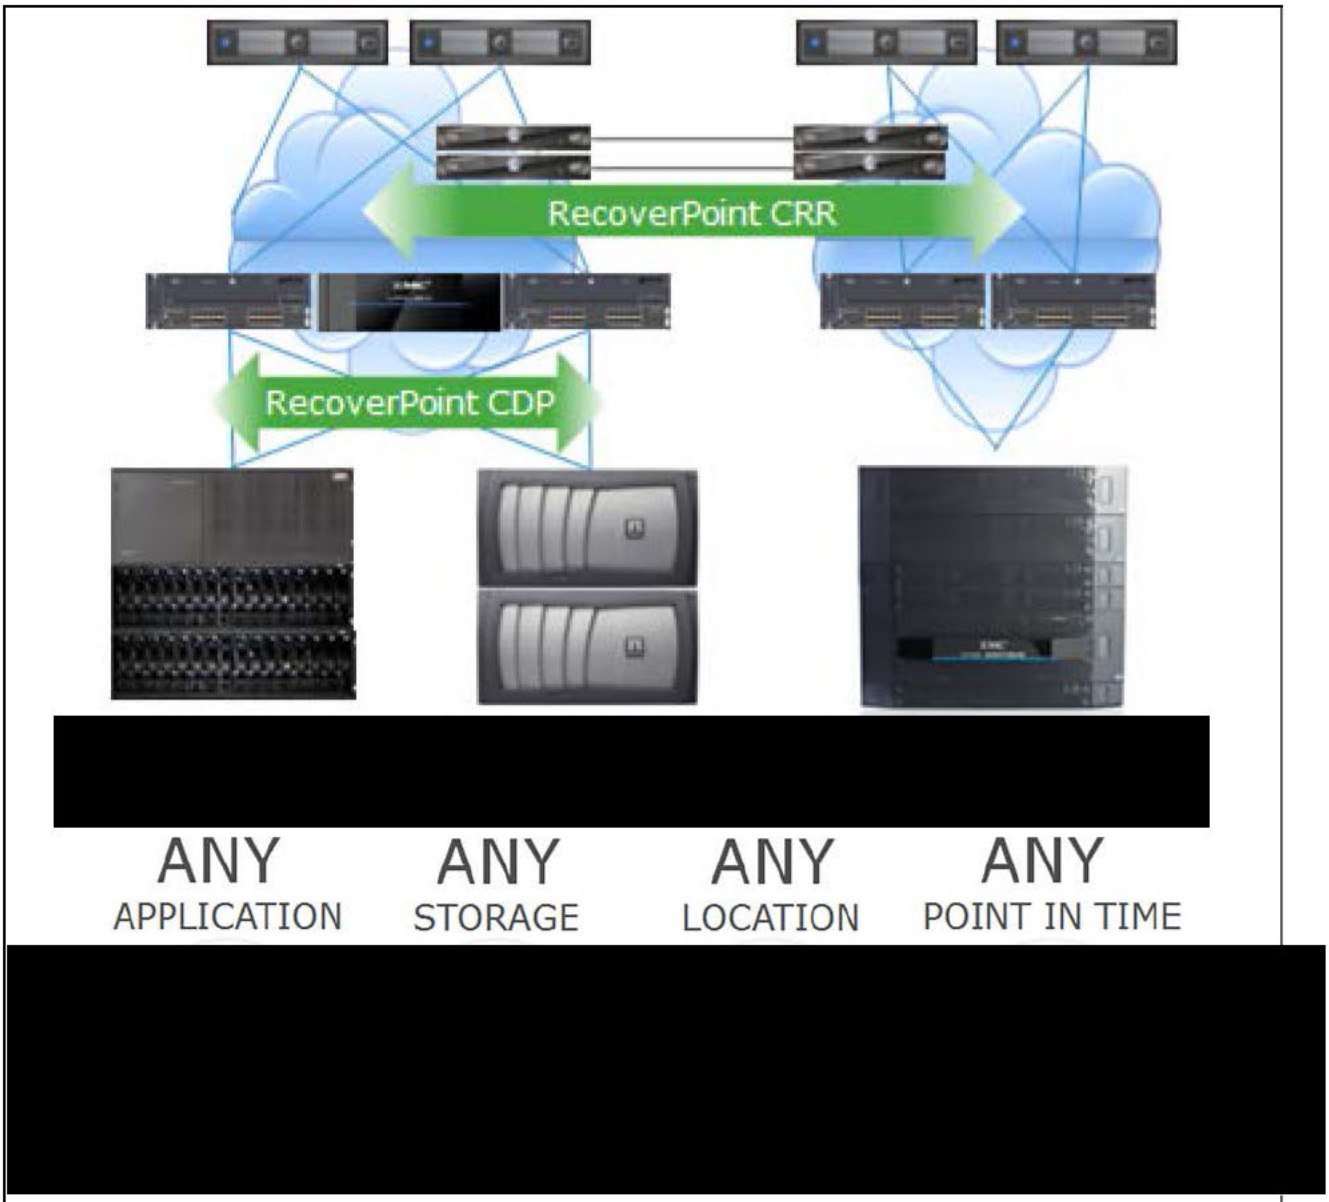

Figure 3.2.4.2-2 [redacted]

[redacted]

Figure 3.2.4.2-3 below shows the failover capabilities of the [redacted] storage platform in the Unisys solution. The modular frames in the Unisys N+1 architecture can be configured in pairs to further increase the reliability and resiliency of the underlying [redacted] infrastructure.

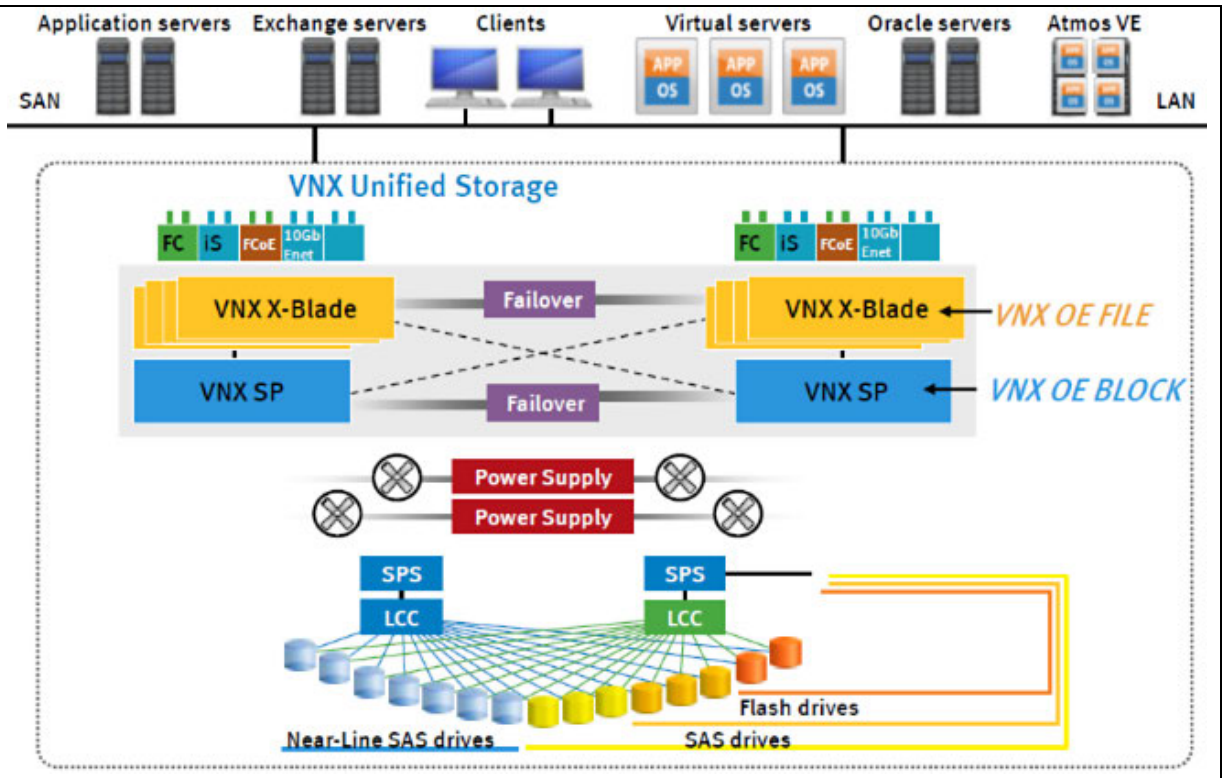

Figure 3.2.4.2-3 - [redacted]

The primary storage trends over the last two decades have reflected the increasing feature sets of mid-tier modular frames. Thus feature sets that customers paid a high premium for in Mainframe-class monolithic storage frames are, over time, refined and offered in the mid-tier frames. No company has been more successful in this storage trend than [redacted] and this accounts for its majority market share in the industry. The [redacted] product series takes advantage of the [redacted], offered within the Unisys solution, to manage communications between servers and storage. This replicates the process that occurs in the storage controllers of large storage frames and allows a pair of separate [redacted] storage frames to appear as a single entity to the servers through [redacted].

[redacted]

The [redacted] illustrated in **Figure 3.2.4.2-4** provides a cost-effective way of integrating diverse storage frames from different vendors and from different frame models from a single vendor and virtualize the storage in a manner that servers are unaware of the storage hardware beneath the [redacted] layer.

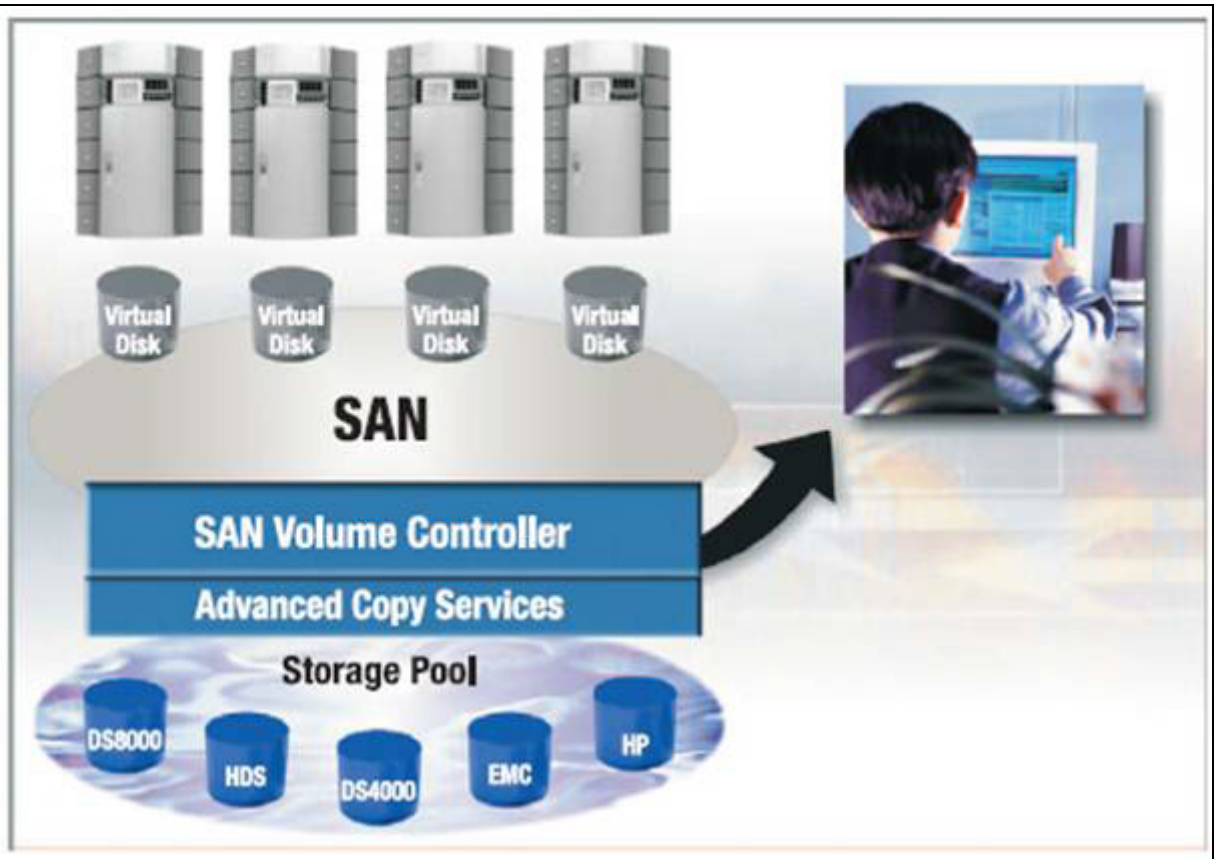

Figure 3.2.4.2-4 - [redacted]

SAN Volume Controller is designed to help increase the amount of storage capacity that is available to host applications. By pooling the capacity from multiple disk systems within the SAN, it helps enable storage administrators to reach beyond traditional islands of SAN storage and deploy storage in ways that can help best meet the needs of host applications.

Because the SVC hides the physical characteristics of storage from host systems, SAN Volume Controller is designed to help insulate host applications from physical changes to the storage pool. This ability can help applications continue to run without disruption as Unisys makes changes to the storage infrastructure. This will increase availability of Commonwealth services because a hardware refresh of storage frames can be conducted without disruption to the Commonwealth's servers providing access to data even when the replaced storage frame has been evacuated of data and unplugged.

End User Reports

- Standard Reports are summarized in 3.3.2.
- Custom Reports are offered by Unisys via the Enterprise Services Catalog

Tiered Service/Support Levels

The Commonwealth of Pennsylvania has indicated in Schedule J.2 - Datacenter Service Level Matrix the desired service tiers/support levels. In the design of the Services and the infrastructure needed to deliver those Service to the Commonwealth, the Unisys Team defined

the Service Tiers to align to those requirements. A fuller explanation and representative sample of all the Services provided in this structure can be found in the response to Section 3.2.1.5 sub-requirement 1.

1.C Escalation Procedures

Escalation procedures will be configured with the Unisys ITSM SLM toolset to support meeting SLA's proactively with automated escalations when incidents are approaching SLA violations. Also, there is a proactive escalation process for incident tickets supported by the Unisys service desk which manages all escalations for normal operations. The Unisys PMO will be involved with any critical escalations as a senior Account Manager will be managing the technical response team and Service Desk communications for critical Priority 1incidents. This includes well defined communications and notifications, status updates, and procedures to support restoring services effectively and efficiently. Escalation procedures are part of the Incident Management Process described in Schedule F, Section 3.2.1.4 Service Desk.

The overall approach for providing daily operations and monitoring including Processes and Procedures, Tools and Applications, End User Reports, Tiered Service/Support Levels and Escalation Procedures is described in Schedule F, Section 3.2.3.2.

1.D Monitor local operations, troubleshoot and resolve operational issues. Monitor system backup processing on a daily basis.

As described in the Facilities Management and Site Operations Schedule F, Sections 3.2.3.1 & 3.2.3.2, Unisys maintains sufficient onsite staff to manage local operations at Unisys-managed facilities. As described above, the backup monitoring is automated in the Unisys solution. In most cases simply re-starting a backup results in a successful backup because needed resources are tied up during peak times but become available a short time later. Unisys automates the restart process automatically. If the restarted backup fails then incident tickets are created to alert the team. Thus critical issues get right to Level 2 and Level 3 support as appropriate.

1.F Actively monitor the daily operations of all storage units.

The Unisys solution automates monitoring of storage units through the integration of ITSM incident ticketing and Nagios collectors which monitor SNMP and SMI-S interfaces on all storage units. Just as with Backup Services anomalies in the storage logs or alerts or warnings about component or service failures automatically created Incident Tickets that are tracked and escalated through the ITSM technical support structures.

1.G Maintain a log for each storage unit.

These logs are maintained on the storage units and a log of exceptions that require intervention are maintained in the Unisys ITSM ticket logging repositories.

1.H Complete weekly service logs indicating the frequency logs are reviewed, and the status of the daily backup process.

The Unisys solution is able to eschew weekly checks of service logs by automating near-instant ticket generations for failures and abnormal activities registered in the system logs.

1.I Create problem records for any abnormal condition and any repairs that have been made.

The Unisys solution creates incident tickets for abnormal conditions and required repairs. The resolution of these tickets provides a record of repairs.

2 Staff, Storage Management Staff Resumes

2.A Provide appropriately trained staff that hold current manufacturer certifications for hardware and software technical support (where available).

Unisys provides trained and certified storage and backup staff for the hardware and software proposed.

2.B Staff will interact with vendor support Services as needed.

Unisys provides the services as part of a standard Level2 and Level3 support services just as ITIL-based processes would stipulate.

2.C Provide Commonwealth with a resume or CV for each operational staff member assigned to this engagement.

Representative resumes for personnel providing Storage and Backup Services are located in the tab marked Rep-Resumes in Section 5.0 Personnel.

2.D A copy will be maintained on Offeror file including required background checks and clearances as required.

Unisys complies.

2.E Offeror must submit a representative sample of staff resumes typically provided for these positions detailing their experience, education, and certifications.

Representative resumes for personnel providing Storage and Backup Services are located in the tab marked Rep-Resumes in Section 5.0 Personnel.

3 Service Desk, Tiered Support

3.A Provide platform level operational and technical support for the computing platform.

Unisys complies.

3.B Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.

Offeror must describe its approach to providing and maintaining different tiered levels of support.

As described above, the Nagios collectors in the Unisys ITSM technical support architecture are tightly integrated into the service hardware and software componentry in order to automatically create incident tickets as needed that are tracked and escalated within the Unisys ITSM Service framework until incident resolution.

This process is described in much greater detail in Schedule F, Section 3.2.3.2 Site Operations.

3.C Provide a tiered level of support Services (e.g. Gold, Silver, Bronze)

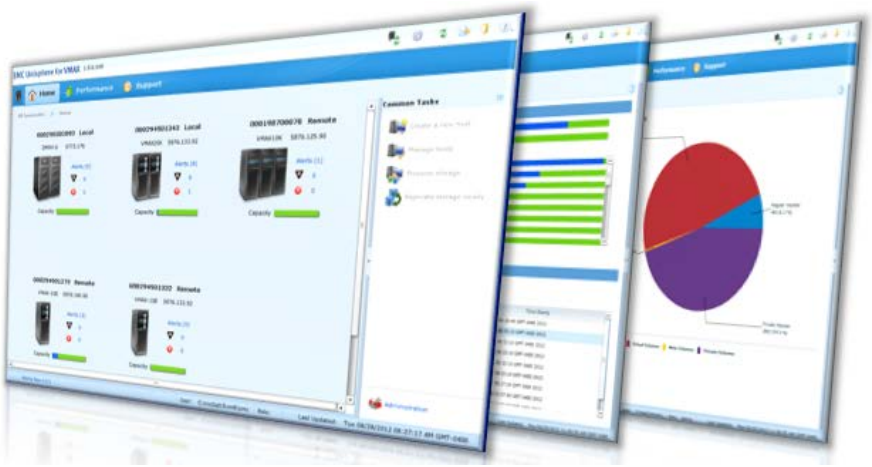
Offeror must provide a representative sample of available tiered service support Services.

The following table highlights the available tiers and associated capabilities.

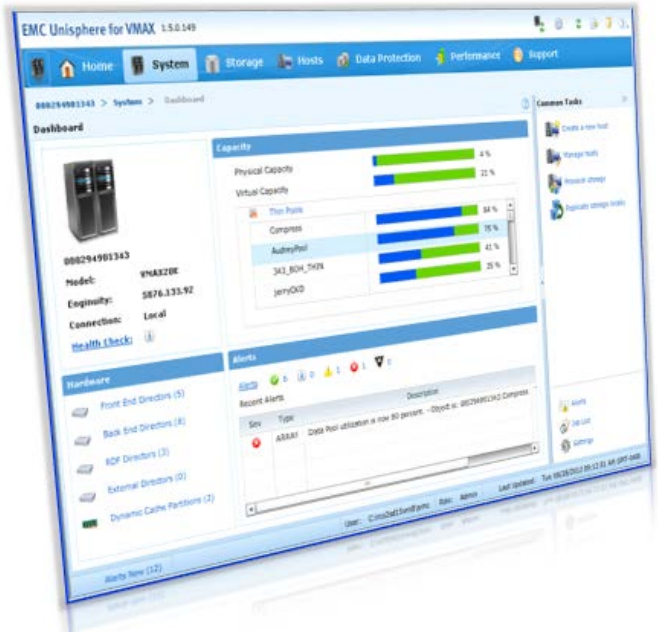
Tiered Support Level	Description
Platinum	• Provides 99.999% Application Infrastructure Availability • Storage frame is monitored via Nagios • Fully Managed Services • Asset Tracked In CMDB **with relationships** • Requires 3 storage frames load balanced and geographically dispersed
Gold	• Provides 99.99% Application Infrastructure Availability • Storage frame is monitoredvia Nagios • Fully Managed Services • Asset Tracked In CMDB **with relationships**
Silver	• Provides 99.9% Application Infrastructure Availability • Storage frame is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB **with relationships**
Bronze	• Provides 99.4% Application Infrastructure Availability • Storage frame is monitored via Nagios • Fully Managed Services • Asset Tracked In CMDB **with relationships**
Basic	• Provides 98.5 % Application Infrastructure Availability • Storage frame is monitored via Nagios • Fully Managed Services • Asset Tracked In CMDB **with relationships**
IaaS	• Provides no Application Infrastructure Availability • No Monitoring

	• No Managed Services • Asset Tracked In CMDB **with relationships**

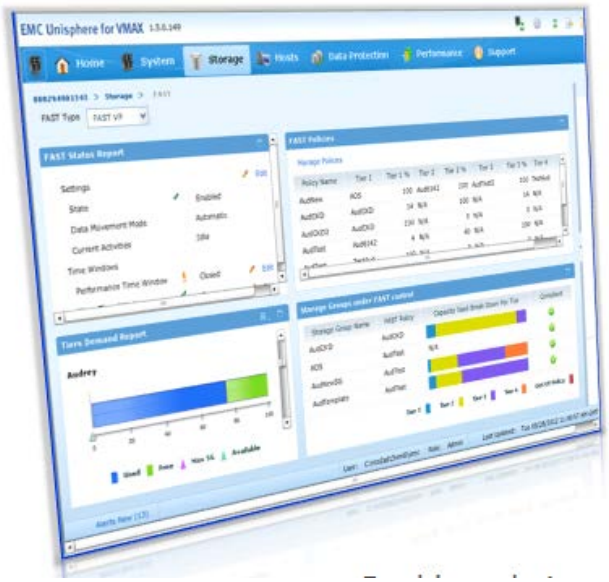
The Commonwealth's storage infrastructure will be managed by tightly integrated [redacted] management toolsets.



The [redacted] provides many feature sets. The array view, shown below, gives administrator quick access to a view of the underlying health of the hardware, capacity utilizations, and any infrastructure incidents.



The [redacted] tool integrates with the [redacted] of tools, as shown below, to provide easy management of storage policies, virtual storage pools, and the use of tiered storage by server groups.



The Unisys solution also provides storage services managed by the [redacted] which provides these services advantages for the Commonwealth:

- Unisys can manage heterogeneous storage from a single point of control
- Unisys technical teams can Move data among virtualized storage systems without disruptions to servers
- Optimize solid-state storage deployments automatically with [redacted]
- Allow for non-disruptive scalability from the smallest configuration to the largest
- Implement stretched configurations for high availability and data mobility between data centers

4 System Backup Review and Audit, Gap Assessment

4.A Offeror must describe its approach to perform an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives.

The Unisys Team will conduct an initial review and audit of the backup policies, procedures and reports, to confirm the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives. The detailed process for conducting this audit, and how the audit findings will be communicated back to the Commonwealth can be found in Schedule F, Section 3.2.4.2, Subsection 4.

4.B Offeror must describe its approach to identifying gaps and potential risks, and how those gaps and risks will be resolved.

During transition and transformation, the Unisys solution includes an extended onsite presence of a CommVault technical manager who aids the Unisys Team in the search for existing gaps and

risks, along with potential improvements to the backup systems during the transition phase of the solution. This technical expert has extensive experience in implementations and in identifying value-add opportunities. The skills of this technical expert are married to the Unisys Team's extensive expertise around current backup operations. Jointly they lead the transition to the more cost effective CommVault backup infrastructure. The Unisys Team, also working with the CommVault technical manager, manages the review and audit of backup clients that move from the legacy system into the CommVault system. During transition a like-to-like set of backup policies, procedures, reports, schedules, retention periods, target directories, and recovery point objectives are built out. The Unisys Team can then present the Commonwealth for opportunities to further optimize the infrastructure to improve the quality of services or provide better cost efficiencies for the same services.

The Unisys Backup team is also able to compare the Backup inventory of clients and policies to the CMDB inventory to locate "negative" gaps in case a server or critical data set is introduced into the Fully Managed environment and, through unlikely process failures, was not also protected with sufficient backup resources. The Unisys governance processes and the processes generated by the Unisys solution's Enterprise Services Catalog are designed to remove such failures. Additionally, a compare of Backup infrastructure inventory from the backup tools perspective with the CMDB can locate a gap should one occur as an additional level of protection The activities to perform the gap analysis are described in F.3.2.4.2, Requirement 4.

4.C Monitor system backup processing on a daily basis.

As mentioned above, backup system processing is monitored automatically through the integration of Nagios collectors which generate incident tickets and automated runbook procedures upon backup abnormalities that would threaten data protection.

4.D Review daily backup log for successful completion.

4.E Note failures, and correct the problem.

The backup monitoring is automated in the Unisys solution. This reduces the cost of Backup services to the Commonwealth because staff is no longer needed to watch the nightly progress of backups and then intervene when the rare problem arises. In most cases simply re-starting a backup results in a successful backup because needed resources are tied up during peak times but become available a short time later. Unisys automates the restart process automatically. If the restarted backup fails then incident tickets are created to alert the team. Thus critical issues get right to Level 2 and Level 3 support as appropriate.

4.F Create problem record for any abnormal condition and any repairs that have been made.

Incident tickets are created automatically and create a record of abnormal conditions. Following ITIL V3 based processes Level2 and Level3 will review incidents for root causes that create multiple tickets. This identification of problems allows the team to establish workarounds and request architecture reviews as necessary. Repairs are also driven by incident tickets that are automatically generated by the Nagios collectors. Repairs are carried out as part of Incident ticket resolution and are logged following ITIL V3 Change

Management processes.

4.G An automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to identified Commonwealth staff and Offeror technical support for follow up and corrective action.

This is included as part of the CommVault tools as described above in Section 4.D/E.

5 Monitor Network Connectivity, Toolset

5.A Offeror must describe its real-time monitoring approach and toolset to provide and maintain network availability and performance.

Unisys provides event management solutions to help verify network connectivity and consistent system response times. Unisys will utilize automated system management tool(s) to provide real- time monitoring and notification of storage availability and response times including the stop and start times to support SLA availability measurements.

For a complete understanding of how this subset of Event Management Tools supports enterprise Event Management please refer to 3.2.3.2 Site Operations.

5.B Ensure network connectivity, and consistent system response times.

Unisys monitors for continuous network connectivity via network and SAN ports. As is typical with network architecture bandwidth is provided at amounts that generally exceed a normally operating device's ability to put data across the port.

5.C Identify automated system management tool(s) to ensure storage system availability and expected response times. Stop / Start time records will be a source of input for SLA measurements.

The Unisys Nagios collectors interrogate the SAN switch interfaces and create incident tickets upon failures that interrupt access to storage systems and threaten SLAs for availability and response times. These tickets along with the time of resolution provide the input for SLA measurements.

5.D Identify tool set(s).

Offeror must identify tools it uses to support network availability and performance.

The following tools are the major toolsets to support network and system event management and monitoring.

Monitoring Software	Managed Configuration	Monitoring and Management

	Items (CI's)	Functionality
[redacted]	LAN Devices including: • Switches • Routers • Load Balancers • Firewalls	Provides deep network device availability and performance monitoring, DNS, IP address management, network configuration management, and network traffic bandwidth throughput monitoring
[redacted]	Microsoft servers, databases, network devices, and storage hardware.	Provides a standard set of availability, performance and critical service monitors developed by Unisys for monitoring across infrastructure items including: • Servers • Network devices (switches, routers, load balancers) • Storage devices • Middleware • Applications (Exchange, Citrix XenApp, etc.)

6 Patch Management

6.A Ensure storage device operating systems are maintained with the current system patch level, including firmware upgrades.

Offeror must describe its approach to patch management.

Offeror must identify tools used to manage system patches.

The Unisys technical support team will work with the Commonwealth agencies to verify that the storage devices are maintained with the current patch levels including firmware upgrades

Unisys will follow the Change Management Process for applying patches and upgrades. This process will maintain the change record in the Unisys ITSM platform provided by BMC and also update the CMDB configuration management file upon deployment for windows server environment Configuration Items (CI's). The Change Record will be related to the CI's in the CMDB as an audit trail for changes to Windows CI's upon the completion of the Release and Deployment Process for changes.

Due to the criticality of storage components Unisys does not use automation tools for patch updates but relies on the careful attention of trained storage staff to manage each upgrade and reserves the option to require vendors to complete patch upgrades under the supervision of Unisys storage staff.

6.B Offeror must describe its approach for testing and validating updates to the OS and 3rd Party software that it supports.

Unisys approach to testing and validating updates to the OS and 3rd party software is to follow the Release Process for all changes into all production environments. The Release Process includes:

- Change ticket approvals
- Test planning and accepted test results

- Release and deployment planning including release back-out plans
- Release testing for risky deployments
- Early life cycle support to help deliver a successful deployment
- Release back-out for failed releases

The Unisys Team has partner access to the comprehensive battery of tests completed by EMC and IBM for all storage infrastructure components and will use this access to weigh the relative merits and risks associated with version releases. Although quite rare if a security patch for a storage component were released Unisys would propose a revised and potentially accelerated upgrade schedule through the normal change governance schedule so that the Commonwealth holds final approval for such changes.

6.C Offeror must describe its approach to communicating unscheduled and scheduled outages, including escalation process.

Unisys follows the standard ITIL V3 based Change Management governance for all scheduled changes and the ITIL V3 based Incident and Unisys Escalation processes for all unscheduled activity.

6.D Analyze monthly service patches and determine which patches need to be applied.

Monthly services patches rarely occur for storage hardware but Unisys pays close attention to vendor service announcements and will alert the Commonwealth with recommendations for a course of action should these arise.

6.E Create a change record, log the update in the storage system log, and install based on maintenance schedule.

The Unisys ITILV3 based processes for Change Management are strictly followed and include the steps listed above.

6.F Notify impacted Commonwealth users immediately of any unscheduled service interruptions via email/web.

Unisys approach to communicating unscheduled outages is to send notifications to key stakeholders for the Commonwealth/Agencies/Unisys/Third Parties depending on the outage. This will be through email, voice, Services Portal and Remedy broadcast capabilities. The same communications will be used for scheduled outages with additional communications in forward schedules of change reports.

Escalations for unscheduled outages are handled through the standard processes for managing incidents. Unisys service desk will manage all incidents and provide that proper escalation communications to key Commonwealth/Unisys/Third Parties personnel are managed. The BMC [redacted] will also be configured to escalate incident tickets based on incident priorities and SLAs to confirm that incidents tickets are being managed to SLA times for incident response and resolution.

To support the operational and technical support needs of the Commonwealth, the Unisys Team will deploy incident, problem and change management processes that define the flow of support from the Help Desk up through Level 3 support. These processes are closely aligned to the common IT Service Delivery platform. For more detailed information on these processes, please refer to Schedule F, Section 3.2.3.2.

6.G The Offeror must document normal work hours and holiday schedules with each agency to determine the contact method and escalation process of each Commonwealth agency.

Unisys will document and update yearly normal work hours and holiday schedules for each agency. This documentation will be used as a data feed into the operational documentation listing escalation processes and contact methods Unisys is to use when contacting agency personnel.

6.H Coordinate at an agency level and account for any required patching as technology upgrades require.

Unisys complies with the requirement to provide required patching for Fully-Managed components.

7 Data Storage Approach and Toolset

7.A Utilize data storage conservation techniques such as data de-duplication or other industry standards, to reduce the overall footprint of the data.

Offeror must describe approach and toolset to meet this requirement.

Offeror must describe data retention options/Services to store data for extended periods.

Unisys offers the Commonwealth the [redacted] platform and the CommVault suite of backup and archiving software to achieve data de-duplication. In addition Unisys offers the Commonwealth the means to transfer backup data sets from backup-based tape and disk to archive-based disk storage for long term retention and assured deletion at the expiration of the retention cycle. Like the EMC Avamar platform, a proprietary hardware solution, the CommVault offers the Commonwealth a means to utilize de-duplication not only at the target backup media to reduce capacity but also de-duplication at the source of the data the Commonwealth server that is backed up. This latter capacity reduces network load due to backups and speeds up the backup process by using hashed handshakes between backed-up server and the backup server.

Figure 3.2.4.2-5 below shows the basic concepts of CommVault's client and target based deduplication. The client to be backed up tracks all of the blocks that have changed within any file that needs to be backed up. Before sending the backup data it compares these blocks to a hashtable representing blocks that the media agent (aka Backup Server) already has stored. As a result of this source-based deduplication process the client only sends the backup server blocks that it has never seen before from any other client. Thus is five servers store a copy of a company policy document it is only sent to the backup server once, greatly reducing network bandwidth required for backups and also speeding up backups significantly: the faster transfer rates occur for the duplicated blocks that do not have to be sent at all. The Backup Server, with very low CPU processing costs when compared to disk-based controller CPUs does the de-

duplication processing for data that is sent to the backup target media, represented in the illustration as the magnetic library but this could be either a tape-based or disk-based backup media target.

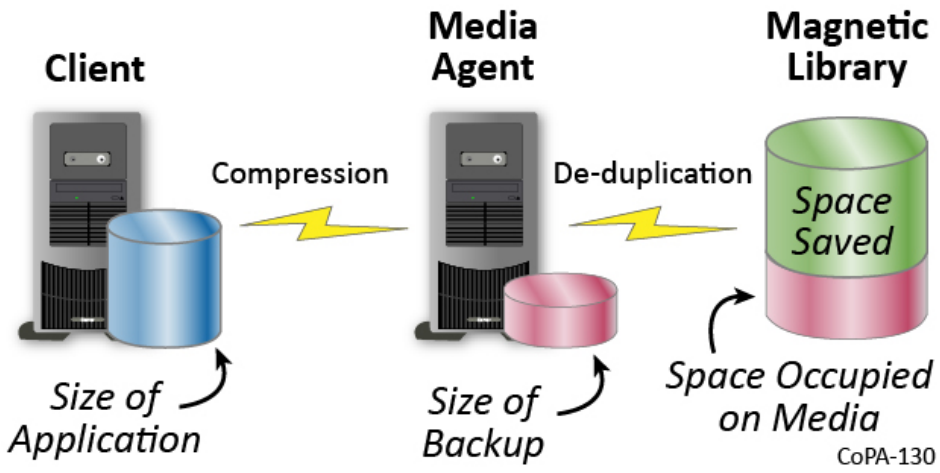


Figure 3.2.4.2-5 – CommVault Data Deduplication

Unisys also considered the option of implementing Thin Provisioning for the Commonwealth because this is an industry-standard tool used to reduce storage foot print although it is not widely used. Thin Provisioning would allow a vendor to report that 2 TBs of storage had been allocated to a server but the server would only be provided with a stub or an IOU that would be filled only as the server began to fill up the space with actual data. However Thin Provisioning also brings with it significant risk of performance impacts. Basically if a vendor has "thin provisioned" 1,000 TBs but has only provided 100TBs of actual disk to meet data requests then the I/O demand on the actual disk provisioned is 10 times greater than if the 100TBs had actually landed on 1,000 TBs of actual disk. Unisys would like to caution the Commonwealth to consider both the billing and performance implications of any solutions that represent "Thin Provisioning" as a significant cost saver: That savings comes with a high I/O performance penalty and removes transparency by disconnecting billing statements based on Thin Provisioned storage from the actual storage hardware and software that provide capacity-based performance.

8 Storage Self Management Service, Toolset

8.A Propose options/solutions for self-provisioning or limited self-management of storage as a service.

Offeror must describe approach and toolset to meet this requirement.

The Services Portal provided in the proposal offers a means for Commonwealth users to submit the most common storage management requests to create new storage, expand or contract existing storage, and tear down no longer needed storage assets. This also applies to requests to insert, modify, add, create or remove backup services at a server by server granularity.

The request and provisioning process for each of the anticipated platforms are as follows:

1. The Commonwealth User (user) will log onto the Services Portal, and select the Enterprise Services Catalog.

2. The Enterprise Services Catalog tool will authenticate and authorize the user
3. Based on what the user is authorized to do, they will be able to select the following:
   a. Storage Quantity
   b. Service Tier – Platinum, Gold, Silver, Bronze, Basic
   c. Storage Services
4. The Enterprise Services Catalog tool's workflow engine will then handle all authorizations for the provisioning.
5. Once approved, the Enterprise Services Catalog tool will open all change records needed to provision a the service request.
6. Once the change record is approved, the Enterprise Services Catalog Tool will run an automated run book for each platform that will provision the service request.
7. The Enterprise Services Catalog tool will then register the change in the following tools as appropriate:

[redacted]

8. Once all provisioning tasks have been performed, the Enterprise Services Catalog tool will notify the user that the storage has been provisioned and is ready for use.

9 CI Service Risk

9.A Reduce service risks.

Offeror must provide methods to eliminate or mitigate service risks.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,
- Improve client satisfaction,
- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery

- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

9 CI Service Risk

9.A Reduce service risks.

Offeror must provide methods to eliminate or mitigate service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

10.A Improve service quality.

On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional

details in this area.

11 CI Client Satisfaction

11.A Improve client satisfaction.

Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

12 CI Service Transparency

12.A Ensure service transparency.

Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

13 CI Reduce Cost of Service

13.A Improve/reduce cost of service.

Offeror must provide examples of Storage Management initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manages quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

A few examples of Storage Management Continuous Service Improvement that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections are outlined below:

Storage Management

The DPH has implemented Distributed File Systems (DFS) to replicate our DPH File Server down to [redacted] In the event of a true disaster, files to perform our duties during and after the DR will be available. Data replication occurs in real time and is de-duplicated over the wire thus saving bandwidth on the WAN link. This confirms that our documentation, recovery scripts and procedures are current and accessible at all times to support Commonwealth agencies during disaster recovery drill and in the event of an actual disaster. By avoiding having to ship tapes containing this information to [redacted] and having to restore them, Unisys has improved the recovery time objective for disaster drills and disaster events.

Storage Management

As part of the DPH's continuing improvements in its backup infrastructure, the DPH has improved the successful recovery an 8TB database archive for IES from 10.7 hours down to nearly 4 hours by improving the bandwidth from .75Tb/hour to 2TB/hour. The DPH accomplished this by bypassing the AIX VIO Shared Ethernet Adapter (SEA) built in restrictions and optimizing throughput between the media servers and the data domain.

Storage Reporting - Service Level and Other Reports:

Throughout the contact, Unisys has provided a vast amount of contractual reporting to the Commonwealth. The reports include, but are not limited to Monthly Performance Reporting for each supported agency/bureau, Major reporting improvements include, Quarterly Vulnerability Reporting, Monthly XIV Storage Reporting for IES and DOR physical hosts, Monthly Storage Reports for PLCB, Monthly VMAX Storage Reports for DPW.

Storage SAN Advances:

Through advanced configuration and deployment of an Avamar grid the DPH is capable of replicating deployments of virtual servers between data centers. This capability is also leveraged for several disaster recovery scenarios including initial DR deployments and annual disaster recovery drills.

Storage Replication for DR:

Storage replication solutions have been implemented for several agencies using the latest disk to disk replication technology. These solutions have enabled a reduced dependency on tape media and drives for backup while providing a disk to disk update to offsite data supporting both data backup as well as disaster recovery requirements. Ongoing research and trials are conducted in conjunction with product support organizations to provide proper configuration and optimal performance for the technology supporting this critical managed service.

Disk-based Backup Strategy:

The Unisys solution leverages Data Domain products to facilitate disk-based backups and data

replication to an offsite location. This eliminates cost and unreliability associated with tape media and significantly expedites recovery time in the event of a disaster. The implementation of a disk to disk with data de-duplication strategy for IES resulted in a significant reduction in backup and restore times for the extremely large, rapidly growing SAP data store. At the time that IES migrated to the DPH, the data store in SAP was 5 TB. This data store had previously been backed up across 32 tape drives taking close to five hours to back up. This left IES exposed to issues with tape media that would prevent the ability to restore effectively. Since their implementation, the size of the SAP data store peaked at 9 TB with performance on the disk-based backup solution enabling completion of backups in less than four hours.

Unisys Team Experience

The Unisys Team experience is outlined in the above section.

Benefits to the Commonwealth

The Unisys Backup Service provides significant costs savings over those offered by competitors. Unisys has teamed with CommVault which is quickly displacing its competitors in market share due the high value provided by their solution at cost competitive rates. The Commonwealth also benefits from CommVault's strategic decision to expand its customer base within the state government market.

The Unisys solution for Storage Management provides interoperable, innovative automation and integration between the Unisys ITSM monitoring and management and the standard management tool suites offered by EMC, IBM, and CommVault. This innovation allows the Unisys ITSM technical support staff to remove costly labor-based monitoring and escalation and provide the Commonwealth with more cost effective solutions.

The Unisys integration of ITSM monitoring and management tools with logging and alert features provided by EMC, IBM, and CommVault also provides a higher quality of services for the Commonwealth by automating incident ticket creations to engage technical staff proactively. The ITSM monitoring of event logs within Infrastructure components can create incident tickets on an initial logged event before the event cascades into a service disruption.

3.2.4.3 ERP Hosting – SAP / Oracle

ERP Hosting – SAP service will provide hosting and operational support Services for two SAP-ERP systems that are currently located at the DPH. One system Services the General Accounting System application, and the other Services the Integrated Tax System application for the Department of Revenue. Each application has associated development and testing environments support on segregated equipment. Offeror must support various production and non-production versions of the applications and the associated hardware. The roles and the number of staff members required to perform the below listed tasks will be determined by the Offeror.

Due to the critical and complex nature of these SAP environments, the Commonwealth requires an experienced SAP hosting provider. The Offeror's proposed target infrastructure design for the Commonwealth's SAP environments must include a certified SAP sizing report prior to migration of the systems.

The ERP Hosting – Oracle service will provide hosting and operational support Services for the current Oracle Enterprise system utilized by the Pennsylvania Liquor Control Board (PLCB). The application has associated development and testing environments support on segregated equipment. Offeror must support various production and non-production versions of the applications and the associated hardware.

Requirements		Describe Compliance
1.	Provide ERP Hosting Services for SAP and Oracle based applications.	Offeror must describe its approach to providing ERP Hosting Services for both SAP and Oracle ERP systems. Offeror must provide a minimum of 3 verifiable Customer References of customers that use its SAP Hosting Services. Offeror must provide a minimum of 3 verifiable Customer References of

		customers that use its Oracle Hosting Services.
2.	Monitor local system operations, troubleshoot and resolve operational issues. Actively monitor the daily operations of all ERP systems. Maintain a log for each server detailing hardware / software configuration and critical service operations. Document review of the system logs on a weekly basis to ensure critical system Services are processing without errors. Complete weekly server log indicating which logs were reviewed, date and initial the log.	Offeror must describe its approach to monitoring and maintaining SAP and Oracle ERP systems including the following: • Processes and Procedures • Tools / Applications • End User Reports o Standard o Custom • Tiered Service/Support Levels • Escalation Procedures
3.	Monitor system backup processing on a daily basis. Review daily backup log for successful completion. Note failures, and correct the problem. Create problem record for any abnormal condition and any repairs that have been made. An automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.	Offeror must describe its approach to perform an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives. Offeror must describe its approach to identify gaps and potential risks, and how those gaps and risks will be resolved.
4.	Provide IBM, SAP, and Oracle trained staff holding current manufacturer certifications for hardware and software technical support. Staff will interact with vendor support Services when	Offeror must submit a representative sample of staff resumes typically provided for these positions detailing their experience, education, and certifications.

	needed. Provide Commonwealth with a resume or CV for each operational staff member assigned to this engagement. A copy will be maintained on Offeror file including required background checks and clearances as required.	
5.	Provide cost effective operational and technical support for the computing platform. Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users. Provide a tiered level of support Services (e.g. Gold, Silver, and Bronze).	Offeror must describe its approach to providing and maintaining different tiered levels of ERP (SAP & Oracle) support.
6.	Ensure network connectivity, and consistent system response times. Utilize automated system management tool(s) to ensure real-time monitoring and notification of server availability and response times. Stop / Start times of servers will be a source of input for SLA measurements. Identify tool set(s).	Offeror must describe its real-time monitoring approach and toolset to provide and maintain network availability and performance. Offeror must identify tools it uses to support network availability and performance.
7.	Ensure server operating systems are maintained with the current system patch level, based on the Services provided by the server. Analyze monthly service patches and determine which patches need to be applied, by server type. Create a change record, log the update in the server log, and install based on server maintenance schedule. Implement a Patch Management Program to ensure the timely	Offeror must describe its approach to patch management including analysis, communications, schedule (change records) and installation process. Offeror must describe its approach for testing and validating updates to the OS and 3rd Party software that it supports. Offeror must describe its approach to communicating unscheduled and scheduled outages, including its escalation process.

	application of updates on all infrastructure platforms in accordance with Commonwealth IT policy guidelines.	
8.	User Account Management Provide certified system administration staff to create and maintain the registration of profiles, associated groups, and the security permissions required to service the approved client base of the system and application.	Offeror must describe its administration/support approach and provide representative resumes.
9.	Procurement Planning Provide program and process to refresh the hardware at asset end-of-life, and when upgrades are needed to meet anticipated growth in utilization.	Offeror must describe its program and processes for upgrading systems.
10.	SLA Reporting Collect actual system availability, utilization and response time data. On a monthly basis, Offeror must create a SLA report for the Commonwealth and Vendor Management teams.	Offeror must describe its processes and toolset for monitoring and maintaining service levels. Offeror must provide a representative sample of its SLA reports for ERP hosting Services.
Continual Service Improvement		
11.	Reduce service risks.	Offeror must provide methods to eliminate or mitigate service risks.
12.	Improve service quality.	On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.
13.	Improve client satisfaction.	Offeror must provide examples of

		previous Offeror initiatives aimed at continually improving client satisfaction.
14.	Ensure service transparency.	Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.
15.	Improve/reduce cost of service.	Offeror must provide examples of ERP Hosting initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Many of the Commonwealth's Agencies use ERP systems from SAP and Oracle to provide critical services within the Commonwealth or to their constituents. The Unisys Team will provide an ERP hosting service based upon the infrastructure support services provided for the Windows, Linux, AIX, Storage and Backup hosting services. Due to the unique application requirements for each ERP implementation, Unisys will work with each agency to confirm that the design and implementation of the infrastructure to support each ERP system meets the agency and application requirements.

As part of the ERP Hosting service, the Commonwealth benefits from data center compute services supporting multiple production and non-production application environments. These environments used for production, development, and test will use segregated hardware for each of the following ERP services leveraging the compute services' flexible and cost effective architecture.

- IES – SAP - General Account System
- DOR – SAP Treasury and Risk Management – Integrated Tax System
- PLCB – Oracle Enterprise

The Unisys Team includes support staff with experience managing complex infrastructure deployments for both SAP and Oracle environments. The support team maintains certifications with ongoing training for infrastructure support including Microsoft Windows, [redacted] storage products, and IBM AIX. In addition, the support team has access to the vendor's support organizations for SAP, Microsoft, [redacted] Oracle IBM, and [redacted]

During the transition planning activities for the migration of the SAP environments from the DPH, Unisys will work with the hardware vendors to provide an SAP sizing report. This report

will be used to validate that the server infrastructure planned in the new facility will meet the current requirements of the existing implementation.

1 ERP hosting Service Approach

1.A Provide ERP Hosting Services for SAP and Oracle based applications.

Offeror must describe its approach to providing ERP Hosting Services for both SAP and Oracle ERP systems.

For the Commonwealth ERP Hosting Service for SAP and Oracle, Unisys will use similar technologies and services provided for the Windows, Linux, AIX, Security and Storage services. By using similar technologies and services, the Unisys Team can provide access to a broad set of capabilities and flexibility to support the ERP infrastructure. Unisys also recognizes that ERP systems have unique requirements and will structure the ERP services to meet those requirements, such as using SAP and Oracle authorized patches, segregated infrastructure and recommended designs by SAP or Oracle.

1.B Offeror must provide a minimum of 3 verifiable Customer References of customers that use its SAP Hosting Services.

The Unisys Team provides SAP Hosting services for the following customers:

- IES SAP Enterprise System
  The Commonwealth was one of the first states to fully-integrated business processes in a SAP Enterprise Resource Planning (ERP) system across all state agencies. First implemented in 2002, the SAP ERP system efficiently and securely supports more than 53 state agencies and processes millions of finance, budget, procurement, supplier relationship, plant maintenance, payroll, travel, human resource and employee self-service transactions monthly. The Commonwealth's Bureau of Integrated Enterprise System (IES) migrated the SAP ERP system to the DPH in 2010 and has entrusted Unisys with the care of its supporting infrastructure since that time
- DOR SAP Integrated Tax System
  In 2011, the Department of Revenue (DOR) began a project to implement an Integrated Tax System to replace, update, and augment many of the current tax management systems used by the agency. DOR selected SAP's Treasury and Risk Management platform as the basis for the platform and had the system deployed within the DPH to have its infrastructure supported by Unisys. Unisys continues to work with DOR to add additional infrastructure as DOR implements additional functions and services as part of the agency's migration to an integrated platform.
- World Leading Brewery Company
  In 2007, a world's leading brewery company engaged Unisys as a partner to implement a common SAP HCM ECC 6.0 deployment across 30+ countries over a 5 year period and provide ongoing support. The program included the design and standardization of global employee HR Processes and integration with other corporate tools. The result of the program was a 20% reduction in the cost of maintenance by the IT organization through the use of an approach of one platform, and one framework using uniform processes and data across the enterprise.

1.C Offeror must provide a minimum of 3 verifiable Customer References of customers that use its Oracle Hosting Services.

The Unisys Team provides Oracle Hosting services for the following customers:

Pennsylvania Liquor Control Board (PLCB) Enterprise Resource Planning (ERP)

The Commonwealth of Pennsylvania supports and monitors all the retail and wholesale operations of State liquor sales. The PLCB ERP Phase I environment initially deployed 15 AIX LPARS into the DPH on IBM P6 570 servers in 2009. The effort continued through a Phase II deployment which brought in an additional 40 LPARS along with management servers and a storage device into the DPH. All statistical and financial data for PLCB are processed on the environment at the DPH.

In addition, the PLCB deployed a new point-of-sale application – SkillNet in 2011. This deployment brought all of the cash register processing into the DPH via SUSE Linux on virtual machines. The PLCB operates over 620+ Wine and Spirit stores and contributes over $500 million dollars per year to the PA General Fund.

During 2012, the ERP suite was rebranded to Integrated Business Management System (IBMS). The DPH assisted in the application deployment of this major upgrade to the PLCB in February of 2013. This upgrade also brought the introduction of Linux virtual machines into the DPH which captures the retail data warehouse (RDW) transactions, retail demand forecasting (planning), Oracle internet directory, Hyperion (statistical information) and an Oracle WebCenter.

California State University

Since 2001, California State University (CSU) has entrusted their Oracle PeopleSoft Higher Education environment's infrastructure support to Unisys. Unisys provides infrastructure hosting services from our Salt Lake [redacted] data center. As part of the 2011 renewal, Unisys added flexibility to scale the services with consumption based model to support CSU's business needs and activities as well as provides test, development and disaster recovery infrastructure from Unisys [redacted] Data Center.

United Kingdom Ministry of Justice

Since 1998, Unisys provides Oracle Financials hosting and application support for the United Kingdom Ministry of Justice as part of business process outsourcing program with Liberata. Unisys provides 2nd and 3rd level support for the compute services as well as the Oracle applications and related services. Unisys maintains the platforms to current levels, implements additional functionality such as Hyperion Reporting, and tests the latest releases with the Ministry's stake holders.

2.A Offeror must describe its approach to monitoring and maintaining SAP and Oracle ERP systems including the following:

Processes and Procedures,

Tools / Applications,

End User Reports (Standard and Custom),

Tiered Service/Support Levels, and

Escalation Procedures

Monitor local system operations, troubleshoot and resolve operational issues.

Actively monitor the daily operations of all ERP systems.

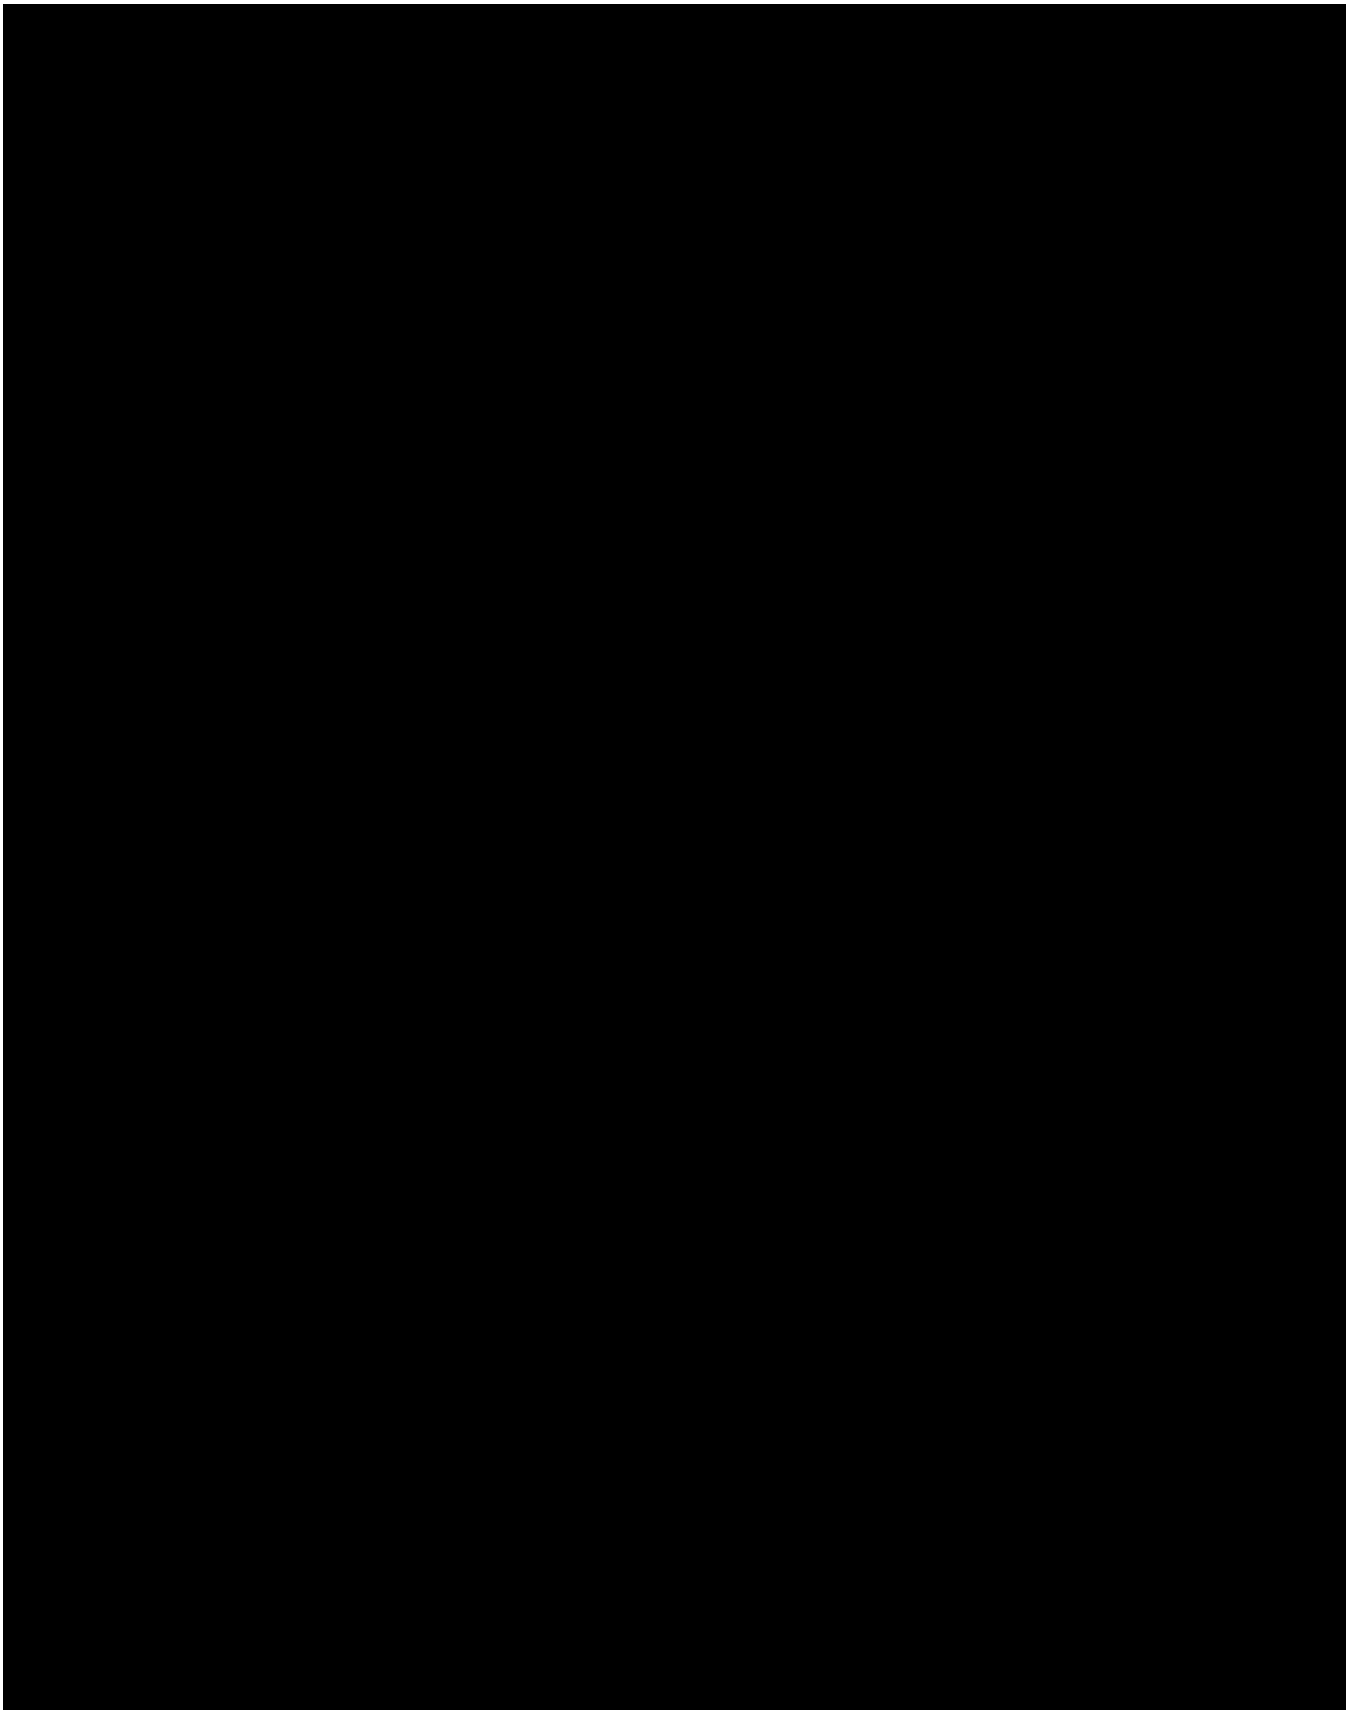
Unisys will provide hosting and operation support services to the Commonwealth of Pennsylvania for SAP and Oracle ERP systems operating on required versions of AIX, Linux, and Windows systems at the Commonwealth's [redacted] and Unisys data centers. Staffing required to perform the operational tasks listed below will be US based Unisys Team personnel both on-site and remote to the data centers.

a. ***Processes and Procedures.*** The processes and procedures for providing SAP and Oracle ERP system managed Compute Services will be documented in the CCPM which will be reviewed and approved by the Commonwealth. The scope of these processes and procedures will be based on the ITIL framework as well as technology best practices for support of Windows, AIX, Linux, Storage, Backup, and Network platforms, including infrastructure support best practices recommended by SAP and Oracle.

b. ***Tools/Applications.*** Unisys has outlined the complete approach to monitoring operations and supporting automated remediation over time from a common enterprise infrastructure platform across all technical towers for the Commonwealth in F3.2.3.2 Site Operations. The following is an overview of how all platforms, including the SAP and Oracle ERP Compute Services environments, will be monitored and managed.

The Integrated Unisys ITSM Management Platform software tools are summarized in **Figure 3.2.4.3-1.**

[redacted]



[redacted]

Figure 3.2.4.3-1 - Unisys ITSM Tools

c. *End User Reports*

The Unisys Team will provide common End User Reports for the ERP systems. The overall approach for end user reports is described in Schedule F, Section 3.2.3.2. Custom Reports are offered by Unisys via the Enterprise Services Catalog

d. Tiered Service/Support Levels

The Commonwealth of Pennsylvania has indicated in Schedule J.2 - Datacenter Service Level Matrix the desired service tiers/support levels. In the design of the Services and the infrastructure needed to deliver this Service to the Commonwealth, Unisys defined the Service Tiers to align to those requirements. A detailed explanation and representative sample of all the Services provided in this structure can be found in the response to Schedule F, Section 3.2.1.5 sub-requirement 1.

Tiered Support Level	Description
Platinum	• Provides 99.999% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB • Requires 3 servers load balanced and geographically dispersed
Gold	• Provides 99.99% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB • Requires 2 servers load balanced
Silver	• Provides 99.9% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB
Bronze	• Provides 99.4% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB

Basic	• Provides 98.5 % Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB

e. Escalation Procedures.

Escalation procedures will be configured with the Unisys ITSM toolset to support meeting SLA's proactively with automated escalations when incidents are approaching SLA violations. Also, there is a proactive escalation process for incident tickets supported by the Unisys service desk which manages all escalations for normal operations. The Unisys PMO will be involved with any critical escalations as a senior Account Manager will be managing the technical response team and Service Desk communications for critical Priority 1incidents. This includes well defined communications and notifications, status updates, and procedures to support restoring services effectively and efficiently. Escalation procedures are part of the Incident Management Process described in F3.2.1.4 Service Desk.

The overall approach for providing daily operations and monitoring including Processes and Procedures, Tools and Applications, End User Reports, Tiered Service / Support Levels and Escalation Procedures is described in Schedule F, Section 3.2.3.2.

2.B Maintain a log for each server detailing hardware / software configuration and critical service operations.

Each server supported by the Unisys Team, including the SAP and Oracle ERP servers, will have their hardware and software configurations tracked within the Configuration Management Database (CMDB) and discovered with Atrium Discovery and Dependency Mapping (ADDM). By using an online CMDB with discovery, the Commonwealth benefits from having consistent data on the configurations which can be reported on an as needed basis versus maintaining a manual configuration log.

2.C Document review of the system logs on a weekly basis to ensure critical system Services are processing without errors.

The Unisys Team will collect each server's system logs and using the log management tool's report management functions, validate that critical system services are operating correctly on a weekly basis. In addition to the weekly review, the log management tool is integrated with the Enterprise System Management (ESM) toolset to automate notification of errors and events identified within the logs. As part of the notification, for system services operating with errors, an incident ticket will be created.

2.D Complete weekly server log indicating which logs were reviewed, date and initial the log.

The Unisys Service Delivery Manager will complete a weekly server log indicating which logs were reviewed, date and initial the log. A copy of this log will be made available to the Commonwealth on the Real-time Dashboard for review. These logs will be retained for one

year.

3 System Backup Systems Review and Audit

3.A Monitor system backup processing on a daily basis.

During Steady State operations for Fully Managed servers, the CommVault backup system processing is monitored automatically through the integration of Nagios collectors which generate incident tickets and automated run book procedures upon backup abnormalities that would threaten data protection. This provides reliability in the daily backup processes by addressing run-time issues.

3.B Review daily backup log for successful completion.

Note failures, and correct the problem.

Create problem record for any abnormal condition and any repairs that have been made.

The Unisys Team's solution automates the monitoring of backup logs. Appropriate support personnel are notified to address failures through the ITSM system and corrective actions are taken. Successful backups are reported daily.

Unisys support staff are trained to identify patterns of failure that result in incidents and, following ITIL V3 processes, escalate these to the status of a problem with applicable workarounds and final resolutions. Repairs are carried out as part of Incident ticket resolution and are logged following ITIL V3 Change Management processes.

3.C An automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.

The Commonwealth benefits from the new Unisys approach to monitoring backup success rates. In most cases simply re-starting a backup results in a successful backup because needed resources are tied up during peak times but become available a short time later. Unisys automates the restart process. If the restarted backup fails then incident tickets are created to alert the Backup support team. Thus critical issues get right to Level 2 and Level 3 support personnel without even involving Level 1 support staff.

This automation of incident ticketing provides the Commonwealth with another advantage. During service delivery reviews the Commonwealth can also review response times to failures that might put critical applications at greater risk. Through the incident severity rating processes Unisys has the ability to adjust severity levels so that incidents that are closer to critical applications can receive prioritized support responses.

The full details for the innovative backup service provided to meet the Commonwealth's data protection needs are included in the F.3.2.4.2 Storage Management.

3.D Offeror must describe its approach to perform an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives.

As part the Transition data gathering activities, the Unisys Team will meet with the Commonwealth to review and audit backup policies, procedures and reports. The activities to perform this review are described in F.3.2.4.2, Requirement 4.

3.E Offeror must describe its approach to identify gaps and potential risks, and how those gaps and risks will be resolved.

During transition and transformation, the Unisys solution includes an extended onsite presence of a CommVault technical manager who aids the Unisys Team in the search for existing gaps and risks, along with potential improvements to the backup systems solution. This technical expert has extensive experience in implementations and in identifying value-add opportunities. The skills of this technical expert are married to the Unisys Team's extensive expertise around current backup operations. Jointly they lead the transition to the more cost effective CommVault backup infrastructure. The Unisys Team, also working with the CommVault technical manager, manages the review and audit of backup clients that move from the legacy system into the CommVault system. During transition a like-to-like set of backup policies, procedures, reports, schedules, retention periods, target directories, and recovery point objectives are built out. The Unisys Team can then present the Commonwealth with opportunities to further optimize the infrastructure to improve the quality of services or provide better cost efficiencies for the same services.

The Unisys Backup team is also able to compare the Backup inventory of clients and policies to the CMDB inventory to locate "negative" gaps in case a server or critical data set is introduced into the Fully Managed environment and, through unlikely process failures, was not also protected with sufficient backup resources. The Unisys governance processes and the processes generated by the Unisys solution's Enterprise Services Catalog are designed to remove such failures. Additionally, a compare of Backup infrastructure inventory from the backup tools perspective with the CMDB can locate a gap should one occur as an additional level of protection

The activities to perform the gap analysis are described in F.3.2.4.2, Requirement 4.

4 Staff, IBM systems, Oracle, and SAP Staff Resumes

4.A Offeror must submit a representative sample of staff resumes typically provided for these positions detailing their experience, education, and certifications.

Provide IBM, SAP, and Oracle trained staff holding current manufacturer certifications for hardware and software technical support.

The Unisys support team is composed of personnel who maintain education and certifications in a variety of infrastructure platforms including AIX, Windows, [redacted] and EMC and IBM Storage. Section 5.0 provides resumes for key personnel and representative personnel who have IBM, SAP, and Oracle training or certifications.

4.B Staff will interact with vendor support Services when needed.

As part of ongoing operations, the Unisys support team will have access to SAP, Oracle, IBM, and other vendor support services to assist with resolution of major incidents and problems. The Unisys Team maintains partnerships with Oracle, SAP, IBM and EMC and will use these partnerships as needed to provide a high quality service for the Commonwealth ERP infrastructure.

4.C Provide Commonwealth with a resume or CV for each operational staff member assigned to this engagement.

Representative resumes for support staff responsible for ERP hosting services can be found in Section 5.0 Personnel.

4.D A copy will be maintained on Offeror file including required background checks and clearances as required.

A copy of the resumes as well as the results of the background checks will be maintained by the Unisys Team as part of the management service. The approach for managing resumes and background checks is described in Section 5.0 Personnel.

5 Service Desk, Tiered Support

5.A Offeror must describe its approach to providing and maintaining different tiered levels of ERP (SAP & Oracle) support.

Provide cost effective operational and technical support for the computing platform.

By using a combination of services based upon the Windows, Linux, AIX, Security and Storage services proposed for the Commonwealth's environment and flexible options for the ERP systems, the Unisys Team will provided a cost effective service for both the infrastructure components and the operational and technical support.

The tiers of support for ERP services are described in requirement 2.A above.

5.B Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.

The ERP hosting services support will be available and accessible to Service Desk and authorized Commonwealth personnel. The service management processes for Service Request, Incident and Change Management will be the primary methods for requesting Level 2 or 3 support for the ERP systems, Agencies however will also have access to the support teams through the Agency Account Manager.

The activities and interactions between the Service Desk and Level 2 and 3 support are described in Schedule F, Section 3.2.3.2.

5.C Provide a tiered level of support Services (e.g. Gold, Silver, and Bronze).

As part of the overall infrastructure support model, the ERP hosting service will support the multiple tiers of support requested for the Fully Managed and Managed Only services, including Platinum, Gold, Silver, Bronze, and Basic.

The tiers of support for ERP services are described in requirement 2.A above.

6 Monitor Network Connectivity, Toolset

6.A Ensure network connectivity, and consistent system response times.

Offeror must describe its real-time monitoring approach and toolset to provide and maintain network availability and performance.

Utilize automated system management tool(s) to ensure real-time monitoring and notification of server availability and response times. Stop / Start times of servers will be a source of input for SLA measurements.

Identify tool set(s).

Offeror must identify tools it uses to support network availability and performance.

Unisys will provide event management solutions to provide network connectivity and consistent system response times. Unisys will utilize automated system management tool(s) to provide real- time monitoring and notification of server availability and response times including the stop and start times of servers to support SLA availability measurements.

The tools are indicated below and the enterprise Event Management's overall approach is described in Schedule F, Section 3.2.3.2 Site Operations.

The following tools are the major toolsets to support network and system event management and monitoring.

Monitoring Software	Managed Configuration Items (CI's)	Monitoring and Management Functionality
SolarWinds	LAN Devices including: • Switches • Routers • Load Balancers • Firewalls	Provides deep network device availability and performance monitoring, DNS, IP address management, network configuration management, and network traffic bandwidth throughput monitoring
Nagios	Microsoft servers, databases, network devices, and storage hardware. [redacted] unisys.com	Provides a standard set of availability, performance and critical service monitors developed by Unisys for monitoring across infrastructure items including: • Servers • Network devices (switches, routers, load balancers)

		• Storage devices • Middleware • Applications (Exchange, Citrix XenApp, etc.)

7 Patch Management

7.A Ensure server operating systems are maintained with the current system patch level, based on the Services provided by the server.

Offeror must describe its approach to patch management including analysis, communications, schedule (change records) and installation process.

Implement a Patch Management Program to ensure the timely application of updates on all infrastructure platforms in accordance with Commonwealth IT policy guidelines.

The Unisys technical support team will work with the Commonwealth agencies to determine patch policies, such as the Commonwealth ITBs, that should be applied to the ERP environments. As ERP application have unique requirements for some operating system and other software patches, the updates and advisements provided by SAP and Oracle will be included as part of the overall approach for patch management for the systems supporting the ERP environment.

The overall approach to patch management including analysis, communications, scheduling via change management and installation processes is described in Schedule F, Section 3.2.3.2 Site Operations.

7.B Offeror must describe its approach for testing and validating updates to the OS and 3rd Party software that it supports.

Unisys approach to testing and validating updates to the compute system' OS and 3rd party software in the SAP and Oracle ERP environments follows the Release Process for changes into ERP environments. The Release Process includes:

- Change ticket approvals
- Test planning and accepted test results
- Release and deployment planning including release back-out plans
- Release testing for risky deployments
- Early life cycle support to help provide a successful deployment
- Release back-out for failed release

The overall approach for testing, as part of patch management, various OS and 3rd Party software, when necessary, is described in Schedule F, Section 3.2.3.2 Site Operations.

7.C Offeror must describe its approach to communicating unscheduled and scheduled outages, including its escalation process.

The Unisys Team communicates unscheduled outages by sending notifications to key stakeholders for the Commonwealth, individual Agencies, Unisys Team, and Third Parties depending on the outage. This will be through email, voice, Services Portal and Remedy broadcast capabilities. The same communications will be used for scheduled outages with additional communications in forward schedules of change reports. The communications procedures will be documented within the CCPM.

Escalations for unscheduled outages are handled through the standard processes for managing incidents. Unisys service desk will manage all incidents and manage escalation communications to key Commonwealth/Unisys/Third Parties personnel. The Unisys ITSM application will also be configured to escalate incident tickets based on incident priorities and SLAs for response and resolution.

The overall escalation communications approach is described in Schedule F, Section 3.2.3.2 Site Operations.

7.D Analyze monthly service patches and determine which patches need to be applied, by server type.

As server OS patches are released from the respective manufacturers, the Unisys Team will validate the patches monthly with the ERP application team and check the SAP and Oracle support sites. As the ERP manufacturers require additional time to validate if a patch can impact the application, additional time before installing the patches may be required. Patches will be recommended based on the servers function. The testing and planning for rollout of the patches will follow the release process as defined in requirement 7.C.

The overall approach to analyzing patches is part of the patch management process described in Schedule F, Section 3.2.3.2 Site Operations.

7.E Create a change record, log the update in the server log, and install based on server maintenance schedule.

Each patch window will be processed through change management and performed during the approved change schedule. After the patch has successfully been applied, the CMDB will be updated.

The overall patch management process including the use of change management is described in Schedule F, Section 3.2.3.2 Site Operations.

8 User Account Management

8.A Provide certified system administration staff to create and maintain the registration of profiles, associated groups, and the security permissions required to service the approved client base of the system and application.

Offeror must describe its administration/support approach and provide representative resumes.

The Unisys Team's Windows, Linux and AIX support teams will provide user, profile, group, and security permission management on individual Windows, Linux and AIX servers. For Windows servers operating on an Active Directory domain, Unisys will work with Commonwealth Active

Directory support team to request changes in the Active Directory environment to support user, profile, group or security permissions changes.

Unisys recommends that the Commonwealth agency user account teams submit requests to have OS level user account changes made by the Unisys Team. However, the Commonwealth's authorized personnel performing agency user account management for the ERP application and require OS level user account changes can be provided with the appropriate privileges to make the associated user account changes.

All changes for user account management will be initiated through the service request and change management process and require an approved change record for implementation. The process for user account management will be documented within the CCPM.

User Account Management support will be provided by personnel with similar skills and experience indicated by the resumes located within Section 5.0 Personnel.

9 Plan, Procurement Planning

9.A Provide program and process to refresh the hardware at asset end-of-life, and when upgrades are needed to meet anticipated growth in utilization.

Offeror must describe its program and processes for upgrading systems.

Technology Refresh Plan

As part of the overall architecture support, the Commonwealth's environment will be reviewed on a quarterly basis to identify technology, services or components which require replacement to maintain the Commonwealth's business needs and associated service levels. The overall technology refresh plan will be documented in Key Deliverable D-03. This plan will be used for all Unisys supported environments including the Commonwealth ERP systems.

The overall Technology Refresh approach is described in Schedule F, Section 3.2.1.5.1 .

Capacity Management and Forecasting

The Commonwealth ERP systems will be monitored and reported from the Event Management Platform [redacted] and from the [redacted] t to support the ERP systems Capacity Management requirements. As part of the Capacity and Performance Management processes, , the performance and capacity reports will be generated and reviewed with the Commonwealth on a regular basis.

During transition the SAP and Oracle compute environments' capacity requirements will be assessed as part of the establishment of the Performance and Capacity Management Processes described in Schedule F, Sections 3.2.2.6 and 3.2.2.2.

10 SLA Reporting

10.A Collect actual system availability, utilization and response time data.

Offeror must describe its processes and toolset for monitoring and maintaining service levels.

Unisys will provide a SLA data collection and reporting process to support ERP Application

SLA's that will be established when Commonwealth agencies request services in the Enterprise Services Catalog to map infrastructure to ERP applications. Upon completion of the requested services, SLA's can be established for each ERP application's supporting infrastructure, based on requested :

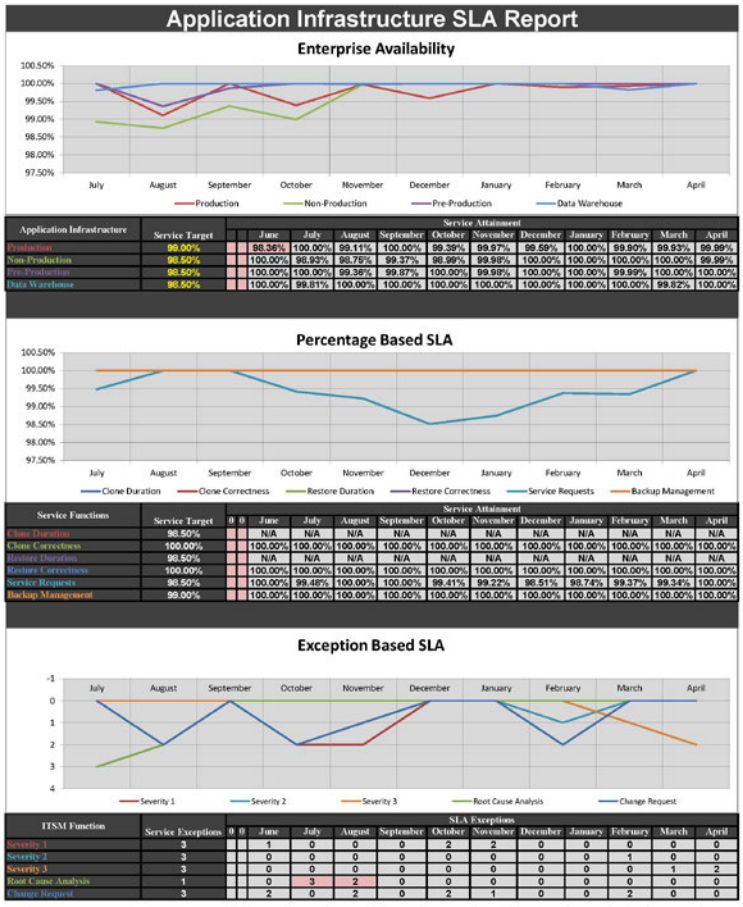
- System Availability
- Utilization
- Response Time

The SLA data will be tracked using the Service Level Management tool. The SLA Reporting solution is described in Schedule F, Section 3.2.1.2.

10.B On a monthly basis, Offeror must create a SLA report for the Commonwealth and Vendor Management teams.

Offeror must provide a representative sample of its SLA reports for ERP hosting Services.

Service Level reports will be generated on a monthly basis. These reports will be made available through the Services Portal via the dashboard and reviewed with the Commonwealth. An example of the monthly report is shown in the figure below. In addition to the monthly report, the Unisys Team is implementing an online operational dashboard via the Services Portal. An example of the dashboard is located in Schedule F, Section 3.2.3.2.



Application Infrastructure	Service Target	Service Attainment										
		June	July	August	September	October	November	December	January	February	March	April
Production	99.00%	98.36%	100.00%	99.11%	100.00%	99.39%	99.97%	99.59%	100.00%	99.90%	99.93%	99.99%

Figure Application Infrastructure SLA Report

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,
- Improve client satisfaction,
- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,

- Quality Plans: transition and steady state service delivery
- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

11 CI Service Risk

11.A Reduce service risks.

Offeror must provide methods to eliminate or mitigate service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

12 CI Service Quality

12.A Improve service quality.

On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

13 CI Client Satisfaction

13.A Improve client satisfaction.

Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

14 CI Service Transparency

14.A Ensure service transparency.

Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

15 CI Reduce Cost of Service

15.A Improve/reduce cost of service.

Offeror must provide examples of ERP Hosting initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

A few examples of ERP Hosting – SAP/Oracle support and initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections are outlined below:

Disk-based Backup Strategy:
Unisys leverages EMC's Avamar and Data Domain products to facilitate disk-based backups and data replication to an offsite location. This eliminates cost and unreliability associated with tape media and significantly expedites recovery time in the event of a disaster. The implementation of a disk to disk with data de-duplication strategy for IES resulted in a significant reduction in backup and restore times for the extremely large, rapidly growing SAP data store. At the time that IES migrated to the DPH, the data store in SAP was 5 TB. This data store had previously been backed up across 32 tape drives taking close to five hours to back up. This left IES exposed to issues with tape media that would prevent the ability to restore effectively with the implementation of disk-based backup, the SAP data store has completed backup in less than four hours, even with peaks of 9 TB size.

Flexible Capacity
As part of the migration to virtual infrastructure and a services based model, the California State University Higher Education PeopleSoft environment added the capability to use and adjust their compute services to meet the fluctuations in demands during key periods during the year, such as, class enrollment, application cycles and other peak usage while also reducing the overall physical footprint of the system.

Unisys Team Experience

Unisys Team Experience is located above in Requirements 1.B and 1.C.

Benefits to the Commonwealth

By providing an integrated service management approach for all compute services, the Unisys Team will enable the Commonwealth with common processes and tools to maintain the ERP environments consistently and cost-effectively. In addition, the Unisys Team will work with the Commonwealth's ERP teams to optimize their use of the new Infrastructure as a Service to support the fluctuations with peak load which occur during the year. This will support the Commonwealth's need to support the business while also managing the environment's overall capacity.

The Commonwealth can leverage additional technical services including SAP, Oracle and other technical skills via the Enterprise Services Catalog to support ongoing operations or unique projects. The Enterprise Services Catalog also includes the option for application monitoring services for additional monitoring capability.

3.2.4.4 UNIX Support – AIX / Linux

The Unix Support – AIX / Linux service will provide hosting and operational support Services for AIX and Linux server systems. The systems will be located in the Offeror's datacenters. Offeror must support various versions of the AIX and Linux operating systems. The number of staff members required to perform the operational tasks listed below will be determined by the Offeror.

Exhibit B.2 - Commonwealth Owned DPH IT Assets (see PLCB Oracle systems)

Requirements		Describe Compliance

1.	Monitor local operations, troubleshoot and resolve operational issues.
	
	Actively monitor the daily operations of all AIX / Linux systems. Assume responsibility for all master and subordinate console functions. Issue operator commands to control all In-Scope platforms. Assume the responsibility for and perform all console operations. Monitor the performance of online interactive traffic and take appropriate action to resolve online-system-related incidents and/or problems, including escalating (as appropriate) the incident and/or problem to the proper Level 2 Support group. Monitor the transmission of files between the
		Offeror must describe its UNIX/Linux monitoring, operations and troubleshooting approach Commonwealth including the following:
		
		• Processes and Procedures
		• Tools / Applications
		• End User Reports
		  o Standard
		  o Custom
		• Support Levels
		• Escalation Procedures

	Commonwealth and any other parties as designated by Commonwealth. Provide operational support for data transmission (send/receive), consistent with commercial or agency standards. Manage, maintain, monitor, and control online and batch process, both scheduled and unscheduled (including on-request processing). Maintain a log for each server detailing hardware / software configuration and critical service operations. Review the system logs on a weekly basis to ensure critical system Services are processing without errors. Document review of the system logs on a weekly basis to ensure critical system Services are processing without errors. Complete weekly server log indicating which logs were reviewed, date and initial the log. Maintain and update the operational documentation for all operations procedures and Services.	
2.	Provide a review and analysis of UNIX system performance/capacity to determine if current performance/capacities are sufficient to support the needs of the UNIX stakeholders.	Offeror must perform an initial review and audit of the current UNIX usage, procedures and reports and provide an analysis of the current UNIX usage, processes and reports currently being supported. Offeror must document its review and audit findings and recommendations.
3.	Production Control and Scheduling (including batch processing) Describe the process of scheduling batch jobs within Commonwealth agency defined windows to achieve maximum performance as long as	Offeror must describe its approach to supporting the batch processing needs of the Commonwealth including the following: • Processes and Procedures • Tools / Applications

	required batch completion times are met. A cross platform (e.g. Window, Unix, and Mainframe) system will be required. Where practicable, provide for automated scheduling of batch work and processes including backups. Commonwealth agencies have a number of applications that require scheduling software / batch processing software (i.e. $Universe, SAP certified, etc.), this software is heavily integrated into many of these systems. Develop, maintain, and utilize an emergency contact list and escalation procedures to resolve abnormally ended jobs. Resolve abnormally ended jobs caused by conditions external to production programs. Repair abnormally ended jobs when possible and perform job restarts in accordance with the Service Management Manual. Check job outputs and print queues, and change job priorities. Notify Commonwealth agencies in accordance with the Offeror's proposed notification procedures in the event that applications do not execute properly.	• End User Reports o Standard o Custom • Tiered Service & Support Levels • Escalation Procedures Offeror must describe how it will operate and maintain current scheduling/batch software tools.
4.	Monitor system backup processing on a daily basis. Review daily backup logs for successful completion. Note failures, and correct the problem. Create	Offeror must describe its approach to performing an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives.

	problem record for any abnormal condition and any repairs that have been made. An automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.	Offeror must describe its approach to identifying gaps and potential risks, and how those gaps and risks will be resolved.
5.	Provide AIX and Linux trained staff that hold current manufacturer certifications for hardware and software technical support. Provide technical advice and support to the Application Development and Maintenance (ADM) and Database Administration (DBA) staffs, as required. Post award; provide Commonwealth with a resume or CV for each operational staff member assigned to this engagement. A copy will be maintained on Offeror file.	Offeror must submit a representative sample of staff resumes typically provided for these positions detailing their experience, education, and certifications.
6.	Provide cost effective operational and technical support for the computing platform. Provide platform level operational and technical support for the computing platform. List the service levels for the various service tiers that can be provided. See Schedule J.1 Datacenter Service Level Management for the definitions of the expected options. Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.	Offeror must describe its approach to supporting the operational and technical support needs of the Commonwealth.

7.	Ensure network connectivity to COPANET, and consistent system response times. Utilize automated system management tool(s) to ensure real-time monitoring and notification of server availability and response times. Stop / Start times of servers will be a source of input for SLA measurements.	Offeror must describe its real-time monitoring approach and toolset to provide and maintain network availability and performance. Offeror must identify tools it uses to support network availability and performance.
8.	Ensure server operating systems are maintained with the current system patch level, based on the Services provided by the server. Analyze monthly service patches and determine which patches need to be applied, by server type. Create a change record, log the update in the server log, and install based on server availability schedule. Change requests will be approved and authorized using the change management process. Notify the Commonwealth of any scheduled or unscheduled service interruptions. Implement a Patch Management Program to ensure the timely application of updates on all infrastructure platforms in accordance with Commonwealth IT policy guidelines.	Offeror must describe its approach to supporting the software patch needs of the Commonwealth. Offeror must describe its approach to testing and validating updates to the OS and 3rd Party software that it supports. Offeror must describe its approach to communicating unscheduled and scheduled outages, including escalation process.
9.	User Account Management Provide certified system administration staff to create and maintain the registration of profiles, associated groups, and the security permissions required to service the	Offeror must describe its approach to supporting the needs of the Commonwealth.

	approved client base of the system and application.	
10.	Procurement Planning Provide program and processes to refresh the hardware at asset end-of-life, and when upgrades are needed to meet anticipated growth in utilization.	Offeror must describe its approach to supporting the needs of the Commonwealth.
11.	SLA Reporting Collect actual system availability, utilization and response time data. On a monthly basis, create a Service Level Agreement report for the Commonwealth and Vendor Management teams.	Offeror must describe its approach to supporting the needs of the Commonwealth.
12.	The Offeror must provide Software License Management.	Offeror must describe solution and approach to meet this requirement.
Continual Process Improvement		
13.	Reduce service risks.	Offer to identify methods and approaches to eliminate or mitigate service risks.
14.	Improve service quality.	On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.
15.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
16.	Ensure service transparency.	Offeror must identify methods and practice to ensure service transparency, providing visibility into service execution.
17.	Improve/reduce cost of service.	Offeror will provide examples of UNIX Support initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or

		exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Commonwealth has a large investment in the development of mission critical applications on the IBM AIX platform across multiple agencies. These applications often require the performance, reliability and stability inherent to the Unix platform. Unisys and its partner, IBM, recognizes the strategic importance of this platform, and of the services needed to confirm this platform is available. To this end, the Unisys Team will perform all services around the AIX operating system, and underlying Flex Systems pSeries hardware platform. The Unisys team management of the AIX platform provides the Commonwealth with numerable advantages that other vendors can't match. Amongst these advantages are the reduction of risk. The Unisys team manages hundreds of thousands of AIX systems globally for customers across our portfolio. A large percentage of these AIX systems house mission critical applications. Leveraging the expertise of the Unisys team with the proposed hardware and software platform is a natural fit that reduces risk at every level, from infrastructure through the operating system to the application layer.

Linux is an important platform, increasingly becoming the platform of choice for database servers, internet and intranet servers, and infrastructure servers. Its influence and importance in the data center is growing yearly, and we expect this to become an even more important strategic platform for the Commonwealth. Unisys will provide support for the Linux platform across the Commonwealth, and will apply the processes, procedures and experience gained on other accounts maintain the platform. Additionally, through a unified framework of common IT Service Management tools and ITIL V3 aligned processes, Unisys will bring unique and innovative approaches to enterprise management to gain efficiency and increase reliability of this strategic platform.

1 AIX and Linux Operations Approach

1.A Offeror must describe its UNIX/Linux monitoring, operations and troubleshooting approach Commonwealth including the following:

The Unisys Team will provide hosting and operation support services to the Commonwealth of Pennsylvania for required versions of AIX and Linux systems at the Commonwealth [redacted] and Unisys data centers. Staffing required to perform the operational tasks listed below will be US based Unisys Team personnel both on-site and remote to the data centers.

Processes and Procedures

The processes and procedures for providing AIX/Linux infrastructure managed services will be documented in the CCPM which will be reviewed and approved by the Commonwealth. The scope of these processes and procedures will be based on the ITIL framework as well as technology best practices for support of AIX/Linux platforms.

Processes and procedures will be developed for the following areas:

- Server technology support – build and maintain for hardware, software, connectivity
- Vendor management – technical support, maintenance coverage, and remote access capability
- Platform specific procedures – customer notification, technical support escalations patching process/schedule, security monitoring, and log reviews

Tools / Applications

The Unisys Team has outlined the approach to monitoring operations and supporting automated remediation over time from a common enterprise infrastructure platform across all technical towers for the Commonwealth in F3.2.3.2 Site Operations.

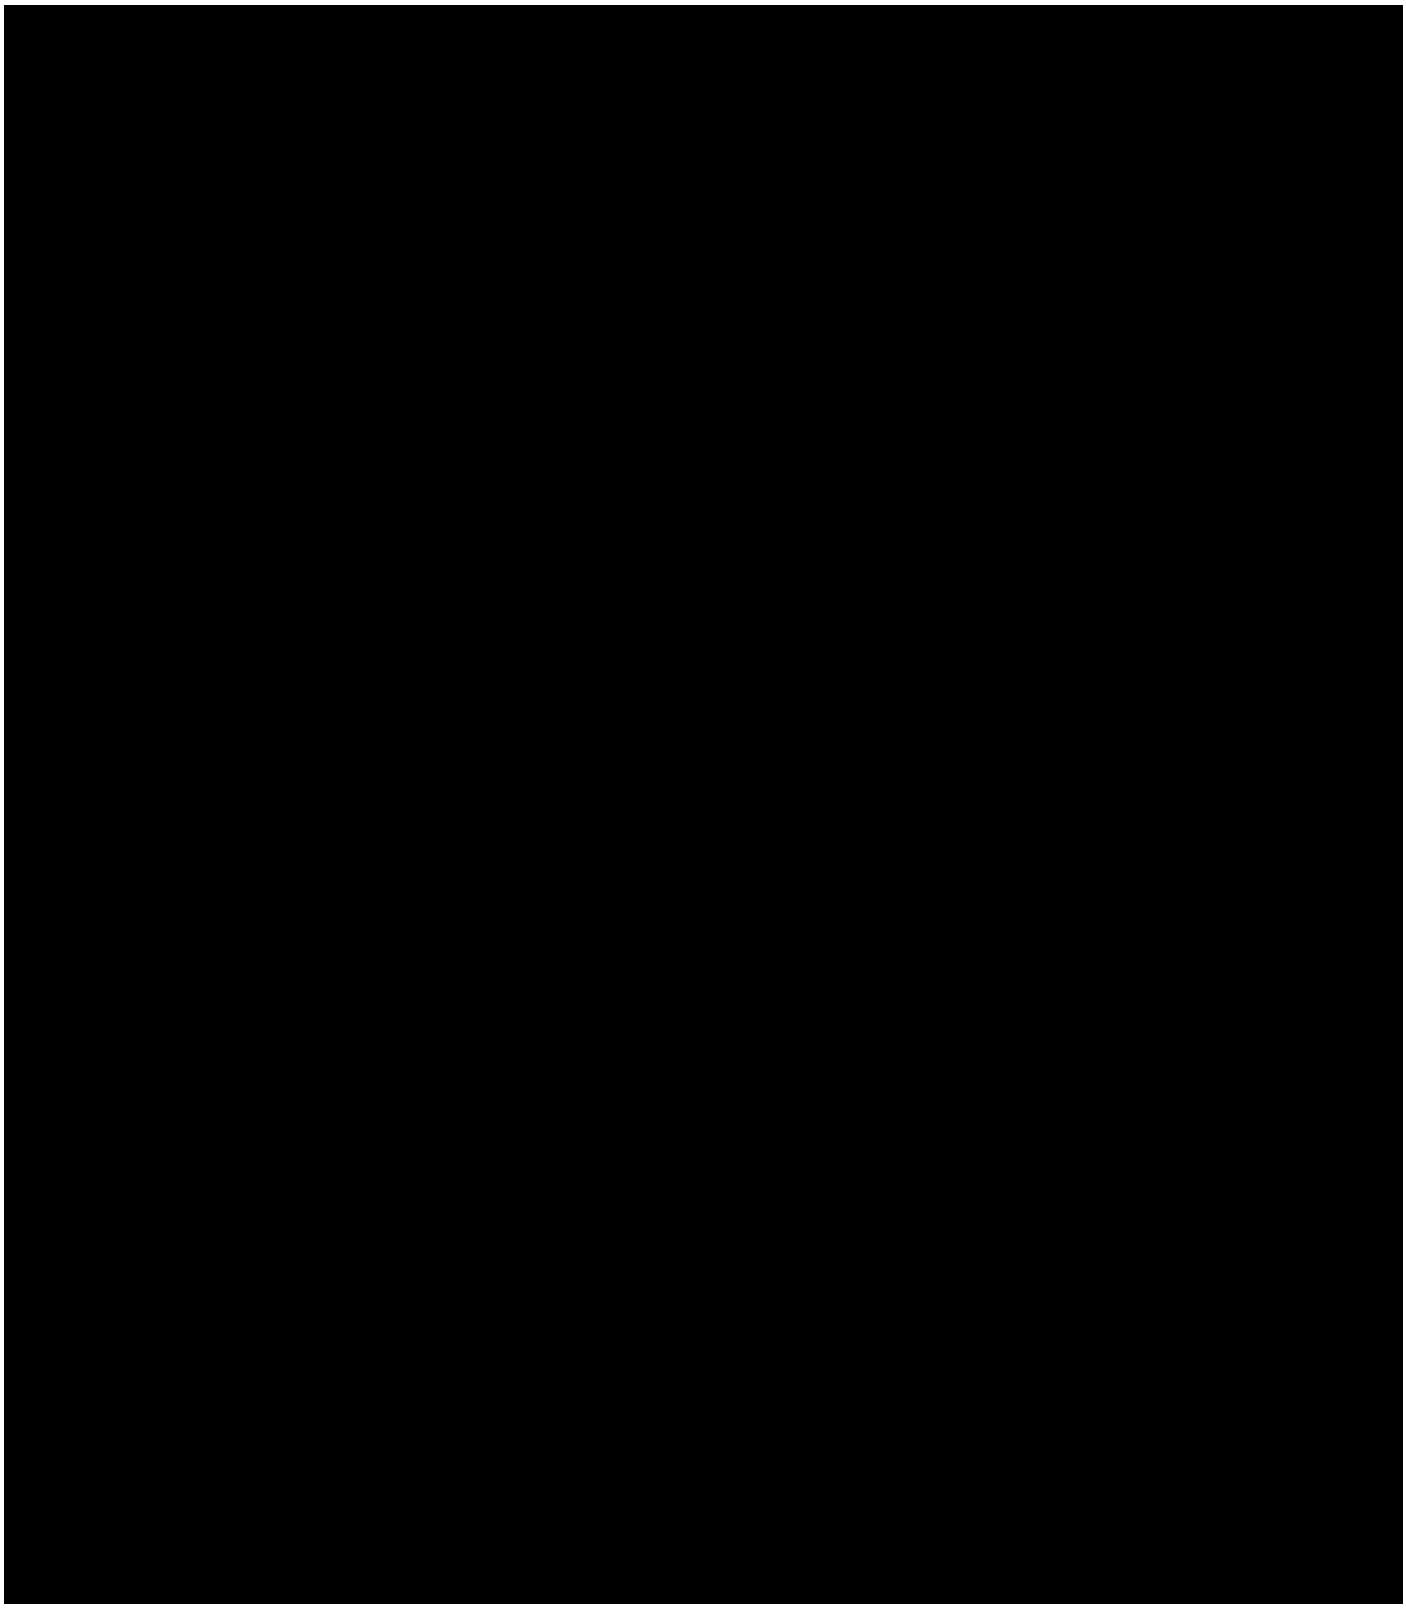
The Unisys Team will also implement, support, and operate a comprehensive and integrated Information Technology Service Management (ITSM) Architecture dedicated to the cross functional process support for all services provided to the Commonwealth for this contract. The proposed ITSM Architecture, shown in **Figure 3.2.4.4-1**, will provide an effective and efficient operational platform to support the Commonwealth's agencies application infrastructure for the following ITIL V3 (Information Technology Infrastructure Library) Service Management Processes.

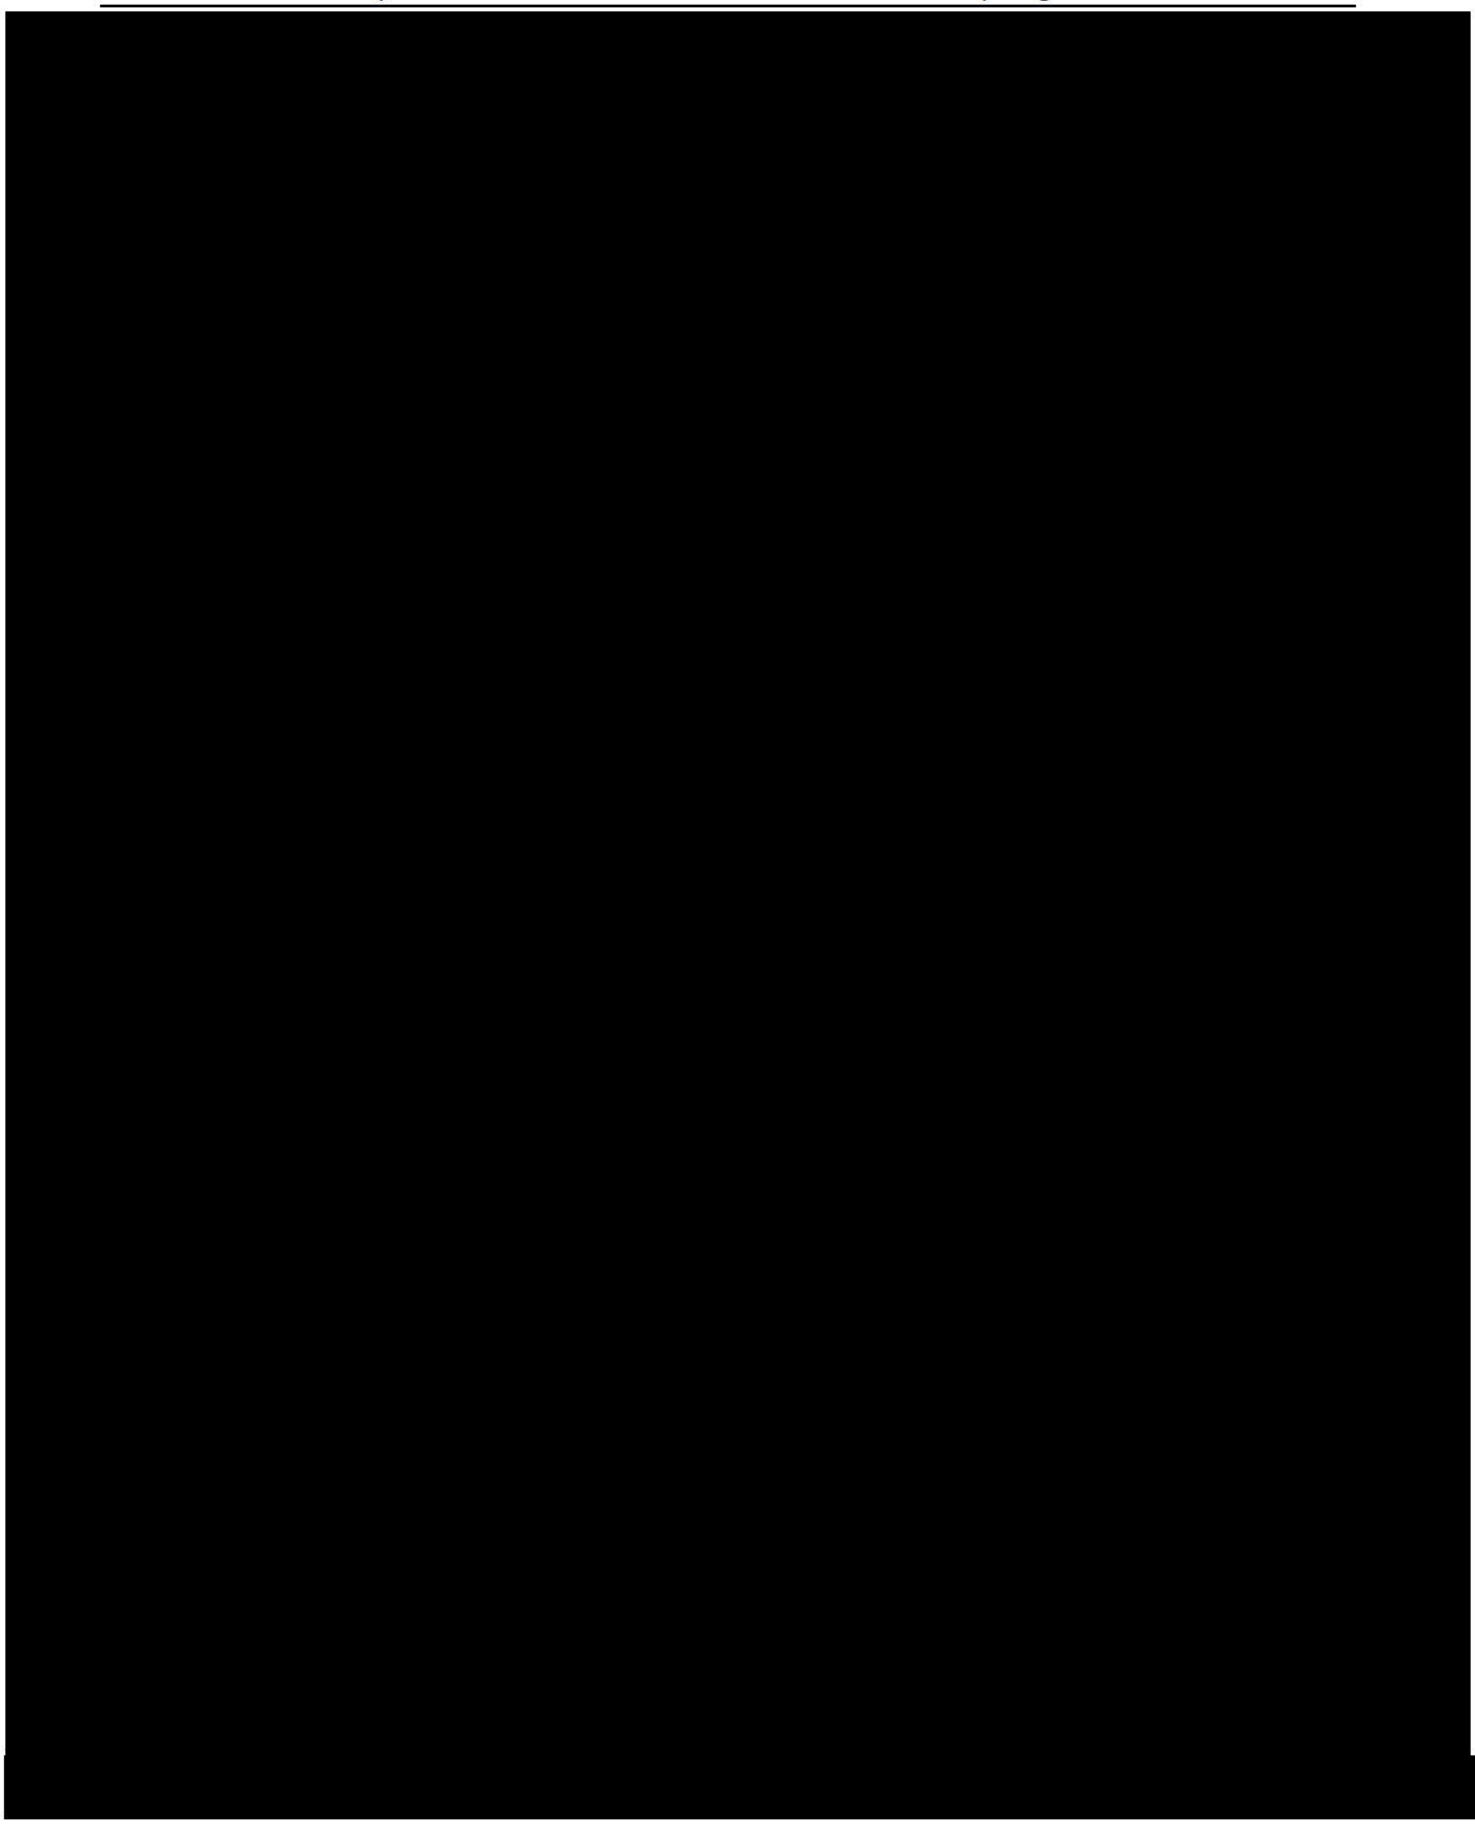
[redacted]

Figure 3.2.4.4-1 - Proposed Unisys ITSM Integrated Architecture.

The Integrated ITSM Management Platform software tools are summarized in the **Figure 3.2.4.4-2**.

[redacted]





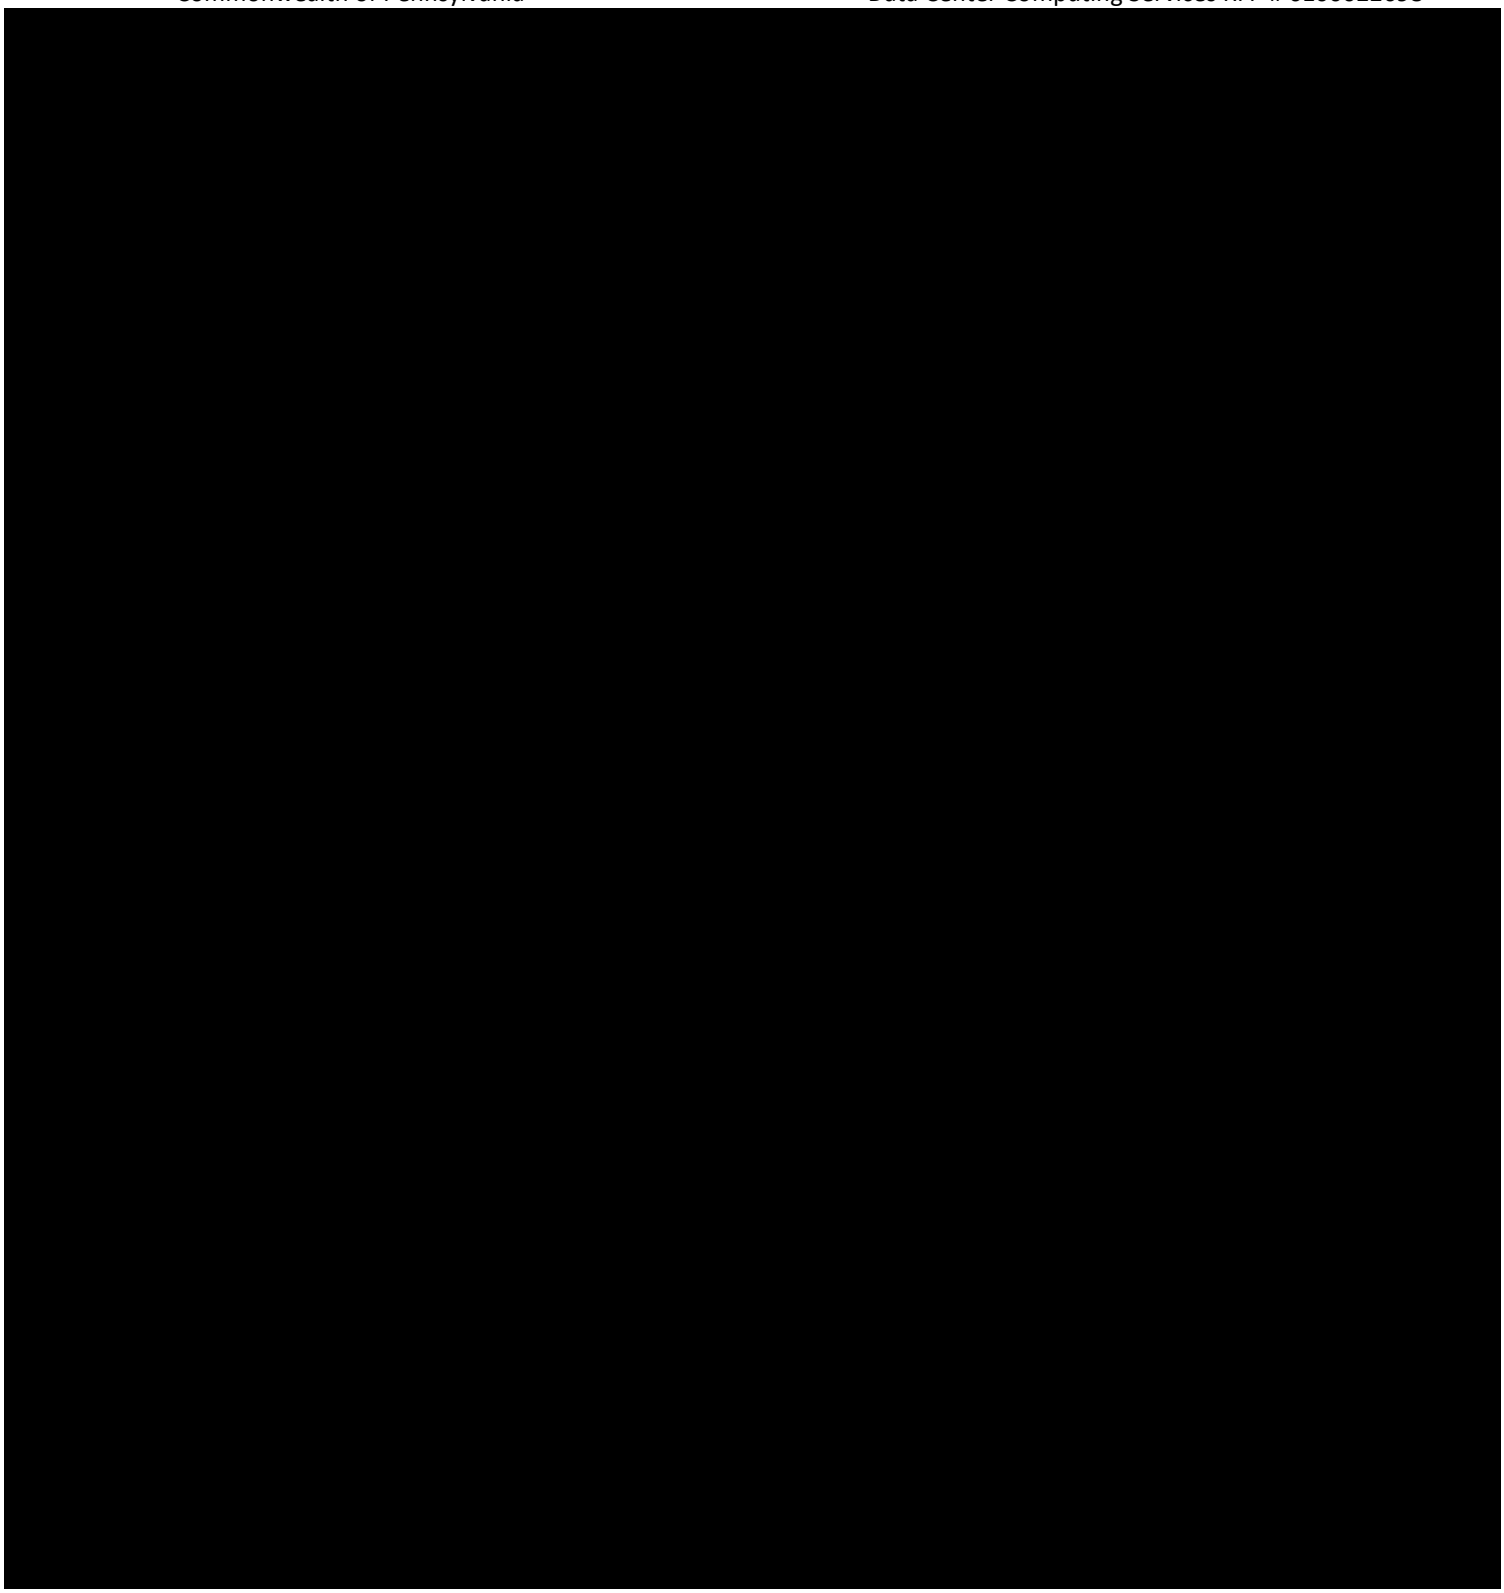


Figure 3.2.4.4-2 - The Unisys Team's ITSM Tools

The Unisys Team will assess the Commonwealth's current ITSM toolsets during transition. Assessment results determine which tools will be supported within this overall target ITSM proposed architecture, replaced, or eventually migrated to the target environment ITSM tools shown in **Figure 3.2.4.4-2**. Some of the tools that will be evaluated and assessed during transition include:

- NIMS
- IBM Systems Director

The resulting architectural decisions will be reviewed and approved by the Commonwealth's agencies. Some identified tools will continue to offer the functionality they currently providing, but will be integrated into the overall ITSM proposed architecture.

End User Reports (Standard and Custom)

Standard Reports are summarized in Schedule F, Section 3.3.2. Examples of standard IT Service Management (ITSM) status reports for critical processes include:

- Change Management
- Incident Management
- Problem Management

Custom Reports are offered by Unisys via the Enterprise Services Catalog.

Support Levels

In order to provide customization and flexibility to Commonwealth agencies, the Unisys Team offers tiered levels of managed services for AIX and Linux servers. These tiers offer various levels of administrator experience, on-site coverage and responsiveness SLA's. The tiers are designed to allow for flexibility to manage mission critical as well as development or

demonstration environments.

The following table highlights the available tiers and associated capabilities.

Tiered Support Level	Description
Platinum	• Provides 99.999% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB **with relationships** • Requires 3 servers load balanced and geographically dispersed
Gold	• Provides 99.99% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB **with relationships** • Requires 2 servers load balanced
Silver	• Provides 99.9% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB **with relationships**
Bronze	• Provides 99.4% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB
Basic	• Provides 98.5 % Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB **with relationships**

Escalation Procedures

As part of the communication management plan, the Unisys Team will work closely with the Commonwealth of Pennsylvania to structure effective escalation procedures. These procedures will be developed to provide guidance for escalation activities in a number of categories including incident management service response, management notification, and service quality.

For incident management service response, escalation procedures will define the schedule, criteria, methods, and participants for the escalation of issues or incidents impacting computing services to the Commonwealth. The primary objective of this escalation is to assign appropriate vendor resources with the necessary skills to the incident process to restore service. The procedure will include steps to contact approved agency stakeholders to provide initial notification and to engage in joint problem determination/resolution activity as appropriate.

Escalation procedures will also include provisions to notify Commonwealth and Vendor

management staff of major service impacting events as well as to provide continuous updates are provided until the incident is resolved. In order to provide an easy method for the Commonwealth to notify the vendor of service quality concerns, the escalation procedures include the process and contacts to register the service quality issues for review and action.

For more details, including the specifics of the escalation process, please see Schedule F, Section 3.2.3.2 Site Operations.

Monitor local operations, troubleshoot and resolve operational issues.

Actively monitor the daily operations of all AIX / Linux systems.

The Unisys Team will provide hosting and operation support services to the Commonwealth of Pennsylvania for required versions of AIX and Linux systems. We will monitor the daily and local operations through the common IT Service Management platform. For details about tools and processes, please see Schedule F, Section 3.2.3.2 Site Operations.

1.B Assume responsibility for all master and subordinate console functions.

The Unisys Team will assume responsibility for all master and subordinate console functions. The Unisys Team is committed to improving service while reducing costs. To achieve this, the Unisys Team will utilize automation techniques whenever possible to enhance all master and subordinate console operations and to proactively monitor the mainframe and server environments. These automation techniques have been used and proven in delivery of our services to the Commonwealth and other clients.

1.C Issue operator commands to control all In-Scope platforms.

The Unisys Team issues console operations commands within the current contract. This will continue under the new contract. The Single Point Operations (SPO) workstation consoles and Accessory Manager sessions are used for the responding to or issuance of commands to the AIX and Linux systems.

1.E Assume the responsibility for and perform all console operations.

The Unisys Team will assume the responsibility for the console and perform all console operations for AIX and Linux utilizing the tools as detailed above.

1.F Monitor the performance of online interactive traffic and take appropriate action to resolve online-system-related incidents and/or problems, including escalating (as appropriate) the incident and/or problem to the proper Level 2 Support group.

The Unisys Team will monitor online interactive traffic and provide necessary troubleshooting support.

To support the operational and technical needs of the Commonwealth, the Unisys Team will

deploy incident, problem and change management processes that define the flow of support from the Service Desk up through Level 2 and Level 3 support. These processes are closely aligned to the common IT Service Delivery platform. For more detailed information on these processes, please refer to Schedule F, Section 3.2.3.2.

1.G Monitor the transmission of files between the Commonwealth and any other parties as designated by Commonwealth.

Provide operational support for data transmission (send/receive), consistent with commercial or agency standards.

The AIX and Linux platforms perform a high number of transmission files between the Commonwealth and other parties. Tools are provided to perform the file transfers using Commonwealth standards. The monitoring of file transfers has been established with the agencies and is effective to support the requirements to date. During Data Gathering Unisys will review with the Commonwealth which of the file transfers should be monitored by the Unisys Team.

Using monitoring of the scheduling tools through the tool consoles and operating system console messages, the Unisys Team will provide operational support. Should a transfer fail the Unisys Team will respond to messages or escalate to the appropriate support organization.

1.H Manage, maintain, monitor, and control online and batch process, both scheduled and unscheduled (including on-request processing).

The Unisys Team will provide batch monitoring activities using a combination of on-site and remotely located personnel (batch operators) and tools. The Unisys Team monitors the batch processing environment and provides alerts to the agencies via established processes of success and failure. The Unisys Team today provides monitoring and alerting functions. Additional services to procure the Unisys Team resources for full batch creation, scheduling and troubleshooting are available via the Enterprise Services Catalog.

1.I Maintain a log for each server detailing hardware / software configuration and critical service operations.

The Unisys Team will maintain a log for each server detailing hardware/software configuration and critical service operations using the Configuration Management Database (CMDB) and automated discovery and dependency tool. By maintaining the log for each server as an entry within the CMDB, the Commonwealth and the Unisys Team's Systems Administrators have access detailing all pertinent server information, including but not limited to hardware/software configuration, critical service operations, past errors that impact critical system Services, and major outage information. Reports from the CMDB are available to the Commonwealth via the online Services Portal.

1.J Review the system logs on a weekly basis to ensure critical system Services are processing without errors.

Document review of the system logs on a weekly basis to ensure critical system Services are processing without errors.

The Unisys Team actively monitors the system logs for processing errors. For system services operating with errors, an incident ticket will be created to track until the error is corrected. Tickets are driven through the Incident Management system described in Schedule F 3.2.1.4 "Service Desk". Additionally the Unisys Team reviews the system logs on a weekly basis and will document the reviews. The Unisys Team will collect AIX and Linux system logs and output from the OpCon and BL/Sched scheduling tools and using the report management functions within these tools, validate that critical system services are operating correctly.

1.K Complete weekly server log indicating which logs were reviewed, date and initial the log.

The Unisys Service Delivery Manager will complete a weekly server log indicating which logs were reviewed, date and initial the log. A copy of this log will be made available to the Commonwealth on the Services Portal for review. These logs will be retained for one year.

1.L Maintain and update the operational documentation for all operations procedures and Services.

The processes and procedures for providing AIX and Linux infrastructure operational support will be documented in the CCPM which will be reviewed and approved by the Commonwealth.

2 Systems, Review and Audit UNIX

2.1 Provide a review and analysis of UNIX system performance/capacity to determine if current performance/capacities are sufficient to support the needs of the UNIX stakeholders.

Offeror must perform an initial review and audit of the current UNIX usage, procedures and reports and provide an analysis of the current UNIX usage, processes and reports currently being supported.

Offeror must document its review and audit findings and recommendations.

The Unisys Team will provide a review and analysis of UNIX system performance/capacity, usage, procedures and reports and provide an analysis to the Commonwealth.

AIX:

For AIX systems, during the transition phase, the Unisys Team will bring in subject matter experts to perform an analysis of the AIX servers and their interaction with other servers in the infrastructure using a tool call [redacted]). This group will also conduct application affinity studies for the applications that reside on the AIX servers' as part of their base infrastructure. After TADDM is run and the data gathered, the Unisys Team will conduct a series of meetings with the Commonwealth to discuss the AIX servers, how they support the applications, where they may be concerns and make recommendation for the migration of the AIX data and possible consolidation. This is done before the Unisys Team takes control of the AIX environment.

Once the Unisys Team has control of the AIX environment, managing performance

necessary to achieve the Service Level requirements, we will provide monitoring, measuring, analyzing, and reporting systems performance and will work with the Commonwealth to recommend changes when performance levels threaten to fall short of the desired Service Levels.

Capacity Management includes developing and maintaining tactical and strategic plans to accommodate the Commonwealth's changing business needs. Capacity Management services include measuring system performance and providing the information to more accurately partition the resources according to meaningful workload statistics. It also provides a robust automated forecast system and an application model to forecast Service Levels and resource usage requirements for the most resource-intensive services.

The Unisys Team proposes to provide the following performance and Capacity Management Services:

1) Maintaining the tools, based upon a web portal interface, to gather monitoring information and to define the performance indicators and thresholds being monitored, including DASD, CPU, and memory.
2) Recommending and implementing, when approved, changes to resolve performance issues, address capacity problems, and optimize utilization.
3) Analyzing and reporting on performance, capacity trends, and peak period utilization using data gathered to work with the Commonwealth to determine future requirements on a quarterly basis.

Linux:

The initial review and audit of the current usage of the Commonwealth's compute infrastructure will be performed in two phases:

1) The first phase will be accomplished as the Unisys Team prepares to migrate the existing workload from each of the existing Commonwealth data centers into the new data centers. During this time, the Unisys team will deploy tools to collect and analyze all aspects of the Commonwealths current compute usage. Analysis of these workloads will be used to determine the optimal method for migrating these servers. This analysis will also serve as a baseline against which future capacity planning can be compared.
2) The second phase will occur when the Unisys Team deploys the new Capacity Planning process and tools into the Commonwealth compute environment. This phase will perform two functions, it will cover those servers not covered in phase one, and will perform a new audit once the workloads have been deployed in the new data centers.

3 Production Control and Scheduling Approach, Toolset including batch processing

3.A Offeror must describe its approach to supporting the batch processing needs of the Commonwealth including the following:

Reading the RFP documentation, it is clear that the Commonwealth considers production control and scheduling a core function of system operations. This function builds, tests, and monitors production loads and reports results to the Commonwealth and the Unisys Team. Production control executes defined processes and procedures related to the Commonwealth's

production workload, including scheduled maintenance, job control, data library levels, problem management, and change tracking. The production control activity coordinates all tasks in daily production operations. The Unisys Team will be responsible for the timely notification of each application owner for events defined by those application owners, whether they be Commonwealth of Pennsylvania agents, or other third party vendors.

The first step in providing production control and scheduling services is to work closely with the Commonwealth to get a clear understanding of requirements and dependency during Due Diligence. The Unisys Team will then incorporate these requirements into its production control process to develop a true cross platform, cross data center, unified production control and scheduling process. The objective is to achieve batch service level commitments through an efficient use of resources and technologies. For example, data will be gathered to develop statistics for the number of jobs executed per day/week/month, show the number of abends per day/week/month, etc., and provide these details to the Commonwealth via the Unisys Services Portal. This information will be used internally for problem trending and analysis, to verify that batch cycles complete in a timely manner and service level agreements are met.

The production control and scheduling function will use the Unisys Team's automated tools to open problem tickets for issues that impact production processing. The Unisys Team will track problem tickets and work with the Commonwealth for problem resolution in order to verify that production processing executes with as few interruptions as possible.

Promotions from test to production are subject to the production change management procedure that includes demonstration of successful system integration testing, as well as the Commonwealth's feedback and acceptance testing. This production change management procedure needs to be an integrated process across IT functions. The Unisys Team will work with the Commonwealth to integrate your requirements into our established, controlled production and change management procedures.

The Unisys Team will work with each the Commonwealth business unit to schedule changes into their respective production environments, following the same global production change management procedure.

Before applications are put into production, the following criteria need to be met:

- Identifying the Commonwealth operations point-of-contact.
- Determining the production change management procedure and tool to be used.
- Obtaining access to the production change management procedure and tool for project managers, project team leaders, and key project personnel who may become involved in creating production change management records.
- Establishing the timeframe requirements for entering a production change management record notifying the Commonwealth operations organization of the Unisys Team plans for introducing application changes into production.

The application maintenance organization documents the established production change approval process, including required communications and the method of obtaining authorization for promotion into the production environment.

The project manager or project team leader is responsible for communicating the plans for

introducing application changes into production to the Commonwealth operations point-of-contact. This communication is generally performed by the creation of a change management record, using the production change management tool. The project manager, project team leader, or selected project key personnel function in the role of change requester by communicating project plans to the Commonwealth operations organization. The data that must be provided to the Commonwealth operations organization includes:

- Planned date of code promotion into production.
- Backup plans should promotion fail.
- The Unisys Team application maintenance contact for the promotion.
- Listing of applications and modules involved in the promotion.
- Library location of the modules planned for promotion.

Processes and Procedures

The processes and procedures for providing Production Control and Scheduling, including batch management processing services will be developed in cooperation with the Commonwealth, its application support organizations and the Commonwealth's application owners. After completion, these processes and procedures will be documented in the CCPM which will be reviewed and approved by the Commonwealth. The scope of these processes and procedures will be based on the ITIL V3 framework as well as technology best practices for support of production control and scheduling.

Tools / Applications

The [redacted] will be used as the primary enterprise wide tool to support production control and scheduling. After an assessment during contract transition it will be determined how to transition current Unisys and IBM Mainframe batch processing from current tools and Commonwealth run production control and scheduling to Unisys operated production control and scheduling. Currently, the Unisys Team is offering a Catalog Service to migrate individual batch jobs to Unisys Team maintained and operated production control and scheduling.

The Unisys Team remote US batch operators will manage, maintain, monitor, and control online and batch process, both scheduled and unscheduled (including on-request processing), and in addition the system administrators will maintain a log for each server detailing hardware / software configuration and critical service operations. The Unisys Team will update the operational documentation.

End User Reports (Standard and Custom)

Standard Reports are summarized in Schedule F, Section 3.3.2. Examples of standard IT Service Management (ITSM) status reports for critical processes include:

- Change Management
- Incident Management

➢ Problem Management

Custom Reports are offered by Unisys via the Enterprise Services Catalog.

Tiered Service & Support Levels

The Unisys Team has provided the below tiered support level in alignment with Exhibit J.

Tiered Support Level	Description
Platinum	• Provides 99.9% Batch Processing Completed Successfully.

Escalation Procedures

Escalation procedures are part of the Incident Management Process described in F3.2.1.4 Service Desk. Escalation procedures will be configured with the [redacted] to support meeting Service Levels proactively with automated escalations when incidents are approaching SLA violations. Also, there is a proactive escalation process for incident tickets supported by the Unisys service desk which manages all escalations for normal operations. The Unisys PMO will be involved with any critical escalations as a senior Account Manager will be managing the technical response team and Service Desk communications for critical Priority 1incidents. This includes well defined communications and notifications, status updates, and procedures to support restoring services effectively and efficiently.

For additional details please see Schedule F, Section 3.2.3.2 Site Operations.

Offeror must describe how it will operate and maintain current scheduling/batch software tools.

The Unisys Team will operate and maintain current scheduling/batch software tools. The Unisys Team will maintain current scheduling/batch software tools ([redacted] and tools supporting the Unisys and IBM Mainframe environments such as [redacted] until an assessment and plan are completed during transition to either maintain current approach or migrate existing batch production control programs into one enterprise tool (i.e. [redacted]) as the Commonwealth desires for efficiency and effectiveness. Unisys will provide transition services for individual batch jobs to [redacted] as a Catalog Service.

3.B Describe the process of scheduling batch jobs within Commonwealth agency defined windows to achieve maximum performance as long as required batch completion times are met.

A cross platform (e.g. Window, Unix, and Mainframe) system will be required.

Where practicable, provide for automated scheduling of batch work and processes including

backups.

Commonwealth agencies have a number of applications that require scheduling software / batch processing software (i.e. $Universe, SAP certified, etc.), this software is heavily integrated into many of these systems.

The [redacted] application will be used for production control and monitoring and will send abnormal events to the BMC Event Management platform to automatically open incident tickets based on predefined batch monitoring events. Within the [redacted] SLA's will be managed proactively for batch production control and monitoring, and reporting with automated escalations when incidents are approaching SLA violations. Also, there is a proactive escalation process for incident tickets supported by the Unisys service desk which manages all escalations for normal operations. This includes well defined escalation, communication and status updates, and procedures to support restoring services effectively and efficiently.

The Unisys Team will operate and maintain current scheduling/batch software tools. The Unisys Team will maintain current scheduling/batch software tools ([redacted] and tools supporting the Unisys and IBM Mainframe environments such as [redacted] until an assessment and plan are completed during transition to either maintain current approach or migrate existing batch production control programs into one enterprise tool (i.e. [redacted] as the Commonwealth desires for efficiency and effectiveness. Unisys will provide transition services for individual batch jobs to [redacted] via the Enterprise Services Catalog.

3.C Develop, maintain, and utilize an emergency contact list and escalation procedures to resolve abnormally ended jobs.

The Unisys Team will develop, maintain, and utilize an emergency contact list and escalation procedures to resolve abnormally ended jobs.

3.D Resolve abnormally ended jobs caused by conditions external to production programs.

The Unisys Team will resolve abnormally ended jobs caused by conditions external to production programs. The Unisys Team will analyze exit codes in log files, and work with the job owners to correct the issue if it is code related. If the issue is an external system or external process failure, the Unisys Team will open an Incident ticket.

3.E Repair abnormally ended jobs when possible and perform job restarts in accordance with the Service Management Manual.

The Unisys Team will repair abnormally ended jobs when possible and perform job restarts in accordance with the Service Management Manual.

3.F Check job outputs and print queues, and change job priorities.

The Unisys Team will check job outputs and print queues, and change job priorities under the following conditions:

- A job or print failure is detected
- An Incident is raised by the Commonwealth end user

Any change initiated via Incident management will be made through change control. Changes will be tested in a test/development environment before being promoted to production. Additionally, Unisys will perform daily random spot checks on job and print queue logs to confirm proper completion.

3.G Notify Commonwealth agencies in accordance with the Offeror's proposed notification procedures in the event that applications do not execute properly.

The Unisys Team will notify Commonwealth agencies in accordance with our proposed notification procedures in the event that applications do not execute properly.

4 System Backup Review and Audit

4.A Offeror must describe its approach to performing an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives.

Offeror must describe its approach to identifying gaps and potential risks, and how those gaps and risks will be resolved.

The Unisys Team will conduct an initial review and audit of the backup policies, procedures and reports, to verify the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives. The detailed process for conducting this audit, and how the audit findings will be communicated back to the Commonwealth can be found in Schedule F, Section 3.2.4.2, Subsection 4.

4.B Monitor system backup processing on a daily basis.

The Commonwealth benefits from the Unisys Team's approach to monitoring backup success rates. Unisys does not need to maintain staff to watch the nightly progress of backups and then intervene when the rare problem arises. In most cases simply re-starting a backup results in a successful backup because needed resources are tied up during peak times but become available a short time later. The Unisys Team automates this restart process. If the restarted backup fails then incident tickets are created to alert the team. Thus critical issues get right to Level 2 and Level 3 support personnel without even involving Level 1 support staff. On a daily basis Unisys also produces reports on backup successes.

4.C Review daily backup logs for successful completion.

The Commonwealth benefits from the Unisys Team's automated approach to monitoring backup success rates.

This automation of incident ticketing provides the Commonwealth with another advantage. During service delivery reviews the Commonwealth can review response times to failures that might put critical applications at greater risk. Through the incident severity rating processes

Unisys has the ability to adjust severity levels so that incidents that are closer to critical applications can receive prioritized support responses.

The Commonwealth can also designate application owners who require read access to the backup management console so that these individuals have ready access to monitor both the success and failure rates for backups as well as the backup content. As often happens some applications require specific bundles of directory backups and this access provides application owners a means of validating that customized backups have been implemented properly and are running correctly.

4.D Note failures, and correct the problem.

Failed backups automatically create incident tickets which are escalated from Level 1 through Level 3 support groups as necessary until resolved.

4.E Create problem record for any abnormal condition and any repairs that have been made.

Incident tickets are created automatically and create a record of abnormal conditions. Following ITIL-based processes Level 2 and Level 3 will review incidents for root causes that create multiple tickets. This identification of problems allows the team to establish workarounds and request architecture reviews as necessary. Repairs are also driven by incident tickets that are automatically generated by the Nagios collectors which review system logs for hardware. Failed backups will be automatically re-started upon a first failure because a second run of the backup is, more often than not, successful.

4.F An automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.

The backup software produces daily, weekly, and monthly reports like the one shown below in **Figure 3.2.4.4-3**. The Nagios collectors in the ITSM infrastructure will create tickets automatically upon a failure of a backup for action by Level 1, Level 2, and Level 3 support as necessary. The Commonwealth can designate authorized personnel to receive notifications of these incident tickets, their status, and their resolution.

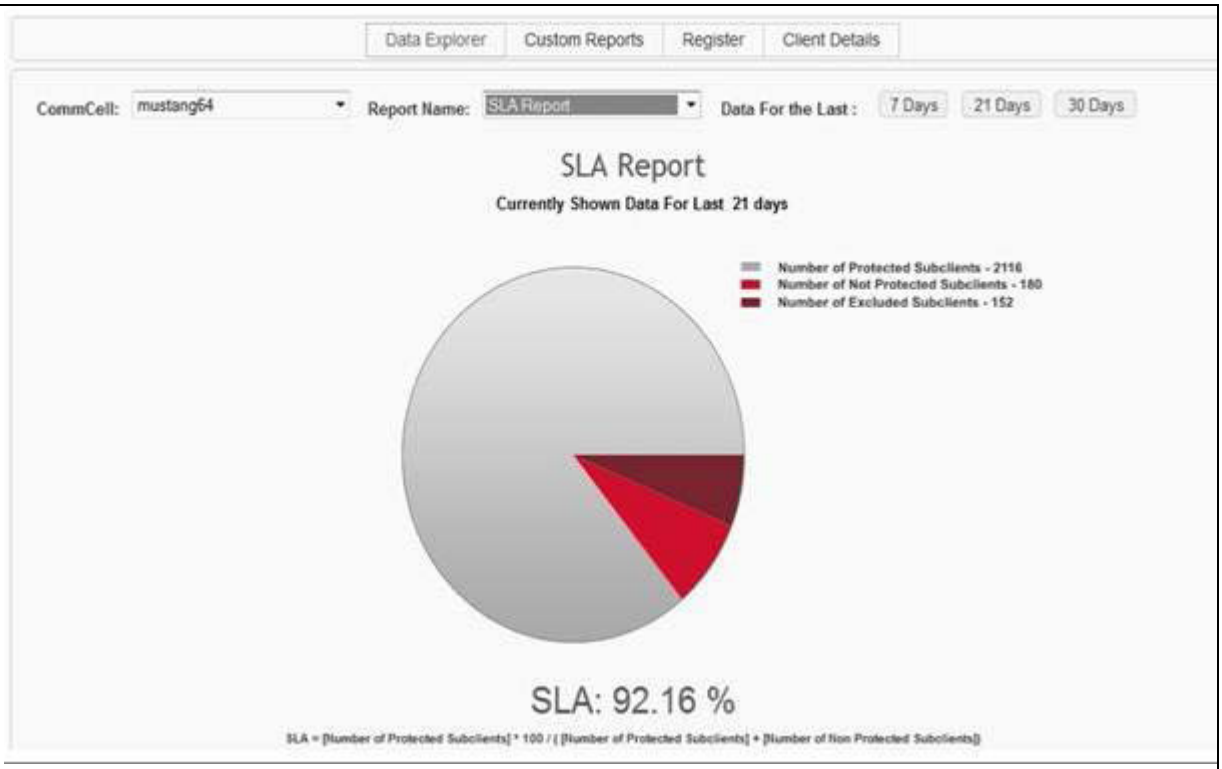

Figure 3.2.4.4-3 – Sample Backup Report

5 Staff, AIX and Linux Staff Resumes

5.A Offeror must submit a representative sample of staff resumes typically provided for these positions detailing their experience, education, and certifications.

Provide AIX and Linux trained staff that hold current manufacturer certifications for hardware and software technical support.

The Unisys Team will include qualified and certified staff to support AIX and Linux platforms. Representative resumes for personnel providing Linux and AIX Services are located in the tab marked Rep-Resumes in Section 5.0 Personnel.

5.B Provide technical advice and support to the Application Development and Maintenance (ADM) and Database Administration (DBA) staffs, as required.

The Unisys Team will provide technical advice and support to the Application Development and Maintenance (ADM) and Database Administration (DBA) staffs, as required. The first point of contact for this will be the Unisys Team's architecture office, which will be staffed with architects dedicated to the Commonwealth and its agencies. These architects can then reach back into the greater Unisys and IBM organizations to engage specific expertise as needed.

5.C Post award; provide Commonwealth with a resume or CV for each operational staff member assigned to this engagement.

Post award the Unisys Team will provide the Commonwealth with a resume for each operational staff member assigned to this engagement. Representative resumes for personnel providing Linux and AIX Services are located in the tab marked Rep-Resumes in Section 5.0 Personnel.

5.D A copy will be maintained on Offeror file.

The Unisys Team will maintain a copy of all resumes for staff assigned to the Commonwealth.

6 Service Desk, Tiered Support

6.A Offeror must describe its approach to supporting the operational and technical support needs of the Commonwealth.

To support the operational and technical support needs of the Commonwealth, the Unisys Team will deploy incident, problem and change management processes that define the flow of support from the Service Desk up through Level 3 support. These processes are closely aligned to the common IT Service Delivery platform. For more detailed information on these processes, please refer to Schedule F, Section 3.2.3.2.

Provide cost effective operational and technical support for the computing platform.

The Commonwealth of Pennsylvania has included in this RFP all the elements needed to achieve measurable and ongoing cost effective operational and technical support for the UNIX platform. Unisys will realize these cost efficiencies by properly integrating these pieces into a unified Enterprise Service Management solution. Included in the response to this RFP are tool sets that align to ITIL V3 processes. The Unisys Team will also deploy additional automation that will serve to realize further efficiencies. Finally, Unisys unique Continual Service Improvement Implementation Program will drive efficiency into the enterprise by continually reviewing outages, incidents, and other operational data to make specific recommendations to the Commonwealth to enable further efficiency.

The Unisys Team has included the cost efficiencies gained through adoption of the IT Service Management platform, ITIL V3 aligned processes utilization of a common server platform and through the deployment of automation into the solution. The efficiencies in the Unisys Team's solution are built in and reflected in the price of a resource unit.

6.B Provide platform level operational and technical support for the computing platform.

List the service levels for the various service tiers that can be provided.

In order to provide customization and flexibility to Commonwealth agencies, the Unisys Team offers tiered levels of managed services for Capacity on Demand servers. These tiers offer various levels of administrator experience, on-site coverage and responsiveness SLA's. The tiers are designed to allow for flexibility to manage mission critical as well as development or demonstration environments.

The following table highlights the available tiers and associated descriptions.

Tiered Support Level	Description
Platinum	• Provides 99.999% Application Infrastructure Availability • Server is monitoring via [redacted] • Fully Managed Services • Asset Tracked In CMDB **with relationships** • Requires 3 active servers load balanced and geographically dispersed
Gold	• Provides 99.99% Application Infrastructure Availability • Server is monitoring via [redacted] • Fully Managed Services • Asset Tracked In CMDB **with relationships** • Requires 2 active servers load balanced and geographically dispersed
Silver	• Provides 99.9% Application Infrastructure Availability • Server is monitoring via [redacted] • Fully Managed Services • Asset Tracked In CMDB **with relationships**
Bronze	• Provides 99.4% Application Infrastructure Availability • Server is monitoring via [redacted] • Fully Managed Services • Asset Tracked In CMDB **with relationships**
Basic	• Provides 98.5 % Application Infrastructure Availability • Server is monitoring via [redacted] • Fully Managed Services • Asset Tracked In CMDB **with relationships**

Based on the tired Service Levels, the Unisys Team will provide the Commonwealth a tiered approach to the UNIX environment. For the Platinum (99.999%) support level the Unisys Team will enlist all three Unisys data centers to provide an active-active-active solution with all components being fully redundant and each site supporting 50% of the peak load. Clustering will not be required for this support since the three sites will provide redundancy and will allow for planned outages in one site at a time. For the Gold (99.99%) level support, the Unisys Team will enlist two of the Unisys data centers and provide an active-active solution with all components being fully redundant with automatic failover and clustering is required. For Silver (99.9%) the Unisys Team will require only one of the Unisys data centers for production, but clustering is required. For Bronze (99.5%) and Basic support IBM a single data center is sufficient and clustering is not required. The Unisys Team will provide initial Level 2 Primary support for the Commonwealth's AIX infrastructure. If a problem should arise requiring

additional support the Unisys Team can leverage support from additional Global Delivery Center personnel as well as other resources within Unisys and its partner's organization for problem resolution.

Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.

The proposed solution includes a robust technical support staff with the necessary skills to provide the managed services requested by the Commonwealth of Pennsylvania in this RFP. The staffing levels are determined based on key performance indicators which specify the expected number of devices to be supported by each member of the technical team. The team will be staffed with junior and senior positions to provide coverage for Level 2 and Level 3 technical support requirements. Human resource actions including writing position descriptions, development plans, and funding for certifications are all targeted to verify that the technical support resources are prepared to support the managed services.

To support the operational and technical support needs of the Commonwealth, the Unisys Team will deploy incident, problem and change management processes that define the flow of support from the Help Desk up through Level 3 support. These processes are closely aligned to the common IT Service Delivery platform. For more detailed information on these processes, please refer to Schedule F, Section 3.2.3.2.

7 Monitor Network Connectivity, Toolset

7.A Ensure network connectivity to COPANET, and consistent system response times.

Offeror must describe its real-time monitoring approach and toolset to provide and maintain network availability and performance.

Unisys will provide event management solutions to help deliver network connectivity and consistent AIX and Linux systems response times. Unisys will utilize [redacted] applications to record incidents tickets that are generated from Linux server monitoring tools to provide real- time monitoring and notification of server availability and response times including the stop and start times of servers to support SLA availability measurements. SLA availability measurements are measured in [redacted] and displayed in the Real-time Dashboard SLA Portal Applications available to Commonwealth agency personnel. The following tools are the major toolsets to support network and system event management and monitoring

Monitoring Software	Managed Configuration Items (CI's)	Monitoring and Management Functionality
[redacted]	LAN Devices including: • Switches • Routers • Load Balancers • Firewalls	Provides deep network device availability and performance monitoring, DNS, IP address management, network configuration management, and network traffic bandwidth throughput monitoring

[redacted]	Microsoft and Linux servers, databases, network devices, and storage hardware.	Provides a standard set of availability, performance and critical service monitors developed by Unisys for monitoring across distributed architecture infrastructure items including: □□ Servers □□ Network devices (switches, routers, load balancers) □□ Storage devices □□ Middleware □□ Applications (Exchange, Citrix XenApp, etc.)
[redacted]	AIX servers	Provides a standard set of availability, performance and critical service monitors developed by IBM for monitoring across infrastructure items including: □□ AIX, IBM Mainframes

For a complete understanding of how this subset of Event Management Tools supports enterprise Event Management please refer to 3.2.3.2 Site Operations.

7.B Utilize automated system management tool(s) to ensure real-time monitoring and notification of server availability and response times. Stop / Start times of servers will be a source of input for SLA measurements.

Offeror must identify tools it uses to support network availability and performance.

The table above, in the answer to 7A, shows details for [redacted] the tool the Unisys Team will deploy to monitor Commonwealth connectivity. The balance of the table details the ancillary tools that will work with [redacted] to create an automated system for real-time monitoring of the Commonwealth compute environment.

For a complete understanding of how this subset of Event Management Tools supports enterprise Event Management please refer to 3.2.3.2 Site Operations.

8 Patch Management

8.A Ensure server operating systems are maintained with the current system patch level, based on the Services provided by the server.

Offeror must describe its approach to supporting the software patch needs of the Commonwealth.

Offeror must describe its approach to testing and validating updates to the OS and 3rd Party software that it supports.

The Unisys Team will follow the Commonwealth of Pennsylvania's ITB for patch policy, "ITB-SYM006 - Desktop and Server Software Patching Policy" for patching of UNIX servers.

AIX:

Software patching, validation of OS updates and outage communication is a bit different for AIX systems from other traditional platforms. An AIX system can be removed for planned hardware or software reconfiguration, maintenance, or upgrade by being dynamically redistributed across the remaining set of active systems. Once the system is ready to be brought back on line, it can be reintroduced in a non-disruptive manner and participate in dynamic workload balancing. The Commonwealth will be notified on a regular basis of scheduled or unscheduled service interruptions.

The performance of platform system administration covers the following services:

- Installation/maintenance of OS/OS patches/OS utilities.
- Problem determination/resolution for OS/OS patches/OS utilities.
- Review/recommend new OS/OS patches/OS utilities versions/patches.
- Install/upgrade OS/OS patches/OS utilities.
- Physical and logical storage management.
- Security configuration (IBM has exclusive security access control to the physical hardware, O/S and system tools, with the Commonwealth retaining responsibility for application security).
- Monitoring / support / reporting configuration setups.
- Performance monitoring and Capacity planning.
- Install and maintenance of backup software and applications.
- The Unisys team will setup and perform backup/recovery of OS and OS utility files. Unisys will provide Backup/ Recovery of files.
- Assist with automation efforts for system administration labor tasks.
- Report on related Service Levels.
- Provide technical support for application developers and the Commonwealth management.
- Participate in the Change Management and Problem Management processes.
- Provide [redacted] support.

Linux:

The toolset to support the automation of patch release and deployment is [redacted] Unisys will maintain in this toolset the appropriate patch policies for determining patch deployment and compliance. The [redacted] will be maintained with all the current patches supplied by the OEM's and will be used to manage the production state of patch deployment in the Linux environment. The following table shows all tools utilized in the management of Linux system patches.

Tool	Functionality

[redacted]	1. Maintains all current patches for the Linux operating systems 2. Performs the patching of systems.
[redacted]	Provides the following functionality related to patching: • Incident management • Change management
[redacted]	Configuration Items (CI) are automatically updated as needed post patching.
[redacted]	Updates the CMDB with needed additions to the CI

Unisys approach to testing and validating updates to the OS and 3rd party software is to follow the Release Process for all changes into all production environments. The Release Process includes:

- Change ticket approvals
- Test planning and accepted test results
- Release and deployment planning including release back out plans
- Release testing for risky deployments
- Early life cycle support to deliver a successful deployment
- Release back out for failed releases

8.B Analyze monthly service patches and determine which patches need to be applied, by server type.

The Unisys System Administration will analyze monthly service patches and determine which patches need to be applied, by server type. A recommended patch report will be reviewed with the Commonwealth. Upon Commonwealth approval, an implementation plan will be jointly developed. The implementation plan will list all activities to be performed in the patching of the server, contacts to call to test the server post-patch, test plans, and back out plans should the patch or testing fail.

8.C Create a change record, log the update in the server log, and install based on server availability schedule.

In accordance to the approved implementation plan, the Unisys System Administration team will create a change record in the Change Management System, log the update in the server log, and install the patch based on server availability schedule.

8.D Change requests will be approved and authorized using the change management process.

Before the patch is applied to the server, the Unisys team will confirm change requests are approved and authorized by the Commonwealth Change Authorization Board, as well as each agency with an interest in the server being patched, using the change management

process.

8.E Notify the Commonwealth of any scheduled or unscheduled service interruptions.

Offeror must describe its approach to communicating unscheduled and scheduled outages, including escalation process.

Unisys approach to communicating unscheduled outages is to send notifications to key stakeholders for the Commonwealth/Agencies/Unisys/Third Parties depending on the outage. This will be through email, voice, Services Portal and Remedy broadcast capabilities. The same communications will be used for scheduled outages with additional communications in forward schedules of change reports.

Escalations for unscheduled outages are handled through the standard processes for managing incidents. Unisys service desk will manage all incidents and verify that proper escalation communications to key Commonwealth/Unisys/Third Parties personnel are managed. The [redacted] will also be configured to escalate incident tickets based on incident priorities and SLA's to verify that incidents tickets are being managed to SLA times for incident response and resolution.

8.F Implement a Patch Management Program to ensure the timely application of updates on all infrastructure platforms in accordance with Commonwealth IT policy guidelines.

The Unisys team will work with the Commonwealth to implement a patch management program that provides timely application of updates to all infrastructure platforms, in accordance with the Commonwealths IT policies and guidelines, and as described by the answers to the previous sub-requirement 8A.

9 User Account Management

9.A Provide certified system administration staff to create and maintain the registration of profiles, associated groups, and the security permissions required to service the approved client base of the system and application.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The Unisys Team will provide user, profile, group, and security permission management on individual AIX or Linux servers. Unisys recommends that the Commonwealth agency user account teams submit requests to have OS level user account changes made by Unisys. However, the Commonwealth's authorized personnel performing agency user account management for the AIX or Linux systems which require OS user account changes can be provided with the appropriate privileges to make user account changes. All changes for user account management will be initiated through the service request and change management process and will require an approved change record for implementation. The process for user account management will be documented within the CCPM.

10 Procurement Management

10.A Provide program and processes to refresh the hardware at asset end-of-life, and when upgrades are needed to meet anticipated growth in utilization.

Offeror must describe its approach to supporting the needs of the Commonwealth.

Procurement management is defined by the Unisys as Technology Refresh and as Capacity

Management and Forecasting. These two are further defined as follows:

a) Technology Refresh Plan

i) As part of the overall architecture support, the Commonwealth's environment will be reviewed on a quarterly basis to identify technology, services or components which require replacement to maintain the Commonwealth's business needs and associated service levels. The review will include the following activities. The overall technology refresh plan will be documented in Key Deliverable D-03. This plan will be used for all Unisys supported environments including the Commonwealth UNIX systems.

ii) Using the data within the Asset Management and Configuration Management databases, identify the technical components within the UNIX system environment which require replacement within the next 18 month period based upon the a 60 month replacement cycle.

iii) Review End of Sales and Service Life notices from the Manufacturers to validate if a component has been discontinued or has available ongoing maintenance options.

iv) Review ongoing Capacity and Performance reports to identify components with a refresh requirement which have additional needs driving a requirement or opportunity to change the component's classification to a different component to maintain the functionality and service levels.

v) Identify replacement technical components based upon the current Enterprise Services Catalog offerings

vi) Validate replacement technical components meet the current requirements for the impacted Commonwealth applications.

vii) Identify risk and impact for the Commonwealth environment to replace existing technical components or services.

viii) Create technology refresh recommendations, impact statements, and high level implementation plan.

ix) Present the technology refresh plan to the Commonwealth using the solution architecture review process.

x) Upon approval of the refresh plan, open service requests for each migration group and develop the detailed project plan for the migration plans.

b) Capacity Management and Forecasting

i) The Commonwealth UNIX systems will be monitored and reported from the Event Management Platform ([redacted] and from the [redacted] to support the UNIX Capacity Management requirements. As part of the Capacity and

Performance Management processes, , the performance and capacity reports will be generated and reviewed with the Commonwealth on a regular basis.

ii) During transition the UNIX environment capacity requirements will be assessed as part of the establishment of the Performance and Capacity Management Processes described in Schedule F, Sections 3.2.2.6 and 3.2.2.2. The assessments will be used to generate capacity and performance management recommendations and plans. . The Unisys Capacity Manager and Performance Analyst will work with the Commonwealth/Agencies to forecast AIX/Linux workload requirements in order to support the current and forecasted workload, as well as establish the monitoring requirements to support the ongoing daily assessment of the workload performance on the windows platform in total and by agency. Any recommendations to increase, modify or decrease UNIX systems capacity will be processed through the Change Process after reviewing recommendations with Commonwealth Stakeholders in the Capacity and Performance regularly scheduled meetings where trends, issues and forecasts are discussed and reviewed.

iii) As part of the annual Capacity and Forecast planning activity, the Unisys Team will work with the Commonwealth to identify what changes in growth are expected and provide recommendations on additional upgrades.

iv) In addition to the Commonwealth's growth forecasting information, the Unisys Team will use the data within the Capacity Management, Asset Management and Configuration Management databases and identify the technical components within ERP system environment which require upgrades or additional infrastructure to support the forecasted growth requirements.

v) Identify replacement or upgrade technical components based upon the current Enterprise Services Catalog offerings and the vendor's available products.

vi) Validate that the identified upgrades or additional components meet the current and forecasted requirements for the impacted Commonwealth ERP system.

vii) Identify risk and impact for the Commonwealth UNIX systems to upgrade or add additional components.

viii) Create the capacity upgrade recommendations, impact statements, and high level implementation plan.

ix) Present the capacity upgrade plan to the Commonwealth using the solution architecture review process.

x) Upon approval of the capacity upgrade plan, open service requests for upgrade project and develop the detailed project plan.

11 SLA Reporting

11.A Collect actual system availability, utilization and response time data.

The purpose of establishing a strong SLA reporting framework is to provide transparency into

the Commonwealth's vendors in its various technical towers. This framework must consist of industry best tools and processes, and should be developed in cooperation between Unisys, Unisys partners, the Commonwealth, and other Commonwealth vendors. The end result of this cooperative effort should be an SLA reporting framework that delivers the following:

- The establishment and maintenance of open communications with the Commonwealth through the governance structure, which encompasses regular meetings and delivers regular reports, many of which are available for the Commonwealth to access online.
- A process to work collaboratively with the Commonwealth to update the Service Level Document when services or service levels are created or modified based on a mutually agreed to process.
- Monitors and reports adherence to Service Levels.
- Verify that service level commitments are met by regularly reviewing service level commitments, compared with actual service level attainment.
- Take corrective actions based on root cause analysis to reduce the impact of future service level failures.
- Define needed monitoring and service level reports.
- Review service operations through management and technical reviews to analyze service level related measurements and take action.
- Identify when changes are required to the Service Levels

The Unisys Team will establish an SLA process and technical architecture to support all SLA's for this contract. See the overview in F3.2.1.2 Availability/SLM. Level 1 of the SLM process is outlined below in **Figure 3.2.4.4-4**:

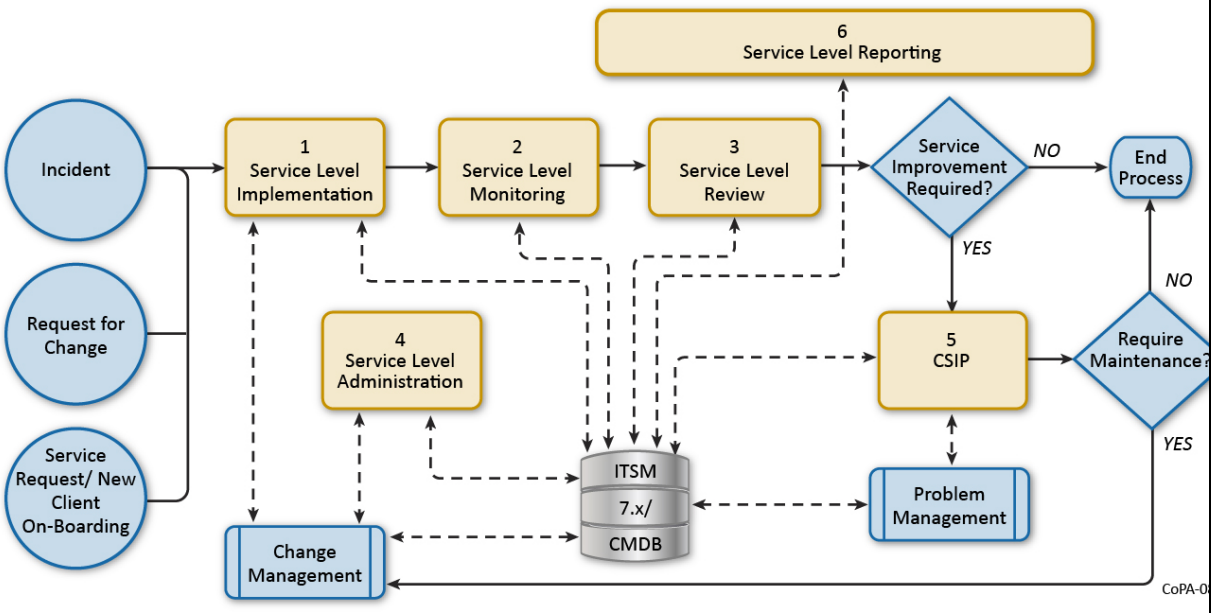

Figure 3.2.4.4-4 – SLM Process

Unisys will provide a detailed set of processes and procedures to support Service Level Management during transition of this contract. The process and procedures will support this

top level view of the process which includes:

1) Service Level Implementation
2) Service Level Monitoring
3) Service Level Review
4) Service Level Administration
5) Service Level Improvements (CSIP)
6) Service Level Reporting

The Unisys Team will provide the technical architecture and toolsets to support monitoring and maintaining service levels for the windows platform .The [redacted] will be used as the single unified platform to manage Service Level Agreements for Commonwealth agencies. [redacted] provides a continuous real-time platform for defining, measuring, monitoring, reporting, and reviewing the performance of SLA's to make sure that adequate levels of service are delivered in alignment with the Commonwealth's objectives for service delivery. The business contract will contain agreements in which the levels of service are specified. These agreements consist of individual service targets or goals that are used to evaluate whether the agreement is in compliance.

The [redacted] Application uses all the other [redacted] modules as inputs to determining if an SLA is in compliance. The [redacted] modules used for transaction inputs to determine if service level targets and goals are in compliance include:

- Incident Management
- Problem Management
- Change Management
- Asset/Configuration Management
- Performance/Capacity Management

11.B On a monthly basis, create a Service Level Agreement report for the Commonwealth and Vendor Management teams.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The [redacted] and in some unique cases other tools as described in F3.2.1.2 will be used to push near real time SLA reporting data into the Real-time Dashboard reporting tool. The Agency Account Manager will review the monthly SLA report with the Commonwealth representatives.

See **Figure 3.2.4.4-5** for sample dashboard snapshot.

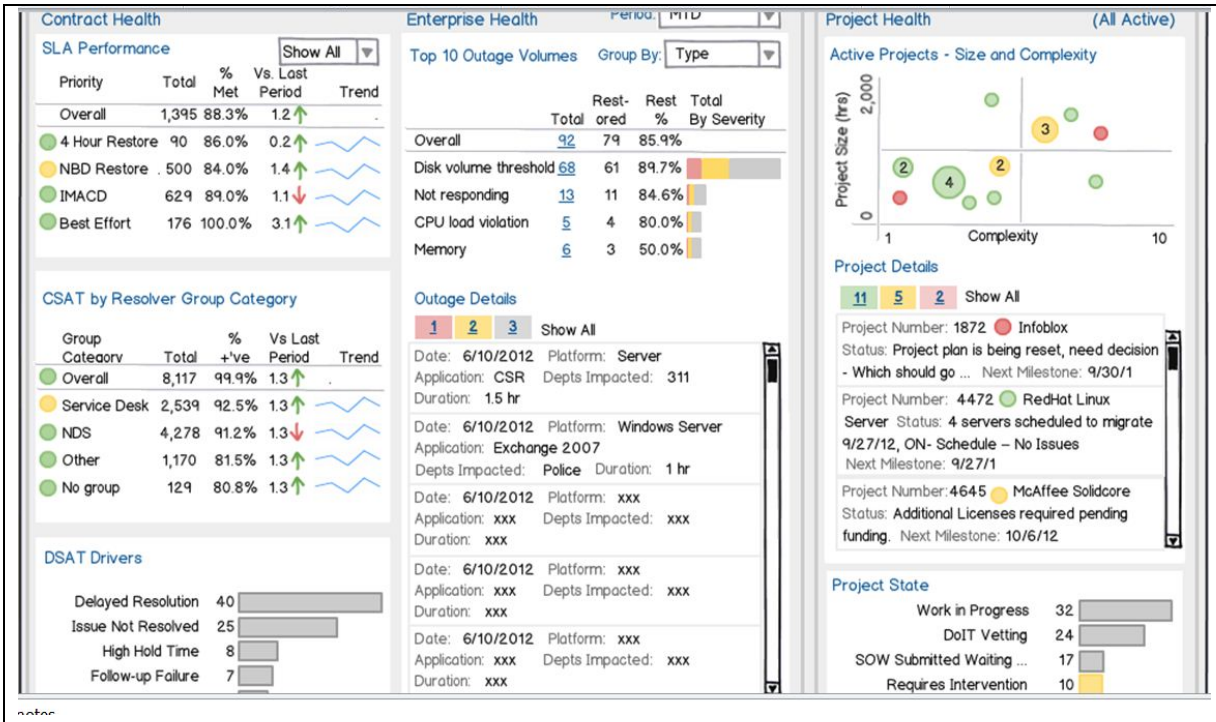

Figure 3.2.4.4-5– Sample Real-time Dashboard snapshot

12 Software License Management

12.A The Offeror must provide Software License Management.

Offeror must describe solution and approach to meet this requirement.

The Unisys Team will provide Software License Management for all infrastructure including UNIX platforms. The Unisys Team will provide 3rd Party License Management service for the Commonwealth and Unisys provided infrastructure software products. Unisys will be solely responsible for the management of all infrastructure software license products provided through this contract.

AIX:

For the AIX operating system, the Unisys Team uses a Definitive Software Library (DSL) to control the master copy of all production software, as well as related software licenses and controlled documentation for each release. We will also use a Definitive Hardware Store (DHS) to control spare components that are maintained at the production configuration level for use in recovery situations. Check-in and check-out of DSL and DHS components are strictly controlled by established release management procedures. Through our standardized process and version control, we validate that the software and hardware being rolled out are secure and traceable, such that only authorized versions are installed.

Linux:

The Unisys team will provide Software License Management for all infrastructure including Unix platforms. The Unisys team will provide 3rd Party License Management service for the Commonwealth and Unisys provided infrastructure software products. The goals of this service are to:

- Verify software contract compliance (to avoid non-compliance legal issues and expenses)
- Manage costs of software inventory by matching requirements for use to needs
- Confirm software maintenance contracts are maintained on schedule through early notifications

Unisys will coordinate with the Commonwealth to confirm compatibility between Commonwealth provided applications related software, and Unisys provided infrastructure software.

The following is the approach Unisys will execute during transition and as an ongoing process to provide 3rd party software license inventory and tracking per agency related infrastructure:

- Load all Unisys and Commonwealth software asset license contract information into the [redacted] application
- Load all software license certificate , license type, entitlements, manufacturer, and product information into the [redacted] e for the Software License Contract
- Run discovery through [redacted] to identify all software installations
- Run the [redacted] to build relationships between the discovered software CI's recorded in the [redacted] and the license certificates
- Run the [redacted] and [redacted] to identify noncompliant licenses and inventory for the Unisys and Commonwealth Asset Managers to audit the completeness and accuracy of the information
- Identify discrepancies in the information and make corrections
- Rerun Compliance Reports and 3Rd party software license inventory reports to get signoff from the Commonwealth and Unisys Asset managers that inventory is properly linked to license certificates in the production environment and the information is complete and accurate
- Provide notifications to Commonwealth/Agencies/Unisys and other Commonwealth service providers when there are software compliance issues or requirements for licenses to be purchased or retired from analysis of license inventory.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,

- Improve client satisfaction,
- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery
- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

13 CI Service Risk

13.A Reduce service risks.

Offeror must provide methods to eliminate or mitigate service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

14 CI Service Quality

14.A Improve service quality.

On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

15 CI Client Satisfaction

15.A Improve client satisfaction.

Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

16 CI Service Transparency

16.A Ensure service transparency.

Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

17 CI Reduce Cost of Service

17.A Improve/reduce cost of service.

Offeror must provide examples of Storage Management initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

Unisys examples of continuous improvement

Examples of continuous service improvement have been included below under Unisys Team Experience.

Unisys Team Experience

A few examples of Server Management Continuous Service Improvement that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections are outlined below:

- American Red Cross
  Unisys hosts the client's mission-critical computing environment in the Unisys [redacted] data center which has been qualified to operate regulated biomedical systems. The data center is instrumented with the Unisys Enterprise Systems Management platform and fully integrated it into the ITSM infrastructure, giving the client an end-to-end solution that provides management and monitoring across the enterprise from a single command center. Included in this support are 160 IBM AIX systems. The standard monitoring platform runs on a Linux platform. Since the client went live in June 2012, they have experienced outstanding service delivered consistently across the enterprise and are achieving the value that was expected from their business case for the portions of the program that have been implemented to date. In the data center, we are achieving 99.9% uptime at a 40% lower cost than with their previous provider.

- City of Chicago
  Moving Linux virtual guests to Red Hat Enterprise Virtualization for the City of Chicago is saving many thousands of dollars in [redacted] licensing costs. Additionally, using Red Hat Enterprise Virtualization for Chicago Police Department decreased the startup costs for a virtual solution from $30,000 to $3,000.

- Live Partition Mobility Project – PLCB
  In July 2011 the DPH began the High Availability/LPM project which ran through September 2011. This project benefited PLCB by minimizing down time for any planned/unplanned outages. By Implementing LPM the DPH team is able to migrate

virtual machines (LPARS) from one physical frame to another, thus allowing maintenance to occur in a non-disruptive manner minimizing planned and unplanned outages. This improvement also enhanced the overall utilization of existing hardware and maximizing storage flexibility.

- Server Management:
  VM replication was implemented to improve the Recovery Point Objective of our Netbackup master servers from 24 hours down to approximately 6 hours. This change will also lower the time it takes to recover the Netbackup server in the DR environment from 2.5 hours to around 30 minutes expediting the start of DR database recovery efforts by almost 80%.

- AIX Server Recovery Improvements:
  To improve disaster recovery times, we converted AIX mksysb to iso images to facilitate a much faster server recovery time. Prior to this change, we used CD images or mksysb restores from tape. This resulted in an 85% improvement in recovery times.

- Server Virtualization Technologies:
  The DPH has deployed virtualization technologies that have improved troubleshooting and recovery efforts for several Commonwealth agencies. The DPH is able to create a test image from an existing production system through cloning. This live cloning capability allows the DPH to clone live running servers with near zero impact to the production system allowing diagnostics to occur on the cloned virtual machine as opposed to the production environment as was done in the past.

- Server Virtualization Technologies:
  The DPH has also provided the Commonwealth access to a [redacted] feature called Change Block Tracking that enables emergency restores of customer servers in as little as 15 minutes during monitored test windows. The agency puts in a change project request to take a snapshot of the existing system turning on Change Block Tracking allowing for expedited restoration of the server as needed. Most server restores prior to this capability were taking as long as 2 hours to restore/recover.

Benefits to the Commonwealth

The Unisys Team's UNIX infrastructure design was designed to deliver value to the Commonwealth through the following attributes:

- Standardization – by standardizing on IBM's Flex System platform for Windows, Linux, AIX and Capacity on Demand, the Unisys brings a powerful, cross platform capability to the Commonwealth.
- Efficiency – Utilizing IBM Flex System across multiple platforms drives efficiency into all process, from patch management to service delivery, resulting in year over year efficiency gains that benefits the Commonwealth throughout the length of the contract.
- Manageability – The common IT Service Management platform is leveraged across all hardware platforms, allowing for even more efficiency at the service delivery level. The capability to manage and maintain the full breath of the Commonwealth enterprise in a single, highly integrated toolset will allow the Unisys Team to offer new services in the future to meet changing demands.
- Optimization – Through a rigorous capacity management process and toolset, the Unisys

Team will aggressively optimize existing capacity, and allow us to make timely, specific virtualization and consolidation recommendations to the Commonwealth to meet its goal of increased virtualization and to prevent virtual sprawl.

- Automation – The Unisys Team will use the same Enterprise Services Catalog and automated run books to provision and manage Windows systems as the Commonwealth. The tools being deployed allow for increased automation across the enterprise in ways that will directly benefit the Commonwealth.
- Agility – With all the standardization being done, it would be very easy to lose sight of the need for an agile infrastructure. By utilizing Flex Systems for Windows and UNIX, the Commonwealth will have the ability to quickly reconfigure systems due to changing regulatory frameworks, even down to the ability to isolate workloads on AIX, Windows and Linux within the same chassis, a capability unique in the marketplace. In short, the server infrastructure can be rapidly changed as need to meet challenges in the future.

3.2.4.5 Mainframe Services

The Mainframe Services will provide hosting and operational support Services for both IBM and Unisys mainframe systems. These mainframe systems run several Logical Partitions (LPAR's) and Integrated Facility for Linux (IFL) partitions. Offeror must support the mainframe operating systems and the management of the associated partitions. The number of support staff members required to perform the tasks listed below will be determined by the Offeror.

Listed below are the basic Services required to manage the Mainframe systems required by the Commonwealth. Offeror must include these Services in addition to the base level of Services in this Offering.

Exhibit B.6 - DPH - COPA NETWORK

Requirements		Describe Compliance
1.	Provide Mainframe systems and operations (Unisys, IBM). Ability to purchase metered IBM &	Offeror must describe its approach to supporting the needs of the Commonwealth including the following:

	Unisys Million Instructions Per Second (MIPS). Monitor local operations, troubleshoot and resolve operational issues. Actively monitor the daily operations of all mainframe (current) systems. Assume responsibility for all master and subordinate console functions. Issue operator commands to control all In-Scope platforms throughout the organization. Provide all tools and apps that are currently being provided, for example MAPPER/APPMAP, browser based terminal emulation access, and middleware components (like OpenTI, IBM WBM & WMQ, etc.) that are critical to agency operations and application usage. Assume the responsibility for and perform all console operations. Monitor the performance of online interactive traffic and take appropriate action to resolve online-system-related incidents and/or problems, including escalating (as appropriate) the incident and/or problem to the proper Level 2 Support group. Monitor the transmission of files between the Commonwealth and any other parties as designated by the Commonwealth. Provide operational support for data transmission (send/receive), consistent with commercial or agency standards. Manage, maintain, monitor, and control online and batch process, both scheduled and unscheduled (including on-request processing).	• Processes and Procedures • Tools / Applications • End User Reports o Standard o Custom • Tiered Service/Support Levels • Escalation Procedures

	Maintain a log for each system detailing hardware / software configuration and critical service operations. Review the system logs on a weekly basis to ensure critical system Services are processing without errors. Maintain and update the operational documentation for all operations procedures and Services.	
2.	Provide a review and analysis of mainframe usage to determine if current usage is required to support the needs of the mainframe stakeholders. Offeror must perform an initial review and audit of the current mainframe usage, procedures and reports and provide an analysis of the current mainframe usage, processes and reports currently being supported. Offeror must document its review and audit findings and recommendations.	Offeror must describe solution and approach to meet this requirement.
3.	Production control and scheduling (including batch jobs) Provide a process of scheduling batch jobs within Commonwealth agency defined windows to achieve maximum performance as long as required batch completion times are met. Provide for automated scheduling of batch work and processes including backups. Provide the capability for agencies to schedule and monitor batch processing. Develop, maintain, and utilize an emergency contact list and escalation	Offeror must describe solution and approach to meet this requirement.

	procedures to resolve abnormally ended jobs. Resolve abnormally ended jobs caused by conditions external to production programs. Repair abnormally ended jobs when possible and perform job restarts in accordance with the Service Management Manual. Check job outputs and print queues, and change job priorities. Notify Commonwealth agency customers in accordance with the notification procedures in the event that applications and batch processing do not execute properly.	
4.	Batch Monitoring Actively monitor batch operations on all mainframe systems on a daily basis. Maintain a log for each batch system and review the system logs on a daily basis to ensure key batch Services are processing without errors. Document review of the system logs on a daily basis to ensure critical batch Services are processing without errors. Notify Commonwealth agencies in accordance with the notification procedures in the event that batch processing does not execute properly. Offeror must provide online monitoring of batch processing by the Commonwealth.	Offeror must describe its approach to supporting the needs of the Commonwealth. Offeror must describe its approach to allowing Commonwealth users to monitor the batch processing online.
5.	Monitor system backup processing on	Offeror must describe its approach to performing an initial review and audit of the backup policies, procedures and reports, to

	a daily basis. Process to review daily backup log for successful completion. Note any failures, initial and date the log, and correct the problem. Create problem record for any abnormal condition and any repairs that have been made. Automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.	ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives. Offeror must describe its approach to identifying gaps and potential risks, and how those gaps and risks will be resolved.
6.	Provide cost effective, operational, and technical support for the computing platform. Provide platform level operational and technical support for computing platforms including Mainframe, Storage, AIX, LINUX, SAP, Oracle and Windows architects. Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users. Provide technical advice and support to the Application Development and Maintenance (ADM) and Database Administration (DBA) staffs, as required. List the service levels for the various levels of service tiers that can be provided. See **Schedule J.1 Datacenter Service Level Management** for the definitions of the expected options.	Offeror must describe its approach to supporting the needs of the Commonwealth.
7.	Ensure network connectivity to	

	COPANET, and consistent system response times. Utilize automated system management tool(s) to ensure real time monitoring and notification of system availability and response times. Stop / Start times of servers will be a source of input for SLA measurements	Offeror must describe its real-time monitoring approach and toolset to provide and maintain network availability and performance. Offeror must identify tools it uses to support network availability and performance.
8.	Ensure operating systems are maintained with the current system patch level, based on the Services provided by the server. Analyze monthly service patches and determine which patches need to be applied. Create a change record, log the update in the system log, and install based on system availability schedule. Notify the Commonwealth of any scheduled or unscheduled service interruptions with consideration to Commonwealth scheduled holidays and standard workweek. Implement a Patch Management Program to ensure the timely application of updates on all infrastructure platforms in accordance with Commonwealth IT policy guidelines.	Offeror must describe its approach to supporting the needs of the Commonwealth. Offeror must describe its approach for testing and validating updates to the OS and 3rd Party software that it supports. Offeror must describe its approach to communicate unscheduled and scheduled outages, including escalation process.
9.	User Account Management Provide certified system administration staff to create and maintain the registration of profiles, associated groups, and the security permissions (including password management) required to service the approved client base of the system and	Offeror must describe its approach to supporting the needs of the Commonwealth.

	application.	
10.	Procurement Planning Provide a program and process to refresh the hardware at asset end-of-life, and when upgrades are needed to meet anticipated growth in utilization	Offeror must describe its approach to supporting the needs of the Commonwealth.
11.	SLA Reporting Collect actual system availability, utilization and response time data. Create a SLA report on a monthly basis, for the Commonwealth and Offeror.	Offeror must describe its approach to supporting the needs of the Commonwealth.
12.	The Offeror must provide Software License Management.	Offeror must describe solution and approach to meet this requirement.
13.	Coordinate at an agency level and account for any required patching as technology upgrades require.	Offeror must describe its approach to supporting the needs of the Commonwealth.
Continual Service Improvement		
14.	Reduce service risks. Methods to eliminate or mitigate service risks.	Offeror must describe its approach to supporting the needs of the Commonwealth
15.	Improve service quality. On a quarterly basis, make recommendations to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.	Offeror must describe its approach to supporting the needs of the Commonwealth.
16.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
17.	Ensure service transparency. Methods and practice to ensure service	Offeror must describe its approach to supporting the needs of the

	transparency, providing visibility into service execution.	Commonwealth.
18.	Improve/reduce cost of service.	Offeror must provide examples of Mainframe Support initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Unisys Team has evaluated the exhibits and schedules and the requirements stated in the Mainframe Services section of the RFP as a basis for the solution provided. The Unisys Team is uniquely positioned to provide Mainframe Services to the Commonwealth due to the fact the team is responsible for all manufacturing, support and innovation for the Commonwealth mainframe platforms. In addition the team has many years of experience not only supporting the requirements of the Commonwealth but all users of Unisys and IBM mainframe technologies worldwide.

Commonwealth has an over 30 year history of supporting mission critical applications using Unisys and IBM Mainframe technology. In support of the Commonwealth the Unisys Team has provided both platform and operational support for the mainframe platforms for over 13 years under the current Data Powerhouse contract with high levels of client satisfaction. The Commonwealth benefits from having the mainframe suppliers being its operational and technical support staff in that new features and functionality introduced within the mainframe environments have been introduced to the Commonwealth agencies during application deployment planning processes.

The Unisys Mainframe offering will continue to provide the Commonwealth with the hardware and software platforms, tools and mainframe operations and support staff required to support their mission critical application services.

The Unisys Team will deliver Mainframe services to the Commonwealth that include the following:

- New Mainframe platforms to replace the current technology on the floor
- New per MIP pricing for Mainframe Services
- Implementation and transition services to migrate the mainframe environments from the existing to the new data centers with reduced risk and minimal downtime to the agencies
- Existing tools and utilities utilized by the Commonwealth agencies to support their application processing requirements

- Ongoing support for the mainframe operating system software suites
- As needed, compiling, mapping, and linking programs
- Management of the operating environment ensuring optimal operating system performance
- Monitoring local operations, troubleshooting and resolving operational issues associated with the mainframe operating systems
- Maintaining a log for each partition detailing hardware and software configurations and critical service operations
- Monitoring system backup processing on a daily basis
- Providing trained staff holding manufacturer recognized certifications for hardware and software technical support
- Providing platform level operational and technical support for the computing platform based on service level selected
- Working in conjunction with other technical disciplines to provide advice and support as required
- Ensuring mainframe operating systems are maintained with the current patch level in accordance with services provided on that server
- Utilizing the change management process, preparing proper documentation to be used when changes are necessary in the environment
- Reviewing and analyzing system performance and capacity to determine if current performance and capacities are sufficient to support the needs of the Commonwealth
- Creating and maintaining the registration of profiles, associated groups, and the security permissions required to service the approved client base of the operating system
- Accountability for the mainframe platform availability
- Network connectivity into COPANET
- SLA and other reporting as detailed in the RFP requirements

Unisys mainframe services continue the long history of providing a mission critical processing environment for both the Unisys and IBM mainframes. In the sections that follow the Unisys Team describes in greater detail how the solution meets the Commonwealth's requirements. All Unisys and IBM mainframe services will be managed from the ITIL service reference model. Tools specific to both environments are employed where necessary but the operation is ultimately orchestrated and responsive to the common service management environment described in Unisys response to Schedule F's section 3.2 subsections.

In response to the requirements stated in the Mainframe Services Section the Unisys Team has separated responses into two technical towers. The first tower is around Unisys Mainframe Services and the second is the IBM Mainframe Services. While there are many similarities and commonality between functions such as ITSM, notification and reporting and support services, there are other areas which are unique to the platform that warrant separate responses.

Unisys Mainframe

1 Mainframe Operations Approach

1.A Offeror must describe its approach to supporting the needs of the Commonwealth including the following:

Processes and Procedures

Tools / Applications

End User Reports (Standard and Custom)

Tiered Service/Support Levels

Escalation Procedures

Provide Mainframe systems and operations (Unisys, IBM).

Processes and Procedures

The processes and procedures for providing Unisys Mainframe infrastructure managed services will be documented in the CCPM which will be reviewed and approved by the Commonwealth. The scope of these processes and procedures will be based on the ITIL framework as well as technology best practices for support of Unisys Mainframe platforms.

Processes and procedures will be developed for the following areas:

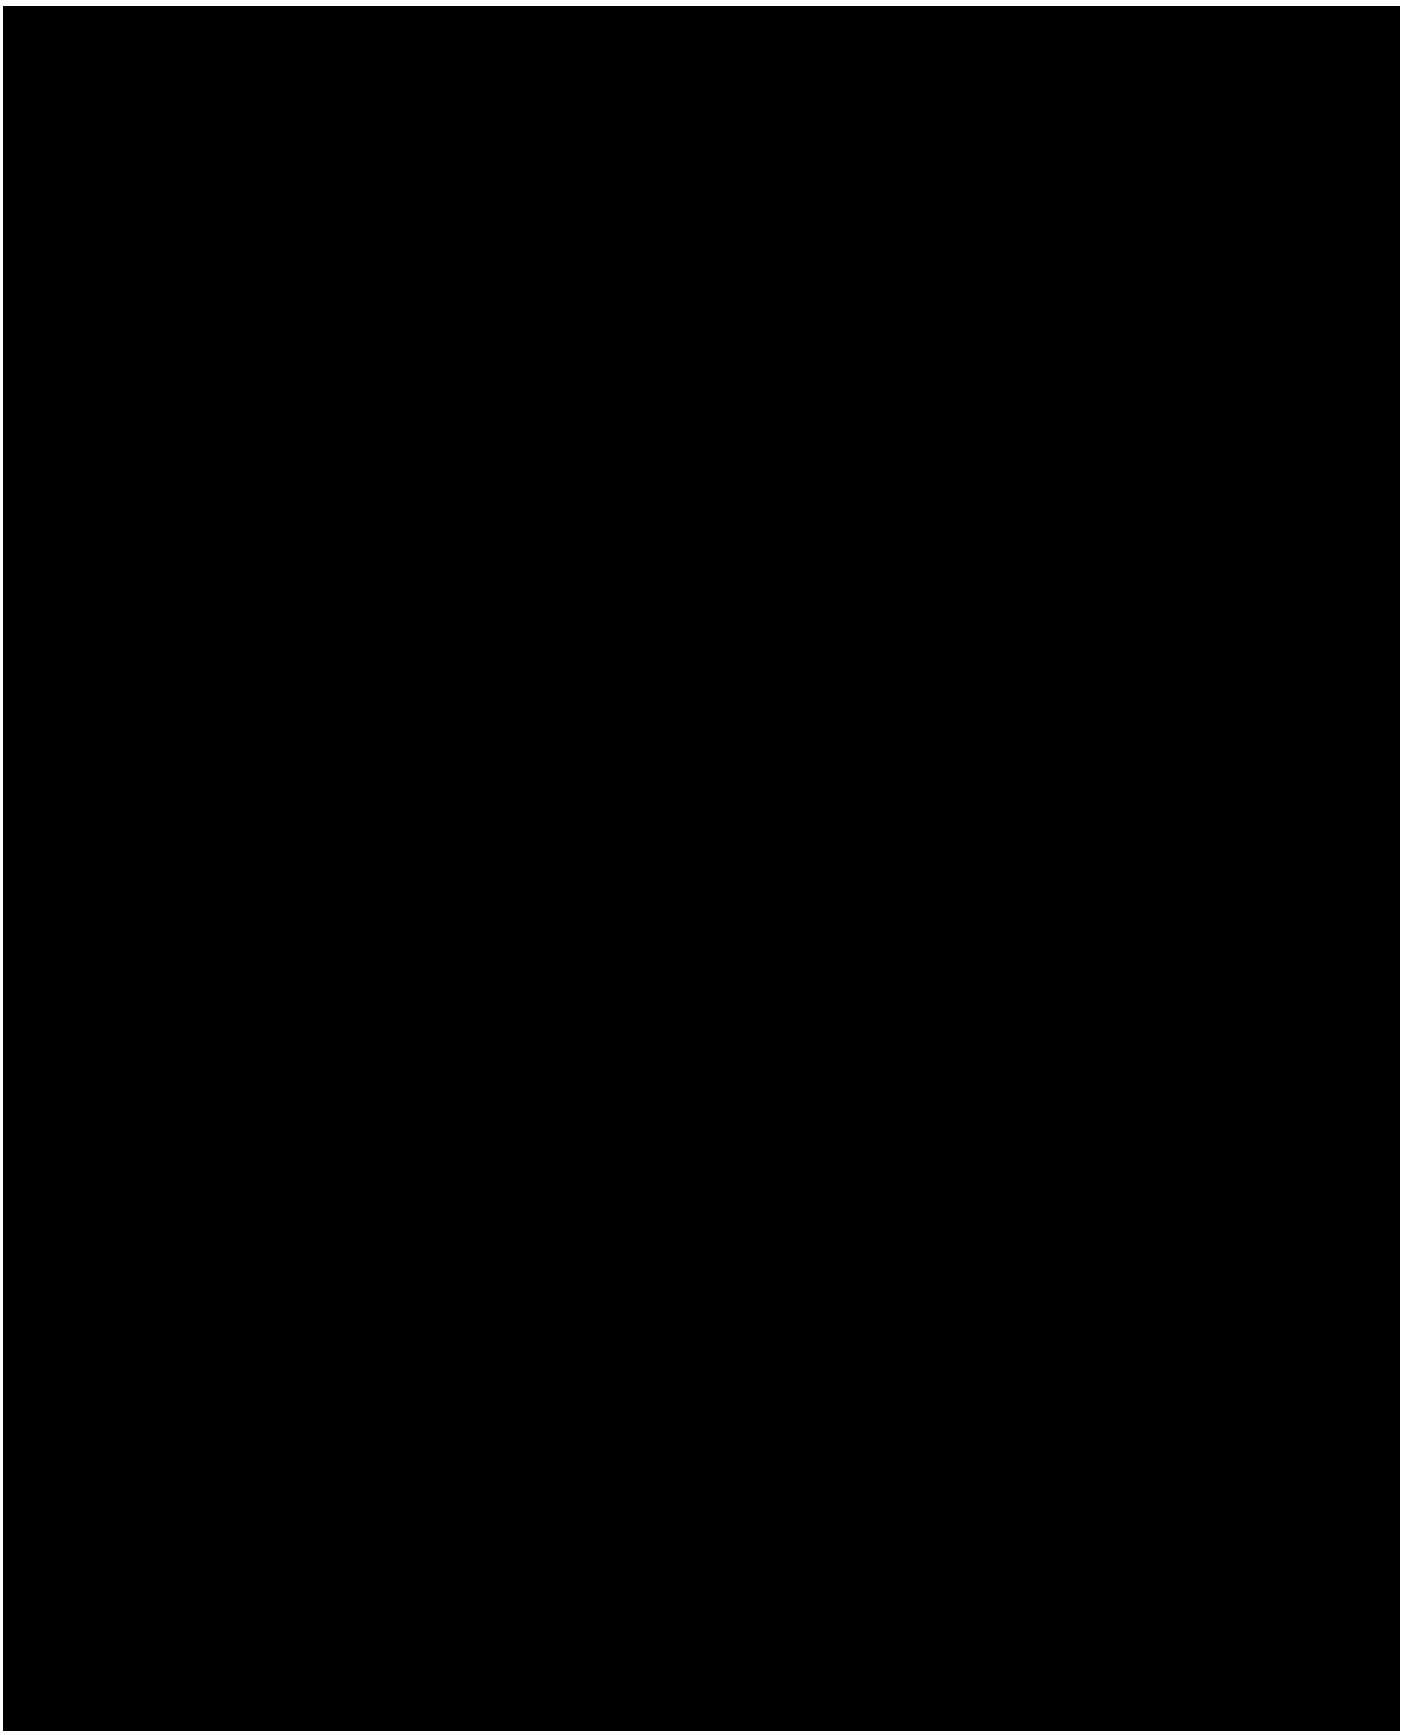
- Mainframe technology support – build and maintain for hardware, software, connectivity
- Vendor management – technical support, maintenance coverage, and remote access capability
- Platform specific procedures – customer notification, technical support escalations patching process/schedule, security monitoring, and log reviews
  - Tools/Applications

Unisys has outlined the complete approach to monitoring operations and supporting automated remediation over time from a common enterprise infrastructure platform across all technical towers for the Commonwealth in F3.2.3.2 Site Operations.

Unisys will implement, support, and operate a comprehensive and integrated Information Technology Service Management (ITSM) Architecture dedicated to the cross functional process support for all services provided to the Commonwealth for this contract. The proposed ITSM Architecture, shown in **Figure 3.2.4.5-1**, will provide an effective and efficient operational platform to support the Commonwealth's agencies application infrastructure for the following ITILV3 (Information Technology Infrastructure Library) Service Management Processes.

Figure 3.2.4.5-1 - Proposed Unisys ITSM Integrated Architecture

A full description of the tools used for the ITSM Management Platform is contained in the Schedule F, Section 3.2.3.2 "Site Operations". The specific tools as they pertain to the Unisys mainframe are summarized in the **Figure 3.2.4.5-2**.



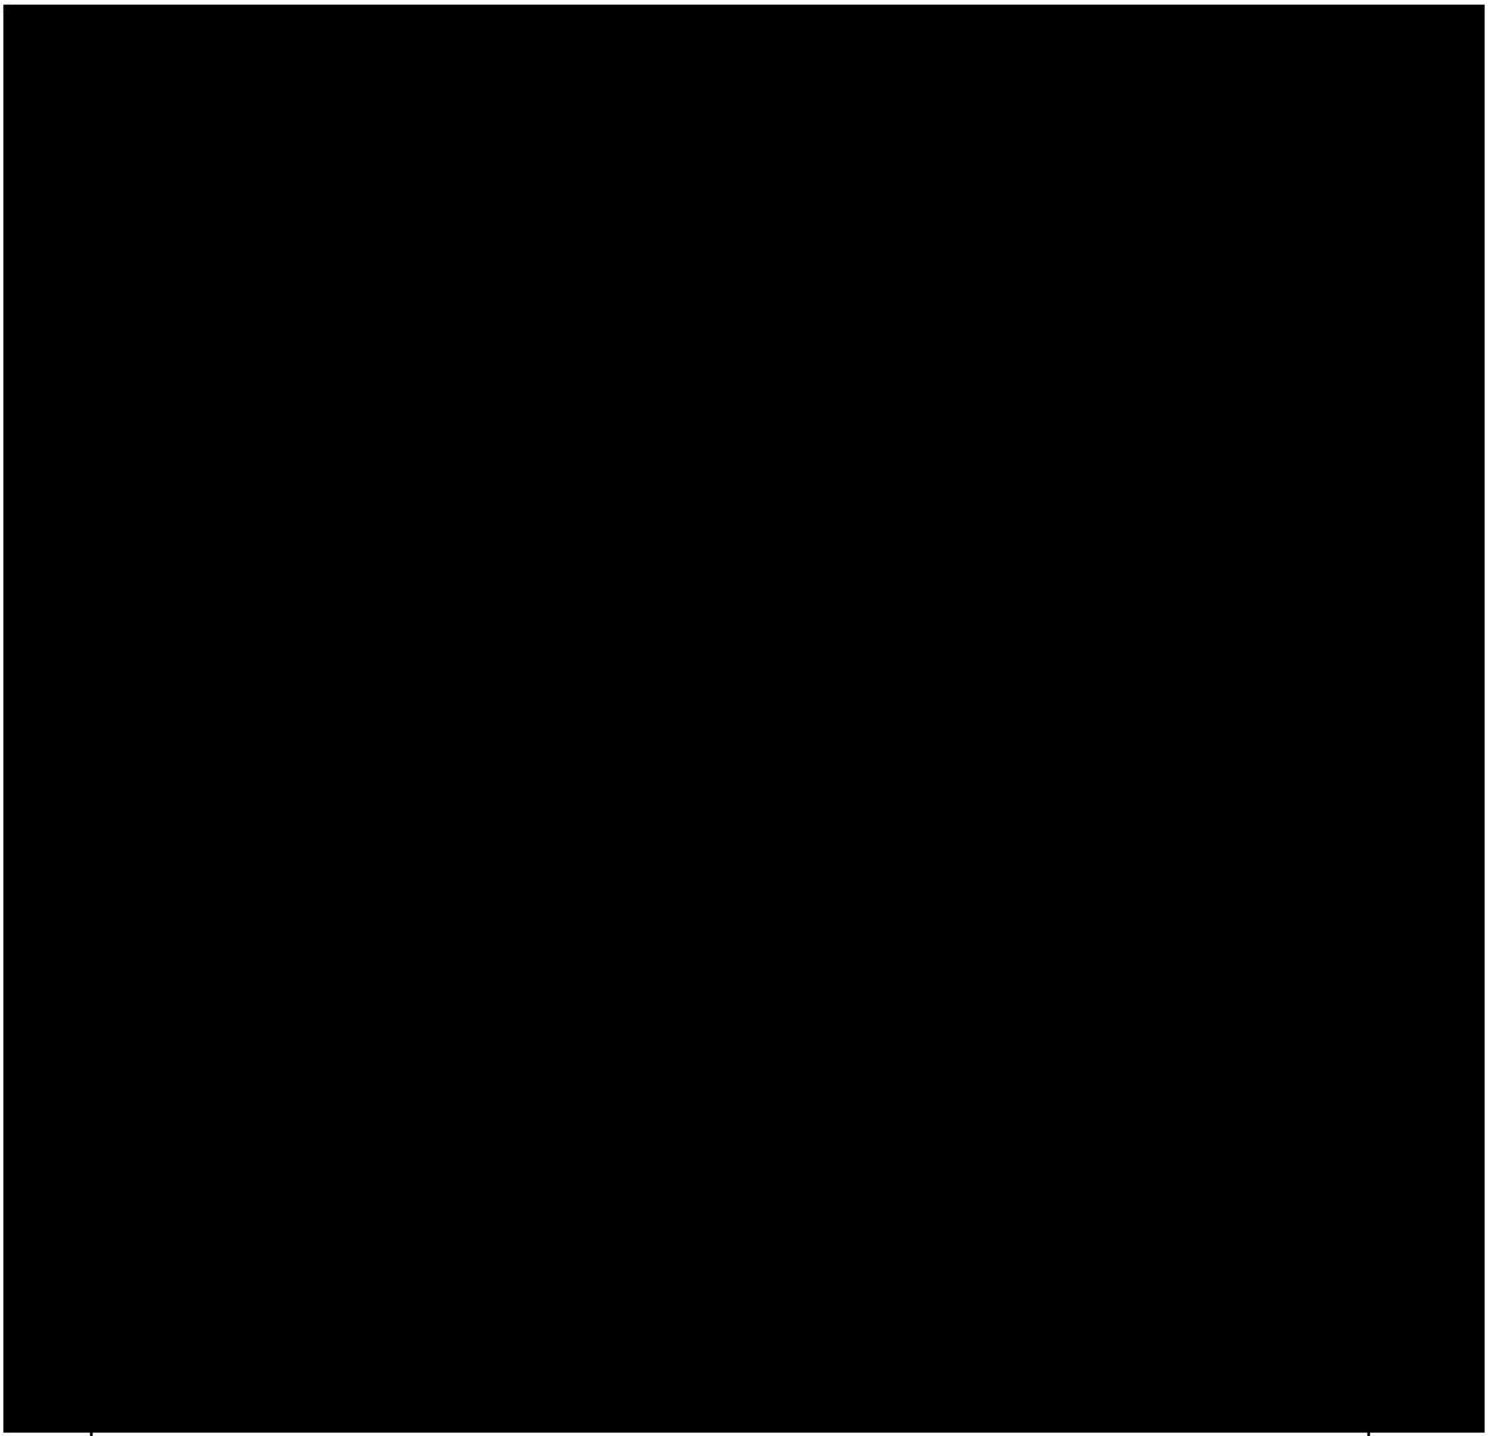


Figure 3.2.4.5-2 - Unisys Mainframe ITSM Tools

Unisys will assess the Commonwealth's current ITSM toolsets during transition. Assessment results determine which tools will be supported within this overall target ITSM proposed architecture, replaced, or eventually migrated to the target environment ITSM tools shown in **Figure 3.2.4.5-2**. The resulting architectural decisions will be reviewed and approved by the Commonwealth's agencies. Some identified tools will continue to offer the functionality they are currently providing, but will be integrated into the overall ITSM proposed architecture.

- End User Reports
  - Standard Reports are summarized in 3.3.2.
  - Custom Reports are offered by Unisys via the Enterprise Services Catalog
- Tiered Service/Support Levels

The Commonwealth of Pennsylvania has indicated in Schedule J.2 - Datacenter Service Level Matrix the desired service tiers/support levels. In the design of the Services and the infrastructure needed to deliver those Service to the Commonwealth, Unisys defined the Service Tiers to align to those requirements. A fuller explanation and representative sample of all the Services provided in this structure can be found in the response to Schedule F, Section 3.2.1.5, sub-requirement 1. The service tiers in the Unisys solution are as follows:

Tiered Support Level	Description This Service Level measures the percentage of time the Applications are Available during the applicable Measurement Window
Platinum	• 99.999% Application Infrastructure Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365
Gold	• 99.99% Application Infrastructure Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365
Silver	• 99.9% Application Infrastructure Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365
Bronze	• 99.4% Application Infrastructure Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365
Basic	• 98.5% Application Infrastructure Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365

Escalation Procedures

As part of the communication management plan, Unisys will work closely with the Commonwealth of PA to structure effective escalation procedures. These procedures will be developed to provide guidance for escalation activities in a number of categories including

incident management service response, management notification, and service quality.

For incident management service response, escalation procedures will define the schedule, criteria, methods, and participants for the escalation of issues or incidents impacting computing services to the Commonwealth. The primary objective of this escalation is to assign appropriate vendor resources with the necessary skills to the incident process to restore service. The procedure will include steps to contact approved agency stakeholders to provide initial notification and to engage in joint problem determination/resolution activity as appropriate.

Escalation procedures will also include provisions to notify Commonwealth and Vendor management staff of major service impacting events as well as to confirm continuous updates are provided until the incident is resolved. In order to provide an easy method for the Commonwealth to notify the vendor of service quality concerns, the escalation procedures will include the process and contacts to register the service quality issues for review and action.

Provide Mainframe systems and operations (Unisys)

To support the requirements of the Commonwealth under the new contract Unisys will continue to offer Mainframe technology and operational support staff aligned with the Commonwealth tools and processes. Unisys will offer ClearPath Mainframe MIPS to support the application processing requirements. Details of the Unisys Mainframe offering are contained in Schedule F, Section 3.1.3.

The Unisys Mainframe environment includes both operational and support staff. This staff has many years supporting the needs of the Commonwealth and will be utilized under the new contract.

1.B Ability to purchase metered Unisys Million Instructions Per Second (MIPS).

Through the Catalog of Services the Commonwealth can procure MIPS based on an allocation model where the agencies will request the MIPS they require within the Catalog and can utilize the allocated MIPS to the total requested.

1.C Monitor local operations, troubleshoot and resolve operational issues.

Unisys is providing staff in the operation center which will be monitoring the batch processing and console messages. This staff provides monitoring of mainframe operations and provides troubleshooting to resolve operational issues. There are well established and tested escalation processes in place to address system related incidents. Escalation processes are described in Schedule F, Section 3.2.1.4 “Service Desk”. Notification of incidents to the appropriate Level 2 support group is part of the in place process today and will continue in the future.

1.D Actively monitor the daily operations of all mainframe (current) systems.

Unisys is providing staff in the operation center which will be monitoring the daily operations of the mainframe systems. This staff provides monitoring of mainframe operations within the current contract. This will continue under the new contract in support of the Commonwealth

processing requirements. Unisys utilizes tools such as OpCon and BL/Sched for Mainframe scheduling and Enterprise Output Manager for print. The scheduling tools and console messages are actively monitored for response requests and error conditions. The console logs are stored on the Commonwealth SPO Server for review and archive. These logs are maintained for approximately 90 days.

Unisys will drive cost reduction and efficiencies through leveraging our local and remote resources and deploying proven tools and capabilities into the environment. Unisys is committed to improving service while reducing costs. To achieve this, Unisys will utilize automation techniques whenever possible to enhance console operations and to proactively monitor the mainframe and server environments. These automation techniques have been used and proven in delivery of our services to other clients.

Mainframe operations will include monitoring ongoing operations and responding to events, alerts, or incidents. Activities performed include online and batch monitoring, recovery and restart, root cause analysis, incident and change management, and resource availability balancing.

Unisys will work with the Commonwealth to develop a comprehensive Policies and Procedures Job Scheduling Manual for the Unisys mainframe that will include specific instructions on what, when, and how to schedule and recover. Unisys will provide local staff to support the scheduling needs. Job scheduling also includes library management, the process of making sure the correct version of application code is promoted to production.

1.E Assume responsibility for all master and subordinate console functions.

The Unisys staff provides console operations functions within the current contract. This will continue under the new contract.

Dorado – Monitoring of the overall system consoles is done via the Single Point Operations (SPO) workstation consoles. Utilizing the Automated Message System (AMS) tool, many of the repetitive messages or conditions are automatically responded to by the system. For each organization (agency) an Operational Procedures Manual is maintained to address specific operational processes used in their environments. In the event that an undocumented alert is received escalation is made to the appropriate agency contact. These contacts are maintained in the Operations procedures Manuals. Monitoring of the BATCH processing is done through a combination of the SPO console and OpCon.

Libra – Monitoring of the overall systems consoles is done via an Accessory Manager sessions. Utilizing the Automated Message System (AMS) tool, many of the repetitive messages or conditions are automatically responded to by the system. An Operational Procedures Manual is maintained to address specific operational processes used in these environments. In the event that an undocumented alert is received escalation is made to the appropriate agency contact. These contacts are maintained in the Operations procedures Manuals. Monitoring of the BATCH processing is done through Web Console.

1.F Issue operator commands to control all In-Scope platforms throughout the organization.

The Unisys staff issue console operations commands within the current contract. This will

continue under the new contract. The Single Point Operations (SPO) workstation consoles and Accessory Manager sessions are used for the responding to or issuance of commands to the Dorado and Libra systems.

1.G Provide all tools and apps that are currently being provided, for example MAPPER/APPMAP, browser based terminal emulation access, and middleware components (like OpenTI, IBM WBM & WMQ, etc.) that are critical to agency operations and application usage.

Unisys has reviewed all Unisys and third party provided tools in use by the Commonwealth as contained in Exhibits B.4 and B.10 – Third Party Software Assets . Unisys has provided third-party license management for the various mainframe tools identified in the exhibits provided. This will continue under the new contract and the ability to procure the required tools will be provided by the Catalog of Services.

1.H Assume the responsibility for and perform all console operations.

The Unisys staff has console operations responsibility within the current contract. This will continue under the new contract. Refer to response 1.E above for a description of console operation functions.

1.I Monitor the performance of online interactive traffic and take appropriate action to resolve online-system-related incidents and/or problems, including escalating (as appropriate) the incident and/or problem to the proper Level 2 Support group.

The Unisys staff provides monitoring of online interactive traffic and provides troubleshooting to resolve operational issues. There are well established and tested escalation processes in place to address system related incidents. Notification of incidents to the appropriate Level 2 support group is part of the in place process today and will continue in the future. . Escalation processes are described in Schedule F, Section 3.2.1.4 “Service Desk”.

1.J Monitor the transmission of files between the Commonwealth and any other parties as designated by the Commonwealth.

The Mainframe platforms perform a high number of file transmissions between the Commonwealth and any other parties. Tools are provided on the Mainframes to perform the file transfers using Commonwealth standards. The monitoring of file transfers has been established with the agencies and is effective to support the requirements to date. During Data Gathering Unisys will review with the Commonwealth which of the file transfers should be monitored by Unisys staff.

1.K Provide operational support for data transmission (send/receive), consistent with commercial or agency standards.

Using monitoring of the scheduling tools through the tool consoles and operating system console messages, the staff will provide operational support. Should a transfer fail the staff will respond to any messages or escalate to the appropriate support organization.

1.L Manage, maintain, monitor, and control online and batch process, both scheduled and unscheduled (including on-request processing).

Unisys will provide batch monitoring activities using a combination of on-site and remotely located personnel (batch operators) and tools. For the Unisys mainframes OpCon and BL/Sched are used to manage and monitor the batching process. Unisys monitors the batch processing environment and provides alerts to the agencies via established processes of success and failure. Unisys today provides monitoring and alerting functions. Additional services to procure Unisys resources for full batch creation, scheduling and troubleshooting are available via the Catalog of Services.

1.M Maintain a log for each system detailing hardware / software configuration and critical service operations.

Within the services provided today by Unisys the hardware and software configurations are documented and reviewed with the Commonwealth agencies. Sources of data include the Exhibits from the contract as well as data extractions from the mainframe partitions. Hardware/Software configurations are currently maintained in the ODB and in COMUS The ODB operations database (ODB) is a database populated with information from the Site Configuration Management System (SCMS) database. The ODB contains configuration information that the Exec needs to operate component hardware. COMUS is an OS 2200 software tool that provides standard procedures for managing the installation and maintenance of certain OS 2200 software products. As part of the services provided under the new contract Unisys will integrate the mainframe configuration elements into the CMDB to have one master record of configuration data improving accuracy of information. Configuration information is updated on a cyclical basis based on changes in the environment and a multi-year record of configuration information is maintained for review by the Commonwealth. [redacted] in **Figure 3.2.4.5-3** below shows for mainframe discovery, normalization, and reconciliation process before pushing configuration management updates into the production CMDB.

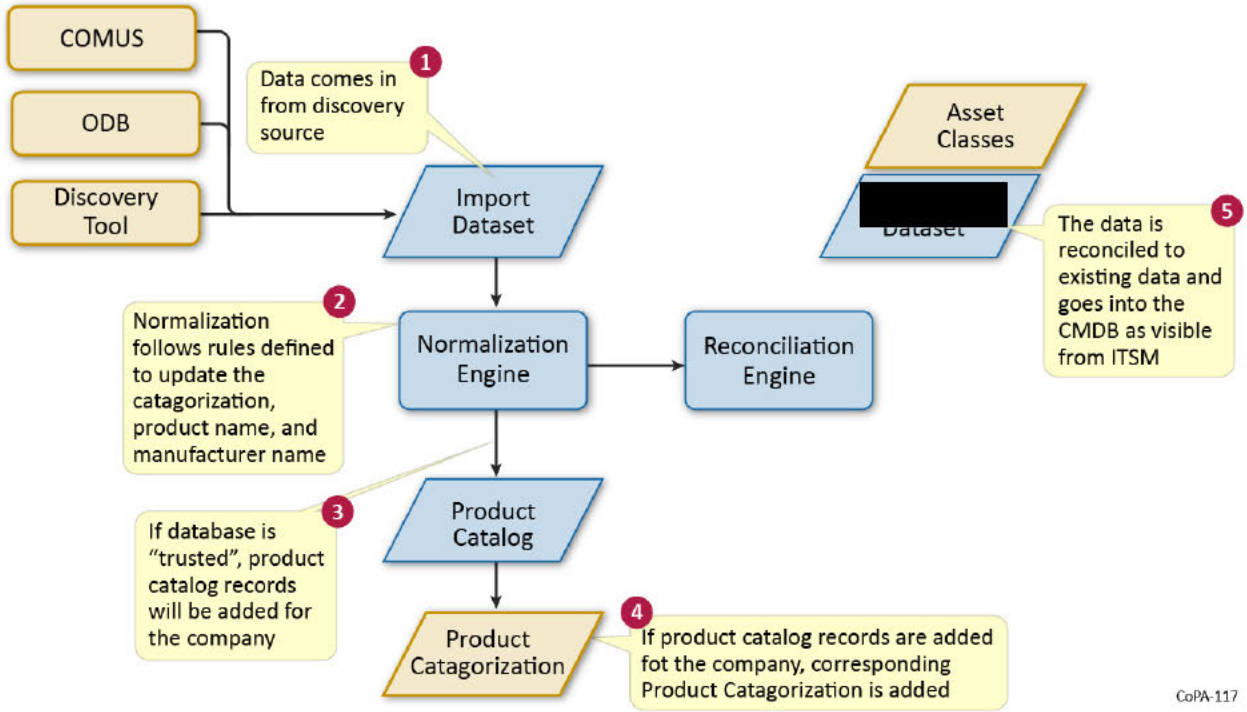

Figure 3.2.4.5-3 - [redacted]

1.N Review the system logs on a weekly basis to ensure critical system Services are processing without errors.

Unisys actively monitors the system logs for processing errors. For any system services operating with errors, an incident ticket will be created to track until the error is corrected. Tickets are driven through the Incident Management system described in Schedule F 3.2.1.4 "Service Desk". Additionally Unisys reviews the system logs on a weekly basis. The Unisys Team will collect each mainframe's system logs and output from the OpCon and BL/Sched scheduling tools and using the report management functions within these tools, validate that critical system services are operating correctly.

Daily Status Reports (Overview of Last 24 Hours) are produced and e-mailed to a specific distribution list for each of the supported state agencies. They are posted to the Services Portal for archive. Incident Ticket Reports are generated automatically from ITSM and posted to the Services Portal.

1.O Maintain and update the operational documentation for all operations procedures and Services.

Unisys will update and maintain operational documentation and processes within the CCPM and these will be reviewed with the Commonwealth on a periodic basis. Changes to the CCPM are subject to the Change Management Process. Please refer to Schedule F 3.2.1.3 "Change and Release Management" for a full description of the Unisys Change and Release Management process.

Unisys utilizes a Change Project to perform functions such as updated to operation manuals, processes and procedures. A variety of templates have been created for this to update

documentation. A sample screen shot of the current template screen is shown below in **Figure 3.2.4.5-4**:

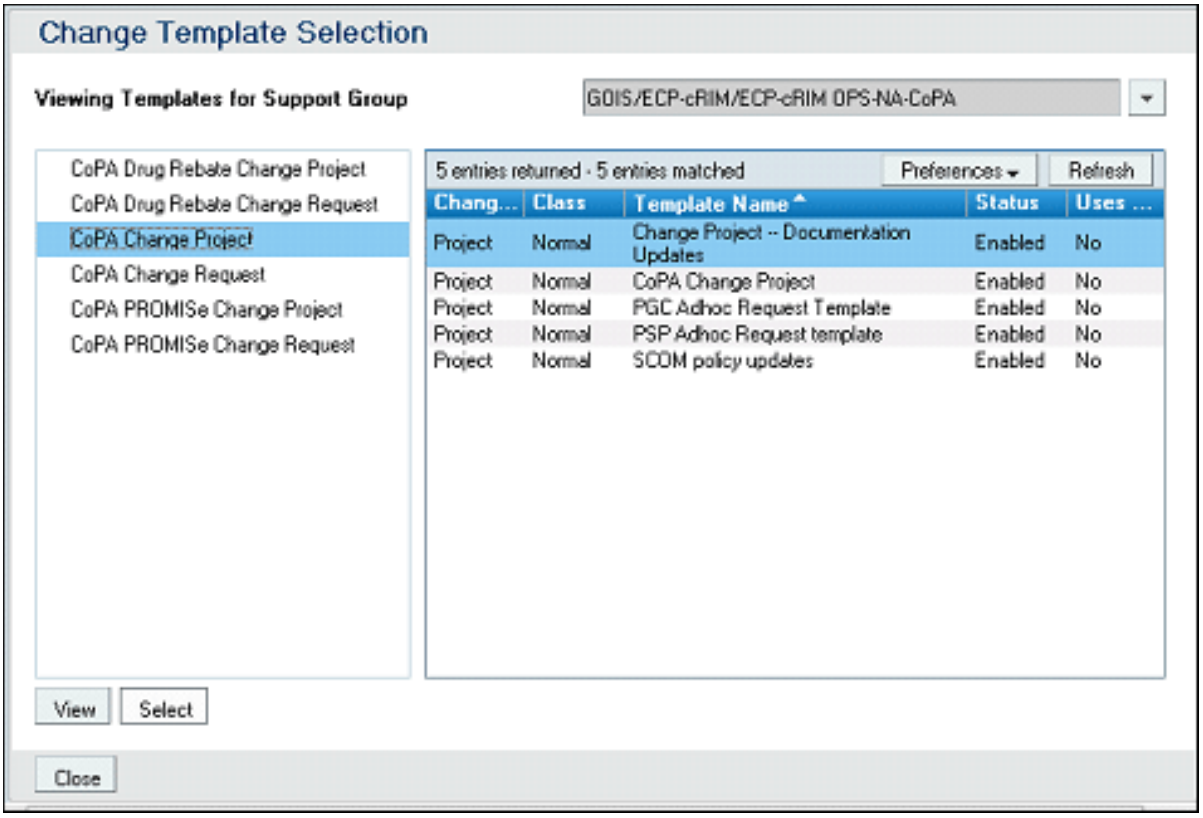

Figure 3.2.4.5-4 – Change Template screen

Once the appropriate selection is made the user is prompted for various input data to complete the documentation change. Once the user input is complete the process of notification and approval takes place until the technical writing and approval process is undertaken and completed.

2 Mainframe Usage Review and Audit

2.A Provide a review and analysis of mainframe usage to determine if current usage is required to support the needs of the mainframe stakeholders.

Offeror must describe solution and approach to meet this requirement.

The RFP requirements state that an initial review of mainframe utilization, processes and reports and to document the findings for the Commonwealth. The Mainframe usage is monitored constantly today using the Sightline tool identified in the Exhibits. Usage data is available for review by the Commonwealth agencies.

Upon contract initiation Unisys will perform a current state audit of mainframe performance. Current processes and reports will be reviewed with the Commonwealth to determine if any additions or changes are required.

2.B Offeror must perform an initial review and audit of the current mainframe usage, procedures and reports and provide an analysis of the current mainframe usage, processes and reports currently being supported.

The initial review and audit of the current usage of the Commonwealth's compute infrastructure will be accomplished as Unisys prepares to migrate the existing workload from each of the existing Commonwealth data centers into the new data centers. During this time, Unisys will deploy tools to collect and analyze all aspects of the Commonwealths current compute usage. Analysis of these workloads will be used to determine the optimal method for migrating these servers. This analysis will also serve as a baseline against which future capacity planning can be compared.

Unisys provides Monthly Performance Reports and Annual Capacity Planning Reports to the Commonwealth. These reports will be utilized to get baseline performance statistics as part of the audit process. In the new contract the mainframe usage reports will be generated using the current tool set and will be available to authorized Commonwealth users via the user portal. Sample Monthly Performance Report in **Figure 3.2.4.5-5** shows an example of a report produced for the Unisys mainframe environment.

System	System Availability		Online Transaction Processing Subsystem								Batch Completion (SLA=0)	DASD (Gigabytes)			CPU Utilization	
System A/B	SLA	Current Month	SLA	Current Month	SLA	Current Month	SLA	Current Month	SLA	Current Month	Current Month	Configured	Actual	%	Peak	Average
			Server A													
Agency A Web	99.90%	100.00%	99.70%	100.00%							0	151.5	55.6	37%	78.1%	12%
			Server B													
Agency A EDI	99.70%	100.00%	99.70%	100.00%							0	204.0	75.9	37%	0.0%	0%
			Server C		Web Server 1		Web Server 2		OLTP							
Agency B System A	99.90%	100.00%	99.90%	100.00%	99.70%	100.00%	99.70%	100.00%	99.90%	100.00%	0	2,465.0	2,651.3	104%	84.4%	58%
			Server D		MAPPER		APPMAP		OLTP							
Agency B System C	99.90%	100.00%	99.90%	100.00%	99.90%	100.00%	99.70%	100.00%	99.90%	100.00%	0	2,465.0	2,651.3	104%	100.0%	99%
			Server E													
Agency B System F	99.90%	100.00%	99.90%	100.00%							0	1,504.2	981.7	65%	99.4%	49%
Agency B Open Systems												49,595.9	40,894.3	82%		CoPA-231

Figure 3.2.4.5-5 - Sample Mainframe Monthly Performance Report

For Unisys Mainframe systems, During the transition phase Unisys will bring in subject matter experts to perform an analysis of the Unisys Mainframe systems and their interaction with other servers in the infrastructure using a tool called Atrium Discovery and Dependency Mapping (ADDM). This group will also conduct application affinity studies for the applications that reside on the Unisys Mainframe systems' as part of their base infrastructure. After ADDM is run and the data gather Unisys will conduct a series of meetings with the Commonwealth to discuss the Unisys Mainframe systems, how they support application, where they maybe concerns and make recommendation for the migration of the Unisys Mainframe systems to the new data centers.

As part of the audit process the Unisys Team will review processes and reports used by the Commonwealth and Unisys Team for applicability in the new environment. The output of this

review process will be utilized to create the audit report.

2.C Offeror must document its review and audit findings and recommendations.

An audit report of findings and recommendations will be provided to the Commonwealth. The key deliverables and reports to be address during this audit include; D-02.57, D-02.58, D-02.59, D-02.79 and D-02.80 found in Schedule K "Key Program Deliverables".

3 Production Control and Scheduling Approach, Toolset including batch jobs

3.A Offeror must describe solution and approach to meet this requirement.

Provide a process of scheduling batch jobs within Commonwealth agency defined windows to achieve maximum performance as long as required batch completion times are met.

Provide for automated scheduling of batch work and processes including backups.

Provide the capability for agencies to schedule and monitor batch processing.

Production Control and Scheduling

Unisys will provide production control and scheduling via the Enterprise Services Catalog. The Service will assess batch job(s) that are currently the Commonwealth's responsibility or are new jobs for production control and scheduling. This Catalog service will assess the requirements of the Commonwealth/Agency requesting this service. The Service will meet the following requirements:

- Provide a process for scheduling batch jobs within Commonwealth agency defined windows to achieve required batch completion times. Provide for automated scheduling of batch work and processes including backups.
- Provide the capability for agencies to schedule and monitor batch processing.
- Resolve abnormally ended jobs caused by conditions external to production programs.
- Repair abnormally ended jobs when possible and perform job restarts in accordance with the Service Management Manual.
- Check job outputs and print queues, and change job priorities.

The first step in providing production control and scheduling services is to work closely with the Commonwealth to get a clear understanding requirements and dependency during Due Diligence. Unisys will then incorporate these requirements into its production control process to develop a true cross platform, cross data center, unified production control and scheduling process. The objective is to achieve batch service level commitments through an efficient use of resources and technologies. For example, data will be gathered to develop statistics for the number of jobs executed per day/week/month, show the number of abends per day/week/month, etc., and provide these details to the Commonwealth via the Unisys Services Portal. This information will be used internally for problem trending and analysis, to verify that batch cycles complete in a timely manner and service level agreements are met.

The production control and scheduling function will use Unisys automated tools to open problem tickets for issues that impact production processing. Unisys will track problem tickets and work with the Commonwealth for problem resolution in order to verify that production

processing executes with as few interruptions as possible.

Unisys will work with the Commonwealth/Agencies to determine if current batch jobs should be converted to [redacted] or if existing tools should continue to be utilized. Unisys intends to standardize per the Commonwealth's requirement to have one enterprise platform for batch job production control and scheduling.

To allow the Commonwealth to schedule and monitor batch and backup jobs Unisys has provided the following tools for the mainframe systems as Enterprise Services Catalog items:

- Batch Scheduling and Monitoring
  - [redacted])
  - [redacted])
- Backup Scheduling and Monitoring
  - [redacted])
  - [redacted]

Authorized Commonwealth staff will have access to these tools to schedule and monitor the batch and backup jobs.

3.B Develop, maintain, and utilize an emergency contact list and escalation procedures to resolve abnormally ended jobs.

Unisys will notify Commonwealth agency customers (an emergency contact list) in accordance with the notification procedures in the event that applications and batch processing do not execute properly. Emergency contact lists and escalation processes are contained in the ITSM system. For full description of the Unisys ITSM system please refer to Schedule F 3.2.3.2 "Site Operations".

3.C Resolve abnormally ended jobs caused by conditions external to production programs.

Unisys will work with the Commonwealth agency customers to resolve abnormally terminated jobs in accordance with the established procedures in the event that applications and batch processing do not execute properly.

The Restart/Recovery Procedures vary by agency under the current contract. For those agencies that have documented Restart/Recovery Procedures which do not require change, these procedures will be followed. For any which require change Unisys will work with the Commonwealth agencies to add/modify the procedures. In the event of an undocumented abnormal termination, the appropriate agency contact will be notified.

Critical services (programs) are monitored daily and through automations will alert in the event of failures/errors. All failures/errors are documented in the specific agency Daily Status Reports as well as via ITSM.

3.D Repair abnormally ended jobs when possible and perform job restarts in accordance with the Service Management Manual.

Unisys will repair abnormally ended jobs and perform job restarts in accordance with the Service Management Manual in the event that applications and batch processing do not execute properly.

Processes to repair abnormally ended jobs are described in Schedule F 3.2.3.2 “Site Operations”.

3.E Check job outputs and print queues, and change job priorities.

For print output the Commonwealth uses Enterprise Output Manager (EOM) for mainframe print jobs. This tool will be utilized to check job outputs and print queues and change job priorities. Unisys or authorized Commonwealth staff can access the EOM console and check print status or change priorities.

3.F Notify Commonwealth agency customers in accordance with the notification procedures in the event that applications and batch processing do not execute properly.

For problem resolution and repair the following process will be utilized used:

- Note failures using scheduling tools
- Open Incident ticket to record issues and corrective activity
- Provide automated notification of batch failures
- Resolution of batch failure
- Close of Incident ticket

Incident Ticket Reports are generated automatically from ITSM and posted to the Commonwealth Services Portal.

Full description of the notification procedures are contained in Schedule F 3.2.3.2 “Site Operations”.

4 Monitor Batch operations

4.A Offeror must describe its approach to supporting the needs of the Commonwealth.

Actively monitor batch operations on all mainframe systems on a daily basis.

Unisys will provide Batch Monitoring as a Catalog Service. The Service will monitor batch job(s) that are currently the Commonwealth’s responsibility or are new jobs for monitoring. This Catalog service will assess the monitoring requirements of the Commonwealth/Agency requesting this service. The Service will meet the following requirements:

- Actively monitor batch operations on all mainframe systems on a daily basis.
- Maintain a log for each batch system and review the system logs on a daily basis to verify key batch Services are processing without errors.

- Document review of the system logs on a daily basis to confirm critical batch Services are processing without errors.
- Notify Commonwealth agencies in accordance with the notification procedures in the event that batch processing do not execute properly.

4.B Maintain a log for each batch system and review the system logs on a daily basis to ensure key batch Services are processing without errors

Batch operations are accomplished through OpCon on the OS 2200 platform and BL/Sched on the MCP platform. The Unisys staff monitors these logs and reports to the Commonwealth agencies any exceptions that occur. The tools produce daily logs of batch completion and failure and the Unisys Team reviews these logs on a daily basis and produces reports which are shared with the Commonwealth agencies.

Daily Status Reports (Overview of Last 24 Hours) are produced and e-mailed to a specific distribution list for each of the supported Commonwealth agencies. It is also posted to the Services Portal for archive.

4.C Document review of the system logs on a daily basis to ensure critical batch Services are processing without errors.

Unisys actively monitors the system logs for processing errors. For any system services operating with errors, an incident ticket will be created to track until the error is corrected. Tickets are driven through the Incident Management system described in Schedule F 3.2.1.4 “Service Desk”. Additionally, Daily Status Reports are generated to document batch failures as well as the OpCon Console alerting to Batch failures.

4.D Notify Commonwealth agencies in accordance with the notification procedures in the event that batch processing does not execute properly.

Daily Status Reports are provided to the specific agency for review as well as being posted to the Services Portal for internal review. Review of the System Log constitutes analysis of the Console messages for batch processing. These messages are analyzed live visually by Operations as well as the Autoaction Message System (AMS), for Unisys Dorado Mainframe processing errors. AMS highlights and holds on the console, all batch processing errors, to provide they are further documented and reviewed in detail. This is a well-established process and will continue under the new contract. Full description of the notification procedures are contained in Schedule F 3.2.3.2 “Site Operations”.

4.E Offeror must provide online monitoring of batch processing by the Commonwealth.

Offeror must describe its approach to allowing Commonwealth users to monitor the batch processing online.

Authorized users from the Commonwealth agencies have access to the scheduling tools and have console access to the Unisys Mainframe environments allowing them the ability to monitor and correct any batch execution incidents. Sample Batch Monitoring Screen in **Figure 3.2.4.5-6** shows an example of a monitoring screen from the OpCon tool.

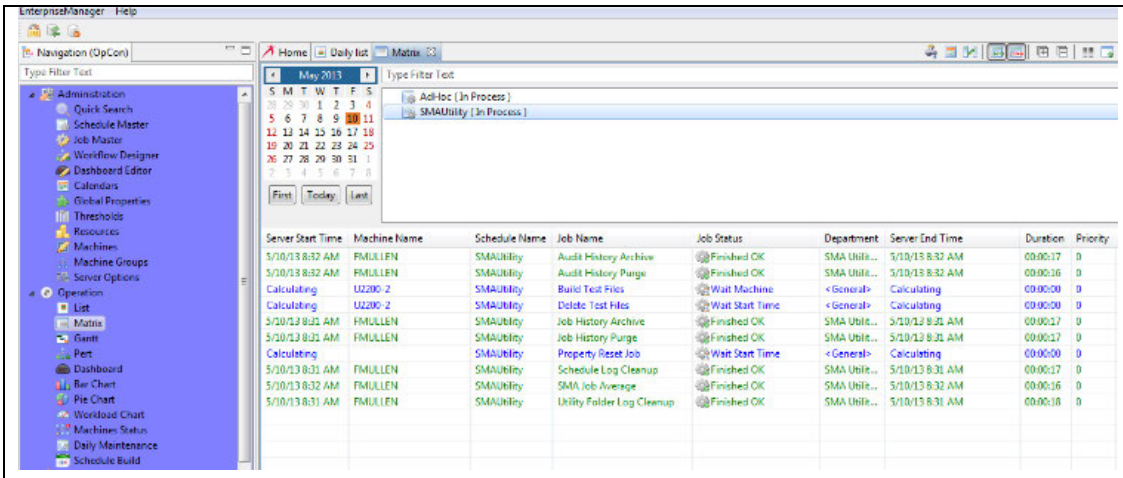

Figure 3.2.4.5-6 - Sample Batch Monitoring Screen

5 System Backup review and Audit

5.A Offeror must describe its approach to performing an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives.

Offeror must describe its approach to identifying gaps and potential risks, and how those gaps and risks will be resolved.

During the Due Diligence phase after contract initiation Unisys will review the current backup environment against backup windows, retention policies and recovery point objectives and will produce an audit report of their findings. As part of that audit report Unisys will include potential risks and gaps they have identified and will review them with the Commonwealth with potential mitigation strategies and costs. Offerings available from the Enterprise Services Catalog will be reviewed with the Commonwealth and passed through the Architectural Review Board for final approval. Key deliverables and due dates to be addressed with this process include the following; D-02.42, D-02-43 and D-02.44 as contained in Schedule K “Key Program Deliverables”.

5.B Monitor system backup processing on a daily basis.

5.C Process to review daily backup log for successful completion.

Unisys mainframe backup operations system backups are performed through BL/Lib on the Libra mainframes and SMA OpCon on the Dorado platforms. Both Unisys and Authorized Commonwealth staff will have access to these tools. Should errors occur in the backup processing, an incident ticket will be created to track until the error is corrected. Tickets are driven through the Incident Management system described in Schedule F 3.2.1.4 “Service Desk”.

The Backup Administration Console is monitored on a 7x24 basis to report backup initiation, progress and failures and also to report completions. Failures are responded to by automatic restart procedures or operational procedures.

A Daily Status Report is generated and e-mailed to a specific distribution list for each of the supported state agencies. It is also posted to the Services Portal for archive.

An example of a sample backup report is shown in the **Figure 3.2.4.5-7** below.

OPERATIONS DAILY STATUS REPORT

Commonwealth Agency

Figure 3.2.4.5-7 - Sample Backup Report

5.D Note any failures, initial and date the log, and correct the problem.

The Commonwealth has benefited from the long standing process used by Unisys to monitor Mainframe backup success rates. Using the OpCon and BL/Lib software tools Unisys monitors the nightly progress of backups and then intervene when the rare problem arises. In most cases simply re-starting a backup results in a successful backup because needed resources are tied up during peak times but become available a short time later. Unisys automates the restart process automatically. If the restarted backup fails then incident tickets are created to alert the Backup support team. Thus critical issues get right to Level 2 and Level 3 support personnel without even involving Level 1 support staff. Escalation processes are described in Schedule F 3.2.1.4 " Service Desk".

This automation of incident ticketing provides the Commonwealth with another advantage. During service delivery reviews the Commonwealth can review response times to failures that might put critical applications at greater risk.

Incident Ticket Reports are generated automatically and logs are created with the date time and

assigned resources are from ITSM system and posted to the Services Portal.

Through the incident severity rating processes Unisys has the ability to adjust severity levels so that incidents that are closer to critical applications can receive prioritized support responses.

5.E Create problem record for any abnormal condition and any repairs that have been made.

For problem resolution and repair the following process will be utilized used:

- Note failures using scheduling tools
- Open Incident ticket to record issues and corrective activity
- Provide automated notification of batch failures
- Resolution of batch failure
- Close of Incident ticket

Tickets are driven through the Problem Management system described in Schedule F 3.2.1.4 "Service Desk."

5.F Automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.

Unisys has a proven automated approach to monitoring daily backups. On a daily basis Unisys also produces reports on backup successes. The Daily Status Reports are provided to the specific agency for review as well as being posted to the Services Portal.

6 Technical Support

6.A Offeror must describe its approach to supporting the needs of the Commonwealth.

Provide cost effective, operational, and technical support for the computing platform.

The Unisys mainframe systems are a key component of the overall application environment within the Commonwealth. For over 25 total years and 13 years under the current contract Unisys has been providing high levels of operational and technical support to the Commonwealth with high client satisfaction ratings. The Commonwealth wants to continue to receive this high level of support with the lowest cost.

6.B Provide platform level operational and technical support for computing platforms including Mainframe, Storage, AIX, LINUX, SAP, Oracle and Windows architects.

The Mainframe/Midrange Infrastructure function provides hosting and operational support services for both IBM and Unisys mainframe and midrange systems. The service supports all mainframe operating systems and management of the associated logical partitions on the platform. This combined team has provided the services predating the inception of the Data PowerHouse contract in 1999.

The Unisys Mainframe function will continue to be supported by senior level Unisys engineers with over 25 years supporting the Commonwealth's systems with specialty in the OS220 and MCP operating systems. For operational and technical support of non-mainframe platforms please refer to the following sections.

Storage	Schedule F, Section 3.2.4.2
AIX	Schedule F, Section 3.2.4.4
Linux	Schedule F, Section 3.2.4.4
SAP	Schedule F, Section 3.2.4.3
Oracle	Schedule F, Section 3.2.4.3
Windows	Schedule F, Section F 3.2.4.1

This team understands the business priorities associated with applications that run on that platform for the Department of Public Welfare, the Pennsylvania State Police, and the Pennsylvania Game Commission. For representative resumes please refer to Section 5 “Personnel”.

The proposed solution includes a robust technical support staff with the necessary skills to provide the managed services requested by the Commonwealth of Pennsylvania in this RFP. The staffing levels are determined based on key performance indicators which specify the expected number of devices to be supported by each member of the technical team. The team will be staffed with junior and senior positions to provide coverage for Level 2 and Level 3 technical support requirements. Human resource actions including writing position descriptions, development plans, and funding for certifications are all targeted to confirm that the technical support resources are prepared to support the managed services.

In addition to providing the required resources, Unisys will be focused on proper work allocation and skills development. The ITSM7 system will be the primary tool used to allocate work across the various service towers providing communications and control capabilities for delivering the services. Skills development will be provided with formalized training programs and peer mentoring assignments to allow for on the job training opportunities.

6.C Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.

As part of the proposed solution, Unisys will provide Level 2 and Level 3 support to the Commonwealth of Pennsylvania. The proposed solution includes a robust technical support staff with the necessary skills to provide the managed services requested by the Commonwealth of Pennsylvania in this RFP. The staffing levels are determined based on key performance indicators which specify the expected number of devices to be supported by each member of the technical team. The team will be staffed with junior and senior positions to provide coverage for Level 2 and Level 3 technical support requirements. Human resource actions including writing position descriptions, development plans, and funding for certifications are all targeted to confirm that the technical support resources are prepared to support the managed services.

Incident tickets are created automatically and create a record of abnormal conditions. Following ITIL-based processes Level2 and Level3 will review incidents for root causes that create multiple tickets. This identification of problems allows the team to establish workarounds and request architecture reviews as necessary. Tickets are driven through the Incident Management system described in Schedule F 3.2.1.4 "Service Desk".

6.D Provide technical advice and support to the Application Development and Maintenance (ADM) and Database Administration (DBA) staffs, as required.

Unisys is the provider of the Mainframe technology and our staff has direct access to Unisys engineering and support organization to make sure the Commonwealth has the best level of service possible. The staff provides 7x24 operational and technical support through both onsite and remote staff which reduces the overall cost to the Commonwealth without introducing risk. This staff also provides Level 2 and 3 support to the Service desk. Under the new contract Unisys will provide the same level of technical and operational support that is done today. A Services Catalog item has been added to enable the Commonwealth to procure any additional ADM and DBA technical advice and support outside what is being delivered today.

As part of the weekly change meetings Unisys participates and provides advice to the application and database staff as part of the application review process. Based upon new application or database requirements and solution knowledge available through Unisys and our partners, the staff provides and will continue to provide technical support to these staffs.

6.E List the service levels for the various levels of service tiers that can be provided. See Schedule J.1 Datacenter Service Level Management for the definitions of the expected options.

The Commonwealth of Pennsylvania has indicated in Schedule J.2 - Datacenter Service Level Matrix the desired service tiers/support levels. In the design of the Services and the infrastructure needed to deliver those Service to the Commonwealth, Unisys defined the Service Tiers to align to those requirements. A fuller explanation and representative sample of all the Services provided in this structure can be found in the response to Schedule F, Section 3.2.1.5, sub-requirement 1. The service tiers in the Unisys solution are as follows:

Tiered Support Level	Description This Service Level measures the percentage of time the Applications are Available during the applicable Measurement Window
Platinum	• 99.999% Application Infrastructure Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365
Gold	• 99.99% Application Infrastructure Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365

Silver	99.9% Application Infrastructure Availability SLA Measurement Window – Monthly Hours of Measurement – 24x7 Days of Measurement – 365
Bronze	99.4% Application Infrastructure Availability SLA Measurement Window – Monthly Hours of Measurement – 24x7 Days of Measurement – 365
Basic	98.5% Application Infrastructure Availability SLA Measurement Window – Monthly Hours of Measurement – 24x7 Days of Measurement – 365

7 Monitor Network Connectivity, Toolset

7.A Ensure network connectivity to COPANET, and consistent system response times.

Offeror must describe its real-time monitoring approach and toolset to provide and maintain network availability and performance.

As part of the overall application environment which includes Mainframe, Open Systems and end user devices the mainframes require a high degree of network connectivity and performance. Many of mainframe centric applications have migrated off the traditional “green screen” usage to more server to server or web based access and the reliance on the network and performance requirements have increased.

Included in the Mainframe technical design is the review of the current network utilization and network connectivity to meet performance requirements and the results have been designed into the mainframe configurations. The Mainframe configurations provided in the Enterprise Services Catalog have the network connectivity included to meet the current and projected future network requirements. These designs also include full redundancy to provide for network connections should a card or switches fail.

From a monitoring and notification view Unisys provides a holistic approach in which availability and response times are viewed from a mainframe centric (looking out) and user centric (looking in) perspective. From the mainframe view the operating software provides notification of disconnects should an error occur. From an application performance view Sightline provides performance monitoring across the mainframe and open platforms and provides automated alerts of performance issues. Refer to Schedule F 3.2.1 “Network and Security Architecture” for a full description of the Unisys network solution.

7.B Utilize automated system management tool(s) to ensure real time monitoring and notification of system availability and response times. Stop / Start times of servers will be a source of input for SLA measurements

Offeror must identify tools it uses to support network availability and performance.

Unisys will provide event management solutions to help provide network connectivity and consistent windows systems response times. Unisys will utilize [redacted] applications to record incidents tickets that are generated from mainframe monitoring tools to provide real-time monitoring and notification of mainframe availability and response times including the stop and start times of mainframes to support SLA availability measurements. SLA availability measurements are measured in [redacted] and displayed in the Real-time Dashboard available to Commonwealth/Agency personnel. The following tools are the major toolsets to support network and system event management and monitoring.

Monitoring Software	Managed Configuration Items (CI's)	Monitoring and Management Functionality
[redacted]	LAN Devices including: • Switches • Routers • Load Balancers • Firewalls	Provides deep network device availability and performance monitoring, DNS, IP address management, network configuration management, and network traffic bandwidth throughput monitoring
[redacted]	Microsoft servers, databases, network devices, and storage hardware.	Provides a standard set of availability, performance and critical service monitors developed by Unisys for monitoring across infrastructure items including: • Servers • Network devices (switches, routers, load balancers) • Storage devices • Middleware • Applications (Exchange, Citrix XenApp, etc.)

For a complete understanding of how this subset of Event Management Tools supports enterprise Event Management please refer to 3.2.3.2 Site Operations. Refer to Schedule F 3.2.1 "Network and Security Architecture" for a full description of the Unisys network tools.

8 Patch Management

8.A Implement a Patch Management Program to ensure the timely application of updates on all infrastructure platforms in accordance with Commonwealth IT policy guidelines.

Offeror must describe its approach to supporting the needs of the Commonwealth.

Unlike Windows or other open systems operating environments the mainframes are typically not patched on a monthly basis. On mainframes the operating systems are patched based on new system release levels or to enable new features as requested by the Commonwealth. Unisys staff reviews new features and operating system levels and presents them to the Commonwealth during the change meetings to determine if any patching or upgrades are required. Based upon approval and scheduling with the Commonwealth Unisys applies the changes to the mainframe systems. Commonwealth Information Technology Bulletins (ITBs)

will be followed.

8.B Offeror must describe its approach for testing and validating updates to the OS and 3rd Party software that it supports.

Rather than deploying changes directly to the production environments, the development or Unisys test partitions are used to test and validate all new operating system patches and hardware components. Once fully tested and approved by the Commonwealth the patches are applied to the production partitions.

The Unisys technical support team will work with the Commonwealth agencies to determine patch policies that should be applied to the Mainframe environment.

Unisys will follow the Change Management Process for applying patches to the Mainframe environment. This process will maintain the change record in the [redacted] and also update the CMDB configuration management file upon deployment for the Mainframe environment Configuration Items (CI's). The Change Record will be related to the CI's in the CMDB as an audit trail for changes to server CI's upon the completion of the Release and Deployment Process for changes.

Unisys approach to testing and validating updates to the Mainframe OS and 3rd party software in the Mainframe environment is to follow the Release Process for all changes into all production environments. The Release Process includes:

- Change ticket approvals
- Test planning and accepted test results
- Release and deployment planning including release back-out plans
- Release testing for risky deployments
- Early life cycle support to help provide a successful deployment
- Release back-out for failed releases

Software patching, validation of OS updates and outage communication is specific to the Mainframe systems. A Mainframe partition (in the Dorado environment) or Development system (in the Libra environment) can be removed for planned hardware or software reconfiguration, maintenance, or upgrade. Once upgrades and patches are applied and validated by the Commonwealth and Unisys the systems are brought back on line. Upon approval by the Commonwealth the remaining Production environments will be updated and tested based on the same process which was utilized for the no-production environments.

8.C Ensure operating systems are maintained with the current system patch level, based on the Services provided by the server.

Unisys reviews the mainframe release levels and verifies the operating systems are maintained within the Unisys software support cycle. Unisys proactively reviews future operating system releases and documents any impacts the release may have on agency applications processing environments. This allows adequate preparation time for new operating system releases to be

applied when available.

8.D Analyze monthly service patches and determine which patches need to be applied.

Unisys staff members review the current operating system releases and the applicability of applying new software releases to the mainframe platforms. Based on new features or fixes in the operating system Unisys will present to the Commonwealth agencies any fixes or new releases that should be applied in the next update cycle.

8.E Create a change record, log the update in the system log, and install based on system availability schedule.

The implementation of the changes is part of the change management process in which the change ticket is created prior to the application of the patch. After the patching is complete the change ticket is closed. The mainframe system scan identifies the changes and updates are made to the CMDB.

Change reports are generated automatically from ITSM and posted to the Services Portal.

8.F Notify the Commonwealth of any scheduled or unscheduled service interruptions with consideration to Commonwealth scheduled holidays and standard workweek.

Offeror must describe its approach to communicate unscheduled and scheduled outages, including escalation process.

Unisys approach to communicating unscheduled outages is to send notifications to key stakeholders for the Commonwealth/Agencies/Unisys/Third Parties depending on the outage. This will be through email, voice, portal and Remedy broadcast capabilities. The same communications will be used for scheduled outages with additional communications in forward schedules of change reports.

Escalations for unscheduled outages are handled through the standard processes for managing incidents. Unisys service desk will manage all incidents and provide that proper escalation communications to key Commonwealth/Unisys/Third Parties personnel are managed. The [redacted] will also be configured to escalate incident tickets based on incident priorities and SLAs to verify that incidents tickets are being managed to SLA times for incident response and resolution.

Emergency contact lists and escalation processes are contained in the ITSM system. For full description of the Unisys ITSM system please refer to Schedule F 3.2.3.2 “Site Operations”.

9 User Account Management

9.A Provide certified system administration staff to create and maintain the registration of profiles, associated groups, and the security permissions (including password management) required to service the approved client base of the system and application.

Offeror must describe its approach to supporting the needs of the Commonwealth.

User account management including creation and maintenance of the registration of profiles, associated groups, and the security permissions (including password management) is a function which is done by Commonwealth staff under the current contract. An Enterprise Services Catalog item has been added to enable the Commonwealth to procure account management services. A full description of the Unisys Security Management offering is contained in Schedule F 3.2.2.5 "Security Management".

10 Procurement Management

10.A Provide a program and process to refresh the hardware at asset end-of-life, and when upgrades are needed to meet anticipated growth in utilization

Offeror must describe its approach to supporting the needs of the Commonwealth.

The Commonwealth requires a program and process to refresh the hardware at asset end-of-life, and when upgrades are needed to meet anticipated growth in utilization. The Unisys Team as part of the Service Delivery framework participates in capacity planning and procurement planning. Using this planning process end-of-life dates and new application requirements as well as ongoing capacity management are used to identify when upgrades or replacements are needed. As with the other technology areas the Mainframes will be part of the Technology Refresh Plan and Capacity Management process. On overview of these is shown below as related to Mainframe services

- Technology Refresh Plan
  - As part of the overall architecture support, the Commonwealth's environment will be reviewed on a quarterly basis to identify technology, services or components which require replacement to maintain the Commonwealth's business needs and associated service levels. The review will include the following activities. The overall technology refresh plan will be documented in Key Deliverable D-03. This plan will be used for all Unisys supported environments including the Commonwealth Mainframe systems.
  - Using the data within the Asset Management and Configuration Management databases, identify the technical components within the Mainframe system environment which require replacement within the next 18 month period based upon the a 60 month replacement cycle.
  - Review End of Sales and Service Life notices from the Manufacturers to validate if a component has been discontinued or has available ongoing maintenance options.
  - Review ongoing Capacity and Performance reports to identify any components with a refresh requirement which have additional needs driving a requirement or opportunity to change the component's classification to a different component to maintain the functionality and service levels.
  - Identify replacement technical components based upon the current Services Catalog offerings
  - Validate replacement technical components meet the current requirements for the impacted Commonwealth applications.

- Identify risk and impact for the Commonwealth environment to replace existing technical components or services.
- Create technology refresh recommendations, impact statements, and high level implementation plan.
- Present the technology refresh plan to the Commonwealth using the solution architecture review process.
- Upon approval of the refresh plan, open service requests for each migration group and develop the detailed project plan for the migration plans.

➢ Capacity Management and Forecasting

- The Commonwealth Mainframe systems will be monitored and reported from the Capacity Management system used as part of the Unisys management toolset. As part of the Capacity Management process, the capacity reports will be generated and reviewed with the Commonwealth on a regular basis.
- As part of the annual Capacity and Forecast planning activity, Unisys will work with the Commonwealth to identify what changes in growth are expected and provide recommendations on additional upgrades.
- In addition to the Commonwealth's growth forecasting information, Unisys will use the data within the Capacity Management, Asset Management and Configuration Management databases and identify the technical components within Mainframe system environment which require upgrades or additional infrastructure to support the forecasted growth requirements.
- Identify replacement or upgrade technical components based upon the current Services Catalog offerings and the vendor's available products.
- Validate that the identified upgrades or additional components meet the current and forecasted requirements for the impacted Commonwealth Mainframe system.
- Identify risk and impact for the Commonwealth Mainframe system to upgrade or add additional components.
- Create the capacity upgrade recommendations, impact statements, and high level implementation plan.
- Present the capacity upgrade plan to the Commonwealth using the solution architecture review process.
- Upon approval of the capacity upgrade plan, open service requests for upgrade project and develop the detailed project plan.

11 SLA Reporting

11.A Collect actual system availability, utilization and response time data.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The purpose of establishing a strong SLA reporting framework is to provide transparency into the Commonwealth's vendors in its various technical towers. This framework must consist of industry best tools and processes, and should be developed in cooperation between Unisys, Unisys partners, the Commonwealth, and other Commonwealth vendors. The end result of this cooperative effort should be an SLA reporting framework that delivers the following:

- The establishment and maintenance of open communications with the Commonwealth through the governance structure, which encompasses regular meetings and delivers regular reports, many of which are available for the Commonwealth to access online.
- A process to work collaboratively with the Commonwealth to update the Service Level Document when services or service levels are created or modified based on a mutually agreed to process.
- Monitors and reports adherence to Service Levels.
- Verify that service level commitments are met by regularly reviewing service level commitments, compared with actual service level attainment.
- Take corrective actions based on root cause analysis to reduce the impact of future service level failures.
- Define needed monitoring and service level reports.
- Review service operations through management and technical reviews to analyze service level related measurements and take action.
- Identify when changes are required to the Service Levels

Unisys will establish an SLA process and technical architecture to support all SLA's for this contract. See the overview in Schedule F, Section 3.2.1.2 "Availability/SLM". Level 1 of the SLM process is shown in **Figure 3.2.4.5-8** below:

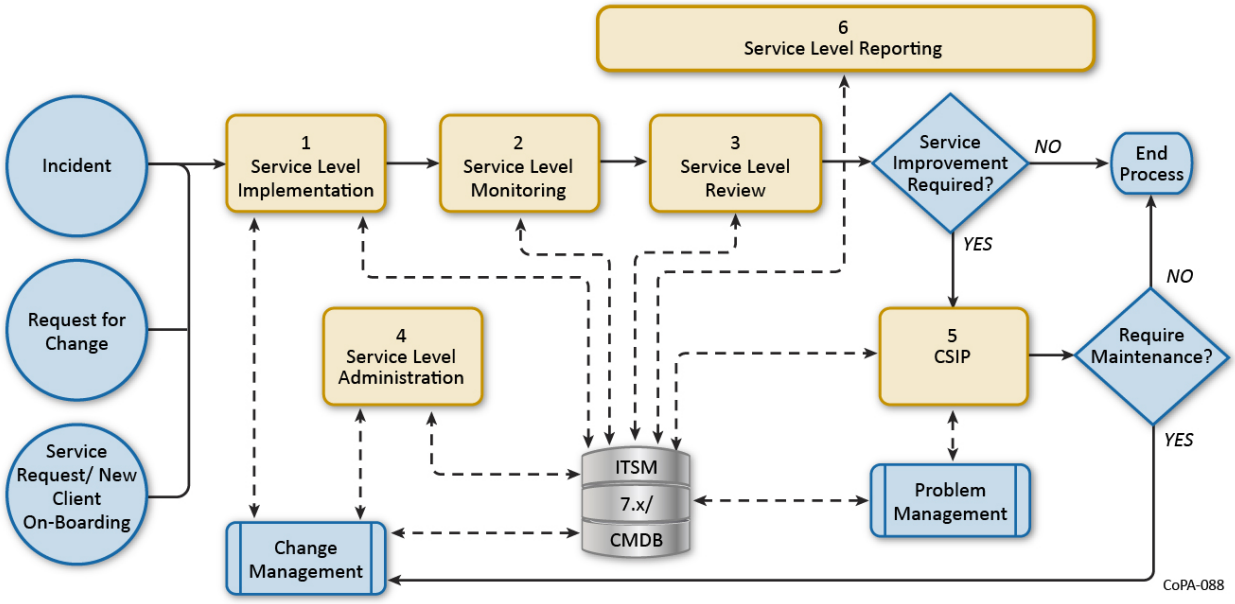

Figure 3.2.4.5-8 - SLM Reporting

Unisys will provide a detailed set of processes and procedures to support Service Level Management during transition of this contract. The process and procedures will support this top level view of the process which includes:

- Service Level Implementation
- Service Level Monitoring
- Service Level Review
- Service Level Administration
- Service Level Improvements (CSIP)
- Service Level Reporting

Unisys will provide the technical architecture and toolsets to support monitoring and maintaining service levels for the mainframe platforms .The [redacted] will be used as the single unified platform to manage Service Level Agreements for Commonwealth agencies. [redacted] provides a continuous real-time platform for defining, measuring, monitoring, reporting, and reviewing the performance of SLA's (per J1 – J3) for mainframe services to make sure that adequate levels of service are delivered in alignment with the Commonwealth's objectives for service delivery. The business contract will contain agreements in which the levels of service are specified. These agreements consist of individual service targets or goals that are used to evaluate whether the agreement is in compliance.

The [redacted] uses all the other [redacted] modules as inputs to determining if an SLA is in compliance. The [redacted] modules used for transaction inputs to determine if service level targets and goals are in compliance include:

- Incident Management
- Problem Management
- Change Management
- Asset/Configuration Management
- Performance/Capacity Management

The [redacted] and in some unique cases other tools as described in F3.2.1.2 will be used to push near real time SLA reporting into the SLA PureShare dashboard reporting tool.

11.B Create a SLA report on a monthly basis, for the Commonwealth and Offeror.

Unisys uses a combination of Sightline and mainframe data are used to report on availability, utilization and response time data. Unisys provides a variety of Monthly SLA reports to OA via the agency specific Monthly Performance Reports and the BES Monthly Report. These reports are generated and posted on a portal as well as e-mailed to key stakeholders.

Key deliverables and due dates to be addressed for SLAs include the following; D-02.04, D-02.05, D-02.06, D-02.07 AND D-02.08 as contained in Schedule K " Key Program Deliverables".

Figure 3.2.4.5-9 below is a snapshot of the Real-time Dashboard which will be available to authorized Commonwealth users.

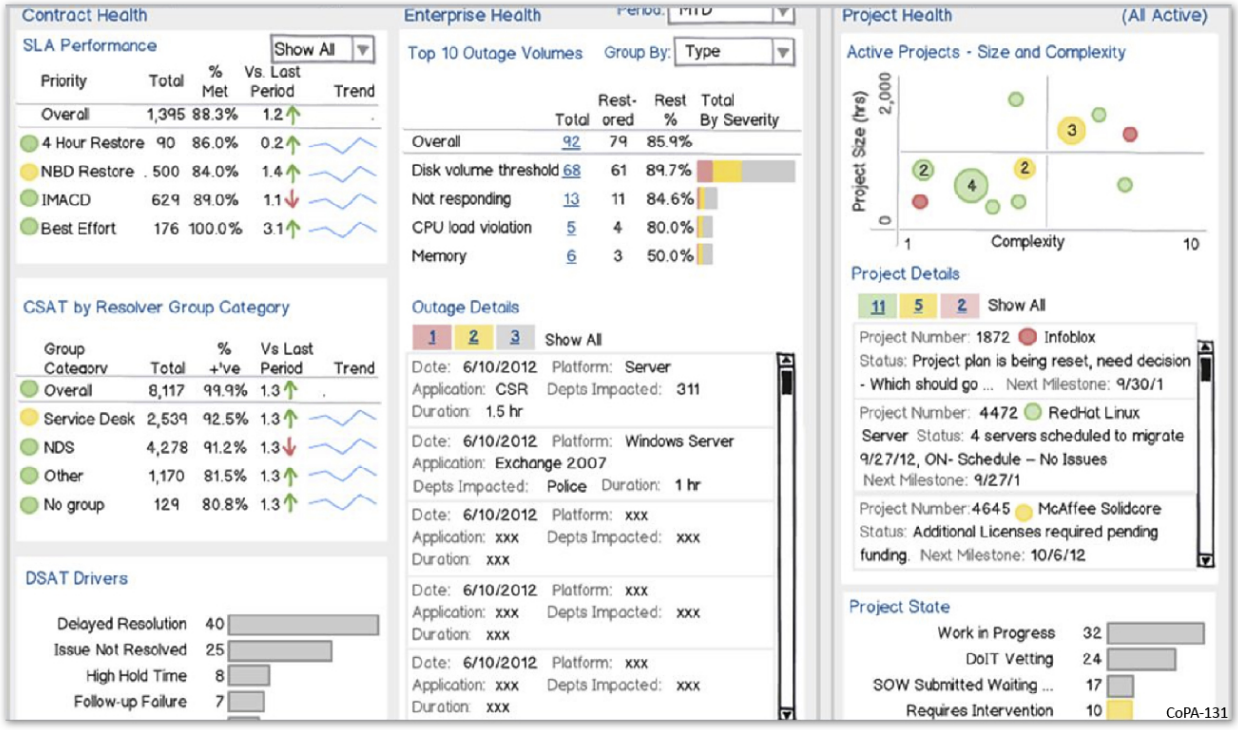

Figure 3.2.4.5-9 - Sample SLA Dashboard

12 Software License Management

12.A The Offeror must provide Software License Management.

Offeror must describe solution and approach to meet this requirement.

Unisys will provide Software License Management for all infrastructure including mainframe platforms. Unisys will provide 3rd Party License Management service for the Commonwealth and Unisys provided infrastructure software products. Unisys will be solely responsible for the management of all infrastructure software license products provided through this contract. The goals of this service are to:

- Confirm software contract compliance (to avoid non-compliance legal issues and expenses)
- Manage costs of software inventory by matching requirements for use to needs
- Verify software maintenance contracts are maintained on schedule through early notifications

Unisys will coordinate with the Commonwealth to verify compatibility between Commonwealth provided applications related software, and Unisys provided infrastructure software.

The following is the approach Unisys will execute during transition and as an ongoing process

to provide 3rd party software license inventory and tracking per agency related infrastructure.

- Load all Unisys and Commonwealth software asset license contract information into the [redacted]
- Load all software license certificate , license type, entitlements, manufacturer, and product information into the [redacted] for the Software License Contract
- Run discovery through [redacted] to identify all software installations Run the [redacted] to build relationships between the discovered software CI's recorded in the [redacted] and the license certificates
- Run the [redacted] to identify non-compliant licenses and inventory for the Unisys and Commonwealth Asset Managers to audit the completeness and accuracy of the information
- Identify any discrepancies in the information and make corrections
- Rerun Compliance Reports and 3Rd party software license inventory reports to get signoff from the Commonwealth and Unisys Asset managers that inventory is properly linked to license certificates in the production environment and the information is complete and accurate
- Provide notifications to Commonwealth/Agencies/Unisys and other Commonwealth service providers when there are software compliance issues or requirements for licenses to be purchased or retired from analysis of license inventory.

Unisys provides third-party software license management as part of the service today and this will continue with the new contract.

13 Mainframe Patching Approach

13.A Coordinate at an agency level and account for any required patching as technology upgrades require.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The Unisys technical support team will work with the Commonwealth agencies to determine patch policies that should be applied to the Unisys Mainframe environment. Patching is part of the Change Management process. Patches are identified and discussed with the agencies. Patches are applied based upon an agreed upon schedule. Please refer to Schedule F, Section 3.2.1.3 Change and Release Management of this document for detail on the formal ITSM7 change management process.

Unisys will follow the Change Management Process for applying patches to the production Unisys Mainframe environment. This process will maintain the change record in the [redacted] platform and also update the CMDB configuration management file upon deployment for the mainframe environment Configuration Items (CI's). The Change Record will be related to the CI's in the CMDB as an audit trail for changes to Mainframe CI's upon the completion of the Release and Deployment Process for changes. Change Reports are generated automatically from ITSM and posted to the Commonwealth DPH SharePoint Portal.

IBM Mainframe

IBM Mainframe Operations Approach

1.A Offeror must describe its approach to supporting the needs of the Commonwealth including the following:

Processes and Procedures

Tools / Applications

End User Reports (Standard and Custom)

Tiered Service/Support Levels

Escalation Procedures

Provide Mainframe systems and operations (Unisys, IBM).

The Unisys Team will provide all mainframe systems and operations support for both the Unisys and IBM mainframe environments. This section will detail the Unisys Team's approach to supporting The Commonwealth's IBM mainframe operating systems.

The Unisys Team will actively monitor the daily operations of all mainframe systems using a combination of on-site and remotely located personnel and tools. The Team proposes to apply our experience, global expertise, and broad scope of proven tools and methodologies to enable the Commonwealth to achieve the required results. In implementing our mainframe services, we will take a collaborative approach in which we leverage the Commonwealth's best processes, transform any that do not work well, and integrate them with The Team's proven approaches. We will evaluate and blend these processes in a manner that will best meet the business needs of the Commonwealth.

Processes and Procedures

The processes and procedures for providing IBM Mainframe infrastructure managed services will be documented in the CCPM which will be reviewed and approved by the Commonwealth. The scope of these processes and procedures will be based on the ITIL framework as well as technology best practices for support of IBM Mainframe platforms.

Processes and procedures will be developed for the following areas:

- Mainframe technology support – build and maintain for hardware, software, connectivity
- Vendor management – technical support, maintenance coverage, and remote access capability
- Platform specific procedures – customer notification, technical support escalations patching process/schedule, security monitoring, and log reviews

Tools / Application

Unisys has outlined the complete approach to monitoring operations and supporting automated remediation over time from a common enterprise infrastructure platform across all technical towers for the Commonwealth in F3.2.3.2 Site Operations.

The Unisys Team will implement, support, and operate a comprehensive and integrated

Information Technology Service Management (ITSM) Architecture dedicated to the cross functional process support for all services provided to the Commonwealth for this contract. The proposed ITSM Architecture, shown in **Figure 3.2.4.5-10**, will provide an effective and efficient operational platform to support the Commonwealth's agencies application infrastructure for the following ITILV3 (Information Technology Infrastructure Library) Service Management Processes.

Figure 3.2.4.5-10 - Proposed Unisys ITSM Integrated Architecture.

The Unisys Team will provide all tools and applications that are currently provided by IBM. The Unisys Team will also provide browser based terminal emulation access and middleware components that are critical to agency operations and application usage.

The Integrated ITSM Management Platform software tools as they pertain to the IBM

mainframe are summarized in the **Figure 3.2.4.5-11**.

Listed below are additional tools utilized in the operational and technical support of the Commonwealth.

	[redacted]	[redacted]

Unisys will assess the Commonwealth's current ITSM toolsets during transition. Assessment results determine which tools will be supported within this overall target ITSM proposed architecture, replaced, or eventually migrated to the target environment ITSM tools. The resulting architectural decisions will be reviewed and approved by the Commonwealth's agencies. Some identified tools will continue to offer the functionality they currently providing, but will be integrated into the overall ITSM proposed architecture.

- End User Reports
  - Standard Reports are summarized in 3.3.2.
  - Custom Reports are offered by Unisys as a Catalog Service
- Tiered Service/Support Levels

The Commonwealth of Pennsylvania has indicated in Schedule J.2 - Datacenter Service Level Matrix the desired service tiers/support levels. In the design of the Services and the infrastructure needed to deliver those Service to the Commonwealth, Unisys defined the Service Tiers to align to those requirements . A fuller explanation and representative sample of all the Services provided in this structure can be found in the response to Schedule F, Section 3.2.1.5, sub-requirement 1. The service tiers in the Unisys solution are as follows:

Tiered Support Level	Description This Service Level measures the percentage of time the Applications are Available during the applicable Measurement Window
Platinum	• 99.999% Application Infrastructure Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365
Gold	• 99.99% Application Infrastructure Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365
Silver	• 99.9% Application Infrastructure Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365
Bronze	• 99.4% Application Infrastructure Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365

Basic	98.5% Application Infrastructure Availability SLA Measurement Window – Monthly Hours of Measurement – 24x7 Days of Measurement – 365

Escalation Procedures

As part of the communication management plan, the Unisys Team will work closely with the Commonwealth of PA to structure effective escalation procedures. These procedures will be developed to provide guidance for escalation activities in a number of categories including incident management service response, management notification, and service quality.

For incident management service response, escalation procedures will define the schedule, criteria, methods, and participants for the escalation of issues or incidents impacting computing services to the Commonwealth. The primary objective of this escalation is to assign appropriate vendor resources with the necessary skills to the incident process to restore service. The procedure will include steps to contact approved agency stakeholders to provide initial notification and to engage in joint problem determination/resolution activity as appropriate.

Escalation procedures will also include provisions to notify Commonwealth and Vendor management staff of major service impacting events as well as to provide continuous updates are provided until the incident is resolved. In order to provide an easy method for the Commonwealth to notify the vendor of service quality concerns, the escalation procedures will include the process and contacts to register the service quality issues for review and action.

Provide Mainframe systems and operations (IBM)

To support the requirements of the Commonwealth under the new contract the Unisys Team will continue to offer IBM Mainframe technology and operational support staff aligned with the Commonwealth tools and processes. The Unisys Team will offer IBM mainframe MIPS and CPWS to support the application processing requirements. Details of the IBM Mainframe offering are contained in Schedule F, Section 3.1.3.

The IBM mainframe environment includes both operational and support staff. This staff has many years supporting the needs of the Commonwealth and will be utilized under the new contract.

1.B Ability to purchase metered IBM & Unisys Million Instructions Per Second (MIPS).

Through the Catalog of Services the Commonwealth can procure MIPS or CPWS based on an allocation model where the agencies will request the MIPS or CPWS they require within the Catalog and can utilize the allocated MIPS or CPWS to the total requested.

1.C Monitor local operations, troubleshoot and resolve operational issues.

The Unisys Team, which includes IBM resources familiar with the Commonwealth's

environment and requirements, is providing staff in the operation center that will be monitoring the batch processing and console messages. The staff provides monitoring of mainframe operations and provides troubleshooting to resolve operational issues. There are well established and tested escalation processes in place to address system related incidents. Escalation processes are described in Schedule F, Section 3.2.1.4 "Service Desk". Notification of incidents to the appropriate Level 2 support group is part of the in place process today and will continue in the future.

1.D Actively monitor the daily operations of all mainframe (current) systems.

The Unisys Team staff provides monitoring the daily operations of the IBM mainframe operations within the current contract. The Unisys Team will actively monitor the daily operations of all IBM mainframe systems using a combination of on-site and remotely located personnel and IBM tools. The Unisys Team proposes to apply our experience, global expertise, and broad scope of proven tools and methodologies to enable the Commonwealth to achieve the required results. This will continue under the new contract in support of the Commonwealth processing requirements.

This includes delivery of mainframe services to the Commonwealth as the Unisys Team utilizes a formal, integrated methodology. Each process in our methodology rigorously follows a pattern of planning, testing, coordinating, implementing, monitoring, and reporting on delivery in its specific area.

The Unisys Team will drive cost reduction and efficiencies through leveraging our local and remote resources and deploying proven tools and capabilities into the environment. The Unisys Team is committed to improving service while reducing costs. To achieve this, the Unisys Team will utilize automation techniques whenever possible to enhance console operations and to proactively monitor the mainframe and server environments. These automation techniques have been used and proven in delivery of our services to other clients.

Mainframe operations will include monitoring ongoing operations and responding to events, alerts, or incidents. Activities performed include online and batch monitoring, recovery and restart, root cause analysis, incident and change management, and resource availability balancing.

The Unisys Team will work with the Commonwealth to develop a comprehensive Policies and Procedures Job Scheduling Manual for the IBM mainframe that will include specific instructions on what, when, and how to schedule and recover. The Unisys Team will provide local staff to support the scheduling needs. Job scheduling also includes library management, the process of making sure the correct version of application code is promoted to production.

1.E Assume responsibility for all master and subordinate console functions.

The Unisys Team will assume responsibility for all master and subordinate console functions. The Unisys Team is committed to improving service while reducing costs. To achieve this, the Unisys Team will utilize automation techniques whenever possible to enhance all master and subordinate console operations and to proactively monitor the mainframe and server environments. These automation techniques have been used and proven in delivery of our

services to the Commonwealth and other clients.

1.F Issue operator commands to control all In-Scope platforms throughout the organization.

The Unisys Team staff issue console operations commands within the current contract. This will continue under the new contract. The Mainframe consoles are used for the responding to or issuance of commands to the zLinux and iSeries systems.

1.G Provide all tools and apps that are currently being provided, for example MAPPER/APPMAP, browser based terminal emulation access, and middleware components (like OpenTI, IBM WBM & WMQ, etc.) that are critical to agency operations and application usage.

The Unisys Team has reviewed all IBM and third party provided tools in use by the Commonwealth as contained in Exhibits B.4 and B.10 – Third Party Software Assets. IBM has provided third party license management for the various mainframe tools identified in the exhibits provided. This will continue under the new contract and the ability to procure the required tools will be provided by the Catalog of Services.

Tools and applications currently being provided, that are critical to the agency operations and/or application usage, will continue to be provided by IBM. During the data gathering process, comparable replacement tools or applications may be proposed if in the best interest of the Commonwealth.

1.H Assume the responsibility for and perform all console operations.

The Unisys Team staff has console operations responsibility within the current contract. This will continue under the new contract. Refer to response 1.E above for a description of console operation functions.

1.I Monitor the performance of online interactive traffic and take appropriate action to resolve online-system-related incidents and/or problems, including escalating (as appropriate) the incident and/or problem to the proper Level 2 Support group.

The Unisys Team staff provides monitoring of online interactive traffic and provides troubleshooting to resolve operational issues. There are well established and tested escalation processes in place to address system related incidents. Notification of incidents to the appropriate Level 2 support group is part of the in place process today and will continue in the future. . Escalation processes are described in Schedule F, Section 3.2.1.4 “Service Desk”.

1.J Monitor the transmission of files between the Commonwealth and any other parties as designated by the Commonwealth.

The Mainframe platforms perform a high number of transmission files between the Commonwealth and any other parties. Tools are provided on the Mainframes to perform the file transfers using Commonwealth standards. The monitoring of file transfers has been

established with the agencies and is effective to support the requirements to date. During Data Gathering Unisys will review with the Commonwealth which of the file transfers should be monitored by Unisys Team staff.

1.K Provide operational support for data transmission (send/receive), consistent with commercial or agency standards.

Using monitoring of the scheduling tools through the tool consoles and operating system console messages, the staff will provide operational support. Should a transfer fail the staff will respond to any messages or escalate to the appropriate support organization.

1.L Manage, maintain, monitor, and control online and batch process, both scheduled and unscheduled (including on-request processing).

IBM will provide all batch monitoring activities using a combination of on-site and remotely located personnel (batch operators) and tools. IBM will utilize [redacted] Workload Scheduler to manage and monitor the batching process. The following details the activities associated with mainframe batch monitoring, on-request processing and restart:

- Monitor scheduled batch jobs
- Resolve non-application batch scheduling conflicts for root cause analysis and change management purposes
- Monitor scheduler-related incidents, and develop and recommend changes to the scheduler database
- Perform required batch setup activities, such as ad hoc requests
- Schedule batch jobs that require immediate execution upon request
- Invoke resolution and restart procedures in case of batch job failure
- Recover customer's batch environment
- Log each batch job

The batch operator is responsible for the effective monitoring and recovery of the customer's batch environment. Additionally the batch operator oversees that of all production batch applications are performed, while verifying that problems are promptly detected and proper recovery and escalation procedures are followed. To perform these tasks, the batch operator must possess a solid understanding of batch related tools and processes:

- Provide monitoring of batch execution on a 24 hour x 7 day basis
- Provide failure documentation via the problem management process
- Provide recommendations to the recovery center to enhance and improve the automation platform to eliminate manual tasks, reduce opportunities for error, and improve quality of services

1.M Maintain a log for each system detailing hardware / software configuration and critical service operations.

Within the services provided today by IBM the hardware and software configurations are documented and reviewed with the Commonwealth agencies. Sources of data include the Exhibits from the contract as well as data extractions from the mainframe partitions. As part of the services provided under the new contract the Unisys team will integrate the mainframe configuration elements into the CMDB to have one master record of configuration data improving accuracy of information. Configuration information is updated on a cyclical basis based on changes in the environment and a multi-year record of configuration information is maintained for review by the Commonwealth.

1.N Review the system logs on a weekly basis to ensure critical system Services are processing without errors.

The Unisys Team actively monitors the system logs for processing errors. For any system services operating with errors, an incident ticket will be created to track until the error is corrected. Tickets are driven through the Incident Management system described in Schedule F 3.2.1.4 "Service Desk". Additionally the Unisys Team reviews the system logs on a weekly basis. The Unisys Team will collect each mainframe's system logs and output from the [redacted] Workload Scheduler tools and using the report management functions within these tools, validate that critical system services are operating correctly.

Daily Status Reports (Overview of Last 24 Hours) are produced and e-mailed to a specific distribution list for each of the supported state agencies. They are posted to the Services Portal for archive. Incident Ticket Reports are generated automatically from ITSM and posted to the Services Portal.

1.O Maintain and update the operational documentation for all operations procedures and Services.

The Unisys Team will update and maintain operational documentation and processes within CCPM and these will be reviewed with the Commonwealth on a periodic basis. Changes to the CCPM are subject to Change Management Process. Please refer to Schedule F 3.2.1.3 "Change and Release Management" for a full description of the Unisys Change and Release Management process.

The Unisys Team utilizes a Change Project to perform functions such as updated to operation manuals, processes and procedures. A variety of templates have been created for this to update documentation. A sample screen shot of the current template screen is shown below in **Figure 3.2.4.5-12**:

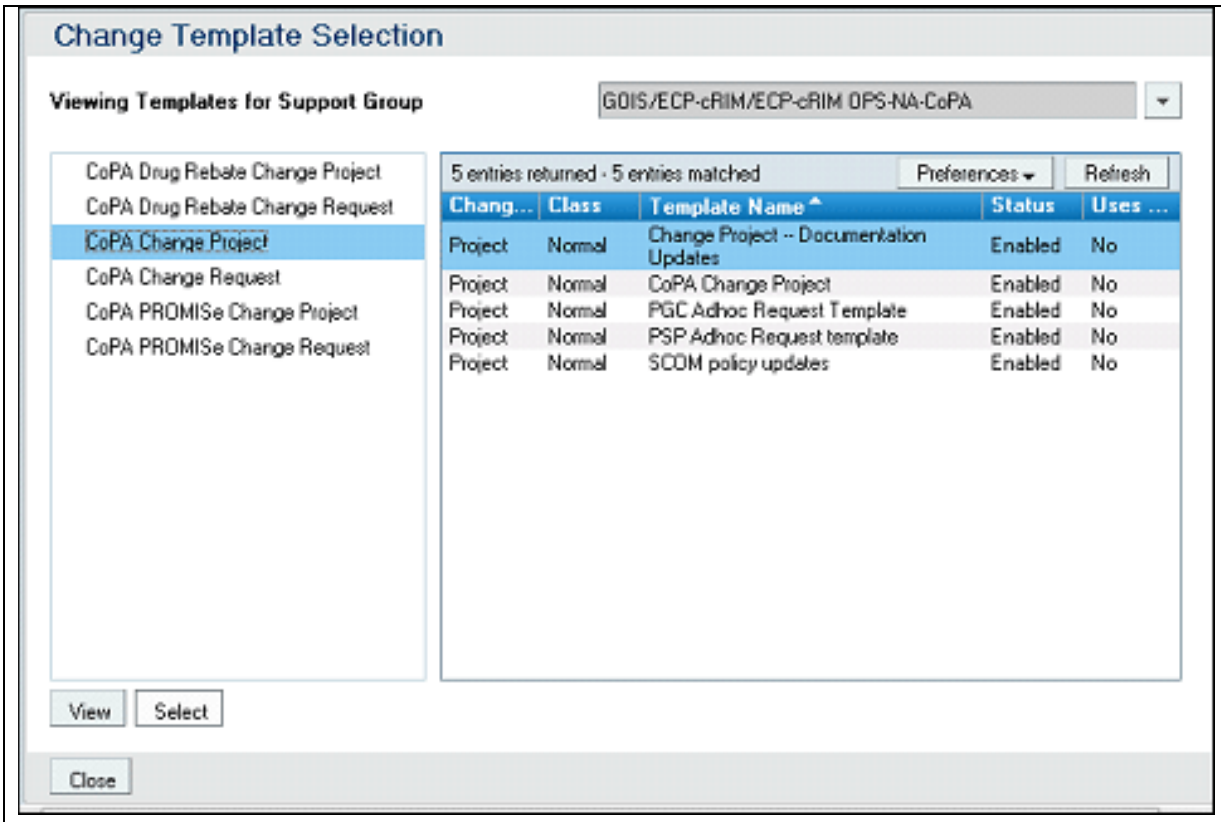

Figure 3.2.4.5-12 – Change Template screen

Once the appropriate selection is made the user is prompted for various input data to complete the documentation change. Once the user input is complete the process of notification and approval takes place until the technical writing and approval process is undertaken and completed.

2 IBM Mainframe Usage Review and Audit

2.A Provide a review and analysis of mainframe usage to determine if current usage is required to support the needs of the mainframe stakeholders.

The RFP requirements state that an initial review of mainframe utilization, processes and reports and to document the findings for the Commonwealth. The Mainframe usage is monitored constantly today using the SRM tool identified in the Exhibits. Usage data is available for review by the Commonwealth agencies.

Upon contract initiation, the Unisys Team will perform a current state audit of mainframe performance. Current processes and reports will be reviewed with the Commonwealth to determine if any additions or changes are required.

2.B Offeror must perform an initial review and audit of the current mainframe usage, procedures and reports and provide an analysis of the current mainframe usage, processes and reports currently being supported.

Offeror must describe solution and approach to meet this requirement.

The initial review and audit of the current usage of the Commonwealth's mainframe environment will be accomplished as the Unisys Team prepares to migrate the existing workload from each of the existing Commonwealth data centers into the new data centers. During this time, the Unisys Team will deploy tools to collect and analyze all aspects of the Commonwealths current compute usage. Analysis of these workloads will be used to determine the optimal method for migrating these servers. This analysis will also serve as a baseline against which future capacity planning can be compared.

The Unisys Team provide Monthly Performance Reports and Annual Capacity Planning Reports to the Commonwealth. These reports will be utilized to get baseline performance statistics as part of the audit process. In the new contract the mainframe usage reports will be generated using the current tool set and will be available to authorized Commonwealth users via the Services Portal.

For IBM Mainframe systems, during the transition phase the Unisys Team will bring in subject matter experts from IBM to perform an analysis of the IBM Mainframe systems and their interaction with other servers in the infrastructure using a tool called ADDM. This group will also conduct application affinity studies for the applications that reside on the IBM Mainframe systems' as part of their base infrastructure. After ADDM is run and the data gathered, The Unisys Team will conduct a series of meetings with the Commonwealth to discuss the IBM Mainframe systems, how they support applications, where they may be concerns and make recommendation for the migration of the IBM Mainframe systems to the new data centers.

As part of the audit process the Unisys Team will review processes and reports used by the Commonwealth for applicability in the new environment. The output of this review process will be utilized to create the audit report.

2.C Offeror must document its review and audit findings and recommendations.

An audit report of findings and recommendations will be provided to the Commonwealth. The key deliverables and reports to be address during this audit include; D-02.57, D-02.58, D-02.59, D-02.79 and D-02.80 found in Schedule K "Key Program Deliverables".

3 IBM Mainframe Production Control and Scheduling Approach, Toolset including batch jobs

3.A Offeror must describe solution and approach to meet this requirement.

Provide a process of scheduling batch jobs within Commonwealth agency defined windows to achieve maximum performance as long as required batch completion times are met.

Provide for automated scheduling of batch work and processes including backups.

Provide the capability for agencies to schedule and monitor batch processing.

Production Control and Scheduling

The Unisys Team will provide production control and scheduling as a Catalog Service. The Service will assess batch job(s) that are currently the Commonwealth's responsibility or are new jobs for production control and scheduling. This Catalog service will assess the

requirements of the Commonwealth/Agency requesting this service. The Service will meet the following requirements:

- Provide a process for scheduling batch jobs within Commonwealth agency defined windows to achieve required batch completion times. Provide for automated scheduling of batch work and processes including backups.
- Provide the capability for agencies to schedule and monitor batch processing.
- Resolve abnormally ended jobs caused by conditions external to production programs.
- Repair abnormally ended jobs when possible and perform job restarts in accordance with the Service Management Manual.
- Check job outputs and print queues, and change job priorities.

The first step in providing production control and scheduling services is to work closely with the Commonwealth to get a clear understanding requirements and dependency during Due Diligence. The Unisys Team will then incorporate these requirements into its production control process to develop a true cross platform, cross data center, unified production control and scheduling process. The objective is to achieve batch service level commitments through an efficient use of resources and technologies. For example, data will be gathered to develop statistics for the number of jobs executed per day/week/month, show the number of abends per day/week/month, etc., and provide these details to the Commonwealth via the Unisys Services Portal. This information will be used internally for problem trending and analysis, to verify that batch cycles complete in a timely manner and service level agreements are met.

The production control and scheduling function will use Unisys automated tools to open problem tickets for issues that impact production processing. The Unisys Team will track problem tickets and work with the Commonwealth for problem resolution in order to verify that production processing executes with as few interruptions as possible.

The Unisys Team will work with the Commonwealth/Agencies to determine if current batch jobs should be converted to [redacted] or if existing tools should continue to be utilized. The Unisys Team intends to standardize per the Commonwealth's requirement to have one enterprise platform for batch job production control and scheduling.

To allow the Commonwealth to schedule and monitor batch and backup jobs The Unisys Team have provided the following tools for the mainframe systems as Enterprise Services Catalog items:

- Batch Scheduling and Monitoring
  - SMA OpCon (Unisys Dorado)
  - BL/Sched (Unisys Libra)
- Backup Scheduling and Monitoring
  - SMA OpCon (Unisys Dorado)
  - BL/Sched (Unisys Libra)
- [redacted] Workload Scheduler

Authorized Commonwealth staff will have access to these tools to schedule and monitor the batch and backup jobs.

3.B Develop, maintain, and utilize an emergency contact list and escalation procedures to resolve abnormally ended jobs.

The Unisys Team will notify Commonwealth agency customers (an emergency contact list) in accordance with the notification procedures in the event that applications and batch processing do not execute properly. Emergency contact lists and escalation processes are contained in the ITSM system. For full description of the Unisys Team's ITSM system please refer to Schedule F 3.2.3.2 "Site Operations".

3.C Resolve abnormally ended jobs caused by conditions external to production programs.

The Unisys Team will work with the Commonwealth agency customers to resolve abnormally terminated jobs in accordance with the established procedures in the event that applications and batch processing do not execute properly.

The Restart/Recovery Procedures vary by agency under the current contract. For those agencies that have documented Restart/Recovery Procedures which do not require change, these procedures will be followed. For any which require change Unisys will work with the Commonwealth agencies to add/modify the procedures. In the event of an undocumented abnormal termination, the appropriate agency contact will be notified.

Critical services (programs) are monitored daily and through automations will alert in the event of failures/errors. All failures/errors are documented in the specific agency Daily Status Reports as well as via ITSM.

3.D Repair abnormally ended jobs when possible and perform job restarts in accordance with the Service Management Manual.

The Unisys Team will repair abnormally ended jobs and perform job restarts in accordance with the Service Management Manual in the event that applications and batch processing do not execute properly.

Processes to repair abnormally ended jobs are described in Schedule F 3.2.3.2 "Site Operations".

3.E Check job outputs and print queues, and change job priorities.

For print output on the IBM platform the Commonwealth uses Job Entry Subsystem 2 (JES2) for z/OS and Remote Spooling Communications Subsystem (RSCS) for z/VM and z/VSE. In addition, some of the commonwealth agencies utilize the VPS product suite. These tool will be utilized to check job outputs and print queues and change job priorities. Unisys Team or authorized Commonwealth staff can access the print consoles and check print status or

change priorities.

3.F Notify Commonwealth agency customers in accordance with the notification procedures in the event that applications and batch processing do not execute properly.

For problem resolution and repair the following process will be utilized used:

- Note failures using scheduling tools
- Open Incident ticket to record issues and corrective activity
- Provide automated notification of batch failures
- Resolution of batch failure
- Close of Incident ticket

Incident Ticket Reports are generated automatically from ITSM and posted to the Commonwealth Services Portal.

Full description of the notification procedures are contained in Schedule F 3.2.3.2 "Site Operations".

4 IBM Mainframe Monitor Batch Operations

4.A Offeror must describe its approach to supporting the needs of the Commonwealth.

Actively monitor batch operations on all mainframe systems on a daily basis.

The Unisys Team will provide all batch monitoring activities using a combination of on-site and remotely located personnel (batch operators) and tools. The Unisys Team will utilize [redacted] Workload Scheduler to manage and monitor the batching process. The following details the activities associated with mainframe batch monitoring and restart:

- Monitor scheduled batch jobs
- Resolve non-application batch scheduling conflicts for root cause analysis and change management purposes
- Monitor scheduler-related incidents, and develop and recommend changes to the scheduler database
- Perform required batch setup activities, such as ad hoc requests
- Schedule batch jobs that require immediate execution upon request
- Invoke resolution and restart procedures in case of batch job failure
- Recover customer's batch environment
- Log each batch job

The batch operator is responsible for the effective monitoring and recovery of the customer's batch environment. Additionally the batch operator oversees that of all production batch applications are performed, while verifying that problems are promptly detected and proper recovery and escalation procedures are followed. To perform these tasks, the batch operator

must possess a solid understanding of batch related tools and processes:

- Provide monitoring of batch execution on a 24 hour x 7 day basis
- Provide failure documentation via the problem management process
- Provide recommendations to the recovery center to enhance and improve the automation platform to eliminate manual tasks, reduce opportunities for error, and improve quality of services

4.B Maintain a log for each batch system and review the system logs on a daily basis to ensure key batch Services are processing without errors

Batch operations are accomplished through [redacted] Workload Scheduler on the IBM platforms. The Unisys Team staff monitors these logs and reports to the Commonwealth agencies any exceptions that occur. The tools produce daily logs of batch completion and failure and the Unisys Team reviews these logs on a daily basis and produces reports which are shared with the Commonwealth agencies.

Daily Status Reports (Overview of Last 24 Hours) are produced and e-mailed to a specific distribution list for each of the supported Commonwealth agencies. It is also posted to the Services Portal for archive

4.C Document review of the system logs on a daily basis to ensure critical batch Services are processing without errors.

The Unisys Team actively monitors the system logs for processing errors. For any system services operating with errors, an incident ticket will be created to track until the error is corrected. Tickets are driven through the Incident Management system described in Schedule F 3.2.1.4 “Service Desk”. Additionally Daily Status Reports are generated to document batch failures.

4.D Notify Commonwealth agencies in accordance with the notification procedures in the event that batch processing does not execute properly.

Daily Status Reports are provided to the specific agency for review as well as being posted to the Services Portal for internal review. Review of the System Log constitutes analysis of the Console messages for batch processing. These messages are analyzed live visually by Operations as well as detected by [redacted] Workload Scheduler and other console tools. The tools highlight and hold on the console, all batch processing errors, to provide they are further documented and reviewed in detail in accordance with the Service Management Manual. This is a well-established process and will continue under the new contract. Full description of the notification procedures are contained in Schedule F 3.2.3.2 “Site Operations”.

4.E Offeror must provide online monitoring of batch processing by the Commonwealth.

Offeror must describe its approach to allowing Commonwealth users to monitor the batch processing online.

Authorized users from the Commonwealth agencies have access to the scheduling tools and have console access to the IBM Mainframe environments allowing them the ability to monitor and correct any batch execution incidents.

5 IBM Mainframe System Backup review and Audit

5.A Offeror must describe its approach to performing an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives.

Offeror must describe its approach to identifying gaps and potential risks, and how those gaps and risks will be resolved.

During the Due Diligence phase after contract initiation the Unisys Team will review the current backup environment against backup windows, retention policies and recovery point objectives and will produce an audit report of their findings. As part of that audit report the Unisys Team will include potential risks and gaps they have identified and will review them with the Commonwealth with potential mitigation strategies and costs. Offerings available from the Enterprise Services Catalog will be reviewed with the Commonwealth and passed through the Architectural Review Board for final approval. Key deliverables and due dates to be addressed with this process include the following; D-02.42, D-02-43 and D-02.44 as contained in Schedule K "Key Program Deliverables".

5.B Monitor system backup processing on a daily basis.

The Unisys Team will actively monitor and manage system backup processing on a daily basis using a combination of on-site and remotely located personnel and tools. In addition the Team will perform the activities listed below. This will provide the Commonwealth a current, stable, compliant, and recoverable system. In the unlikely event of a serious error, the mainframe platforms and all its components will be at sufficiently current levels so support personal can effectively execute a diagnostic and recovery plan. In addition to stability, the Commonwealth can benefit from the latest provisions being made available through software products.

The Unisys Team will:

- Monitor system backup processing on a daily basis
- Define, support, and test diagnostic and recovery tools.
- Maintain a mounted, online backup to the operating system and its critical components and subsystems for rapid recovery in the event of a catastrophic error impacting the mainframe's ability to continue operating and/or fail to Initial Program Load (IPL) off the current operating system.
- Install, test, and support Standalone Recovery (SAR) tools in the event of a catastrophic error that affects both the current and backup operating systems.
- Develop the Backup Plan using a standard planning convention, including policies, procedures and reports
- Update the Backup Plan as necessary to support production changes

- Review the Backup Plan on an annual basis or as warranted by business or technical changes
- Activities associated with day-to-day recovery from non-disaster type failures or service outages that may occasionally occur, and often can be mitigated through fail-over to another server or logical partition (LPAR), are covered by Backup/Recovery, Problem Management, or Availability Management services.

5.C Process to review daily backup log for successful completion.

The Unisys Team will actively monitor and manage system backup processing on a daily basis using a combination of on-site and remotely located personnel and tools. This will provide the Commonwealth a current, stable, compliant, and recoverable system and serve as the process to review daily backup for successful completion.

Unisys Team will:

- Develop the Backup Plan using a standard planning convention, including policies, procedures and reports
- Update the Backup Plan as necessary to support production changes
- Review the Backup Plan on a daily basis to confirm successful completion
- Activities associated with day-to-day recovery from non-disaster type failures or service outages that may occasionally occur, and often can be mitigated through fail-over to another server or logical partition (LPAR), are covered by Backup/Recovery, Problem Management, or Availability Management services.

The Unisys Team will collect each mainframe's system logs and output from the [redacted] Workload Scheduler tools and using the report management functions within these tools, validate successful completion.

5.D Note any failures, initial and date the log, and correct the problem.

The Unisys Team actively monitors the system logs for processing errors. For any system services operating with errors, an incident ticket will be created to track until the error is corrected. Tickets are driven through the Incident Management system described in Schedule F 3.2.1.4 "Service Desk". Additionally the Unisys Team reviews the system logs on a weekly basis. The Unisys Team will collect each mainframe's system logs and output from the [redacted] Workload Scheduler tools and using the report management functions within these tools, validate that critical system services are operating correctly. The Unisys Team will note any failures, initial and date the log, and correct the problem.

The Commonwealth has benefited from the long standing process used by the Unisys Team to monitor Mainframe backup success rates. Using the [redacted] Workload Scheduler tools the Unisys Team monitors the nightly progress of backups and then intervene when the rare problem arises. In most cases simply re-starting a backup results in a successful backup because needed resources are tied up during peak times but become available a short time later. The Unisys Team automates the restart process automatically. If the restarted backup fails then incident tickets are created to alert the Backup support team. Thus critical issues get right to Level 2 and Level 3 support personnel without even involving Level 1 support

staff. Escalation processes are described in Schedule F 3.2.1.4 " Service Desk".

This automation of incident ticketing provides the Commonwealth with another advantage. During service delivery reviews the Commonwealth can review response times to failures that might put critical applications at greater risk.

Incident Ticket Report are generated automatically and logs are created with the date time and assigned resources are from ITSM system and posted to the Services Portal.

Through the incident severity rating processes Unisys has the ability to adjust severity levels so that incidents that are closer to critical applications can receive prioritized support responses.

5.E Create problem record for any abnormal condition and any repairs that have been made.

For problem resolution and repair the following process will be utilized used:

- Note failures using scheduling tools
- Open Incident ticket to record issues and corrective activity
- Provide automated notification of batch failures
- Resolution of batch failure
- Close of Incident ticket

Tickets are driven through the Problem Management system described in Schedule F 3.2.1.4 "Service Desk"

5.F Automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.

The Unisys Team has a proven automated approach to monitoring daily backups. On a daily basis, the Unisys Team produces reports on backup successes. The Daily Status Reports are provided to the specific agency for review as well as being posted to the Services Portal.

6 IBM Mainframe Service Desk, Tiered Support

6.A Offeror must describe its approach to supporting the needs of the Commonwealth.

Provide cost effective, operational, and technical support for the computing platform.

In order to deliver value and a continuously improving service level, the Unisys Team recognizes a standard set of processes and tools are required to offer the scalability and rapid deployment that the Commonwealth business conditions mandate. The Unisys Team will use [redacted] as the strategic model for its operational processes and as the strategic framework for its delivery processes. [redacted] is directly aligned to Process Reference Model for IT (PRM-IT) and provides a sound base to take advantage of leading-edge workflow automation opportunities.

Because the processes are global standards which all of our employees and practitioners follow, new service additions or deletions can be rapidly absorbed or extracted in a repeatable fashion, with less set-up time and fewer errors, no matter where they are delivered from. Our close mapping to ITIL, generally accepted as a best practice, is a validation that we have standardized on a robust set of processes. The process templates are tool and organization independent and allow the Unisys Team to deliver services consistently and competently from anywhere in the world.

Element		Function
People		Access to skills: As the Commonwealth changes over time it can expect to have to integrate new IT operations (or technologies) with a diversity of platforms and tools. IBM's platform level operational and technical support resources are skilled in virtually all manufacturers' products and can readily access the right skills to make the integration successful. Knowledge Transfer: During transition IBM will bring across the Commonwealth skills in support of the Commonwealth account. During the transition period they transfer their account knowledge to IBM peers. Of course, IBM's current extensive knowledge of the Commonwealth's environment will be extensively leveraged.
Process	**Service Management Standards**	**Standardization:** Because the processes are global standards which all of our employees and practitioners follow, new service additions or deletions can be rapidly absorbed or extracted in a repeatable fashion, with less set-up time and fewer errors, no matter where they are delivered from. Our close mapping to ITIL, generally accepted as a best practice, is a validation that we have standardized on a robust set of processes. The process templates are tool and organization independent and allow IBM to deliver services consistently and competently from anywhere in the world. **Repeatability:** These standard processes are extremely well documented. Our employees are both trained in these processes as well as subject to ongoing audit with respect to their proper use of them. This permits our teams to execute rapidly when changes are made to the environment at the Commonwealth's request. Planning time can be reduced and IBM can move more rapidly to execution. **Repeatable, Scalable:** IBM has completed more than 220 complex transitions in the past three years alone. Our well documented, highly repeatable transition process will prove valuable to the Commonwealth in mitigating risk during the initial transition and speeding potential future acquisition

		integration. Some of the characteristics that make our transition repeatable, scalable and a vital asset when integrating acquisitions in the future are: ▪ Global transition and transformation architecture model (GTTA) – continuously improved by IBM to increase speed and seamlessness of transitions ▪ Specialized service teams with experienced technical, transition and transformation skills – experience that will be leveraged during acquisition integration ▪ Process, tools, and intellectual capital to remove risk, ease implementation, and to support continuous improvement – assets such as transition project control books and repositories of lessons learned and best practices ▪ Certified IBM Project Managers with breadth and depth of experience in transitions and transformations.
Technology	**Knowledge access**	IBM captures learning from its delivery operations around the world, meaning that we can use our knowledge base to find similar issues encountered elsewhere and apply appropriate solutions. We can also leverage our broad product and service portfolio to obtain solutions or shortcuts from our hardware, software and services groups to accelerate the deployment of new hardware and remedies to problems as they arise.
	Automation	IBM's ITIL conformant processes and process flows are implemented across an integrated set of highly automated tools that help verify that the Commonwealth receives consistent, predictable and proactive service.

6.B Provide platform level operational and technical support for computing platforms including Mainframe, Storage, AIX, LINUX, SAP, Oracle and Windows architects.

The Mainframe/Midrange Infrastructure function provides hosting and operational support services for both IBM and Unisys mainframe and midrange systems. The service supports all mainframe operating systems and management of the associated logical partitions on the platform. Theses combined teams have provided the services predating the inception of the Data PowerHouse contract in 1999.

The Unisys Team Mainframe function will continue to be supported by senior level engineers with over 25 years supporting the Commonwealth's systems. For operational and technical support of non-mainframe platforms please refer to the following sections.

Storage	Schedule F, Section 3.2.4.2
AIX	Schedule F, Section 3.2.4.4

Linux	Schedule F, Section 3.2.4.4
SAP	Schedule F, Section 3.2.4.3
Oracle	Schedule F, Section 3.2.4.3
Windows	Schedule F, Section 3.2.4.1

Our teams understand the business priorities associated with applications that run on that platform for the Departments of Public Welfare, Transportation, Labor and Industry Unemployment Compensation, Revenue, Corrections, the Pennsylvania State Police, and the Pennsylvania Game Commission. For representative resumes please refer to Section 5 "Personnel".

The proposed solution includes a robust technical support staff with the necessary skills to provide the managed services requested by the Commonwealth of Pennsylvania in this RFP. The staffing levels are determined based on key performance indicators which specify the expected number of devices to be supported by each member of the technical team. The team will be staffed with junior and senior positions to provide coverage for Level 2 and Level 3 technical support requirements. Human resource actions including writing position descriptions, development plans, and funding for certifications are all targeted to verify that the technical support resources are prepared to support the managed services.

In addition to providing the required resources, the Unisys Team will be focused on proper work allocation and skills development. The ITSM7 system will be the primary tool used to allocate work across the various service towers providing communications and control capabilities for delivering the services. Skills development will be provided with formalized training programs and peer mentoring assignments to allow for on the job training opportunities.

6.C Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.

As part of the proposed solution, IBM will provide Level 2 and Level 3 support to the Commonwealth of Pennsylvania for hardware and software within the IBM mainframe environment. The proposed solution includes a robust technical support staff with the necessary skills to provide the managed services requested by the Commonwealth of Pennsylvania in this RFP. The staffing levels are determined based on key performance indicators which specify the expected number of devices to be supported by each member of the technical team. The team will be staffed with junior and senior positions to provide coverage for Level 2 and Level 3 technical support requirements. Human resource actions including writing position descriptions, development plans, and funding for certifications are all targeted to confirm that the technical support resources are prepared to support the managed services.

Incident tickets are created automatically and create a record of abnormal conditions. Following ITIL-based processes Level2 and Level3 will review incidents for root causes that create multiple tickets. This identification of problems allows the team to establish workarounds and request architecture reviews as necessary. Tickets are driven through the Incident Management system described in Schedule F 3.2.1.4 "Service Desk"

6.D Provide technical advice and support to the Application Development and Maintenance (ADM) and Database Administration (DBA) staffs, as required.

IBM is the provider of the Mainframe technology and our staff has direct access to IBM engineering and support organization to make sure the Commonwealth has the best level of service possible. The staff provides 7x24 operational and technical support through both onsite and remote staff which reduces the overall cost to the Commonwealth without introducing risk. This staff also provides Level 2 and 3 support to the Service desk. Under the new contract, the Unisys Team will provide the same level of technical and operational support that is done today.

As part of the weekly change meetings the Unisys Team participates and provides advice to the application and database staff as part of the application review process. Based upon new application or database requirements and knowledge of solution available through the Unisys Team the staff provides and will continue to provide technical support to these staffs.

6.E List the service levels for the various levels of service tiers that can be provided. See Schedule J.1 Datacenter Service Level Management for the definitions of the expected options.

The Commonwealth of Pennsylvania has indicated in Schedule J.2 - Datacenter Service Level Matrix the desired service tiers/support levels. In the design of the Services and the infrastructure needed to deliver those Service to the Commonwealth, the Unisys Team defined the Service Tiers to align to those requirements. A fuller explanation, and representative same of all the Services provided in this structure can be found in the response to Schedule F, Section 3.2.1.5, sub-requirement 1. The service tiers in the Unisys solution are as follows:

Tiered Support Level	Description This Service Level measures the percentage of time the Applications are Available during the applicable Measurement Window
Platinum	• 99.999% Server Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365
Gold	• 99.99% Server Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7 • Days of Measurement – 365
Silver	• 99.9% Server Availability SLA • Measurement Window – Monthly • Hours of Measurement – 24x7

	◻◻ Days of Measurement – 365
Bronze	◻◻ 99.4% Server Availability SLA ◻◻ Measurement Window – Monthly ◻◻ Hours of Measurement – 24x7 ◻◻ Days of Measurement – 365
Basic	◻◻ 98.5% Server Availability SLA ◻◻ Measurement Window – Monthly ◻◻ Hours of Measurement – 24x7 ◻◻ Days of Measurement – 365

7 IBM Mainframe Monitor Network Connectivity, Toolset

7.A Ensure network connectivity to COPANET, and consistent system response times.

Offeror must describe its real-time monitoring approach and toolset to provide and maintain network availability and performance.

As part of the overall application environment which includes Mainframe, Open Systems and end user devices the mainframes require a high degree of network connectivity and performance. Many of mainframe centric applications have migrated off the traditional "green screen" usage to more server to server or web based access and the reliance on the network and performance requirements have increased.

Included in the Mainframe technical design is the review of the current network utilization and network connectivity to meet performance requirements and the results have been designed into the mainframe configurations. The Mainframe configurations provided in the Enterprise Services Catalog have the network connectivity included to meet the current and projected future network requirements. These designs also include full redundancy to provide for network connections should a port, card or switches fail.

From a monitoring and notification view Unisys provides a holistic approach in which availability and response times are viewed from a mainframe centric (looking out) and user centric (looking in) perspective. From the mainframe view the operating software provides notification of disconnects should an error occur. From an application performance view Sightline provides performance monitoring across the mainframe and open platforms and provides automated alerts of performance issues. Refer to Schedule F 3.2.1 "Network and Security Architecture" for a full description of the Unisys network solution.

7.B Utilize automated system management tool(s) to ensure real time monitoring and notification of system availability and response times. Stop / Start times of servers will be a source of input for SLA measurements

Offeror must identify tools it uses to support network availability and performance.

Unisys will provide event management solutions to help verify network connectivity and consistent windows systems response times. Unisys will utilize [redacted] applications to record incidents tickets that are generated from mainframe monitoring tools to provide real- time monitoring and notification of mainframe availability and response times including the stop and start times of mainframes to support SLA availability measurements. SLA availability measurements are measured in [redacted] and displayed in the online operational dashboard as part of the Services Portal available to Commonwealth/Agency personnel. The following tools are the major toolsets to support network and system event management and monitoring.

Monitoring Software	Managed Configuration Items (CI's)	Monitoring and Management Functionality
[redacted]	LAN Devices including: • Switches • Routers • Load Balancers • Firewalls	Provides deep network device availability and performance monitoring, DNS, IP address management, network configuration management, and network traffic bandwidth throughput monitoring
N[redacted]	Microsoft servers, databases, network devices, and storage hardware.	Provides a standard set of availability, performance and critical service monitors developed by Unisys for monitoring across infrastructure items including: • Servers • Network devices (switches, routers, load balancers) • Storage devices • Middleware • Applications (Exchange, Citrix XenApp, etc.)

For a complete understanding of how this subset of Event Management Tools supports enterprise Event Management please refer to 3.2.3.2 Site Operations. Refer to Schedule F 3.2.1 "Network and Security Architecture" for a full description of the Unisys network tools.

8 IBM Mainframe Patch Management

8.A Implement a Patch Management Program to ensure the timely application of updates on all infrastructure platforms in accordance with Commonwealth IT policy guidelines.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The Unisys Team will implement a patch management program that effectively provides the Commonwealth testing and validation of updates to the OS and 3rd Party software that it supports. In addition we will communicate unscheduled and scheduled outages and provide a detailed escalation process for patch management.

The same availability characteristics associated with handling unscheduled outages are

applicable to planned outages as well. A system can be removed for planned hardware or software reconfiguration, maintenance, or upgrade. New work can be dynamically redistributed across the remaining set of active systems. Once the system is ready to be brought back on line, it can be reintroduced in a non-disruptive manner and participate in dynamic workload balancing. The Commonwealth will be notified on a regular basis of any scheduled or unscheduled service interruptions.

Platform system administration covers the following services:

- Install/maintain OS/OS patches/OS utilities.
- Problem determination/resolution for OS/OS patches/OS utilities.
- Review/recommend new OS/OS patches/OS utilities versions/patches.
- Install/upgrade OS/OS patches/OS utilities.
- Security configuration (IBM has exclusive security access control to the physical hardware, O/S and system tools, with the Commonwealth retaining responsibility for application security).
- Setup and perform backup/recovery of OS and OS utility files.
- Report on related SLAs.
- Provide technical support for application developers and the Commonwealth management

Commonwealth Information Technology Bulletins (ITBs) will be followed.

8.B Offeror must describe its approach for testing and validating updates to the OS and 3rd Party software that it supports.

The Unisys Team will first install update to the OS and third-party software updates in a test environment. At the conclusion of sufficient testing by the technical support team the updated environment will be made available to the Commonwealth users to run through their testing procedures in that environment. Upon completion of successful testing the upgraded environment will be cascaded up through the environments and into production upon approval of the Commonwealth.

8.C Ensure operating systems are maintained with the current system patch level, based on the Services provided by the server.

IBM reviews the mainframe release levels and verifies the operating systems are maintained within the IBM software support cycle. The Unisys Team proactively reviews future operating system releases and documents any impacts the release may have on agency applications processing environments. This allows adequate preparation time for new operating system releases to be applied when available.

8.D Analyze monthly service patches and determine which patches need to be applied.

Unisys Team staff members review the current operating system releases and the applicability of applying new software releases to the mainframe platforms. Based on new features or fixes in the operating system the Unisys Team will present to the Commonwealth agencies any fixes or new releases that should be applied in the next update cycle.

8.E Create a change record, log the update in the system log, and install based on system availability schedule.

The implementation of the changes is part of the change management process in which the change ticket is created prior to the application of the patch. After the patching is complete the change ticket is closed. The mainframe system scan identifies the changes and updates are made to the CMDB.

Change reports are generated automatically from ITSM and posted to the Services Portal.

8.F Notify the Commonwealth of any scheduled or unscheduled service interruptions with consideration to Commonwealth scheduled holidays and standard workweek.

Offeror must describe its approach to communicate unscheduled and scheduled outages, including escalation process.

The Unisys Team's approach to communicating unscheduled outages is to send notifications to key stakeholders for the Commonwealth/Agencies/Unisys/Third Parties depending on the outage. This will be through email, voice, portal and Remedy broadcast capabilities. The same communications will be used for scheduled outages with additional communications in forward schedules of change reports.

Escalations for unscheduled outages are handled through the standard processes for managing incidents. Unisys service desk will manage all incidents and verifies that proper escalation communications to key Commonwealth/Unisys/Third Parties personnel are managed. The [redacted] will also be configured to escalate incident tickets based on incident priorities and SLAs to confirm that incidents tickets are being managed to SLA times for incident response and resolution.

Emergency contact lists and escalation processes are contained in the ITSM system. For full description of the Unisys ITSM system please refer to Schedule F 3.2.3.2 "Site Operations".

9 IBM Mainframe User Account Management

9.A Provide certified system administration staff to create and maintain the registration of profiles, associated groups, and the security permissions (including password management) required to service the approved client base of the system and application.

Offeror must describe its approach to supporting the needs of the Commonwealth.

User account management including creation and maintenance of the registration of profiles, associated groups, and the security permissions (including password management) is a function which is done by Commonwealth staff under the current contract. An Enterprise Services Catalog item has been added to enable the Commonwealth to procure user account

management services. A full description of the Unisys Security Management offering is contained in Schedule F 3.2.2.5 "Security Management".

10 IBM Mainframe Procurement Management

10.A Provide a program and process to refresh the hardware at asset end-of-life, and when upgrades are needed to meet anticipated growth in utilization

Offeror must describe its approach to supporting the needs of the Commonwealth.

Refresh coordination begins once refresh planning with the Commonwealth is complete. It is initiated after the proposed schedule has been agreed upon. The refresh coordination process manages the execution of these agreements through refresh coordinators. A refresh coordinator will keep the Commonwealth informed throughout the process, allowing orchestration of all activities required to successfully refresh the in-scope equipment.

When the refresh schedule is agreed to and education materials have been provided, the refresh coordinator will open a management record in our (or the Commonwealth's) problem and change management database. This record will contain the Commonwealth/end user's contact information, location, system configuration, and schedule information and will be updated throughout the refresh process. It is this record that will initiate the perform team by providing the schedule, logistic, and configuration data to complete the end user equipment. As the perform team receives and configures the new equipment, validates the schedule with the end user, and finally completes the refresh, they will continue to update the change management system to provide status. Once the equipment is refreshed, the coordinator will verify that the asset management records are updated, make certain that the end user is able to use the new equipment, and finally close the change management record.

The Unisys Team will use criteria for determining when an asset is at End of Life (EOL), which centers on determining when the hardware vendor will no longer support the device. Typically, hardware support is critical for the Team to be able to meet our service levels and restore the system. Another criterion may be when a particular device has received multiple failures. In either case, the Team considers a device EOL when it is cost prohibitive to fix.

Refresh activities are normally performed in groups (often during off-shift hours) to minimize end-user disruption and reduce costs. The Team will work with the Commonwealth, based on the Commonwealth's changing business needs or the industry's changing market trends, to determine the most-effective refresh strategy. Internally, IBM uses a five-year refresh cycle for mainframes and a four-year refresh cycle for servers. With the Commonwealth's assistance, The Team would identify the equipment that requires refresh and then implement the approved strategy, which would include tracking the age and location of the devices and notifying the Commonwealth when a device is due for refresh.

The Unisys Team will also perform the following activities:

- Notify the Commonwealth when the device is not economical to repair.
- Install the approved devices.
- Provide disposal or redeployment of the replaced device.

The Commonwealth requires a program and process to refresh the hardware at asset end-of-

life, and when upgrades are needed to meet anticipated growth in utilization. The Unisys Team as part of the Service Delivery framework participates in capacity planning and procurement planning. Using this planning process end-of-life dates and new application requirements as well as ongoing capacity management are used to identify when upgrades or replacements are needed. As with the other technology areas the Mainframes will be part of the Technology Refresh Plan and Capacity Management process. An overview of these is shown below as related to Mainframe services

- Technology Refresh Plan
  - As part of the overall architecture support, the Commonwealth's environment will be reviewed on a quarterly basis to identify technology, services or components which require replacement to maintain the Commonwealth's business needs and associated service levels. The review will include the following activities. The overall technology refresh plan will be documented in Key Deliverable D-03. This plan will be used for all Unisys supported environments including the Commonwealth Mainframe systems.
  - Using the data within the Asset Management and Configuration Management databases, identify the technical components within the Mainframe system environment which require replacement within the next 18 month period based upon the a 60 month replacement cycle.
  - Review End of Sales and Service Life notices from the Manufacturers to validate if a component has been discontinued or has available ongoing maintenance options.
  - Review ongoing Capacity and Performance reports to identify any components with a refresh requirement which have additional needs driving a requirement or opportunity to change the component's classification to a different component to maintain the functionality and service levels.
  - Identify replacement technical components based upon the current Enterprise Services Catalog offerings
  - Validate replacement technical components meet the current requirements for the impacted Commonwealth applications.
  - Identify risk and impact for the Commonwealth environment to replace existing technical components or services.
  - Create technology refresh recommendations, impact statements, and high level implementation plan.
  - Present the technology refresh plan to the Commonwealth using the solution architecture review process.
  - Upon approval of the refresh plan, open service requests for each migration group and develop the detailed project plan for the migration plans.

- Capacity Management and Forecasting
  - The Commonwealth Mainframe systems will be monitored and reported from the Capacity Management system used as part of the Unisys management toolset. As part of the Capacity Management process, the capacity reports will be generated and reviewed with the Commonwealth on a regular basis.
  - As part of the annual Capacity and Forecast planning activity, Unisys will work with the Commonwealth to identify what changes in growth are expected and provide recommendations on additional upgrades.
  - In addition to the Commonwealth's growth forecasting information, Unisys will use the data within the Capacity Management, Asset Management and Configuration Management databases and identify the technical components within Mainframe system environment which require upgrades or additional infrastructure to support the forecasted growth requirements.
  - Identify replacement or upgrade technical components based upon the current Enterprise Services Catalog offerings and the vendor's available products.
  - Validate that the identified upgrades or additional components meet the current and forecasted requirements for the impacted Commonwealth Mainframe system.
  - Identify risk and impact for the Commonwealth Mainframe system to upgrade or add additional components.
  - Create the capacity upgrade recommendations, impact statements, and high level implementation plan.
  - Present the capacity upgrade plan to the Commonwealth using the solution architecture review process.
  - Upon approval of the capacity upgrade plan, open service requests for upgrade project and develop the detailed project plan.

11 IBM Mainframe SLA Reporting

11.A Collect actual system availability, utilization and response time data.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The purpose of establishing a strong SLA reporting framework is to provide transparency into the Commonwealth's vendors in its various technical towers. This framework must consist of industry best tools and processes, and should be developed in cooperation between Unisys, Unisys partners, the Commonwealth, and other Commonwealth vendors. The end result of this cooperative effort should be an SLA reporting framework that delivers the following:

- The establishment and maintenance of open communications with the Commonwealth through the governance structure, which encompasses regular meetings and delivers regular reports, many of which are available for the

Commonwealth to access online.

- A process to work collaboratively with the Commonwealth to update the Service Level Document when services or service levels are created or modified based on a mutually agreed to process.
- Monitors and reports adherence to Service Levels.
- Verify that service level commitments are met by regularly reviewing service level commitments, compared with actual service level attainment.
- Take corrective actions based on root cause analysis to reduce the impact of future service level failures.
- Define needed monitoring and service level reports.
- Review service operations through management and technical reviews to analyze service level related measurements and take action.
- Identify when changes are required to the Service Levels

Unisys will establish an SLA process and technical architecture to support all SLA's for this contract. See the overview in Schedule F, Section 3.2.1.2 "Availability/SLM". Level 1 of the SLM process is shown in **Figure 3.2.4.5-13** below:

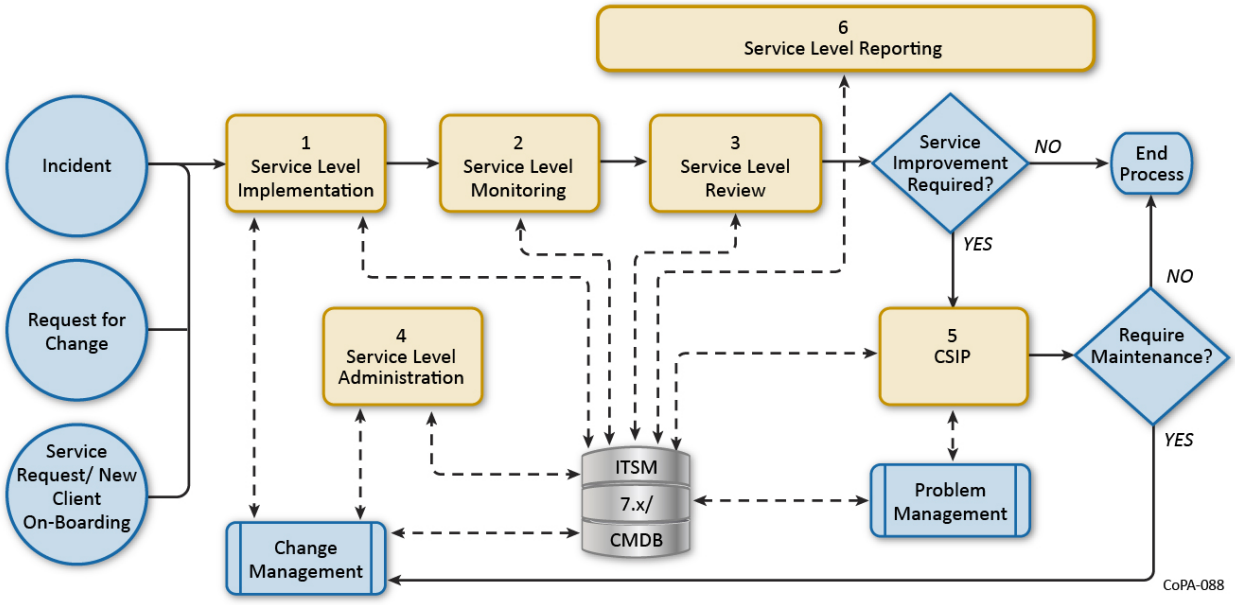

Figure 3.2.4.5-13 - SLM Reporting

Unisys will provide a detailed set of processes and procedures to support Service Level Management during transition of this contract. The process and procedures will support this top level view of the process which includes:

- Service Level Implementation
- Service Level Monitoring

- Service Level Review
- Service Level Administration
- Service Level Improvements (CSIP)
- Service Level Reporting

Unisys will provide the technical architecture and toolsets to support monitoring and maintaining service levels for the mainframe platforms .This includes the automated collection of data like availability and tracking when SLA thresholds are exceeded. The [redacted] ill be used as the single unified platform to manage Service Level Agreements for Commonwealth agencies. [redacted] provides a continuous real-time platform for defining, measuring, monitoring, reporting, and reviewing the performance of SLA's (per J1 – J3) for mainframe services to make sure that adequate levels of service are delivered in alignment with the Commonwealth's objectives for service delivery. The business contract will contain agreements in which the levels of service are specified. These agreements consist of individual service targets or goals that are used to evaluate whether the agreement is in compliance.

The [redacted] ion uses all the other [redacted] modules as inputs to determining if an SLA is in compliance. The [redacted] modules used for transaction inputs to determine if service level targets and goals are in compliance include:

- Incident Management
- Problem Management
- Change Management
- Asset/Configuration Management
- Performance / Capacity Management

The [redacted] and in some unique cases other tools as described in F3.2.1.2 will be used to push near real time SLA reporting into the online operational dashboard reporting tool.

11.B Create a SLA report on a monthly basis, for the Commonwealth and Offeror.

The Unisys Team uses a combination of Sightline and mainframe data are used to report on availability, utilization and response time data. Unisys provides a variety of Monthly SLA reports to OA via the agency specific Monthly Performance Reports and the BES Monthly Report. These reports are generated and posted on a portal as well as e-mailed to key stakeholders. Key deliverables and due dates to be addressed for SLAs include the following; D-02.04, D-02.05, D-02.06, D-02.07 AND D-02.08 as contained in Schedule K "Key Program Deliverables".

12 IBM Mainframe Software License Management

12.A The Offeror must provide Software License Management.

Offeror must describe solution and approach to meet this requirement.

Unisys will provide Software License Management for all infrastructure including mainframe platforms. Unisys will provide 3rd Party License Management service for the Commonwealth and The Unisys Team provided infrastructure software products. Unisys will be solely responsible for the management of all infrastructure software license products provided through this contract. The goals of this service are to:

- Verify software contract compliance (to avoid non-compliance legal issues and expenses)
- Manage costs of software inventory by matching requirements for use to needs
- Confirm software maintenance contracts are maintained on schedule through early notifications

Unisys will coordinate with the Commonwealth to verify compatibility between Commonwealth provided applications related software, and Unisys provided infrastructure software.

The following is the approach Unisys will execute during transition and as an ongoing process to provide 3rd party software license inventory and tracking per agency related infrastructure.

- Load all Unisys, IBM, and Commonwealth software asset license contract information into the [redacted] application
- Load all software license certificate , license type, entitlements, manufacturer, and product information into the [redacted] for the Software License Contract
- Run discovery through [redacted] to identify all software installations Run the BMC License Engine software to build relationships between the discovered software CI's recorded in the BMC Atrium CMDB and the license certificates
- Run the [redacted] and [redacted] to identify non-compliant licenses and inventory for the Unisys and Commonwealth Asset Managers to audit the completeness and accuracy of the information
- Identify any discrepancies in the information and make corrections
- Rerun Compliance Reports and 3Rd party software license inventory reports to get signoff from the Commonwealth and Unisys Asset managers that inventory is properly linked to license certificates in the production environment and the information is complete and accurate
- Provide notifications to Commonwealth/Agencies/Unisys and other Commonwealth service providers when there are software compliance issues or requirements for licenses to be purchased or retired from analysis of license inventory.

Unisys provides third-party software license management as part of the service today and this will continue with the new contract.

Where the Unisys Team can drive higher software cost savings we will provide that license for that tooling. In most cases there is rarely much difference between software tooling, third party license costs, and those of our customers. During due diligence the Unisys Team will research software tools costs and make a determination on which tools should stay licensed to the Commonwealth and which tools license should move over to the Team.

13 IBM Mainframe Upgrade and New Technology Approach

13.A Coordinate at an agency level and account for any required patching as technology upgrades require.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The Unisys technical support teams will work with the Commonwealth agencies to determine patch policies that should be applied to the Unisys and IBM Mainframe environments. Patching is part of the Change Management process. Patches are identified and discussed with the agencies. Patches are applied based upon an agreed upon schedule. Please refer to Schedule F, Section 3.2.1.3 Change and Release Management of this document for detail on the formal ITSM7 change management process.

The Unisys Team will follow the Change Management Process for applying patches to the production Mainframe environment. This process will maintain the change record in the [redacted] and also update the CMDB configuration management file upon deployment for the mainframe environment Configuration Items (CI's). The Change Record will be related to the CI's in the CMDB as an audit trail for changes to Mainframe CI's upon the completion of the Release and Deployment Process for changes. Change Reports are generated automatically from ITSM and posted to the Commonwealth DPH SharePoint Portal.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,
- Improve client satisfaction,
- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery

- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

14 CI Service Risk

14.A Reduce service risks.

Offeror must describe its approach to supporting the needs of the Commonwealth

Methods to eliminate or mitigate service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

15 CI Service Quality

15.A Improve service quality.

Offeror must describe its approach to supporting the needs of the Commonwealth

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional

details in this area.

15.B On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.

Unisys will continually align and re-align IT services to the changing business needs of the Commonwealth Agencies by identifying and implementing improvements to IT services that support business processes. This will be accomplished through our Continuous Service Improvement and Innovation Process (CSIIP). SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean Tools and Methodologies as well as ISO Certified Internal Audits to measure and maintain the highest quality services to the Commonwealth. Unisys will meet with the Commonwealth Agencies monthly to review all the monthly SLA and utilization reporting. Unisys will meet quarterly with the Commonwealth to review the trending analysis and work together to determine the go forward IT Strategy for the Commonwealth. Unisys will make proactive recommendations for system changes to meet the ever changing business requirements of the Commonwealth.

16 CI Client Satisfaction

16.A Improve client satisfaction.

Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

17 CI Service Transparency

17.A Ensure service transparency.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Specific to the Mainframe environment Unisys will leverage the ITIL framework in delivering IT Service Management. Industry accepted Measurement Tools such as Dorado Systems –

OPCON, Libra Systems – BL/Sched and IBM Systems [redacted] Workload Scheduler to monitor and schedule production batch jobs. Sightline will be used on the Unisys Mainframes and SRM–Server Resource Manager on the IBM mainframes to monitor mainframe usage, application performance monitoring and provide information for SLA reporting. SolarWinds will monitor the network infrastructure. Hardware and Software configurations and licenses will be managed proactively through the CMDB. These tools will be the foundation for establishing baselines, performance, capacity, and availability management, and SLA/SLO reporting within the Mainframe environment. These tools and reports will also provide excellent visibility and services transparency to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

17.B Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.

The Unisys Data PowerHouse provides full visibility into mainframe service execution. Commonwealth agencies have full access to monitoring and scheduling tools which run against the mainframe platforms. Various SLA and performance reports are generated and the results posted on a portal. Key reports are e-mailed to Commonwealth stakeholders for their review.

18 CI Reduce Cost of Service

18.A Improve/reduce cost of service.

Offeror must provide examples of Mainframe Support initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

A few examples of Mainframe Services Management Continuous Service Improvement that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections are outlined below:

Unisys Mainframe:

The DPH implemented a process to mirror Client data (86 disk packs using EMC time finder) between production mainframes and those at [redacted] Continual improvements remain underway to expand this process increasing the amount of data supported by time finder by and additional thirty percent. This mirroring technique has provided DPW with the ability to maintain 7 x 24-hour processing while replicating data necessary for disaster recovery down to [redacted] This process improvement has enhanced our ability to perform disaster recovery

data restoration faster than previously possible, from physical tape storage.

Unisys Mainframe:

For major mainframe Operating System Software releases, the DPH implemented a process to utilize Virtual Tape for storage of software to be installed. Previous process utilized physical tape and CD media. New process allowed for preload of software to virtual tape (disk) and eliminated delays due to mount time of physical media as well as improved data transfer rates. This process improvement shortened downtime by 75% for the installation of software and allowed Commonwealth agencies to resume processing faster and more efficiently.

IBM System z10 Migration to z196 Processor:

In 2011, the Department of Labor and Industry was planning to migrate off of the IBM mainframe, but due to unforeseen circumstances, an extension of services were required on the Data PowerHouse mainframe platform. The Unisys Team brought forth a solution to replace the z10 processor with a z196 processor. This offered a number of benefits to the Commonwealth including additional processor capacity, a boost in the integrated facility for Linux (IFL). The system also offered improved performance and increased processor speed with optimizations for DB2 and WebSphere. Since this processor offered more capacity leveraging fewer processors, many agencies realized reductions in software license and maintenance fees.

IBM System z Business Class Mainframe processor

Due to a number of situations including the increase in unemployment compensation benefit terms and skyrocketing unemployment rate coupled with delays experienced on mainframe application modernization efforts, processor utilization rates were projecting to exceed the capacity of the z10 mainframe within the year 2011. We located an IBM Business Class processor in our excess inventory. This machine was equipped with the capacity required to support the Department of Corrections. At no additional cost to the Commonwealth, we seamlessly migrated DOC workload from the z10 mainframe system to the business class processor, providing 180 MIPS of capacity relief on the z10.

Unisys Team Experience

The Unisys mainframe systems are a key component of the overall application environment within the Commonwealth. For over 25 total years and 13 years under the current contract Unisys has been providing high levels of operational and technical support to the Commonwealth with high client satisfaction ratings. The Unisys proposal provides the ability for the Commonwealth to procure mainframe services which meet their application processing requirements.

The Commonwealth has benefited from this teams daily working relationship and knowledge of the agencies that use the Unisys Mainframe technology including the Department of Public Welfare, Pennsylvania State Police and the Pennsylvania Game Commission. This team understands the criticality and business functions of the applications which are supported by the mainframes. The team has provided operational support services and upgrades for the Commonwealth for over two decades. This experience provides the Commonwealth with a unique opportunity to move forward into their new data center model with the lowest risk.

Outside of the Commonwealth team Unisys brings worldwide experience in the support and operations of our mainframe technologies. As the manufacturer of the hardware platforms and developer of the operating systems the team is best positioned to provide new and innovative

solutions to the Commonwealth. The team has direct access to engineering and support resources which are an extension of the direct team supporting the Commonwealth.

The Unisys Team understand the criticality of the applications which are supported on our platforms and will provide the Commonwealth with the lowest risk, least disruptive migration of the current platforms to the new environment.

Some examples of where the team has provided new and innovative solutions to our clients include:

Client	Challenge	Result
Prudential Global Data Services	Operating in a global economy, the ability to improve service levels and drive efficiencies is important. To achieve this, Prudential Global Data Services sought to both consolidate its globally distributed data centers into a centralized location and adopt shared-service IT delivery, without affecting the timeliness or reliability of vital financial services.	1-second completion time for 99% of daily transactions 85% reduction in the runtime of daily management tasks 90% reduction in the time required to restore a production workload
University of Washington	As a higher-education institution, the University of Washington must comply with all U.S. Department of Education (DOE) mandates, including those for information exchange. Recently, this called for updating its existing student loan processing solution to more tightly integrate with federal XML transmission standards, while improving performance, security, and manageability.	Achieved approximately 30-second elapsed time for first large production run Streamlined administration and support of the information exchange function by hosting the process within the ClearPath environment
GSA	The U.S. General Services Administration (GSA) wanted to improve the efficiency of key operations while enabling employees to work more productively. This called for	GSA avoided spending an estimated $9.9 million for new application development by web-enabling, and preserving the value in, existing applications. Through intuitive ClearPath ePortal

	moving from "green screens" to a user-friendly graphical user interface (GUI) for applications that support Federal Asset Management functions, without requiring extensive, time-consuming, and costly changes.	technology and only one week of training, the Agency delivered new capabilities well within deadlines. Thanks to modern front-end interfaces, users can now navigate quickly through newly enhanced applications to perform work faster.
EMC Insurance	EMC turned to Unisys for help in several areas. First, the insurer's portfolio of online services was growing – driving up demand for processing power. In addition, the 35-year-old power equipment in its downtown Des Moines location needed to be updated – causing EMC to consider a costly move of its production data center to a new location.	A robust IT infrastructure, featuring two physically separate data centers with ample capacity to back each other up in case of disaster, is further reinforced with such Tier 3 attributes as dual power and communication feeds and a backup generator at one location—enabling EMC to provide secure Internet services and achieve a quick recovery time objective in disaster situations. The company avoided a $4 million data center "build and relocation" expenditure. BIS and ICE development tools allowed the organization to quickly respond to market demands for new online services. A Pay-for-Use business model and metering technology help EMC put processing power where it's needed—instantly. Built-in power allows ClearPath servers to grow with EMC's business.
TravelSky Technology Limited	A leading provider of information technology solutions for China's air travel and tourism industries needed to provide expanded	Availability: Enabled real-time data delivery and secure, continuous business operations for smooth passenger reservations and

	capacity and secure operations in preparation for the 2008 Olympic Games in Beijing.	departure control Growth: Provides capacity needed to meet double-digit annual traffic growth Agility: Easily supported a 20% increase in peak processing requirements during the Olympics, compared to the average number of transactions per second handled during an active 3-month period in the previous year
State of Washington Automated Client Eligibility System (ACES)	Since the initial install, ACES has had many enhancements and innovations. Web-based development was introduced in phases. Migrating to a Web-based approach has become a priority, and projects are being defined that will move existing legacy-based functions to the web more quickly. A new client facing portal was installed in 2010.	The Team supports a dedicated Mainframe environment for the account. Capacity reports and trending are provided on a monthly basis and IBM works with the customer to define and recommend architecture changes to meet future needs and strategy. IBM manages the Mainframe which includes a z/OS and z/VM Linux platform. The legacy functions of the application run in z/OS and web based functions run in Linux. Services include currency of all system software, installation and configuration. The operation environment is monitored and problems are diagnosed and resolved.
State of Georgia – Georgia Technology Authority	In 2007, the State of Georgia conducted a third-party assessment of the state's IT operations and documented serious and chronic problems throughout state government which included aging infrastructure, the inability to meet minimum industry	IBM provides a scope of service to the State of Georgia that is very similar to that desired by the Commonwealth of Pennsylvania and includes-- Mainframe support Ongoing support: OS patching, hardware break/fix

	standards, the lack of processes and skills, little coordination of spending and deficiencies in disaster recovery. Georgia determined that their most efficient method for addressing their challenges was to partner with private-sector leaders in technology service delivery. The State awarded an 8-year contract for IT Infrastructure Services to IBM. The contract includes mainframes; distributed computing servers and associated storage; tape; network connectivity and security; print; service desk; end-user computing and disaster recovery. The end result meant saving money, staying current with modern technology and ensuring that confidential data remains safe and secure from outside threats.	Common ITIL-based systems management services including incident and problem management, performance management and capacity management Manage backup recovery, tape (on/off site) and disaster recovery. Implement standard monitoring tools and provide 24x7 monitoring. Upon transformation, systems consolidated into a State of Georgia data center supported by IBM

Benefits to the Commonwealth

As the Commonwealth is aware, the current services provided by the Unisys Mainframe team have provided technology and support services with a high level of client satisfaction. The proposed Unisys Mainframe Service solution contained in the response is designed to not only continue to supply the level of services expected but add additional value. The solution is based on the core services provided by the Unisys Team and adds the overall Unisys Enterprise Architecture Operating Model. This Operating model provides consistence in service delivery across all platforms including Enterprise IT Service Management and Managed Hosting services.

The solution provides the Commonwealth with a new hardware compute environment that is based on a consumptive utility model versus the previous fixed asset model available in the past. This new compute model reduces cost to the Commonwealth and provides an opportunity for continuous cost improvement over time as new technologies are released which can be leveraged by the agencies. As part of the Capacity Planning process the Unisys Team will work with the Commonwealth agencies to determine if new Mainframe Services are available which can be leveraged to further reduce costs.

The Unisys Team has been responsible for migration the Commonwealth through several technology upgrades in the past. By selecting the Unisys Team to provide Mainframe Services the Commonwealth avoids both the risk of a newcomer's initial learning curves as well as the

service cost to Agencies and Commonwealth citizens during the outages that often result from such learning curves.

The Unisys Mainframe Services are part of the overall Commonwealth IT Service Management Program. This program will provide additional efficiencies through common processes, increased automation and a centralized CMDB. The IT Service Management program will allow IT resources to focus on problem resolution versus daily operational tasks which will improve service delivery and reduce costs.

3.2.4.6 Security & Firewall

The Security & Firewall service will provide hosting and operational support Services for security products and firewalls located at the data centers. These security devices and Services protect the equipment and applications in the data centers from malicious attempts to penetrate the computing environment with worms, phishing, Trojan horse malware, and unlawful data access. Offeror must install and maintain mainstream security hardware and software utilizing current industry best practices sufficient to protect the enterprise class data center environments with a significant volume of sensitive class data (e.g. HIPAA, CJIS, CHRIA, PCI, PII, etc.). The number of support staff members required to perform the tasks listed below will be determined by the Offeror.

Listed below are the basic Services required to manage the security & firewall systems required by the Commonwealth. Offeror must include these Services in addition to the base level of Services in this Offering.

Exhibit A - Commonwealth Network Environment

Exhibit J.1 through J.3 - Commonwealth Security and Compliance Requirement

Exhibit G.6 - PSP - CJIS Security Policy

Exhibit G.9 - PSP - CCHRI

Exhibit G.7 - PSP - Summary of CJIS Requirements

Exhibit G.12 - PSP - CHRIA Handbook

	Requirements	Describe Compliance
1.	Monitor local security operations, troubleshoot and resolve operational issues. Actively (normal daily process) monitor the operations of all security,	Offeror must describe its approach to supporting the needs of the Commonwealth including the following: • Processes & Procedures

	firewall systems and security zones. Maintain a log for each server/appliance/system and review the system logs on a daily basis to ensure key system Services are processing without errors. Provide the ability to import data to agency SIEM or enterprise SIEM tool for correlation and reporting purposes. Provide the ability for Commonwealth agencies to request security modifications (firewall changes) as documented in the CCPM. Document review of the system security logs on a weekly basis to ensure critical system Services are processing without errors. Complete weekly server log indicating which logs were reviewed, date and initial the log.	• Tools / Applications • End User Reports o Standard o Custom • Tiered Service/Support Levels • Escalation Procedures Offeror must describe prior experience relative to providing datacenter management and support of CJIS, CCHRI, HIPAA and PCI compliant systems.
2.	Provide security training to Commonwealth personnel specific to the security Services being delivered. Provide the Commonwealth with a resume or CV for each operational staff member assigned to this engagement. Comply with agency background checks and clearances as defined in Appendix A - Terms and Conditions.	Offeror must describe its approach to supporting the needs of the Commonwealth. Offeror must submit a representative sample of staff resumes typically provided for these positions and describe the process to ensure compliance of background checks and clearances.
3.	Achieve cost effective 24/7 security operational coverage for this critical system. Provide dedicated security support staff onsite during scheduled business days, and automated log and notification systems to alert security team of possible intrusion events in real time	Offeror must describe its security operations coverage and how it will be applied.

	mode. Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users. Security staff must be available to respond and evaluate the severity of the event 24/7/365.	
4.	Ensure network connectivity, and ensure consistent system response times. Utilize automated system management tool(s) to ensure real-time monitoring and notification of server availability and response times.	Offeror must describe its real-time monitoring approach and toolset to provide and maintain network availability and performance. Offeror must identify tools it uses to support network availability and performance.
5.	Ensure server/appliance operating systems are maintained with the current system patch level. Implement a Patch Management Program to ensure the timely application of security updates on all infrastructure platforms in accordance with Commonwealth IT policy guidelines. Ensure signature and threat analysis files are updated on a regular basis, and conform to industry best practices. Analyze monthly service patches and determine which patches need to be applied, by server type. Create a change record, log the update in the server log, and install based on server availability schedule. Notify the Commonwealth of any scheduled or unscheduled service interruptions.	Offeror must describe its approach to supporting the needs of the Commonwealth. Offeror must describe its approach for testing and validating updates to the OS and 3rd Party software that it supports. Offeror must describe its approach to communicating unscheduled and scheduled outages, including escalation process.
6.	Provide active security operations,	Offeror must describe its Security

	corrective action, and reporting by utilizing Offeror software to monitor inbound and outbound traffic for malicious patterns and content, and take appropriate protective measures. The ability to utilize security management software to detect threats and analyze firewall logs, to proactively detect and protect from malicious events. Comply with agency specific security requirements. Comply with all agency and OA/OIT security policies and ITBs. On a quarterly schedule, run appropriate penetration testing, and report results to Commonwealth and Offeror. Create monthly report on events, incidents and corrective activities. Report that indicates systems not in compliance with security standards. Real time reporting of security breaches.	Operations Process and how it will be applied.
7.	SLA Reporting including but not limited to collecting actual system availability, utilization and response time data. Create a Service Level Agreement report for the Commonwealth and Offeror on a monthly basis.	Offeror must describe its approach to supporting the needs of the Commonwealth.
8.	Software License Management	Refer to 3rd Party Software Management service.
Continual Process Improvement		
9.	Reduce service risks.	Offer methods to eliminate or mitigate

		service risks.
10.	Improve service quality. Make recommendations to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments on a quarterly basis.	Offeror must describe its approach to supporting the needs of the Commonwealth.
11.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
12.	Ensure service transparency using documentation methods to ensure service transparency, by providing visibility into service execution.	Offeror must describe its approach to supporting the needs of the Commonwealth.
13.	Improve/reduce cost of service.	Offeror must provide examples of Security and Firewall Support initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Unisys understands the importance of the critical need for the Commonwealth to protect its equipment, applications, and data such as HIPAA, PCI, PII, CJIS, and CHRIA, from malicious and unlawful attempts to cause harm to its computing infrastructure. Unisys will leverage its experience with industry leading security and firewall products to provide hosting and operational support services within the Commonwealth's data centers.

1 Security Operations Approach, Experience

1.A Offeror must describe its approach to supporting the needs of the Commonwealth including the following:

Processes & Procedures

Tools / Applications

End User Reports (Standard and Custom)

Tiered Service/Support Levels

Escalation Procedures

Monitor local security operations, troubleshoot and resolve operational issues.

Unisys will manage security operations in accordance with our standard model for site operations. Unisys will monitor security devices via a standardized logging platform that supports syslog, SNMP, and Windows event logging. The Unisys SIEM (Security Incident and Event Management) will support correlation of system logs in order to identify, report, and enable security staff to respond to potential security incidents. Schedule F, Sections 3.1.2, 3.2.3.2 and 3.2.2.5 contain additional details regarding the processes, procedures, tools, and applications for monitoring network and security operations as well as escalation procedures.

Unisys will work with Commonwealth security staff to provide periodic, standardized agency reports for security incident and management. The following are some of the significant reports that will be provided to the Commonwealth.

Report Category	Standard Reports
Change Management Standard Reporting	Forward Schedule of Change Emergency Changes Report Change Backlog Report Open Changes by Status Changes that Spawned Incidents Changes that Spawned other Changes Changes Requests Backed Out Change Lifecycle and Process Efficiency Open Changes by Phase Change Rejected by CAB Planned Unavailability by Change Change Lead Time Report Change Backlog Report Change Bypass Process Report Change Trend Report Change Reason Report
Incident Management Standard Reporting	Number of Incidents by Status Incident Volume Trend Report Open Incidents Aging Report Incident Resolution Time Analysis Number of Incidents by Impact Number of Incidents opened by Operations Percentage of Incidents reopened Backlog of Unresolved Incidents

	Top Requestor Departments Top Requestor Sites Number of Incidents by Reported Source Number of Incidents by Product Category Number of Incidents with Status of Pending SLA Performance Summary Response Time Metric Report Metrics Scorecard Incident Trend Report Top 10 Resolvers Group Report
Problem Management Standard Reporting	Number of Problems by Status Percent of Re-occurring Problems by Impact MTTR for a Problem Average Time lag for Problem Resolution and closure Percent of Problems with a RCA Number of Opened Problem by Investigation Drivers Aging of Open Problems Number of Problems by CI Ratio of Problems to Incidents Number of Problems with High Priority Incidents

Security changes and problems will be categorized within these comprehensive reports. The Unisys SIEM tool and Remedy Platform has the ability to provide ad-hoc, customized reporting and will follow prescribed security incident procedures (SIP) in accordance with the ISO27001 standard and associated proposed SIP document. Unisys has a Catalog Service for the Commonwealth to request customized reporting.

1.B Actively (normal daily process) monitor the operations of all security, firewall systems and security zones.

The Unisys SIEM platform integrated with the Remedy Incident platform will provide automated and customizable log reviews and incident escalation to dedicated, on-site security operations staff during the scheduled business day's review of critical system processes and components.

1.C Maintain a log for each server/appliance/system and review the system logs on a daily basis to ensure key system Services are processing without errors.

System logs, including all servers, appliances, and network/security devices will be maintained through a combination of individual server logging, the enterprise monitoring platform, and the

enterprise SIEM system. Data center operations staff will monitor servers, appliances, firewalls and security systems to confirm proper equipment operations. These activities will be documented in logs for each device and reviewed daily for proper operations. Please refer to Schedule F, Section 3.2.3.2 – Site Operations for more details.

1.D Provide the ability to import data to agency SIEM or enterprise SIEM tool for correlation and reporting purposes.

The Unisys SIEM can support exports of security incident data via syslog transfer or flat file export (CEF or CSV) into the Commonwealth's SIEM environment.

1.E Provide the ability for Commonwealth agencies to request security modifications (firewall changes) as documented in the CCPM.

The Commonwealth will be able to request security modifications through the Change Management Process documented in the CCPM.

1.F Document review of the system security logs on a weekly basis to ensure critical system Services are processing without errors.

Unisys will automate security event management using the Unisys SIEM platform with the [redacted]) platform for consolidated incident and event management. Security staff will periodically review system security logs to identify any unusual events.

1.G Complete weekly server log indicating which logs were reviewed, date and initial the log.

The Unisys security team will conduct a weekly server log review, indicating which logs were reviewed. Each entry will be dated and initialed.

1.H Offeror must describe prior experience relative to providing datacenter management and support of CJIS, CCHRI, HIPAA and PCI compliant systems.

Unisys recognizes that the Commonwealth's business needs and application are required to adhere to many federal and state regulations and statutes, including CJIS, CHRIA, IRS Federal Tax Information, PCI and HIPAA. Unisys will continue to work with the Commonwealth to maintain the Commonwealth's environments to meet the technical and audit requirements for these regulations.

Unisys currently supports agencies such as the Department of Public Welfare, Pennsylvania Liquor Control Board, Department of Revenue, the Department of Health, and the Pennsylvania State Police in the DPH required to adhere to and be audited on the security standards of CJIS, CCHRI, HIPAA, PCI, NIST, FISMA and IRS. As required, Unisys will support Commonwealth agencies in complying with these stated security requirements by ensuring the appropriate complement of network security devices are implemented for each agency.

The Unisys Team has provided data center management in support of other government agencies in support of CJIS, CCHRI, HIPAA, and PCI systems. As an example, Unisys designed a data and records management system for the Alabama Criminal Justice Information Center that was required to meet CJIS and CHRIA requirements. The Alabama Criminal Justice Information Center (ACJIC) is a state agency providing local, state, and federal criminal justice agencies with the information needed for citizen safety. ACJIC realized that gaps in its information technology were hindering communications and business continuity. It needed to more efficiently deliver critical information from its network and systems. ACJIC explored several solutions and solution providers before choosing Unisys to help establish an IT infrastructure specifically designed to address the agency's requirements.

2 Training Approach, Security

2.A Provide security training to Commonwealth personnel specific to the security Services being delivered. Offeror must describe its approach to supporting the needs of the Commonwealth.

Unisys will create and present annual training to Commonwealth personnel addressing the security requirements and features of the data center. Please see Schedule F, Section 3.3.2.2 – Security Transition for details on our formal security training program.

2.B Provide the Commonwealth with a resume or CV for each operational staff member assigned to this engagement.

Offeror must submit a representative sample of staff resumes typically provided for these positions and describe the process to ensure compliance of background checks and clearances.

Unisys will manage, as it currently does, background checks for all staff members. A representative sample of staff resumes for individuals who typically fill these positions are provided in the representative resume section of this proposal (see Section 5.0 Personnel).

2.C Comply with agency background checks and clearances as defined in Appendix A - Terms and Conditions.

In accordance with Appendix A section 44, the Unisys Team will perform fingerprint background checks consistent with ITB-SEC009 and CJIS policy on all Unisys Team personnel providing support or services for the Commonwealth. As part of our ISO27001 certification, we perform an annual 3rd party/subcontractor review as well. Unisys has been completing Commonwealth specific background checks since the beginning of the Data PowerHouse contract. Unisys will provide written confirmations to the Commonwealth when the background checks are conducted. Please refer to Schedule F, Section 3.2.1.1.3 Subcontractor Management for more details on our process for performing background checks.

3 Service Desk, Tiered Support, Operational Coverage

3.A Achieve cost effective 24/7 security operational coverage for this critical system.

Offeror must describe its security operations coverage and how it will be applied.

Provide dedicated security support staff onsite during scheduled business days, and automated log and notification systems to alert security team of possible intrusion events in real time mode.

Unisys will provide dedicated network/security support staff onsite during scheduled business days, coupled with automated tools that provide real time notification of suspected security intrusion events. Unisys Security Operations Center (SOC) is comprised of these security support staff and a suite of automated tools that provide comprehensive 24x7x365 monitoring, alerting, and response to security events. Personnel follow specific instructions to mitigate issues according to the Security Incident Procedure (SIP) policy.

3.B Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.

The Unisys security team will provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth users for security related incidents and requests. There are three levels of support in the Incident Management process. The first level of support is provided by service desk agents who have general expertise across many disciplines in order to restore a service. If first level service desk agents cannot restore the service, then a second level service desk agent – who has deeper expertise and more experience resolving incidents – is engaged. Third level escalations involve subject matter experts (e.g., vendors) who generally reside in external organizations (e.g., other IT disciplines or vendors) in order to restore a service. In the case of security related incident handling, the service desk agents will engage the Unisys security team to effectively resolve security matters. Please refer to Schedule F, Section 3.2.3.2 – Site Operations for more details.

3.C Security staff must be available to respond and evaluate the severity of the event 24/7/365.

The Unisys Service Desk (Level 1) will monitor the network/security team's response for security related incidents. The Service Desk will help to verify that the Unisys network/security team responds even during off hours depending upon the SLA requirements for incident priority response.

The [redacted] will collect, prioritize and forward all significant security events to the [redacted]. Network events will be correlated with other significant events and incident tickets will be auto-generated for identified significant security events. Notifications will be sent automatically to the Unisys network/security team (Level 2) and other Commonwealth stakeholders through email.

Events will be escalated to senior Unisys network/security support resources (Level 3) and/or the OEM as needed to verify availability SLAs are met.

4 Monitor network Connectivity, Toolset

4.A Ensure network connectivity, and ensure consistent system response times.

Unisys will provide event management solutions to help confirm network connectivity and consistent system response times. Proactive monitoring tools will be used that monitor excessive delay and latency in the network.

Offeror must describe its real-time monitoring approach and toolset to provide and maintain network availability and performance.

4.B Utilize automated system management tool(s) to ensure real-time monitoring and notification of server availability and response times.

Offeror must identify tools it uses to support network availability and performance.

Unisys will utilize automated system management tool(s) to provide real- time monitoring and notification of server availability and response times including the stop and start times of servers to support SLA availability measurements. The following tools are the major toolsets to support network and system event management and monitoring.

Monitoring Software	Managed Configuration Items (CI's)	Monitoring and Management Functionality
[redacted]	LAN Devices including: • Switches • Routers • Load Balancers • Firewalls	Provides deep network device availability and performance monitoring, DNS, IP address management, network configuration management, and network traffic bandwidth throughput monitoring
[redacted]	Microsoft servers, databases, network devices, and storage hardware.	Provides a standard set of availability, performance and critical service monitors developed by Unisys for monitoring across infrastructure items including: • Servers • Network devices (switches, routers, load balancers) • Storage devices • Middleware • Applications (Exchange, Citrix XenApp, etc.)

For a complete understanding of how this subset of Event Management Tools supports enterprise Event Management please refer to 3.2.3.2 Site Operations.

5 Patch Management

Ensure server/appliance operating systems are maintained with the current system patch level.

Offeror must describe its approach to supporting the needs of the Commonwealth.

Implement a Patch Management Program to ensure the timely application of security updates on all infrastructure platforms in accordance with Commonwealth IT policy guidelines.

Offeror must describe its approach for testing and validating updates to the OS and 3rd Party software that it supports.

Ensure signature and threat analysis files are updated on a regular basis, and conform to industry best practices.

Analyze monthly service patches and determine which patches need to be applied, by server type.

Create a change record, log the update in the server log, and install based on server availability schedule.

Notify the Commonwealth of any scheduled or unscheduled service interruptions.

Offeror must describe its approach to communicating unscheduled and scheduled outages, including escalation process.

The Unisys technical support team will patch based on Commonwealth /Agency policies as defined in the ITBs. The patch program will address policies, processes, procedures for the following:

- Sources of patches (how to obtain them from the OEM's)
- Toolsets that will be used to stage patches for possible deployment
- Change management procedures supporting the Change Management Process to identify, approve and manage deployment of patches
- Compliance procedures to include utilization of the toolsets to run compliance audits and identify out of compliance CI's with patch policies and approved changes
- Process and procedures to bring out of compliance CI's back into compliance

Unisys will follow the Change Management Process for applying patches to all IT infrastructure CI's. This process will maintain the change record in the [redacted] platform and also update the CMDB configuration management file after completion of the patch release and deployment process. The [redacted] change record will be related to the CI's in the CMDB as an audit trail for patch changes upon the completion of the Release and Deployment Process.

The distributed IT infrastructure toolset to support the automation of patch release and deployment is [redacted]. Unisys will maintain in this toolset the appropriate patch policies for determining patch deployment and compliance. The [redacted] Suite will be maintained with all the current patches supplied by the OEM's and will be used to manage the production state of patch deployment in the windows environment.

Unisys approach to testing and validating updates to the all CI's is to follow the release and deployment process for all changes into all production environments. The release process includes:

- Change ticket approvals
- Test planning and accepted test results
- Release and deployment planning including release back out plans
- Release testing for risky deployments
- Early life cycle support to help provide a successful deployment *
- Release back out for failed releases

The Unisys technical support team will work with the Commonwealth/Agencies to determine patch policies for which patches should be applied to the server/appliance environment.

Policies will be implemented to govern changes to the server/appliance environment as it pertains to HIPAA, SOX, CIS, etc. and to conform to the Commonwealth policies.

Unisys will follow the Change Management Process for applying patches to the production environment. This process will maintain the change record in the [redacted] and also update the CMDB configuration management file upon deployment for the server/appliance Configuration Item (CI). The Change Record will be related to the CI in the CMDB as an audit trail for changes to servers.

The toolset to support the automation of patch release and deployment is [redacted]. Unisys will maintain in this toolset the appropriate patch policies for determining patch deployment and compliance. The [redacted] will be updated with all the current patches supplied by the infrastructure OEM's and will be used to manage the production state of patch deployment in the infrastructure environment. Unisys will use BSA to support:

- Policies for the server/appliance environment
- Software distribution and server/appliance patching
- Compliance management of patches required for security policies

6 Security Operations

6A Provide active security operations, corrective action, and reporting by utilizing Offeror software to monitor inbound and outbound traffic for malicious patterns and content, and take appropriate protective measures.

Offeror must describe its Security Operations Process and how it will be applied.

The ability to utilize security management software to detect threats and analyze firewall logs, to proactively detect and protect from malicious events.

Unisys will use a combination of intrusion prevention and SIEM (Security Incident and Event Management) software to monitor all inbound and outbound traffic for malicious content in real-time. Unisys will follow the incident and problem management process to expeditiously report and act on all suspected security events, which may include network based blocking of traffic. Firewall logs will be analyzed by both a standardized syslog platform and a SIEM that will correlate with other device logs (e.g. IPS, server, etc.).

6.B Comply with agency specific security requirements.

Comply with all agency and OA/OIT security policies and ITBs.

A Unisys SOC will be created that will adhere to Commonwealth ITBs, OIT policies, audit/compliance requirements; log, analyze and report real-time on all inbound and outbound data center traffic; perform quarterly penetration tests, and report on all issues including breaches.

6.C On a quarterly schedule, run appropriate penetration testing, and report results to Commonwealth and Offeror.

The Unisys Team will perform a quarterly vulnerability assessment and penetration testing of the data center's IT infrastructure. We have illustrated our steps to conduct this assessment in Schedule F, Section 3.2.2.5 Security Management.:

6.D Report that indicates systems not in compliance with security standards.

Quarterly Cyber Threat Intelligence (CTI) diagnostic: Through the Enterprise Services Catalog, the Commonwealth will be able to obtain a Quarterly Cyber Threat Intelligence diagnostic. As part of this quarterly diagnostic, we will perform the following activities

- Intranet cyber compromise analysis: Identify potential Commonwealth data center servers that may be compromised and are attempting to communicate with known adversary controlled devices on the Internet. We will analyze Commonwealth's security audit logs (up to two TB) that contains data up to two weeks from domain name server (DNS) logs, firewall logs and remote access logs of devices supporting critical data center servers.
- Rogue device discovery diagnostic: Perform an analysis on devices currently found in the data center's network to determine if the devices exhibit rogue or stealth-like characteristics. We will analyze up to two weeks of Network Dynamic Host Configuration Protocol (DHCP) and Address Resolution Protocol (ARP)/Content Addressable Memory (CAM) data from the data center's core network switches supporting critical data center servers. We will perform the rogue device discovery will be performed on the data center network that supports up to 2,000 data center servers.

6.E Create monthly report on events, incidents and corrective activities.

Monthly CTI program diagnostic: A monthly CTI program diagnostic will also be available through the Catalog of Services. We will perform an analysis on up to 25 data center servers to identify presence of potentially unwanted programs, malicious files, and unknown binaries.

Details of the security vulnerability assessment are listed below:

- Vulnerability assessment and penetration testing does not include web application vulnerability testing and social engineering assessment
- The Commonwealth will identify a "Trusted Agent" to help facilitate the security vulnerability assessment. The Trusted Agent is responsible to:
  - Define scope, identify and prioritize the IT assets for the security assessment
  - Make decisions to proceed with applicable testing
  - Coordinate the testing activity with stakeholders like IT infrastructure, application and data center service providers
  - Coordinate with other commonwealth agencies (if applicable) during the testing activities
  - Review the vulnerability reports and owns limited "as needed" distribution of the reports. The sensitive nature of information contained in the reports requires a

specific stakeholder being responsible for managing the communication aspects

- Identify mission critical systems of the Commonwealth, business partners or affiliates, and third parties, as applicable
- Identify the time period for communication to the appropriate stakeholders for high severity security vulnerabilities identified in production environment
- Coordinate and authorize the vulnerability assessment team access to the Commonwealth data center's information technology components considered for vulnerability assessment. In order to avoid interruptions, we recommend running many of the assessment tasks during non-business hours. At the Trusted Agent's direction, we execute as many of these tasks as practical during non-business hours.

➢ The Commonwealth "Trusted Agent" and Unisys information security manager will select the servers for the security vulnerability assessment based on business and security criticality

➢ We will use the data center licensed vulnerability scanning tools for this assessment

➢ The Commonwealth will select the four systems to perform the security configuration risk review

➢ The Commonwealth will identify and provide the appropriate audit logs and data for performing the quarterly and monthly CTI diagnostic assessments.

6.F Real time reporting of security breaches.

Unisys will report all suspected security breaches as severity 1 incidents using the incident management process.

7 SLA Reporting

SLA Reporting including but not limited to collecting actual system availability, utilization and response time data.

Offeror must describe its approach to supporting the needs of the Commonwealth.

Create a Service Level Agreement report for the Commonwealth and Offeror on a monthly basis.

The [redacted] Application will be used as the primary platform to manage Service Level Agreements for Commonwealth agencies. The [redacted] provides a continuous real-time platform for collecting the information to monitor and report against Availability SLA's for the Commonwealth. System Availability measurements are based on incident tickets within the Remedy platform. See Schedule F, Section 3.2.1.2, Availability/SLA Management for complete description of SLA reporting and Availability Management.

Unisys will create a Service Level Agreement report for the Commonwealth on a monthly basis as described in Schedule F, Section 3.2.1.2.

8 Software License Management

Refer to 3rd Party Software Management service.

Unisys will be solely responsible for the management of all infrastructure software license products provided through this contract. The goals of this service are to:

- Verify software contract compliance (to avoid non-compliance legal issues and expenses)
- Manage costs of software inventory by matching requirements for use to needs
- Confirm software maintenance contracts are maintained on schedule through early notifications

Unisys will maintain the Software Licensing and associated Maintenance for the Security and Firewall infrastructure using the Software License Management process defined in Schedule F, Section 3.2.1.8 – 3rd Party License Management. Please refer to this section for a complete description of the entire Software License Management process using the [redacted] and [redacted].

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

- Reduce service risk,
- Improve service quality,
- Improve client satisfaction,
- Provide service transparency, and
- Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

- Service Excellence Office,
- Quality Plans: transition and steady state service delivery
- Industry standard frameworks and methodologies: ITIL, ISO, SSL
- Industry accepted measurement tools
- Continuous Service Improvement & Innovation Processes (CSIIP)
- Risk management, audits and business continuity management
- Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous

Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

9 CI Service Risk

9.A Offeror must provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

10 CI Service Quality

10.A Offeror must provide examples of previous Offeror initiatives aimed at improving service quality.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

11 CI Client Satisfaction

11.A Improve client satisfaction.

Offeror must describe methods to continually improve client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

12 CI Service Transparency

12.A Provide service transparency.

Offeror must provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

13 CI Reduce Cost of Service

13.A Improve/reduce cost of service.

Offeror must provide examples of previous capacity initiatives implemented that achieved reduced costs of Services and that met or exceeded ROI (Return on Investment) analysis projections. If costs of Services increased due to increased required capabilities, so identify.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

A few examples of Security & Firewall support and initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections are outlined below:

1. Reduce Service Risks

In order to proactively identify possible network security risks, the Data PowerHouse implemented intrusion detection services in 2010 for all COPANET/MAN connections. This technology, coupled with the [redacted] MARS logging analysis platform, allows Unisys to identify and correlate IDS, firewall, and network switch/router logs for additional protection against the growing number of network based security threats. Suspected events are investigated and reported to the OA CISO office, which allows the Commonwealth to gain even greater insight into potential risks of their hosted systems and eliminate or mitigate those service risks.

2. Improve Service Quality

In 2010 Unisys began to provide virtual private network (VPN) services to the PA Game Commission in order to provide sensitive data traversing the network from the Data PowerHouse was encrypted. In 2013 the Department of Revenue also plans to utilize these encryption services over COPANET to confirm their data is protected in transit from the DPH.

These are examples of the types of recommendations Unisys will make to the Commonwealth team regarding any system changes that would be appropriate to maintain or improve SLA commitments on a quarterly basis.

3. Improve Client Satisfaction

In late 2009 Unisys began offering vulnerability scanning for nearly all agencies in the Data PowerHouse to expose potential security vulnerabilities and verify that Commonwealth mission critical systems are patched accordingly. This incremental service provides scheduled reports on a quarterly basis that the DPH service delivery staff review with the agency to verify they are able to continuously improve their security posture and reduce overall risk.

4. Provide Service Transparency

The Unisys Data PowerHouse began offering self-service firewall log review to selected agencies that requested this feature in 2012. This allows hosted agencies such as IES and the PA State Police to review the firewall logs that pertain to their managed systems for dropped or accepted packets, reducing their troubleshooting times and expediting the overall firewall change process for them. Agencies with self service capability have praised Unisys for this ability to get a glimpse into their operational network security policy, ensuring that when they are troubleshooting application issues, or deploying new services, they are able to identify and/or anticipate what changes will need to be implemented on the DPH firewalls.

5. Improve/Reduce Cost of Service

As a part of the 2008 contract extension to the Data PowerHouse, Unisys began a firewall consolidation initiative tied to the increasing use of shared infrastructure components and firewall virtualization. Prior to this, agencies in the DPH used separate physical Check Point firewalls. These were consolidated onto a shared [redacted] firewall service module (FWSM) platform, with each agency retaining a logical firewall partition with distinct security policy and configurations. This allowed for a significantly less complex hardware environment and reduced maintenance and licensing costs.

Unisys Team Experience

Unisys has provided decades of mission-critical enterprise security experience with large-scale deployments including Federal agencies. For example, Unisys collaborated with the USDA Agriculture Security Operations Center, 14 product vendors, and 7 technology vendors to implement a forward-thinking security solution to enhance proactive identification and defensive response to cyber security threats at strategic USDA locations throughout the United States.

The implementation of the USDA Security Sensor Array (SSA) was achieved by integrating and incorporating a comprehensive, consolidated, top-down security toolset of seven COTS (Commercial Off-The-Shelf) products and several technologies—the first solution of its kind to be deployed throughout a cabinet-level department in the Federal Government. Within SSA site implementations, seven strategic security technologies were integrated to provide real-time security awareness and understanding of existing and future threats against the USDA assets.

Each SSA includes Security Information and Event Management (SIEM), Intrusion Detection/Prevention System (IDPS), Malware Detection/Prevention System (MDPS), Network Behavior Analysis (NBA), Secure Socket Layer (SSL) Decryption, Packet Analysis, and Data Loss

Prevention (DLP). In addition to enterprise visibility and control, the solution provides local visibility and the capability to resolve Inspector General, OMB, and other security audit findings. SSA delivers the needed protections for USDA. This solution protects 250,000 network nodes at 5,000 locations throughout the United States.

Benefits to the Commonwealth

The Unisys Team, through its extensive security operations expertise, will provide the Commonwealth with:

- Advanced cyber situational awareness and intelligence analysis capability
- Leveraged security strategic planning and design, integrating current tools and organizational structures.
- Operational efficiencies from streamlined incident management
- Accelerated system development, integration, and deployment, with decreased implementation and operational risks.
- Assurance of a secure operational cyber environment through an integrated approach to risk management.

3.2.4.7 Database Management Services

The Database Management Service will provide the Commonwealth with a "managed database" service offering. The service must include the database platform (Hardware/Software) and the ongoing database management administration Services. The Offeror must provide a multi-tiered level of service (e.g. Gold, Silver, and Bronze) across multiple database platforms. While the Commonwealth's application portfolio (over 2,000 applications) currently utilizes numerous database technologies, the majority of the applications that are utilizing database technologies are using Oracle, Microsoft SQL, IMS, Sybase, or DB2.

It is anticipated the Database Management Services will be an optional service that can be utilized by the Agencies beyond the basic infrastructure Services.

Reference Documentation

N/A

Requirements		Describe Compliance
1.	Design, manage, and administer database environments that support multiple business applications.	Offeror must describe proposed approach to designing and supporting enterprise level database platforms and Services that support multiple agency business applications.

2.	Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.	Offeror must describe its approach to supporting the needs of the Commonwealth including the following: • Processes & Procedures • Tiered Service/Support Levels • Tools / Applications • Escalation Procedures • End User Reports o Standard o Custom
3.	Monitor database backup and recovery processing on a daily basis. Review daily backup log for successful completion. Note any failures, initial and date the log, and correct the problem. Create problem record for any abnormal condition and any repairs that have been made. Automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support and identified Commonwealth staff for follow up and corrective action.	Offeror must describe its approach to perform an initial review and audit of the backup and recovery policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives. Offeror must describe its approach to identifying gaps and potential risks, and how those gaps and risks will be resolved.
4.	Provide a multi-tiered level of service (e.g. Platinum, Gold, Silver, Bronze, and Basic) for Oracle, Sybase, Microsoft SQL, IMS or DB2 database platforms. Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.	Offeror must describe its approach to providing multi-tiered Services level.
5.	Utilize the proposed service	Offeror must describe how its proposed

	management Services (e.g. Incident, Service Request, Change, Configuration) to manage database management Services with multiple agency customers.	database management Services will support multiple agency service requests.
6.	Provide a review and analysis of system performance/capacity to determine if current performance/capacities are sufficient to support the needs of the stakeholders.	Offeror must perform an initial review and audit of the current usage, procedures and reports and provide an analysis of the current usage, processes and reports currently being supported. Offeror must document its review and audit findings and recommendations.
7.	Monitor system backup processing on a daily basis. Review daily backup log for successful completion. Note failures, and correct the problem. Create problem record for any abnormal condition and any repairs that have been made. An automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.	Offeror must describe it approach to performing an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives. Offeror must describe its approach to identifying gaps and potential risks, and how those gaps and risks will be resolved.
Continual Process Improvement		
8.	Reduce service risks.	Offeror must provide methods to eliminate or mitigate service risks.
9.	Improve service quality.	On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.
10.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually

		improving client satisfaction.
11.	Ensure service transparency.	Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.
12.	Improve/reduce cost of service.	Offeror must provide examples of Database Management Support initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Unisys Team understands that databases and the database infrastructure serve as a backbone to mission critical Commonwealth applications. The availability, performance and scalability of these databases is critical to meet the business, user and customer needs managed by these applications.

To support this, the Unisys Team will provide optional Database Management Services. These 'managed database' services will be provided on a wide array of hardware/software platforms to provide the Commonwealth architectural flexibility. These hardware platforms include Unisys, IBM, HP, Dell and many other leading vendors on a variety of operating systems including Windows, Linux, Unix, IBM/Unisys mainframe systems, etc. We understand the majority of Commonwealth applications leverage the Oracle, Microsoft SQL, IMS, Sybase or DB2 database management systems. Our team will provide resources proficient in these technologies.

In addition to architectural flexibility, the Unisys Team will also provide various levels of tiered support across the entire array of platforms to best meet your business and financial needs. These services include:

- Design, Manage and Administer Database Environments
- Provide Level 2/3 support to Service Desk and/or Commonwealth Users
- Daily Monitoring of Database Backup and Recovery Processing
- Multi-Tiered Levels of Service
- Service Request Management
- Performance/Capacity Analysis
- Continual Process Improvement

The Database Management Services provided by the Unisys Team are comprehensive in terms of planning, managing and executing database management. The team provides the Commonwealth access to highly skilled and specialized resources with substantial experience managing state government applications and databases, including many existing Pennsylvania solutions such as DPW, L&I, Insurance and more. In addition to our deep Pennsylvania based relationships, our team also maintains strong relationships with the technology vendor community to keep abreast of the latest developments and advances in database technology.

The Database Management team supports the optional managed database service that includes the database platforms hardware and software and the ongoing database management administration services. This team is comprised of a mixture of resources from Unisys, IBM, and Deloitte who are well-versed in Oracle, Microsoft SQL, IMS, Sybase and DB2 database technologies.

The Commonwealth has requested Database Administration Services to be provided as needed through an optional service to agencies that are seeking support in this area. Since the services are optional, and volumes were not provided in Schedule I Volumetrics, precise staffing numbers are not provided within this section. Our approach to providing Database Administration Services to the Commonwealth is to leverage our partners with the most expertise in supporting the database platforms requested.

In this section, we provide details on our database management capabilities, experience and services delivery against the requirements in the RFP.

1 Infrastructure, Database Environment

1.A Design, manage, and administer database environments that support multiple business applications.

Offeror must describe proposed approach to designing and supporting enterprise level database platforms and Services that support multiple agency business applications.

The Unisys Team provides services to effectively design, manage and administer database environments that support multiple business applications. Our team is uniquely positioned to provide the Commonwealth with the Database Management services as it brings highly specialized staff and deep experience in supporting a highly available and performing infrastructure.

The Unisys Team provides the Commonwealth with 24x7 support to manage database administration, operations and availability. The following represents the Enterprise Services Catalog of Database Management Services that highlights the available services to design, manage and administer your Enterprise database solution:

Database Management Service	Description
Database Design	• Design multiple agency business application database environments • Design the database server and storage platform

	topologies • Design high availability and scalable solutions
Database Creation / Management	• Install and patch database software • Create and maintain shell database instance sized appropriately based on supplied requirements • Create high availability/clustered configurations where requested
Backup Management	• Create and establish database backups integrated with the larger system backup strategy • Monitor and verify successful execution, retention and storage of backups
Database Recovery	• Configure and test database recovery solutions from backup or archive log • Support Disaster Recovery planning, rehearsal and execution
Application Release Management	• Support deployment management through various test environments per defined work plans • Execute physical deployment of application objects within the database
Data Management and Reporting	• Refresh data from backup/export periodically • Create and execute data alteration / extract solutions periodically via supplied requirements • Standard or custom reports as requested
Proactive Database Performance Analysis	• Proactively monitor and report on database health and performance • Provide periodic reports highlighting performance trends and consumption patterns
Proactive SQL Analysis / Tuning Recommendations	• Proactively monitor and report on database SQL performance in the production environment • Provide monthly reports highlighting performance trends and a list of SQL tuning opportunities • Development of tuning options for identified performance opportunities
Provide Level 2/3 Technical Help Desk Support	• Support triage and resolution of calls from the Level 1 Help Desk • Collect and report metrics, solutions and outcomes of said support

The Unisys Team currently supports multiple agencies and applications within the

Commonwealth. We have demonstrated experience successfully managing complex system topologies that support multiple applications within distinct program offices and departments. Our approach on delivering successful projects across multiple agencies requires mature project management disciplines, clearly defined service offerings and efficient and timely communication and partnership with our clients.

2 Service Desk, Tiered Support, Level 2/3 Approach

2.A Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.

Offeror must describe its approach to supporting the needs of the Commonwealth including the following:

Processes & Procedures

Tiered Service/Support Levels

Tools / Applications

Escalation Procedures

End User Reports (Standard and Custom)

The Unisys Team provides Level 2 and Level 3 Support to Service Desk and/or Commonwealth Users. The Unisys Team offers multiple levels of database support services to provide timely and efficient handling of service requests, streamlined communications and premium customer service. We provide resources with excellent communication and client service skills to effectively interact with the Service Desk as well as Commonwealth Users to manage database issues/requests.

Our Level 2 technical support provides assistance with basic functionality of the database product, such as availability confirmation, overall performance verification, credential management, authorization and authentication as well as data management services. It is anticipated that Level 2 requests are of limited complexity and usually require limited time to resolve.

The Unisys Team Level 3 technical support includes more specialized and complex services such as targeted performance tuning, database availability and recovery, liaison between application teams and product vendors, overall database configuration, high availability and redundancy management, etc. Level 3 support questions often take more than a single session to resolve, or longer than a single day of engineer time.

The following highlights our approach toward Service Desk and Commonwealth User service/problem requests:

- **Processes and Procedures** – As service requests are identified by clients, the support team logs, triages, investigates and responds to end-user problems or requests. Our team follows a documented problem and incident management process based on the ITIL methodology. Processes and procedures are documented for streamline staff integration as well as facilitating consistent service delivery and expectations. Lastly, our team will focus on timely, clear and targeted communications to effectively manage and close requests with mutual satisfaction.
- **Tiered Service and Support Levels** – The Unisys Team provides tiered services and support levels to provide Commonwealth agencies the ability to customize their support

needs. Services can be 'purchased' from the Enterprise Services Catalog in a tiered support structure highlighted below.

Tiered Support Level	Description
Platinum	• Full time resources proactively monitoring database backups. Available 24x7x365 (on-site coverage averages 96 hrs. / week) with responsiveness SLA's. • Resources are vendor certified (where applicable) with over 10 years of experience
Gold	• Full time resources proactively monitoring database backups. Available 24x7x365 (on-site coverage averages 80 hrs. / week) with responsiveness SLA's. • Resources are vendor certified (where applicable) with over 8 years of experience
Silver	• Full time resources proactively monitoring providing operational status. Available 24x7x365 on-site coverage averages 60 hrs. / week) with responsiveness SLA's. • Resources have over 6 years of qualified experience
Bronze	• Shared resources proactively monitoring providing operational status. Available 24x7x365 on-site coverage averages 40 hrs. / week) with responsiveness SLA's. • Resources are available from a pool of qualified DBA's with over 4 years of experience
Basic	• Shared resources available to support requested execution of listed services. Available 8x5x365 with responsiveness SLA's. • Resources are available from a pool of qualified DBA's with over 2 years of experience

- **Tools or Applications** – In addition to standard desktop software (Office, etc.) the Unisys Team will leverage enterprise class tools to manage database access, inquiry and management. Examples include TOAD, Erwin, Enterprise Manager, Microsoft Management Studio, etc. Licensing changes for these tools may apply and, if required, the tools can be added to the Enterprise Services Catalog. In addition to the database management tools, the Unisys Team will using the enterprise system management tools described in Schedule F, Section 3.2.3.2.
- **Escalation Procedures** –The Unisys Team follows a standard ITIL process flow for service request escalation procedures. The Escalation approach is described in Schedule F, Section 3.2.3.2.
- **End User Reports (Standard and Custom)** – The Unisys Team brings highly experienced

DBAs that provide not only the support in managing databases and resolving issues, but also assisting with the development of end user reports that help with the management of critical Commonwealth applications. Data Management and Reporting is a service included in our Enterprise Services Catalog and governed by the tiered support listed above.

The overall approach for providing daily operations including Processes and Procedures, Tools and Applications, End User Reports, Tiered Service / Support Levels and Escalation Procedures is described in Schedule F, Section 3.2.3.2.

3.A Monitor database backup and recovery processing on a daily basis.

During Steady State operations for Fully Managed servers, the CommVault backup system processing is monitored automatically through the integration of Nagios collectors which generate incident tickets and automated run book procedures upon backup abnormalities that would threaten data protection. This provides reliability in the daily backup processes by addressing run-time issues.

The Unisys Backup team is also able to compare the Backup inventory of clients and policies to the CMDB inventory to locate "negative" gaps in case a server or critical data set is introduced into the Fully Managed environment and, through unlikely process failures, was not also protected with sufficient backup resources. The Unisys governance processes and the processes generated by the Unisys solution's Enterprise Services Catalog are designed to remove such failures. However, following a belt-and-suspenders approach to safety, the compare of Backup infrastructure inventory from the backup tools perspective with the CMDB can locate a gap should one occur.

3.B Review daily backup log for successful completion.

Note any failures, initial and date the log, and correct the problem.

Create problem record for any abnormal condition and any repairs that have been made.

The Unisys solution automates the monitoring of backup logs. Appropriate support personnel are notified to address failures through the ITSM system. Successful backups are reported daily.

Unisys support staff is trained to identify patterns of failure that result in incidents and, following ITIL processes, escalate these to the status of a problem with applicable workarounds and final resolutions. Repairs are carried out as part of incident ticket resolution and are logged following ITIL Change Management processes.

3.C Automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support and identified Commonwealth staff for follow up and corrective action.

The Commonwealth benefits from the Unisys approach to monitoring backup success rates. In most cases simply re-starting a backup results in a successful backup because needed resources are tied up during peak times but become available a short time later. Unisys automates the restart process. If the restarted backup fails then incident tickets are created to alert the Backup support team. Thus critical issues get right to Level 2 and Level 3 support personnel without

even involving Level 1 support staff.

This automation of incident ticketing provides the Commonwealth with another advantage. During service delivery reviews the Commonwealth can review response times to failures that might put critical applications at greater risk. Through the incident severity rating processes Unisys has the ability to adjust severity levels so that incidents that are closer to critical applications can receive prioritized support responses.

The Commonwealth can also designate application owners who require read access to the backup management console so that these individuals have ready access to monitor both the success and failure rates for backups as well as the backup content. As often happens some applications require specific bundles of directory backups and this access provides application owners a means of validating that any customized backups have been implemented properly and are running correctly.

The Unisys Level 1 DBA team also reviews the post script logs to determine the success or failure of the backup. In case of failures, the report is reviewed with a Level 2/3 DBA for an immediate resolution. A tracker report displaying a series of backups for a period identified are shared with the Commonwealth staff, if needed

A full explanation of our innovative backup service to meet the Commonwealth's data protection needs is provided in our response to the 3.2.4.2 Storage Management table.

3.D Offeror must describe its approach to perform an initial review and audit of the backup and recovery policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives.

As part the Transition data gathering activities, the Unisys Team will meet with the Commonwealth to review and audit backup policies, procedures and reports. The activities to perform this review are described in F.3.2.4.2, Requirement 4.

3.E Offeror must describe its approach to identifying gaps and potential risks, and how those gaps and risks will be resolved.

During transition and transformation, the Unisys solution includes an extended onsite presence of a CommVault technical manager who aids the Unisys Team in the search for existing gaps and risks, along with potential improvements to the backup systems during the transition phase of the solution. This technical expert has extensive experience in implementations and in identifying value-add opportunities. The skills of this technical expert are combined with the Unisys Team's extensive expertise around current backup operations. Jointly they lead the transition to the more cost effective CommVault backup infrastructure. The Unisys Team, also working with the CommVault technical manager, manages the review and audit of backup clients that move from the legacy system into the CommVault system. During transition a like-to-like set of backup policies, procedures, reports, schedules, retention periods, target directories, and recovery point objectives are built out. The Unisys Team can then present the Commonwealth for opportunities to further optimize the infrastructure to improve the quality of services or provide better cost efficiencies for the same services.

The activities to perform the gap analysis are described in F.3.2.4.2, Requirement 4.

4 Service Desk, Tiered Support, Multi-Tiered Approach

4.A Provide a multi-tiered level of service (e.g. Platinum, Gold, Silver, Bronze, and Basic) for Oracle, Sybase, Microsoft SQL, IMS or DB2 database platforms.

Offeror must describe its approach to providing multi-tiered Services level.

In order to provide customization and flexibility to Commonwealth agencies, the Unisys Team offers tiered levels of Database Management Services for Oracle, Sybase, Microsoft SQL, IMS and DB2. These tiers offer various levels of administrator experience, on-site coverage and responsiveness SLA's. The tiers are designed to allow for flexibility to manage mission critical as well as development or demonstration environments.

The table above in Requirement 2.A highlights the available tiers and associated capabilities.

4.B Provide Level 2 and Level 3 Support to the Service Desk and/or Commonwealth Users.

The support team providing the database management service will be accessible to the Service Desk and authorized Commonwealth Users through incident tickets assigned to the team. The activities and interactions between the Service Desk and Level 2 and 3 support are described in Schedule F, Section 3.2.3.2.

5 Multi Agency Database Management Services

5.A Utilize the proposed service management Services (e.g. Incident, Service Request, Change, Configuration) to manage database management Services with multiple agency customers.

Offeror must describe how its proposed database management Services will support multiple agency service requests.

The database management services provided by the Unisys Team are customized to the needs of the individual Commonwealth agency via a ITIL centric services catalog. This catalog provides various functional database management support services offered through flexible tiered levels of support based on agency requirements. For example, with the flexible services catalog, the Commonwealth can decide to opt for a Premium Tier support for a critical application for an agency, and decide to choose a Silver Tier support for a less critical application, and another Basic Tier support for non-critical 8AM-5PM application support. This flexibility allows for Commonwealth to serve different agencies and programs in a customized way allowing for the right level of responsiveness and cost.

Our team will leverage ITIL compliant processes to manage Incident, Service Requests, Change and Configuration Modification requests within a multiple agency topology. Our team will leverage enterprise class tools to track the submission, status and disposition of requests with tools such as Remedy, etc. Service request management procedures will be documented to support rapid staff integration, consistent execution and delivery as well as efficient and timely resolution and communication with the requestor.

Our team will work closely with Agency stakeholders to help plan, prioritize and then implement service requests. Requested changes that result in changes to the overall database

configuration are integrated into the Configuration Management Database (CMDB) for architectural documentation, automated monitoring and impact assessment support. Incidents will also be reported, tracked, managed and disposed through our integrated toolset. The toolset will serve as a knowledge repository to help mitigate and avoid reoccurrence of similar issues in the future.

Our integrated team and toolsets will allow us to leverage process best practices, lessons learned and consistent reusable solutions across multiple agencies. This will provide for improved service delivery, more responsive incident management and resolution as well as strategic vision, insight and recommendations to support Agency growth. Lastly, as Commonwealth agencies are working more closely together than ever before, our team will be best positioned to provide efficient, integrated services to support joint, multi-agency initiatives.

The Unisys Team has the technical depth and ITIL based methodology expertise to deliver seasoned level database management support services that will support the continued growth of Commonwealth Agencies. Our team has expertise across a variety of Enterprise class database platforms to support future business growth as well as the integration of new technology across the full spectrum of Commonwealth Agencies. Our efficient, ITIL based Incident, Service Request, Change and Configuration Management processes will provide for efficient and accurate service delivery with effective and timely communication.

6 System Performance Review and Audit

6.A Provide a review and analysis of system performance/capacity to determine if current performance/capacities are sufficient to support the needs of the stakeholders.

Offeror must perform an initial review and audit of the current usage, procedures and reports and provide an analysis of the current usage, processes and reports currently being supported.

Offeror must document its review and audit findings and recommendations.

As the backbone of mission critical applications, database performance, scalability and availability are paramount in delivering strategic business solutions. The Unisys Team has vast experience proactively planning and managing the capacity, configuration and system topology needed to support business processes. Our team will work closely with agency stakeholders to understand the business cycles and translate that into system capacity needs.

Review and analysis of system performance and capacity

Initially, our team will work closely with Commonwealth agencies to perform an analysis of system performance capacity to help verify agencies are positioned to have access to the capacity they need to manage business operations.

The analysis of system performance will cover a wide array of database solutions, including:

- Online Transactional System – A review of business process cycles, batch processing that access transactional repositories, transactional reporting processes and requirements and associated information lifecycle management practices.
- Data Warehouse – A review of the extract, transformation and load (ETL) processes, business analytics processes, cubes and reports that are generated and associated information lifecycle management practices.

- Operational Data Store – Review of ODS ETL processes, reporting and associated information lifecycle management practices.
- Unstructured Data Repositories – Review of any unstructured data (correspondence, images, etc.) solutions and associated capacity needs moving forward.
- Data Recovery – Review of existing data recovery solutions and how that may impact capacity planning.

Verify Current capacity is sufficient

As part of the capacity analysis, the Unisys Team will review the current baseline capacity plan with the Commonwealth to help assess the sufficiency of existing hardware and software resources. As the Commonwealth learns about the application growth from their clients, the Unisys Team develops an average and peak levels of load for estimation against the baseline. This analysis forms the basis for the expected capacity need/growth. Both the expected application usage and the data storage requirements will be used as input to the sizing effort. For the hardware components, this information includes considerations for memory, CPU, network, I/O and disk space. This data will be used to calculate the number of required servers and associated configuration, storage solutions, network accessing solutions and data protection strategies (firewalls, encryption, etc.).

Perform Initial Review and Audit

Current Usage, Procedures and Reports

In addition to the capacity analysis described above, the team will also perform a review of the usage, procedures and reports leveraged against the database. Usage, as discussed, includes the business cycles, ad-hoc reporting, operational reporting, batch processes and other business activities that exercise the database.

Our procedural review will focus on the processes around how the database is governed, including how individual credentials and authorities, service accounts, and data alterations are managed. The analysis will also review the current backup and retention policy and any other Information Lifecycle Management (Purge, Archive) solutions that are in place. Lastly, the review will include a high level review of the procedures around data at rest/in motion encryption and protection.

A high level analysis of reporting processes will be included that focuses on both business reporting as well as database health reports. These reports include generated statistics from the database and the output to identify tuning opportunities, performance anomalies and usage patterns.

Findings will be documented, shared and reviewed with individual agencies to define and verify the 'database lifecycle' baseline. This document will be used moving forward to help govern change validity and impact assessment to the database.

Document Review and Findings

The Unisys Team will prepare, submit and review the findings with the individual agency. The findings will include recommendations to better improve overall operations, decrease costs or increase the maintainability over the current database configuration.

7 System Backup Processing Review and Audit

7.A Monitor system backup processing on a daily basis.

During Steady State operations for Fully Managed servers, the CommVault backup system processing is monitored automatically through the integration of Nagios collectors which generate incident tickets and automated run book procedures upon backup abnormalities that would threaten data protection. This provides reliability in the daily backup processes by addressing run-time issues.

7.B Review daily backup log for successful completion.

Note failures, and correct the problem.

Create problem record for any abnormal condition and any repairs that have been made.

The Unisys Team's backup solution automates the monitoring of system backup logs. Appropriate support personnel are notified to address failures through the ITSM system. Successful backups are reported daily.

Unisys support staff is trained to identify patterns of failure that result in incidents and, following ITIL processes, escalate these to the status of a problem with applicable workarounds and final resolutions. Repairs are carried out as part of Incident ticket resolution and are logged following ITIL Change Management processes.

7.C An automated software process will be utilized to report the completion status of backup processing, with electronic notification of failures sent to Offeror technical support, and identified Commonwealth staff for follow up and corrective action.

The Commonwealth benefits from the new Unisys approach to monitoring backup success rates. In most cases simply re-starting a backup results in a successful backup because needed resources are tied up during peak times but become available a short time later. Unisys automates the restart process automatically. If the restarted backup fails then incident tickets are created to alert the Backup support team. Thus critical issues get right to Level 2 and Level 3 support personnel without even involving Level 1 support staff.

This automation of incident ticketing provides the Commonwealth with another advantage. During service delivery reviews the Commonwealth can review response times to failures that might put critical applications at greater risk. Through the incident severity rating processes Unisys has the ability to adjust severity levels so that incidents that are closer to critical applications can receive prioritized support responses.

The full details for the innovative backup service provided to meet the Commonwealth's data protection needs are included in the F.3.2.4.2 Storage Management.

7.D Offeror must describe it approach to performing an initial review and audit of the backup policies, procedures and reports, to ensure the accuracy of the backup schedules, retention periods, target directories, and recovery point objectives.

Offeror must describe its approach to identifying gaps and potential risks, and how those gaps and risks will be resolved.

The Unisys Team maintains a common set of processes for review, audit and gap analysis for system and database backups. The approach for system backup review, audit, and gap analysis is described in Schedule F, Section 3.2.4.2, Requirement 4.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

6. Reduce service risk,
7. Improve service quality,
8. Improve client satisfaction,
9. Provide service transparency, and
10. Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

8. Service Excellence Office,
9. Quality Plans: transition and steady state service delivery
10. Industry standard frameworks and methodologies: ITIL, ISO, SSL
11. Industry accepted measurement tools
12. Continuous Service Improvement & Innovation Processes (CSIIP)
13. Risk management, audits and business continuity management
14. Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

8 CI Service Risk

8.A Reduce service risks.

Offeror must provide methods to eliminate or mitigate service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

9 CI Service Quality

9.A Improve service quality.

On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

10 CI Client Satisfaction

10.A Improve client satisfaction.

Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

11 CI Service Transparency

11.A Ensure service transparency.

Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

12 CI Improve or Reduce Cost

12.A Improve/reduce cost of service.

Offeror must provide examples of Database Management Support initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

We believe the industrialized manner in which the Unisys Team provides services to the Commonwealth results in efficient, timely and high quality delivery of database services. The efficient, disciplined and repeatable manner by which services are delivered result in reduced cost when compared to less industrialized process management. Additionally, the depth of skill and experience brought forth by our team helps in the prevention of issues, delays or decreased customer satisfaction. Our team is tasked to keep up with database technology changes outside of the standard work day to better understand and prepare for upgrades, new technology integration, and issue management. In addition to their vast, personal experience, our team has access to other practitioners of our global firm to help keep abreast of the latest developments and experiences outside the Commonwealth. Our team has experience with public sector clients at both the local and Federal level as well as all 50 states.

The flexible, Enterprise Services Catalog based, procurement option provided by the Unisys Team also provides for decreased service delivery costs. Our model allows an agency to procure the level of service that is needed to support the business as opposed to the fixed nature of full time employee management. As an example, our 'Basic' tier of service provides for roughly 80 hours of support per month. An agency not using our model would be forced to hire a full time employee to provide this service at roughly 160 hours per month. Our experience has shown that, in this case, the DBA is then given other, non-database responsibilities that dilutes his/her ability to become an expert at database administration – you're left with a resource who is average at two things instead of an expert at one. Our solution provides you access to the equivalent of a fractional resource who is deeply specialized in database technologies that can provide high levels of support at a fraction of the cost.

Unisys Team Experience

The Commonwealth of Pennsylvania leverages many Enterprise class databases to manage the delivery of services to citizens, providers and other stakeholders. Petabytes of data are processed in a variety of database technologies including Oracle, Microsoft SQL, IMS, Sybase and DB2. Our team has provided database management services to the Commonwealth across a variety of these platforms across the Commonwealth including the Departments of Public Welfare, Transportation, Insurance, and Labor and Industry for over 10 years.

In addition, our team has experience in many Federal, State and Local agencies supporting a variety of large scale, public sector lines of business (including almost half of the Affordable Care Act installations throughout the country). This support includes database installation, configuration and tuning services that align with the capacity objectives. Additionally, our team has the technical depth to configure solutions that enhance availability, performance and recoverability in the event of a disaster. Our deep history and familiarity with the database topologies as well as the business processes of these Departments uniquely position us to provide services that will maintain and support growth for years to come.

Benefits to the Commonwealth

The experience described above is also valuable in the introduction of new technologies, processes and solutions. Our team will work closely with you to understand your strategic direction and vision to make appropriate recommendations to further your business goals. One example currently progressing at a Commonwealth agency is the use of database analytics tools and 'Big Data'. The solutions allow for the integration of internal data (databases, correspondence, etc.) and external data (Federal agencies, social media, etc.) to aid in the discovery of trends, facts and opportunities to help a business entity target action to maximize results. Solutions such as these can have a tremendous business benefit with a substantial ROI by leveraging, if progressed by the Commonwealth, Enterprise sharing, licenses and solutions all managed and integrated by the Unisys Team.

3.2.4.8 Limited-Use Colocation Services

While the Commonwealth's goal is to move to a fully managed infrastructure Services model, it is anticipated that there will be a need for the Offeror to provide some limited co-location Services within its proposed data center Services solution. Some examples of where colocation Services may be required are:

- Support for existing systems in the [redacted] prior to transformation to a fully managed service.
- 3rd Party Vendor Equipment that requires co-location with the primary systems for performance and/or security reasons.

The Offeror must provide data center co-location Services with the following options:

- Co-location Service Option 1: Data center Only (Rackspace, power, network connectivity, basic infrastructure Services)
- Co-location Service Option 2: Data center with Managed Services Option (Bronze, Silver, Gold Tiers) – Technology owned maintained by 3rd Party or Commonwealth
- Co-location Service Option 3: Remote Hands Support

Currently there are 3 areas within the Commonwealth [redacted] that are supporting co-location Services. [redacted] facility summary is provided as **Exhibit D.7**. While many of these systems will be migrated to a fully managed service over time, the Offeror shall plan for co-location space in its Data center Architecture.

Reference Documentation

Exhibit D.1 through D.15 Series - Enterprise Datacenter ([redacted] Exhibits

	Requirements	Describe Compliance
1.	Provide colocation Services within each of the datacenters. One of those centers will be the Commonwealth [redacted]	Offeror must describe how each of the datacenters will support its co-location offering within its proposed datacenter architecture.
2.	Provide Colocation Service Option 1: Datacenter Only (Rackspace, power, network connectivity, basic infrastructure Services)	Offeror must describe how it will support this colocation service option.

3.□	Provide Co-location Service Option 2: Datacenter with Managed Services Option (Bronze, Silver, Gold Tiers) – Technology owned maintained by 3rd Party or Commonwealth	Offeror must describe how it will support this co-location service option.
4.□	Provide Co-location Service Option 3: Remote Hands Support	Offeror must describe how it will support this co-location service option.
Continual Process Improvement		
5.□	Reduce service risks.	Offeror must provide methods to eliminate or mitigate service risks.
6.□	Improve service quality.	On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.
7.□	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
8.□	Ensure service transparency.	Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.
Deliverables		
Deliverables are defined in **Schedule K – Key Program Deliverables**		
Offeror Response		

Introduction

Unisys colocation services provide for the Commonwealth's need to maintain its own equipment within the data centers when the selection from the Unisys Enterprise Services Catalog is not practical. This colocation service provide space, power, network and cabinetry on the data center floor.

The colocation service is designed to support rack-mounted equipment within secure colocation cabinets ranging from ¼ cabinet to ½ cabinet and to a full cabinet (reference Schedule C, part numbers "CCSU13330008-A", "CCSU13330009-A", and "CCSU13330010-A" for the colocation configurations) as show in **Figure 3.2.4.8-1**. Optional Enterprise Services Catalog items may combine to meet the unique needs of some agencies including security cages and secure network conduits (see Schedule C, part numbers "CCSU13370501-A" through

"CCSU13370326-A" for secure cages, conduits and other security options).

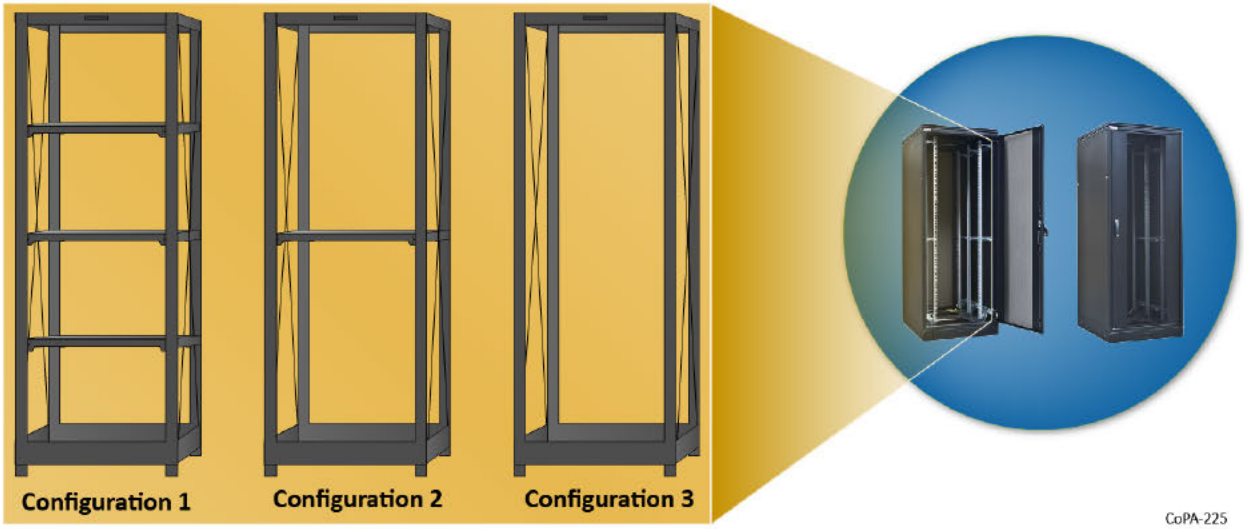

Figure 3.2.4.8-1 – Colocation Configurations

1 CoLocated Services Approach

1.A Provide colocation Services within each of the datacenters. One of those centers will be the Commonwealth [redacted]

Offeror must describe how each of the datacenters will support its co-location offering within its proposed datacenter architecture.

Unisys colocation services are available at [redacted] and the [redacted] The selection of colocation services from the Enterprise Services Catalog triggers a prompt for the choice of a preferred data center and then solicits comments from the requestor where any specifics such as location within the facilities including adjacency to other systems may be provided

The selection of the colocation service initiates the change management process with participation from the Unisys Facilities' Space Management team. This Commonwealth dedicated team advises the Commonwealth and Unisys service management on the best placement of the requested service in the facility as part of the change approval review process.

This placement may be in an area dedicated to colocation service, but specific requirements of the requestor are of key influence in the placement decision, especially related requests such as inclusion in a new or existing security cage.

2 CoLocated Services Option 1 Approach

2.A Provide Colocation Service Option 1: Datacenter Only (Rackspace, power, network connectivity, basic infrastructure Services)

Offeror must describe how it will support this colocation service option.

Colocation Option 1 includes rack space, dual power connection and network termination for a

rack or portion (¼ or ½) of a rack within a Unisys facility or the [redacted] Optionally, the Commonwealth may add a request for physical or logical segregation via caging, security treatments and secure network paths within the designated facilities.

This type of service does not include the addition of monitoring or management automation tools typical to the Fully Managed or Managed Only services. However, this service does benefit from the facilities' infrastructure and its support of the most basic reliability and availability architectures inherent in the Unisys facility and network designs.

This service does not include the services of system administrators or remote touch or other systems such as firewalls or load-balancers; each may be requested separately from the Enterprise Services Catalog. In addition, this colocation option does not include support from the backup and recovery infrastructure in the environment. Pricing for this service is provided in Schedule I's "Catalog of Services"; additional information is also provided in Schedule C. "Services Catalog".

3 CoLocated Services Option 2 Approach

3.A Provide Co-location Service Option 2: Datacenter with Managed Services Option (Bronze, Silver, Gold Tiers) – Technology owned maintained by 3rd Party or Commonwealth

Offeror must describe how it will support this co-location service option.

Colocation Service Option 2 gains many of the service characteristics of the Managed Only service offering with the exception of the standardization inherent in the highly prescriptive configuration of the Managed Only resource units.

This service builds upon Colocation Service Option 1 with the addition of the Unisys monitoring and service management tools. SLA support is provided once the proposed configuration passes SLA testing and when support for the requested SLA tier is demonstrated. In addition, complete application architectural definitions are required for the service level tools to be able to provide SLA monitoring and reporting of an application's infrastructure. Unisys additional Technical Services can be requested to assist in the process of application architecture definition if needed to support the application of SLAs to the requested equipment.

This service includes the support of monitoring and systems administration via the association of a Managed Services resource tier such as bronze, silver or gold during the selection of this service from the Enterprise Services Catalog. Backup and recovery becomes available via a related request of storage services from the Enterprise Services Catalog.

4 CoLocated Services Option 3 Approach

4.A Provide Co-location Service Option 3: Remote Hands Support

Offeror must describe how it will support this co-location service option.

Unisys offers remote hands support for any colocation configuration. This option is selected by combining Technical Services with one of the 3 colocation configuration configurations (full, ½ or ¼ rack) from the Enterprise Services Catalog.

Remote Hands Support offers the Commonwealth the option of designating a practical way of gaining continuous support for a co-located system using support hours occurring in the

cadence of care and maintenance for a system.

When this option is selected, the Commonwealth will be prompted to request a number of hours of support per month from the Unisys Team. This number of hours will be pre-allocated to the Commonwealth IT environment and available to staff to support the designated equipment with remote hands support such as media insertion/attachment, local console actions or other actions requiring physical touch. Build and support are limited only to that activity that requires local access.

Remote Hands Support offers the Commonwealth the option of gaining the support of Unisys server installation, administration and local hands support. Such an approach allows the Commonwealth to estimate both the amount of effort needed and a period within which that effort will occur.

Once selected, Unisys provides the needed Remote Hands Support with an eye to the limits established by the Commonwealth. If those limits are approached, Unisys notifies the requestor to confirm they are aware of that the limit is being reached so that the request can be adjusted if desired. This type of request allows for services.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

11. Reduce service risk,
12. Improve service quality,
13. Improve client satisfaction,
14. Provide service transparency, and
15. Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

15. Service Excellence Office,
16. Quality Plans: transition and steady state service delivery
17. Industry standard frameworks and methodologies: ITIL, ISO, SSL
18. Industry accepted measurement tools
19. Continuous Service Improvement & Innovation Processes (CSIIP)
20. Risk management, audits and business continuity management
21. Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

5 CI Service Risk

5.A Reduce service risks.

Offeror must provide methods to eliminate or mitigate service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

6 CI Service Quality

6.A Improve service quality.

On a quarterly basis, Offeror must also recommend to the Commonwealth team any system changes that would be appropriate to maintain or improve SLA commitments.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

7 CI Client Satisfaction

7.A Improve client satisfaction.

Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

8 CI Service Transparency

8.A Ensure service transparency.

Offeror must provide methods and practices to ensure service transparency, providing visibility into service execution.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

Unisys Team Experience

The Unisys Team has supported each of these 3 options of colocation within the [redacted] for several years in a time and materials capacity.

In addition, Unisys currently offers colocation services from many of its other sites. In Latin America Unisys provides colocation for CETIP, a financial market company. They are using 161 square feet of dedicated space in our Rio de Janeiro Data Center as their disaster recovery location.

Unisys provides colocation services to a major telecommunications company. Our responsibilities within the space include media management in our secure tape storage facility, and ad-hoc smart hands and feet. Unisys also manages power to the racks, air conditioning and balancing, humidity and temperature control. The service is located in our Tier 3 facility in the UK. This site is configured with N+1UPS, generator, and twin power feeds from separate sources and diverse network provisioning. The client retains one of our 3 computer rooms for their exclusive use, occupying approximately 5,000 square feet.

Benefits to the Commonwealth

The Unisys colocation services provide opportunities for the Commonwealth to place equipment that needs to be placed within one of the data centers but cannot be sourced from Unisys. Equipment that must be provided by vendors with unique capability or in support of projects has a way to be placed in the service environment of professionally managed data centers with the facility's service capabilities and properties.

3.2.5 Capacity on Demand Services

3.2.5.1 Server Capacity on Demand

The Server Capacity On Demand is an Infrastructure as a Service (IaaS) offering that ensures the ready availability of server and mainframe capacity to accommodate cyclical, and seasonal, processing requirements, sudden or unplanned production demands, and short-term application development needs. Server capacity may be physical or virtual as requested by the Commonwealth.

The Server Capacity On Demand would include support for the following system platforms:

- X86
  - Windows
  - Linux
- I Series
  - i5/OS
- P Series
  - Linux
  - AIX
- Mainframe
  - IBM
  - Unisys

Reference Documentation

N/A

	Requirements	Describe Compliance
1.	Provide a provisioning capability to support on-demand requests for server resource capacity. The Commonwealth will require access to additional capacity on demand for the following platforms: X86 • Windows	Offeror must describe its request and provisioning process for each of the anticipated platform systems. Offeror must describe its approach to supporting the needs of the Commonwealth including the following: • Infrastructure/Capacity

	• Linux IBM I Series • i5/OS IBM P Series • Linux • AIX Mainframe • IBM • Unisys	• Tiered Service/Support Levels • Tools / Applications to manage and maintain capacity • End User Reports o Standard o Custom Offeror must describe its experience operating and managing mixed computing environments such as the Commonwealth.
2.	Maintain an adequate inventory of Windows/Linux, mid-range, and Mainframe server capacity that will be sufficient to satisfy forecasted informal, ad hoc, and cyclical Commonwealth requests.	Offeror must describe its approach to supporting the needs of the Commonwealth.
3.	As a function of ongoing account management, meet with the Commonwealth/Agencies to assess future server requirements.	Offeror must describe its approach to supporting the needs of the Commonwealth.
4.	Encourage Commonwealth server conservation via server virtualization when appropriate.	Offeror must describe its approach to supporting the needs of the Commonwealth.
5.	Provide expedited service, when requested, to satisfy urgent requirements.	Offeror must describe its approach to supporting the needs of the Commonwealth.
6.	Provide a self-provisioning tool to be used by the agencies to order and configure servers.	Offeror must describe its approach to supporting the needs of the Commonwealth.
Continual Process Improvement		
7.	Reduce service risks.	Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.

8.	Improve service quality.	Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at improving service quality.
9.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
10.	Provide service transparency.	Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.
11.	Ensure service sustainability.	Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.
12.	Improve/reduce cost of service.	Offeror must provide examples of On-Demand Server initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Commonwealth of Pennsylvania is seeking a comprehensive strategy for dealing with the cyclical demands of capacity by utilizing a strategy of capacity on demand. The value to the Commonwealth in pursuing such a strategy is readily apparent, from both a technical and financial perspective. Financially, a capacity on demand strategy shifts the Commonwealth from a mixture of Capital Expense and Operational Expense, to a more predictable Operational Expense. This type of strategy obviates the need for large capital expenditures for the upgrade

and maintenance of compute power on disparate compute platforms, and smoothes the spikes in compute demand caused by cyclical and unforeseen events.

The Commonwealth has asked for a clear definition of the processes and tools that will be utilized in the capacity on demand environment. Unisys has developed a comprehensive strategy in the design of the Server Capacity on Demand infrastructure, by utilizing best of breed hardware and software components that will deliver to the Commonwealth of Pennsylvania a computing infrastructure that will meet the demands of the current workloads, as well as provide the flexibility to move the Commonwealth into the future of a consumption based compute model.

1 Server On Demand Approach

1.A Offeror must describe its request and provisioning process for each of the anticipated platform systems.

The request and provisioning process for each of the anticipated platforms are as follows:

1. The Commonwealth User (user) will log onto the Service Delivery Portal, and select the Enterprise Services Catalog.
2. The Enterprise Services Catalog tool will authenticate and authorize the user
3. Based on what the user is authorized to do, they will be able to select the following:
    a. Technology Platform:
        i. P Series (AIX/Linux)
        - X86 (Windows/Linux)
        - IBM I Series
        - IBM Mainframe
        - Unisys Mainframe
    b. Server Configuration – CPU, Memory, Disk space, etc.
    c. Service Tier – Platinum, Gold, Silver, Bronze, Basic
4. The Enterprise Services Catalog tool's workflow engine will then handle all authorizations for the provisioning.
5. Once approved, the Enterprise Services Catalog tool will open all change records needed to provision the service request.
6. Once the change record is approved, the Enterprise Services Catalog Tool will run an automated run book for each platform that will provision the service request.
7. Post provisioning, the Enterprise Services Catalog tool will call [redacted] as appropriate to perform system patching, security remediation and server conditioning (initial creation of accounts, permissions, etc.).
8. The Enterprise Services Catalog tool will then register the new service in the following tools:
    a. [redacted]

b. [redacted]

c. [redacted]

9. Once all provisioning tasks have been performed, the Enterprise Services Catalog tool will notify the user that the service request has been provisioned and is ready for use.

Offeror must describe its approach to supporting the needs of the Commonwealth including the following:

Infrastructure/Capacity

Inherent in the design of the infrastructure is the ability to utilize extremely small units of growth in all infrastructure components. By utilizing the [redacted] technology as the platform of choice for x86 and IBM pSeries servers, additional capacity in both network and compute can be ordered and brought online very quickly. All hardware platforms will follow a stringent capacity management and optimization process with well-defined triggers for adding capacity that provide future capacity demands are properly planned for and brought online before needed. This provides the Commonwealth an optimized, flexible and automated infrastructure that will smooth demand spikes and ease the last minute budgetary demands for compute power.

Tiered Service/Support Levels

In order to provide customization and flexibility to Commonwealth agencies, the Unisys Team offers tiered levels of managed services for Capacity on Demand servers. These tiers offer various levels of administrator experience, on-site coverage and responsiveness SLAs. The tiers are designed to allow for flexibility to manage mission critical as well as development or demonstration environments.

The following table highlights the available tiers and associated capabilities.

Tiered Support Level	Description
Platinum	• Provides 99.999% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB • Requires 3 servers load balanced and geographically dispersed
Gold	• Provides 99.99% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB

	• Requires 2 servers load balanced
Silver	• Provides 99.9% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB
Bronze	• Provides 99.4% Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB
Basic	• Provides 98.5 % Application Infrastructure Availability • Server is monitoring via Nagios • Fully Managed Services • Asset Tracked In CMDB
IaaS	• Provides no Application Infrastructure Availability • No Monitoring • No Managed Services • Asset Tracked In CMDB

Tools / Applications to manage and maintain capacity

Utilizing the structure found in the Volumetrics tab of Schedule I, an enterprise services catalog will be developed that will enable the Commonwealth to order compute capacity online. The enterprise services catalog will serve two functions: the first as a central location from which the Commonwealth can order common services from Unisys. The second, more pertinent function is to serve as the central point from which compute capacity can be ordered. Capacity can be both provisioned and de-provisioned from this portion of the Enterprise Services Catalog.

The Enterprise Services Catalog includes the following components:

a. iCollaborate, a web-based front end that functions as the entry point into the Enterprise Services Catalog. iCollaborate performs all authentication, authorization and role adjudication functionality based on integration with the Commonwealths Active Directory service.

b. iRequest, the Enterprise Services Catalog component. For the Commonwealth, the Enterprise Services Catalog will allow the user to specify what type of compute platform is required, what size server or LPAR is needed, and lastly the support tier for the servers being ordered.

c. iDeliver, a complete workflow automation engine. The iDeliver component interfaces via API directly to the [redacted]. The iDeliver component will coordinate all change and request management processes, and where automated server provisioning is support, drive the build of the server environment.

This software suite also includes data for chargeback as well as online reporting for utilization, provisioning and de-provisioning.

The following tables lists the other components of the common IT service delivery platform that will be leveraged to deliver automated provisioning to the Commonwealth.

Tool	Function
[redacted]	• Services Catalog • Workflow automation
[redacted]	• Change Management • Incident Management
[redacted]	• Configuration Management Database
[redacted]	• Atrium Discovery and Dependency Mapping • Update of CMDB
[redacted]	• Enterprise Capacity Management across all servers, network and storage devices • Workload Management and visualization
[redacted]	• Provisioning Engine • Provides post provisioning server conditioning • Patch management and security compliance.
[redacted]	• Monitors Server Operation • Opens automated tickets in Incident management.

End User Reports (Standard and Custom)

Standard Reports are summarized in 3.3.2 Status Reports.

Custom Reports are offered by the Unisys Team as a Catalog Service.

Provide a provisioning capability to support on-demand requests for server resource capacity.

Please see the answer to 1.A above for the process that supports the capability of

Commonwealth users to provision server resource capacity. This process is delivered via the Enterprise Services Catalog tool detailed above in this section.

1.B The Commonwealth will require access to additional capacity on demand for the following platforms:

In addition to platform specific tools, [redacted], combined with the capacity management process, enables the Unisys Team to predict future capacity needs, as well quickly identify virtualization and consolidation opportunities across all platforms.

X86 (Windows, Linux)

Server capacity and on-demand environment requires a very vigorous capacity management regimen that must include future encyclical capacity needs calculations factors such as historical utilization, future growth plans as they are developed, as well as the velocity of changes to the environment. With these factors in mind, the environment was designed to be extremely flexible, allowing additional compute capacity that can be added by needed. By utilizing a common compute platform for Windows and Linux physical and virtual servers, decommissioned physical servers can be rapidly redeployed as needed to smooth unexpected surges in capacity. Additionally [redacted] and DRS can distribute and optimize loads to help smooth shorter term spikes.

IBM I Series, i5/OS

IBM System iSeries has double the utilized processing capacity (cores – CPW) available but held in reserve on the refreshed environment to be able to expand during spike periods. Additional costs will not be incurred unless these cores are activated and it won't require a new server to be procured and deployed in order to access that additional processing power.

The IBM System iSeries refreshed environment will have additional cores available for temporary spikes in utilization.

IBM pSeries (Linux, AIX)

For AIX Capacity on Demand, the Unisys Team will use the IBM Flex System hardware platform. With Flex System, capability is also added to share, or over commit, resources on a sliding basis if spikes are experienced by dynamic utilization of resources assigned to other processes, if available for use on a temporary basis. All such 'assignments' will need to be reviewed, confirmed, and approved prior to configuration. IBM System pSeries have additional capacity, cores and memory to meet short term requirements. Infrastructure has been provided, if required, to add more resource for longer term without major changes required. If longer term resources are required, additional costs will apply with requests being submitted via the Enterprise Services Catalog or Change Order.

Mainframe (IBM, Unisys)

Mainframe capacity for the Commonwealth has been highly measured and planned over the

lifecycle of the current contract. The Unisys Team has designed an architecture to support the application requirements with past capacity and processing environment knowledge which are different for agencies which utilize Mainframe MIPS. The Unisys Team will offer Mainframe MIPS capacity via the Enterprise Services Catalog that recognizes the unique processing requirements of the Commonwealth agencies. These include the ability to migrate production and development MIPS from one partition to the other based on current demand.

The Mainframe platforms will provide adequate capacity within the various environments to allow growth should demand require. Increases beyond the initial procured MIPS capacity will be reviewed during Change Management and capacity review meetings and appropriate changes to the environment will be recommended to the Commonwealth for their approval. As part of the service, the Unisys Team provides monthly performance reports and annual capacity planning reports to the Commonwealth which will be utilized to plan for adequate availability of Mainframe MIPS.

IBM Enterprise System zSeries (Mainframe) has 10 times the utilized processing capacity (engines - MIPS) available but held on the refreshed environment to be able to expand during spike periods. Additional costs will not be incurred unless these cores are activated and it won't require a new server to be procured and deployed in order to access that additional processing power.

1.C Offeror must describe its experience operating and managing mixed computing environments such as the Commonwealth.

The Unisys Team manages the infrastructure for several of the agencies in the Commonwealth today, providing mainframe, System I, Windows, Unix, Linux and storage capacity demands. Additionally, the Unisys Team has extensive experience operating and managing complex, mixed computing environments globally. This experience, combined with a common IT Service Management Platform and ITIL V3 aligned processes designed to maximize the capabilities of that platform, allow the Unisys Team to manage a complex environment such as the Commonwealths, while increasing efficiency and bring savings year over year to the Commonwealth.

2 Infrastructure Inventory Approach

2.A Maintain an adequate inventory of Windows/Linux, mid-range, and Mainframe server capacity that will be sufficient to satisfy forecasted informal, ad hoc, and cyclical Commonwealth requests.

Offeror must describe its approach to supporting the needs of the Commonwealth.

Please see the response above to requirement 1 for the Unisys Team's approach to supporting the needs of the Commonwealth.

3 Server Account Management

3.A As a function of ongoing account management, meet with the Commonwealth/Agencies to assess future server requirements.

Offeror must describe its approach to supporting the needs of the Commonwealth.

Unisys Agency Account Managers, Senior Enterprise Infrastructure Architect, and Agency

Infrastructure Architects will meet with the Commonwealth Agencies on a regular basis to understand ongoing business activities and requirements. As part of the quarterly Capacity Review activity, Unisys will use the information from these regular discussions and the Capacity and Performance reports to identify continued growth needs and future server requirements. As additional capacity or server deployments are identified, a service request will be submitted to support the solution development activity and the fulfillment of server deployments to support the Commonwealth's business activities.

For further information on account management and architectural governance, please refer to Schedule F, Section.3.2.1.1.2 and 3.2.1.6.

4 Server Conservation

4.A Encourage Commonwealth server conservation via server virtualization when appropriate. Offeror must describe its approach to supporting the needs of the Commonwealth.

The requirements of this RFP show that the Commonwealth of Pennsylvania is intent upon aggressively moving towards a virtual server landscape. Besides the obvious cost benefit in moving to a virtual environment, there are other tangential benefits for the Commonwealth. Shorter procurement and deployment cycles are such benefits. Another is the creation of an extremely flexible and agile infrastructure, which in itself creates new opportunities for cost reductions beyond what is in the scope of this RFP. However, the realization of these benefits depends on virtualization being adopted as the first choice in server procurement.

The Unisys Team will assist the Commonwealth with server conservation in 3 crucial ways:

1. Server virtualization recommendations
2. Server consolidation recommendations
3. Utilizing Capacity on demand as a tool to assist in capacity optimization

First, the Unisys Team will use the capacity management tools, such as [redacted], to make recommendations to the Commonwealth. As part of the quarterly capacity management reports, Unisys will make recommendations on servers that can quickly be virtualized.

As more servers become virtualized, the Commonwealth runs the risk of virtual server sprawl. To prevent this, the Unisys Team will also make recommendations, based on application information found in the CMDB, to contain the growth of the virtual infrastructure through server and application consolidation. Again, these recommendations will be a part of the quarterly capacity management report.

Last, the Unisys Team will work with the Commonwealth to better utilize Capacity on Demand as a way to conserve servers. The capacity on demand environment utilizes the same hardware platforms as other environments. Because of this, capacity on demand can be utilized as reserve capacity, allowing new applications to be sized to normal operations, and not sized to expected peaks. This same principal applies to unexpected compute demands from legislative mandate. Instead of purchasing new servers that may have a limited life, capacity on demand can be utilized to bring new capacity to applications during cyclical or unexpected peaks.

5 Server Support, expedited

5.A Provide expedited service, when requested, to satisfy urgent requirements.

Offeror must describe its approach to supporting the needs of the Commonwealth.

As stated in the answer above, the capacity on demand environment can be leveraged to bring compute capacity online very rapidly. By choosing specific support tiers when provisioning new compute capacity, the Commonwealth will also, in effect, be provisioning server support capacity on demand. By leveraging the capacity on demand environment as a strategic tool, the Commonwealth can ensure that cyclical or unexpected peaks in compute demand are no longer disruptive events.

6 Server Self Provisioning Tool

6.A Provide a self-provisioning tool to be used by the agencies to order and configure servers.

Offeror must describe its approach to supporting the needs of the Commonwealth.

As part of the solution that Unisys is proposing to the Commonwealth, the application suite mentioned in the answer to requirement 1 above will be made available to the Commonwealth. All server configurations and hardware platforms within schedule I will be available through the Enterprise Services Catalog for self-provisioning. Please refer to requirement 1 above for more details about the Enterprise Services Catalog tools, and the process used to provision compute capacity.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

16. Reduce service risk,
17. Improve service quality,
18. Improve client satisfaction,
19. Provide service transparency, and
20. Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

22. Service Excellence Office,
23. Quality Plans: transition and steady state service delivery
24. Industry standard frameworks and methodologies: ITIL, ISO, SSL

25. Industry accepted measurement tools
26. Continuous Service Improvement & Innovation Processes (CSIIP)
27. Risk management, audits and business continuity management
28. Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

7 CI Service Risk

7.A Reduce service risks.

Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

8 CI Service Quality

8.A Improve service quality.

Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at improving service quality.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

9 CI Client Satisfaction

9.A Improve client satisfaction.

Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

10 CI Service Transparency

10.A Provide service transparency.

Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

11 CI Service Sustainability

11.A Ensure service sustainability.

Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.

Service will be sustained by integrating any new agencies, customers, or services into our standard operational and quality processes and methodologies. We leverage ITIL processes, create quality project plans, utilize industry accepted measurement and monitoring tools, analyze trending reports and provide proactive continuous service improvement throughout the IT lifecycle. This enables new Commonwealth services to experience and sustain IT services and client satisfaction.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

12 CI Improve or Reduce Cost

12.A Improve/reduce cost of service.

Offeror must provide examples of On-Demand Server initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

Unisys Team experience paragraph below details the example of On-Demand Server initiatives.

Unisys Team Experience

California State University was faced with the impact of the California Budget Crisis resulting in the need to reduce IT spend and yet, demonstrate continuous improvement in service delivery. This included reassessing IT support to use emerging technologies and ensuring their IT Infrastructure would support their aggressive software roadmap. The Unisys Team provided Cloud services (server/storage) across hardware platforms with flexibility to scale up/down to handle campus registration peaks, year –end processing cycles and Disaster Recovery. The result gave the California State University system the ability to handle the demand of academic semester/quarterly course scheduling peaks throughout the year with a flexible cost model. It also enabled improvement in Disaster Recovery through building images vs. servers, thus reducing RPO and RTO objectives.

The Unisys Team assigned to the Commonwealth account has also previously demonstrated its ability to deliver a capacity on demand infrastructure, including self-provisioning, to the Commonwealth. Post contract signing, the team that performed the previous work will be assigned to assist in the development and deployment of the new infrastructure on demand environment, to confirm that all lessons learned will be carried forward. This team is intimately familiar with the needs of the Commonwealth, and how to design and run a capacity on demand system in a multi-tenant, highly regulated governmental atmosphere. This represents a significant reduction of risk to the Commonwealth, both technically in design and speed to deployment, and from a regulatory perspective.

Benefits to the Commonwealth

The Unisys Team's capacity on demand solution delivers to the Commonwealth a powerful, agile and responsive tool that can be leveraged to address unexpected needs for compute resources due to unexpected or cyclical peaks in compute resource demand. It will allow the Commonwealth to right size compute resources for their application, provision for average load (not peak loads) and rely on capacity on demand to fill in the gap. In a disaster it's a tool that

can used to quickly spin up excess capacity and bring applications back online quickly.

3.2.5.2 Storage Capacity on Demand

The Storage Capacity On Demand service is an Infrastructure as a Service (IaaS) offering that ensures the ready availability of storage capacity to accommodate cyclical, or seasonal, storage requirements, sudden or unplanned production demands, short-term application development needs, and storage access for web enabled devices.

Reference Documentation

N/A

Requirements		Describe Compliance
1.	Maintain an adequate access to, or supply of storage area equipment, to satisfy forecasted informal, ad hoc, and cyclical Commonwealth requests.	Offeror must describe its approach to supporting the needs of the Commonwealth including the following: • Infrastructure/Capacity • Tiered Service/Support Levels • Tools / Applications to manage and maintain capacity • End User Reports o Standard o Custom
2.	Meet with the Commonwealth on an annual basis, or as requested, to assess future storage requirements.	Offeror must describe its approach to supporting the needs of the Commonwealth.
3.	Encourage data storage conservation via data de-duplication, compression, and other industry techniques.	Offeror must describe its approach to supporting the needs of the Commonwealth.
4.	Provide expedited data storage service to satisfy urgent requirements, as requested.	Offeror must describe its approach to supporting the needs of the Commonwealth.
5.	Provide online storage capabilities (Centralized Private Cloud Storage), which includes web service, browser, and mobile device accessibility, that	Offeror must describe its approach to supporting the needs of the Commonwealth.

	are fully secure, (compliant with ISO 27000, NIST 800-53, and Secure SDLC). This service must provide file-level encryption, multiple hierarchical permission levels, account level dynamic storage-sizing, and anti-virus capability.	
6.	Storage solution must include the capability to make quick copies of databases (SNAPS, Flash copies). Storage backup proposals must include disk-2-disk solutions.	Offeror must describe its approach to supporting the needs of the Commonwealth.
Continual Service Improvement		
7.	Reduce service risks.	Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.
8.	Improve service quality.	Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at improving service quality.
9.	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
10.	Provide service transparency.	Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.
11.	Ensure service sustainability.	Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.

12.	Improve/reduce cost of service.	Offeror must provide examples of On-Demand Storage initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Commonwealth seeks a comprehensive strategy for dealing with the cyclical demands of capacity by utilizing a strategy of capacity on demand. The value to the Commonwealth in pursuing such a strategy is readily apparent, from both a technical and financial perspective. Financially, a capacity on demand strategy shifts the Commonwealth from a mixture of Capital Expense\Operational Expense, to a more predictable Operational Expense. This type of strategy obviates the need for large capital expenditures for the upgrade and maintenance of compute power on disparate compute platforms, and smoothes the spikes in compute demand caused by cyclical and unforeseen events.

The Commonwealth has asked for a clear definition of how the processes and tools will be utilized in the capacity on demand environment. Unisys has developed a comprehensive strategy in the design of the Storage Capacity on Demand infrastructure, by utilizing best of breed hardware and software components that will deliver to the Commonwealth a storage infrastructure that will meet the demands of the current workloads, as well as provide the flexibility to move the Commonwealth into the future.

1 Data Storage Capacity Approach

1.A Maintain an adequate access to, or supply of storage area equipment, to satisfy forecasted informal, ad hoc, and cyclical Commonwealth requests.

The Unisys Team's strategy of providing Config1, Config2, and Config3 storage tiers within the same frame makes it easier to maintain an adequate supply of equipment to meet informal forecasts, ad hoc, and cyclical capacity needs.

The request and provisioning process for each of the anticipated platforms are as follows:

1. The Commonwealth User (user) will log onto the Service Delivery Portal, and select the Enterprise Services Catalog.
2. The Enterprise Services Catalog tool will authenticate and authorize the user
3. Based on what the user is authorized to do, they will be able to select the appropriate

Storage Tier from the following:

a. Technology Platform:

i. P Series (AIX/Linux)

- X86 (Windows/Linux)
- IBM I Series
- IBM Mainframe
- Unisys Mainframe

b. Server Configuration – CPU, Memory, Disk space, etc.

c. Service Tier – Platinum, Gold, Silver, Bronze, Basic

d. Storage Tier – Config1,Config2, and Config3

4. The Enterprise Services Catalog tool's workflow engine will then handle all authorizations for the provisioning.
5. Once approved, the Enterprise Services Catalog tool will open all change records needed to provision the requested storage.
6. Once the change record is approved, the Enterprise Services Catalog Tool will run an automated run book for each platform that will provision the storage.
7. Post provisioning, the Enterprise Services Catalog tool will call [redacted] to perform system patching, security remediation and server conditioning (initial creation of accounts, permissions, etc.)
8. The Enterprise Services Catalog tool will then register the new service in the following tools:
   a. [redacted]
   b. [redacted]
   c. [redacted]
9. Once all provisioning tasks have been performed, the Enterprise Services Catalog tool will notify the user that it's service request has been provisioned and is ready for use.

1.B Offeror must describe its approach to supporting the needs of the Commonwealth including the following:

Infrastructure/Capacity

Tiered Service/Support Levels

Tools / Applications to manage and maintain capacity

End User Reports (Standard and Custom)

Infrastructure/Capacity

Inherent in the design of the infrastructure is the ability to utilize extremely small units of growth in all infrastructure components. By utilizing the IBM and EMC storage products as the platforms of choice for storage, additional capacity in both network and compute can be ordered and brought online very quickly. All hardware platforms will follow a stringent

capacity management and optimization process with well-defined triggers for adding capacity to provide future capacity demands are properly planned for and brought online before needed. This provides the Commonwealth a highly optimized, flexible and highly automated infrastructure that will smooth demand spikes and ease the last minute budgetary demands for storage capacity.

Tiered Service/Support Levels

The storage capacity-on-demand will be broken out to show the 3 tiers of storage requested by the Commonwealth. These reports will also show the expected capacity provided by the backup to disk infrastructure and the snapshotting and ready-copy disk infrastructure.

Tools / Applications to manage and maintain capacity

Utilizing the structure found in the Volumetrics tab of Schedule I, an enterprise services catalog will be developed that will enable the Commonwealth to order compute capacity online. The enterprise services catalog will serve two functions: the first as a central location from which the Commonwealth can order common services from Unisys. The second, more pertinent function is to serve as the central point from which compute capacity can be ordered. Capacity can be both provisioned and de-provisioned from this portion of the Enterprise Services Catalog.

The Enterprise Services Catalog includes the following components:

a. iCollaborate, a web-based front end that functions as the entry point into the Enterprise Services Catalog. iCollaborate performs all authentication, authorization and role adjudication functionality based on integration with the Commonwealths Active Directory service.

b. iRequest, the Enterprise Services Catalog component. For the Commonwealth, the Enterprise Services Catalog will allow the user to specify what type of compute platform is required, what size server or LPAR is needed, and lastly the support tier for the servers being ordered.

c. iDeliver, a complete workflow automation engine. The iDeliver component interfaces via API directly to the [redacted], [redacted] [redacted] [redacted] v[redacted]. The iDeliver component will coordinate all change and request management processes, and where automated server provisioning is support, drive the build of the server environment.

The Enterprise Services Catalog also includes data for chargeback as well as online reporting for utilization, provisioning and de-provisioning.

The following tables lists the other components of the common IT service delivery platform that will be leveraged to deliver automated provisioning to the Commonwealth.

Tool	Function
[redacted]	• Services Catalog • Workflow automation

[redacted]	• Change Management • Incident Management
[redacted]	• Configuration Management Database
[redacted]	• Atrium Discovery and Dependency Mapping • Update of CMDB
[redacted]	• Enterprise Capacity Management across all servers, network and storage devices • Workload Management and visualization
[redacted]	• Provisioning Engine • Provides post provisioning storage conditioning • Patch management and security compliance.
[redacted]	• Monitors StorageOperation • Opens automated tickets in Incident management.

End User Reports

Standard

Standard Reports are summarized in 3.3.2.

Custom Reports are offered by the Unisys Team as a Catalog Service

Custom

Please see the answer to 1.A above for the process that supports the capability of Commonwealth users to provision server resource capacity. This process is delivered via the Enterprise Services Catalog tool detailed above in this section.

2 Data Storage, Annual Data Storage Requirement Meetings

2.A Meet with the Commonwealth on a annual basis, or as requested, to assess future storage requirements.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The Commonwealth seeks at least annual meetings to review capacity and forecasts. The Unisys Program Management Office will establish regularly scheduled meetings to review these metrics. The Unisys Service Delivery Manager will also have ready access to detailed forecasts and will be prepared to meet monthly if this better suites the OA.

Storage capacity and on-demand environment requires a very vigorous capacity management regimen that must include future and cyclical capacity needs calculations factors such as historical utilization, future growth plans as they are developed, as well as the velocity of

changes to the environment. With these factors in mind, the environment is designed to be extremely flexible, allowing additional compute capacity can be added by needed. By utilizing a common pair of EMC and IBM storage platforms for physical and virtual servers, released storage capacity can be rapidly redeployed as needed to smooth unexpected surges in capacity.

The IBM and Unisys Mainframes are also provisioned to the IBM and EMC storage platforms and will benefit from flexible capacity provisioning although, traditionally, these platforms are less likely to have opportunities to take advantage of ad hoc storage provisioning.

3 Data Storage Conservation

3.A Encourage data storage conservation via data de-duplication, compression, and other industry techniques.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The Commonwealth seeks industry-standard techniques to reduce storage costs. Unisys will provide disk deduplication as part of the Enterprise Services Catalog offering. Unisys proposes that in addition to the regular forecast meetings the Capacity Manager will review storage growth rates that exceed forecasts and report back on drivers for accelerated growth within agencies as well as review drivers for the growth with an eye toward landing less used data to more cost effective storage.

4 Data Storage Expedited

4.A Provide expedited data storage service to satisfy urgent requirements, as requested.

Offeror must describe its approach to supporting the needs of the Commonwealth.

As stated in the answer above, the capacity on demand environment can be leveraged to bring storage capacity online very rapidly. By choosing specific support tiers when provisioning new compute capacity, the Commonwealth will also, in effect, be provisioning storage support capacity on demand. By leveraging the capacity on demand environment as a strategic tool, the Commonwealth can confirm that cyclical or unexpected peaks in compute demand are no longer disruptive events.

5 Portal, Data Storage online Portal Capabilities Approach

5.A Provide online storage capabilities (Centralized Private Cloud Storage), which includes web service, browser, and mobile device accessibility, that are fully secure, (compliant with ISO 27000, NIST 800-53, and Secure SDLC). This service must provide file-level encryption, multiple hierarchical permission levels, account level dynamic storage-sizing, and anti-virus capability.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The Commonwealth seeks Secure Centralized Private Cloud Services with server and mobile device accessibility. Unisys will provide these storage services. The complexity of the security features including hierarchy levels will be provided through server-based security systems. This will allow the Commonwealth to selectively choose where to invest higher costs to protect data according to just the applicable security policies rather than impose this cost on all data. Likewise anti-virus will be provided by host-based software but in the case of virus protection all data visible to servers, browsers and mobile devices will have virus protection.

Through the Catalog of Services the Commonwealth will also have access to the Unisys Stealth Solution™ which renders users, data, and infrastructure undetectable to cyber criminals. Built to meet requirements of the U.S. Department of Defense to help secure sensitive information, Unisys Stealth achieved the National Security Agency's National Information Assurance Partnership Common Criteria EAL-4+ certification, protecting data-in-motion across any network regardless if it is private or public.

Benefits of Unisys Stealth Solution

- Render data, users, and your data center dark to the outside world
- Securely protect the user, network, and data center
- Unprecedented security without an expensive reconfiguring of the network

6 Data Storage Copy Approach

6.A Offeror must describe its approach to supporting the needs of the Commonwealth.

Storage solution must include the capability to make quick copies of databases (SNAPS, Flash copies).

The snapshotting feature in the IBM and EMC toolsets creates point-in-time data copies that can be used for data backups, software development and testing, repurposing, data validation, and local rapid restores.

EMC VNX snapshots write new data to a new area within the storage pool without the need to read and write the old data block. This is accomplished with the "redirect on write" (ROW) technology so that a new snapshot does not require a read of the existing LUN.

The IBM SVC offers snapshotting as an interoperable feature that can work across all storage frames.

6.B Storage backup proposals must include disk-2-disk solutions.

The storage features sought by the Commonwealth will be provided by a variety of storage tools including frame-based copy tools such as the EMC RecoverPoint, the EMC VPLEX suite, and the IBM SVC tool suite. The Unisys Team, consisting of both EMC and IBM expert-level storage architects, already has experience within the Commonwealth, proposes this best-of-best interoperable solution.

In order to reduce overall costs, Snapshotting and copy features will be available for selection from the Enterprise Services Catalog rather than applied to all SAN-based storage volumes requested in the Schedule I Volumetrics.

Continual Service Improvement

The Quality Plan begins with the Service Excellence Office (SEO) within the Program Management Office. The SEO function provides definition and oversight of all ITIL process management and analysis functions including Change Management, Release Management, Incident Management, Problem Management, Asset Management, Configuration and CMDB Management, Availability Management, and Service Level Management. Process Managers and Analysts working in the Service Excellence Office are responsible for auditing process

effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous Service Improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

The SEO manages and drives Quality across the Commonwealth's multi-dimensional, complex, and matrixed IT Service Delivery Organizations. The SEO standardizes Quality across COPA Agencies, Unisys, Partner Organizations, as well as across all ITIL IT Services Processes, IT Monitoring & Automation Tools, and Client Satisfaction surveys and processes. Unisys will leverage the ITIL Framework, ISO Certifications, Six Sigma Lean Tools, and our Continuous Service Improvement & Innovation Process (CSIIP) to proactively provide the highest quality IT services are being provided.

The SEO leverages the ITIL framework in delivering IT Service Management. Industry accepted Measurement Tools such as [redacted] The Unisys Capacity Management team can automatically identify under-utilized or over-utilized servers; accurately plan, implement, and manage the Commonwealth's virtualization and cloud computing initiatives; and continuously optimize supporting data center resources. Unisys can integrate performance metrics related to any IT resource (such as physical and virtual servers, databases, middleware, storage, networks, and facilities) or business service. These tools will be the foundation for establishing baselines, performance , capacity, trending, and SLA/SLO reporting for Capacity Management. These tools and reports will also provide excellent visibility and services transparency to the Commonwealth.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

21. Reduce service risk,
22. Improve service quality,
23. Improve client satisfaction,
24. Provide service transparency, and
25. Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

29. Service Excellence Office,
30. Quality Plans: transition and steady state service delivery
31. Industry standard frameworks and methodologies: ITIL, ISO, SSL
32. Industry accepted measurement tools

33. Continuous Service Improvement & Innovation Processes (CSIIP)
34. Risk management, audits and business continuity management
35. Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section Continuous Service Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

7 CI Service Risk

7.A Reduce service risks.

Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section Continuous Service Improvement for additional details in this area.

8 CI Service Quality

8.A Improve service quality.

Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at improving service quality.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

9 CI Client Satisfaction

9.A Improve client satisfaction.

Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

10 CI Service Transparancy

10.A Provide service transparency.

Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at providing service transparency; in particular, visibility into the service execution process.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

11 CI Service Sustainability

11.A Ensure service sustainability.

Offeror must describe its approach and provide examples of previous Offeror initiatives aimed at ensuring service sustainability; in particular, efforts targeted at cost containment and cost reductions.

Service will be sustained by integrating any new agencies, customers, or services into our standard operational and quality processes and methodologies. We leverage ITIL processes, create quality project plans, utilize industry accepted measurement and monitoring tools, analyze trending reports and provide proactive continuous service improvement throughout the IT lifecycle. This enables new Commonwealth services to experience and sustain IT services and client satisfaction.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

12 CI Improve or Reduce Cost

12.A Improve/reduce cost of service.

Offeror must provide examples of On-Demand Storage initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

Unisys examples of continuous improvement

Examples of continuous service improvement have been included below under Unisys Team Experience.

Unisys Team Experience

Unisys Storage Resource Analysis (SRA) and Backup and Recovery Service (RBS) provide multiple ways to rein in storage and backup costs and are offered as a standard Unisys product in the market as well as to Unisys existing customers.

Federal IT managers know that analyzing and benchmarking storage and backup environments is a critical first step in deciding what to do about their agency's persistent data growth. But, the analysis has been difficult to execute in an accurate, unbiased and timely manner. For example:

- An in-house analysis often takes weeks of effort and involves cobbled solutions that rely upon spread sheets for reporting
- Vendors of storage solutions produce tools that analyze their hardware but not others
- Staff reports often sugar-coat deficiencies

The risk of not performing a storage analysis or back-up assessment is significant and results in:

- Operational instability
- Unreliable continuity of operations (COOP) plans
- Significant budgetary shortfalls
- Unplanned storage acquisitions

Knowing the importance of analyzing and benchmarking an agency's storage and back-up environment, Unisys created a suite of storage and back-up services. These services combine the tools and expert consulting required to deliver essential information to federal IT managers in an accurate, unbiased and timely manner.

Services Description

Unisys Storage Resource Analysis (SRA) and Backup and Recovery Service (RBS) provide multiple ways to rein in storage and backup costs:

- Optimize existing storage to improve utilization
- Save costs by retiring inefficient assets
- Reclaim orphaned storage
- Decrease complexity to improve reliability
- Expedite backups and recovery
- Identify points of failure

While the list of options to rein in costs are as different as each agency; the benefits are consistent:

- Transparency into your storage and backup environment
- Confidence to make changes knowing immediate and long-term impact
- Performance improvements of storage and backup
- Savings through well-planned storage acquisitions
- Ability to charge back users of storage
- Reduction in energy costs
- Operational stability

Benefits to the Commonwealth

The Commonwealth seeks cost-savings through a storage-as-a-service model. These are similar to the requirements put forward by the Internal Revenue Service.

The Internal Revenue Service was well-aware of Unisys expertise in storage management when, in 2012, it awarded the Enterprise Storage Acquisition task order to provide private cloud-based storage for the agency's information records.

This task order, awarded against GSA's Alliant Government-wide Acquisition Contract, has a one-year base period and nine one-year options and is potentially worth up to $139 million over 10 years, if all options are exercised. It includes pricing for each year based on the IRS's estimate of its storage requirements.

Under the task order, Unisys will initially acquire storage assets now owned and managed by IRS and will manage the more than 7.5 petabytes of storage space currently in multiple IRS data centers and facilities. Unisys will then plan, build, deploy and maintain a new IRS storage environment, transitioning those assets to a private cloud-based storage-as-a-service model in which the agency will pay for storage capacity as needed.

Under the task order, the IRS will pay only for the amount of storage it needs when it is needed, instead of purchasing storage equipment necessary to meet its peak demands.

"The IRS Enterprise Storage Acquisition program demonstrates how global best practices and

innovative approaches can bring significant cost savings to the US federal government and to taxpayers," says Ted Davies, president of Unisys Federal Systems. "As agencies look to achieve more within tightened budget constraints, we expect to see more agencies following the lead of the IRS."

3.2.5.3 DR Infrastructure on Demand

The DR Infrastructure On Demand service is an infrastructure as a service (IaaS) offering that ensures the ready availability of DR infrastructure; servers, storage systems, networking capabilities, etc. This infrastructure will enable Commonwealth datacenters to recover critical business applications and data in the event of a disaster.

Reference Documentation

N/A

Requirements		Describe Compliance
•	Maintain an adequate inventory of servers, storage systems, and networking capacity sufficient to satisfy forecasted informal, ad hoc, and cyclical Commonwealth requests.	Offeror must describe its approach to supporting the needs of the Commonwealth including the following: • Processes and procedures for developing and testing DR Plans • Capacity (servers, storage, etc.) • Tiered Service/Support Levels • Tools / Applications to manage and maintain capacity • End User Reports o Standard o Custom
•	Meet with the Commonwealth on a annual basis and as requested to assess its future DR requirements.	Offeror must describe its approach to supporting the needs of the Commonwealth.

•	Revise datacenter and disaster recovery plans, upon request of the Commonwealth.	Offeror must describe its approach to supporting the needs of the Commonwealth.
•	Provide support for the Commonwealth with identifying and establishing DR or Continuity of Government (CoG) capabilities and plans.	Offeror must describe its approach to supporting the needs of the Commonwealth.
Continual Process Improvement		
•	Reduce service risks.	Offeror must describe its process and provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.
•	Improve service quality.	Offeror must describe its process and provide examples of previous Offeror initiatives aimed at improving service quality.
•	Improve client satisfaction.	Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.
•	Provide service transparency, in particular, visibility into the service execution process.	Offeror must describe its process and provide examples of previous Offeror initiatives aimed at providing service transparency.
•	Ensure service sustainability, in particular, efforts targeted at cost containment and cost reductions.	Offeror must describe its process and provide examples of previous Offeror initiatives aimed at ensuring service sustainability.
•	Improve/reduce cost of service.	Offeror must provide examples of On-Demand Infrastructure initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Commonwealth seeks a comprehensive strategy for dealing with the cyclical demands of capacity by utilizing a strategy of capacity on demand. The value to the Commonwealth in pursuing such a strategy is readily apparent, from both a technical and financial perspective. Financially, a capacity on demand strategy shifts the Commonwealth from a mixture of Capital Expense and Operational Expense, to a more predictable Operational Expense. This type of strategy obviates the need for large capital expenditures for the upgrade and maintenance of compute power on disparate compute platforms, and smoothes the spikes in compute demand caused by cyclical and unforeseen events.

The Commonwealth has asked for a clear definition of the processes tools will be utilized in the capacity on demand environment. Unisys has developed a comprehensive strategy in the design of the Disaster Recovery on Demand infrastructure, by utilizing the same infrastructure options offered in the Storage on Demand and Server on Demand offerings. These best of breed hardware and software components will deliver to the Commonwealth a DR compute infrastructure that will meet the demands of the current workloads, as well as provide the flexibility to move the Commonwealth into the future.

The Unisys solution provides the Commonwealth with an Enterprise Services Catalog to provide DR Infrastructure on Demand and allows the Commonwealth to grow and expand the Disaster Recovery infrastructure to match the infrastructure capacity provided to critical production applications. The Enterprise Services Catalog is sufficiently granular to allow the Commonwealth to limit Disaster Recovery costs by, for instance, electing to provision only 80% of the Production compute capacity at the Disaster Recovery site. In this way the Commonwealth to purchase disaster compute capacity in appropriate quantities to meet but not exceed the risk threats.

1 DR Infrastructure on Demand

1.A Maintain an adequate inventory of servers, storage systems, and networking capacity sufficient to satisfy forecasted informal, ad hoc, and cyclical Commonwealth requests.

The incremental capacity is supported in the same fashion as the other Infrastructure on Demand components including servers, storage and network.

The details of this provisioning process are described in these Capacity on Demand Sections:

- Schedule F, Section 3.2.5 - Capacity on Demand Services
- Schedule F, Section 3.2.5.1 - Server Capacity on Demand Approach
- Schedule F, Section 3.2.5.2 - Storage Capacity on Demand

1.B Offeror must describe its approach to supporting the needs of the Commonwealth including the following:

Processes and procedures for developing and testing DR Plans

Capacity (servers, storage, etc.)

Tiered Service/Support Levels

Tools / Applications to manage and maintain capacity

End User Reports

The Unisys solution manages DR services within the Infrastructure Architecture framework described in F.3.2.2.2 (Infrastructure Architecture).

The DR Infrastructure on Demand is provided through the selection of required components and services in the Enterprise Services Catalog including granular services to improve DR services for specific data components.

Testing of DR plans is also provided in the Enterprise Services Catalog. The Unisys solution provides the means for Agencies to conduct tests 2 times per year as specified by the Commonwealth but Agencies can also elect to select tests for only once per year if they wish to manage costs for this effort.

The available Capacity, Tiered Service Levels, Tools, and End User Reports are described in detail in Schedule F, Section 1 of 3.2.3.2 (Site Operations)

2 DR, Annual Requirements Assessment Meetings

2.A Meet with the Commonwealth on a annual basis and as requested to assess its future DR requirements.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The Unisys solution provides a IT Risk Manager who has responsibility for maintaining DR plans, and providing reviews and remediation recommendations for the Commonwealth Agencies on an annual basis. These meetings, following testing, provide the opportunity to assess current DR services to the changing needs of critical applications and related risks.

The Commonwealth benefits of reviews and planning for DR within DPH. Unisys has strived to meet and exceed the SLAs for Recovery Time Objectives with each test. The broadened scope of DR testing for agencies in the Unisys-managed data centers allows the Unisys DR team to increase opportunities to test and improve upon DR SLAs. The prior year's test provides the DR team with "lessons learned" even as it achieves existing SLAs. These become the basis for the revisions and improvements to the next test.

3 DR, Disaster Recovery Plan Updates

3.A Revise datacenter and disaster recovery plans, upon request of the Commonwealth.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The Commonwealth will meet with the Unisys IT Risk Manager in the Program Management Office to review the progress of regular Agency-based meetings regularly scheduled by the CO to review and revise plans. The IT Risk Manager works with each Agency to incorporate their

existing DR plans into the online Living Disaster Recovery Planning System (LDRPS) tool set. The tool not only provides a means for accessing DR plans should a disaster actually occur, it also becomes a central repository for plan guides and artifacts which can be managed centrally.

Unisys uses this tool to provide the OA with a cross-Agency survey of plan offerings.

4 DR and CoG Planning Approach

4.A Provide support for the Commonwealth with identifying and establishing DR or Continuity of Government (CoG) capabilities and plans.

Offeror must describe its approach to supporting the needs of the Commonwealth.

The Unisys IT Risk Manager will support the Commonwealth with identifying and establishing DR and CoG capabilities and plans.

Continual Service Improvement

Unisys recognizes the significant importance of Quality and Continuous Service Improvement to:

1. Reduce service risk,
2. Improve service quality,
3. Improve client satisfaction,
4. Provide service transparency, and
5. Improve/reduce costs of service.

Through a continuous cycle of evaluation and improvement within an IT infrastructure, Unisys views quality and continuous service improvement as a critical success factor in driving customer satisfaction for the Commonwealth IT infrastructure. Each of the continuous service improvement areas identified above are driven through the tight integration of the following organizations, industry tools, proven processes and quality deliverables:

1. Service Excellence Office,
2. Quality Plans: transition and steady state service delivery
3. Industry standard frameworks and methodologies: ITIL, ISO, SSL
4. Industry accepted measurement tools
5. Continuous Service Improvement & Innovation Processes (CSIIP)
6. Risk management, audits and business continuity management
7. Client Satisfaction Surveys and Knowledge Management Portal

Collectively this represents Unisys Integrated Quality Plan for the Commonwealth of Pennsylvania.

Specifics on each of these areas are outlined in Schedule F, Section 3.2.1.1.6 Continuous Service

Improvement. Highlights from this section are outlined below and requested service examples are provided at the end of this section.

5 CI Service Risk

5.A Reduce service risks.

Offeror must describe its process and provide examples of previous Offeror initiatives aimed at eliminating or mitigating service risks.

Risk management, independent quality audits, and business continuity management are integral quality management processes. Unisys is committed to managing risks and facilitating the achievement of business objectives the adherence to quality processes. We mitigate risk through the implementation of tight quality controls: standard policies, procedures, roles, risk assumptions, issues, and definitions, etc.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

6 CI Service Quality

6.A Improve service quality.

Offeror must describe its process and provide examples of previous Offeror initiatives aimed at improving service quality.

The quality approach begins with the Service Excellence Office who provides definition and oversight of all ITIL process management and analysis functions. Process managers and analysts working in the Service Excellence Office are responsible for auditing process effectiveness, ensuring that service delivery teams comply with proper execution of processes, and analyzing process trends for anomalies. Continuous service improvement programs in collaboration with Commonwealth agencies are managed by the Service Excellence Office.

Through our Continuous Service Improvement and Innovation Process (CSIIP), the SEO reviews, analyzes and makes recommendations on improvement opportunities in each ITIL lifecycle phase. Unisys will leverage Six Sigma Lean tools and methodologies as well as ISO Certified internal audits to measure and maintain the highest quality services to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

7 CI Client Satisfaction

7.A Improve client satisfaction.

Offeror must provide examples of previous Offeror initiatives aimed at continually improving client satisfaction.

Client satisfaction is extremely important to Unisys and a key focus in our IT solution. The SEO will integrate new agencies, customers and services into our multi-pronged client satisfaction approach that includes Service Desk surveys on the caller's experience, an overall agency satisfaction survey, and quarterly surveys with the Office of Administration. Data collection will

be gathered across multiple levels to gain a clear understanding of the Commonwealth's satisfaction with the IT Services being provided.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

8 CI Service Transparency

8.A Provide service transparency, in particular, visibility into the service execution process.

Offeror must describe its process and provide examples of previous Offeror initiatives aimed at providing service transparency.

The service organizations will use standardized ITSM services processes, IT monitoring and automation tools. ITSM processes will be documented in the Commonwealth Computing Procedures Manual (CCPM). The CCPM will be available to Commonwealth approved staff on the Knowledge Management Portal (KMP) providing desired transparency into service execution processes. Through the Real-time Dashboard, the Commonwealth will have access to current operational performance of their application infrastructure.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

The contracting agency participates in planning, performance and post-testing reviews, thereby having visibility into the entire DR service execution process.

Included below is an example of a review of a successful DR testing that nonetheless included "Issues" and related "Actions" to use the transparency of the report to point to improvements to the service provided. The Unisys Team views "issues" as an opportunity to review services through the ITIL V3 Service Design process and continually improve services.

1. Database Restores
2. Objective
    a. Import backup catalog to Netbackup server at [redacted] and restore databases in time furnctional testing at 8 a.m. on day 3
3. Accomplishments
    a. Catalog import was finished before test began
    b. All AIX Oracle databases were restored by Noon on day 3
    c. Restored PW1 (4TB) and PC1 (10TB) databases
4. Issues
    a. Time to import larger databases was excessively long
    b. RMAN script issue was escalated to Unisys Oracle Tower and Symantec
    c. Some database restores needed to be restarted
    d. NBU log setting caused restart of DB restore on PW1
    e. PW1 restore extended into functional testing time
    f. PC1 database validation did not coplete within test timeframe
    g. PW1 index rebuild did not complete within test timeframe

5. Actions

   a. Retest RMAN scripts before next test

   b. Confirm indexing and validation are part of success criteria

9 CI Service Sustainability

9.A Ensure service sustainability, in particular, efforts targeted at cost containment and cost reductions.

Offeror must describe its process and provide examples of previous Offeror initiatives aimed at ensuring service sustainability.

Service will be sustained by integrating any new agencies, customers, or services into our standard operational and quality processes and methodologies. We leverage ITIL processes, create quality project plans, utilize industry accepted measurement and monitoring tools, analyze trending reports and provide proactive continuous service improvement throughout the IT lifecycle. This enables new Commonwealth services to experience and sustain IT services and client satisfaction.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

10 CI Improve or Reduce Cost

10.A Improve/reduce cost of service.

Offeror must provide examples of On-Demand Infrastructure initiatives that have been implemented or can be utilized to achieve reduced costs of Services and to meet or exceeded ROI (Return on Investment) analysis projections.

The Service Excellence Office will proactively manage quality, continuous service improvement, ITIL process management, and customer satisfaction through a comprehensive quality plan that specifically addresses all of these areas. We believe this is a key differentiator in our partnership with the Commonwealth. Through this new organization and these quality plans, Unisys will drive best in class services and the highest customer satisfaction experience, while reducing overall costs to the Commonwealth.

Please refer to Schedule F, Section 3.2.1.1.6 Continuous Service Improvement for additional details in this area.

The Catalog of Services approach to provisioning DR services provides the Commonwealth with significant opportunities for cost savings. Most organizations approach Disaster Recovery as a Like-to-Like issue and sometimes build out a DR site that is identical in computer power as the Production data center. With the Catalog of Services the Commonwealth could better manage the cost of Disaster Recovery to the likely risks of an actual disaster. For instance, when Unisys crafted the Disaster Recovery plan for the California State University system (CSU) they were reluctant to incur the cost of an identical compute power for a DR plan that they hoped never to use. Unisys presented two options to reduce cost:

3. For virtual servers the computer power was provisioned at a less than 100% of that available for production. CSU was willing to accept a diminished level of service

immediately following an actual data center disaster and Unisys was able to propose a reasonable delivery date to augment the DR facility if an actual disaster occurred. The difference between the current computer power in the DR site and that of the Production data center delivers a monthly savings for CSU.

4. Unisys also provided a means for CSU to utilize assets provisioned for their DR plan as Test and QA/Development servers under the agreement that if an actual disaster occurred then these services would be suspended so that these assets could be pulled into use as the Production infrastructure at the DR site. This allowed CSU to leverage the compute power of the DR site at relatively little risk.

The Agencies in the Commonwealth can, working with the Unisys IT Risk Manager, select servers and storage in the DR facility that would provide a diminished services in the event of an actual disaster. Given the very unlikely chance of an actual disaster this would allow the Agencies to better balance the full cost of a Like-to-Like DR solution against the risk of occurrence of an actual disaster.

Disaster Recovery – File Replication:

The DPH has implemented Distributed File Systems (DFS) to replicate our DPH File Server down to [redacted] In the event of a true disaster, files to perform our duties during and after the DR will be available. Data replication occurs in real time and is de-duplicated over the wire thus saving bandwidth on the WAN link. This provides that our documentation, recovery scripts and procedures are current and accessible at all times to support Commonwealth agencies during disaster recovery drill and in the event of an actual disaster. By avoiding having to ship tapes containing this information to [redacted] and having to restore them, Unisys has improved the recovery time objective for disaster drills and disaster events.

Disaster Recovery – NetBackup Recovery Improvement:

VM replication was implemented to improve the Recovery Point Objective of our NetBackup master servers from 24 hours down to approximately 6 hours. This change will also lower the time it takes to recover the NetBackup server in the DR environment from 2.5 hours to around 30 minutes expediting the start of DR database recovery efforts by almost 80%.

Disaster Recovery-Server Recovery Improvement:

To improve disaster recovery times, the DPH converted AIX mksysb to ISO images to facilitate a much faster server recovery time. Prior to this change, we used CD images or mksysb restores from tape. This resulted in an 85% improvement in recovery times.

Unisys Mainframe- Production Data Mirror Improvement:

The DPH implemented a process to mirror Client data (86 disk packs using EMC time finder) between production mainframes and those at [redacted] Continual improvements remain underway to expand this process increasing the amount of data supported by time finder by and additional thirty percent. This mirroring technique has provided DPW with the ability to maintain 7 x 24-hour processing while replicating data necessary for disaster recovery down to [redacted] This process improvement has enhanced our ability to perform disaster recovery data restoration faster than previously possible, from physical tape storage.

Storage Replication Improvement:

Storage replication solutions have been implemented for several agencies using the latest disk to disk replication technology. These solutions have enabled a reduced dependency on tape media and drives for backup while providing a disk to disk update to offsite data supporting both data backup as well as disaster recovery requirements. Ongoing research and trials are conducted in conjunction with product support organizations to provide proper configuration and optimal performance for the technology supporting this critical managed service.

PSP VDI Improvement:

The State Police was impacted when one of its barracks was closed down due to a mold infestation and they were unable to access computers and have staff in that location for weeks. They were interested in a business continuity plan that would enable them to have access to their files and applications from a remote location. We worked with them to establish a VDI proof of concept at the DPH. Using the Virtual Desktop Interface, they were able to access their information from iPads from any location.

Unisys Team Experience

The Continual Service Improvement sections above provide details of the Unisys Team's rich experience and the value that they have brought to the Commonwealth and its Agencies over the past many years. But the Commonwealth is likely unaware of the breadth of Unisys experience in providing reliable Disaster Recovery operations that provide significant value to customers.

Setting Customers on a course to DR

Unisys provides a service in the market called the Unisys Disaster Recovery Architecture Service. As part of this service the Unisys Team conduct a comprehensive 2-day seminar to provide customers with a solid foundation on which to build an end-to-end application and data disaster recovery capabilities. This service mirrors the embedded service provided to the Commonwealth in this proposal and managed by the Unisys IT Risk Manager on an agency-by-agency basis. For instance the Unisys Disaster Recovery Architecture Services provides:

- Reduction of costs through
  - The deployment of mature recovery services management
  - The collective disaster recovery architectures and processes financially rationalized against explicit, business-driven recovery targets
- Mitigated risk through
  - Knowledge transfer that allows each IT function to understand its specific role within the overall, end-to-end recovery process
  - Institution of proven and formalized recovery services management that yields reliable, disaster recovery capabilities
- Restored quality of service as shown by
  - Disaster recovery, service performance reviews that build confidence through "proof of delivery capability" reports

- Actual disaster recovery costs that become transparent to the business

(for more details see http://www.unisys.com/unisys/inc/pdf/brochures/Disaster_Recovery_Architecture_Service_datasheet.pdf)

Saving Money with efficient DR

Solution

JMC Steel Group worked with Unisys to design and execute a sizeable data center migration and modernization initiative, which standardized the SAP infrastructures at two key data centers on a common hardware platform – and provided the bullet-proof disaster recovery capabilities these critical environments demand.

Results

Carrying out its data center transformation strategy enabled JMC Steel to better support the operations of two major manufacturing facilities. Plus, by making a robust disaster recovery capability a key component of the project, the company greatly improved its ability to avoid the numerous harmful effects of both planned and unexpected downtime.

Metrics

- **Resiliency:** 15-minute recovery time objective (RTO) established and confirmed via testing of automated backup and failover capabilities.
- **Performance:** 300% increase in hardware performance and 50% reduction in response times.
- **Cost avoidance:** $250,000 in lost revenue per four hours of downtime avoided .

http://www.unisys.com/unisys/common/detail.jsp?id=1120000970009510096

Protecting Alabama State citizens through improved DR

The Alabama Criminal Justice Information Center (ACJIC) is a state agency providing local, state, and federal criminal justice agencies with the information needed to ensure citizen safety. ACJIC realized that gaps in its information technology were hindering communications and business continuity. It needed to more efficiently deliver critical information from its network and systems.

Unisys provided a real–time infrastructure with improved disaster recovery and business continuity through a turnkey solution comprising an ES7000/one enterprise server platform, Unisys SafeGuard 30m, and EMC SAN technology.

By implementing the system, ACJIC now has a dependable, cost–effective system that delivers real–time information to end users, supports future growth, and provides robust, reliable operations. It also provides system patches and updates with extreme ease and supports failover requirements. The result is enhanced officer and citizen safety while building trust among constituents.

Metrics

- **Better Security:** Reduced downtime and risk – 24x7 availability with failover in less than one minute from the primary site to the disaster recovery site
- **Reduced Costs:** Lowered costs while processing some 18 million transactions monthly
- **Improved Satisfaction:** Enhanced citizen and officer safety by ensuring a constant flow of real–time information
- **Better Productivity:** Enabled one–to–two–second searches for up to 40 million records in the Law Enforcement Tactical System

http://www.unisys.com/unisys/ri/cs/detail.jsp?id=9400019

Protecting Workers' Compensation through improved IT and DR

EMC Insurance Companies has grown from a provider of workers' compensation coverage to one of the Iowa's largest property and casualty insurance providers – with over 20 branch locations and assets in excess of $3 billion.

A key factor catalyzing nearly 100 years of steady expansion has been EMC's commitment to cultivating successful, lasting relationships with independent agency partners. Yet, as these partnerships grow, so too do the demands for speedy, personalized service that is available around the clock.

With Unisys technology driving its consolidation, virtualization, and business continuity processes, EMC has established an environment that promotes responsiveness and agility across the organization. As a result, the company is better equipped to deliver and support the services that its wide network of branch locations and independent agents demand 24x7.

Metrics

- **Cost:** Consolidated and virtualized 150 existing servers down to 50.
- **Efficiency**: Streamlined disaster recovery procedures, including an 80% reduction in documented processes
- **Service**: Implemented platforms that keep mission-critical systems and applications available at all times

http://www.unisys.com/unisys/ri/cs/detail.jsp?id=10020500013

De Beers UK Streamlines and Strengthens IT Processes and DR

De Beers UK contracted Unisys to outsource and manage the full scope of its IT data centre operations – from hosting critical applications to deploying business continuity measures to providing technical and end-user support services.

The fully managed data centre environment Unisys provided De Beers has enabled the company to improve the flexibility with which it can meet both current and future business and IT demands, eliminated the need to allocate in-house resources to routine IT management tasks, and provided the disaster recovery measures required to ensure the company's infrastructure remains resilient and resistant to failure. What's more, the end-user support capabilities extended the company's resiliency gains to its employees, helping them remain productive and make positive contributions to important initiatives.

Challenge

Minimize the risk of an interruption to global operations, and better support the efforts of end users – without adding complexity or increasing management burden.

Solution

De Beers UK contracted Unisys to outsource and manage the full scope of its IT data centre operations – from hosting critical applications to deploying business continuity measures to providing technical and end-user support services.

Results

The fully managed data centre environment Unisys provided De Beers has enabled the company to improve the flexibility with which it can meet both current and future business and IT demands, eliminated the need to allocate in-house resources to routine IT management tasks, and provided the disaster recovery measures required to ensure the company's infrastructure remains resilient and resistant to failure. What's more, the end-user support capabilities extended the company's resiliency gains to its employees, helping them remain productive and make positive contributions to important initiatives.

Metrics

- **Manageability:** Provisioned a new business intelligence application in four weeks
- **Recoverability:** Confirmed the resiliency of the new infrastructure via a full disaster recovery test

Benefits to the Commonwealth

The Unisys solution provides the Commonwealth with a means to control, manage, and save costs associated with DR services because of the fine granularity in the DR services listed in the Enterprise Services Catalog. Commonwealth Agencies may, for instance, adjust DR services to take on greater risk in times of austerity in order to reduce costs for services.

The Unisys solution provides the Commonwealth with the means to avoid excessive risks and improve the continuity of critical services by utilizing the DR services in the Enterprise Services Catalog to quickly increase DR protections of primary data whenever an Agency is able to identify an increased level of risk associated with critical applications.

As the Unisys Team Experience, Unisys has provided and will provide continual service improvement process that refine processes and services to provide service costs savings through the Unisys enhanced ITIL V3-based Service Design process that adds Continuous

Service Improvement and Innovation Process (CSIIP) Management to the standard ITIL V3 Service Design procedure.

3.2.5.4 Additional Technical Services

The Commonwealth may require additional technical support beyond the standard service level based infrastructure Services. The availability and access to skilled resources would complement the standard hosting offerings. The Offeror is expected to provide these additional resources for both short and longer-term engagements.

Reference Documentation

N/A

	Requirements	Describe Compliance
1.	Provide access to skilled technology resources. Additional technology support Services categories include but are not limited to: • Infrastructure (mainframe, mid-range and x86) Architects/Engineers • Performance Specialists • Database Architects • Database Analysts • Security Architects • Security Analysts • Unix (AIX, Linux) Administrators • Windows Server Administrators • Mainframe Systems Programmers • Batch Administrators • Microsoft Product Specialists (e.g. Exchange, SharePoint)	Offeror must describe its ability to support both short and long-term assignments for a variety of technology skill sets. Offeror must provide representative resumes within each skill category. Offeror must provide a rate card for each resource category in the Cost Matrix.

	• 3rd Party Software Product Specialists • Basis and SAP Oracle support	

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Using the Unisys Enterprise Services Catalog, the Commonwealth will have access to a wide array of additional technical support skills and services related to and on top of the managed compute services which can be used to support ongoing technical support activities, short term assistance requests or new projects. The technical resources and additional technical services are described within the Enterprise Services Catalog in Schedule C Enterprise Services Catalog.

1 Staff, Technical Services Resumes

1.A Offeror must describe its ability to support both short and long-term assignments for a variety of technology skill sets.

Offeror must provide representative resumes within each skill category.

Offeror must provide a rate card for each resource category in the Cost Matrix.

The Unisys Team comprising of Unisys, IBM, Deloitte and a number of Small Diverse Businesses, maintains a wide variety of skilled architects, analysts, technical support and consultants to draw upon to support individual Commonwealth requests for additional resources. The Commonwealth can request the use of additional technology resources through Service Requests via the Enterprise Services Catalog. These additional resources are listed within the Enterprise Services Catalog located in Schedule C. The rate card is available on Tab 5 of Schedule I in Section 10 Cost Submittal. Representative resumes for each type of additional resource are located within section 5 Personnel.

The Commonwealth has the flexibility to use additional technical support personnel and services to support short and long term assignments for projects and ongoing support activities. All requests for the additional skills or services will be recorded within the Enterprise Services Catalog and delivered after approval of the solution by the Commonwealth.

1.B Provide access to skilled technology resources. Additional technology support Services categories include but are not limited to:

Infrastructure (mainframe, mid-range and x86) Architects/Engineers

Performance Specialists

Database Architects

Database Analysts

Security Architects

Security Analysts

Unix (AIX, Linux) Administrators

Windows Server Administrators

Mainframe Systems Programmers

Batch Administrators

Microsoft Product Specialists (e.g. Exchange, SharePoint)

3rd Party Software Product Specialists

Basis and SAP Oracle support

Through the Enterprise Services Catalog, the Unisys Team will support the Commonwealth's request additional technology resources including, but are not limited to the above skilled resources. The Unisys Team maintains a wide variety of skilled architects, analysts, technical support and consultants to draw upon to support individual Commonwealth requests for additional resources. Depending on the skills and functions required and duration of the request, the timeframe to assign the resource may differ.

Unisys Team Experience

Commonwealth of Pennsylvania

As part of a Time and Materials contract, Unisys provides approximately 40 resources to support the Commonwealth of Pennsylvania Enterprise Data Center Unisys Team comprises of about 40 consultants with varied background like Project Managers, System Administrators, Exchange Administrators, Database Administrators, Network engineers, Technical Writers, Automation Engineers, SAN Administrators holding certifications including but not limited to PMP, ITIL, MCSE, MCTS, MCITP, MCDBA, MCSD, OCP, CCNP, CCDP, CISSP and CCSA.

New York State Office of Information Technology Services

As part of a long term relationship beginning in 1976 with the State of New York's Office of Information Technology Services (OITS), the Unisys Team provides skilled additional technical resources to augment OITS's technical team. New York State relies on these resources to manage the Unisys Dorado and Libra Mainframes, related server infrastructure and application development for the Office of Temporary and Disability Assistance, Department of Civil Service, State Education Department and New York State Division of State Police.

Benefits to the Commonwealth

As a part of the additional technical services offerings, the Commonwealth can use the Unisys Team's extensive technical skills to support the Commonwealth's time or complexity driven projects. In addition, the Enterprise Services Catalog offers many additional services, including technologies, assessments and technology management services to enable the Commonwealth

to meet your business needs which require activities above the base compute service offerings.

3.3 Transition Services

3.3.1 Transition Services – Guiding Principals

At present, the Commonwealth's information technology Services are hosted at a variety of Commonwealth data centers, including:

- Shared enterprise facilities - ([redacted] and DPH) and;
- Agency facilities, for example those managed and maintained by DPW, DOR, DOH, PSP and DLI.

The Commonwealth data center locations are identified in Exhibit S - Datacenter locations.

In an effort to reduce data center costs, simplify data center administration, and provide more robust and reliable information Services to the Commonwealth, the Commonwealth data center modernization initiative calls for the phased migration or transition of Commonwealth information Services to the newly-established Offeror managed multi data center environment.

The Guiding Principles associated with the transition to the new data center environment are:

- Transition approach must meet the milestone objectives as described in **Schedule D**.
  - Based on the Commonwealth's number of licenses, additional licenses may be needed for the transition of Services. The Offeror shall be responsible for any additional licenses needed for the transition of service.
  - The Commonwealth, at its sole discretion, may procure the software licenses through existing statewide contract.
- Initial transition approach of the Commonwealth's mainframe and SAP environments requires that the results be as close to the Commonwealth's current configuration as technically possible.
  - Any deviations from current environments must be approved by the Commonwealth.
- Customized approach developed to meet the needs of the Commonwealth
  - The selected Offeror's transition approach shall account for Commonwealth specific needs such as the Transition Considerations and Critical Configuration Considerations as described in Exhibits R and T.
  - The selected Offeror shall implement a discovery process during transition planning to acquire information required to develop a Detailed Transition Plan.
  - The selected Offeror shall include application level transformation models. Transformation models must take into account the initial transition approach that the Commonwealth's mainframe and SAP environments must be as close to the Commonwealth's current configuration as possible.

- Transformation project managers experienced in projects of similar size and complexity.
- Strong governance model, which includes:
  - Clearly defined roles and responsibilities
  - Jointly developed processes
  - Effective meetings and reporting framework to minimize resource requirements while achieving goals
  - Mechanisms in place to identify and address risks and issues
  - Compliance with applicable policies, standards, processes, and procedures
- Effective communication, which includes:
  - Consistent delivery of key messages through well-defined communication plans
  - Tailored communications to target audiences and stakeholders
  - Communications to meet the needs of the Commonwealth.
- Collaboration and teamwork, which includes:
  - Detailed upfront project planning and feedback
  - Agreement on status for reporting purposes
  - Plans scaled to address Commonwealth agency differences in size and complexity
  - Establishment and support for successful deliverable review process
  - Feedback on deliverables throughout the life of the project.

3.3.2 Transition Planning/Governance

The Offeror's Transition Program Management Office (TPMO) will contain a dedicated consolidation specific program team. The team will be responsible to jump-start the consolidation program by bringing respective stakeholders together for a series of transition workshops. The transition workshops will work to align the stakeholders, and produce the following deliverables:

- Overall transition approach and strategy for Server and Mainframe consolidation
- Transition and consolidation governance plan
- Transition risk assessment plan
- Consolidation cost/benefit analysis
- Consolidation stakeholder transition agreements
- Consolidation transition planning guidelines

The TPMO will provide program management Services to deliver architecture, transition plan integration, and organizational change management, as well as quality assurance, verification of testing, financial oversight, and operational readiness for the Mainframe and Server transition/consolidation program. The TPMO will exist under the overall Offeror's PMO office and will include a combination of resources dedicated to the effort full time, plus resources that participate in the program on an as needed basis. The program plan and architecture will be developed by the Offeror and approved by the Commonwealth. The Offeror must verify processes and tools are implemented to support Transition change control, schedule, quality, communications, risk and issues management.

Proposed Transition Plan

The Commonwealth anticipates the following high-level sequence of transition activities. The Offeror must develop an initial transition plan and present with its proposal. At minimum, the Offeror's proposed Transition Plan must reference these activities and project timeframes.

Transition Activities

The high level transition milestones and deliverables are described in **Schedule D - Transition Milestones** and **Schedule K - Key Program Deliverables**.

Target Datacenter Transitions

The following table includes the target datacenter facilities that are to be initially transitioned by the Offeror. The target datacenter facilities are defined as the physical Commonwealth facilities that are selected to be transitioned to the Offeror's control and/or facilities. The Offeror must coordinate with each Commonwealth agency or data center representative to create a *Facility Specific Transition Plan* for each targeted facility. The Offeror must include target datacenter transitions in its proposed Transition Timeline to be included in its proposal. The Offeror must include a "pilot" transition approach to verify successful transitions of Commonwealth applications and infrastructure. This approach will demonstrate to the agencies that Offeror's approach will be successful before moving forward with additional transition phases.

Offeror must establish a high-speed direct link (not via COPANet) with the current DPH location to enable "systems" connectivity that would facilitate the ability to effect smoother transition of data.

The selected Offeror shall not charge the Commonwealth for a transition milestone until the milestone has been accepted by the Commonwealth. Milestone acceptance criteria are described in Schedule D - Transition Milestones.

	Target Datacenter Facilities		Transition Requirement Notes
	Group1 Transitions		
1	**DPH** (All Agency Mainframe – Unisys, IBM; IES SAP, and all other Agency hosted environments)		• The DPH operation and all of its supported agency application workloads must be successfully migrated out of the current facility to the Offeror's Datacenter. • Operations support will be assumed by the Offeror once the workloads are successfully moved to the new provider's datacenter environment. • Key Transition Milestone(s): o Refer to **Schedule D - Transition Milestones**
1	[redacted]		• Offeror must assume operations support of the [redacted] datacenter

	Target Datacenter Facilities		Transition Requirement Notes
			• Key Transition Milestone(s): o Refer to **Schedule D - Transition Milestones**
Group 2 Transition			
2	**DLI**		• The DLI datacenter operations and all of its supported application workloads must be successfully migrated out of the DLI facility to the Offeror's Datacenter. • Key Transition Milestone(s): o Refer to **Schedule D - Transition Milestones**
Group 3 Transitions			
3	**DPW** – Rm. 105, 106 (Lower Environments, PACSES)		• The DPW Rooms 105, 106 datacenter operation and all supported application workloads must be successfully migrated out of the current DPW facility to the Offeror's Datacenter architecture. • Key Transition Milestone(s): Refer to **Schedule D - Transition Milestones**
3	**DOR**		• The DOR datacenter operation and all of its supported application workloads must be successfully migrated out of the current DOR facility to the Offeror's Datacenter architecture. • Key Transition Milestone(s): o Refer to **Schedule D - Transition Milestones**
3	**DOH**		• The DOH datacenter operation and all of its supported application workloads must be successfully migrated out of the current DOH facility to the Offeror's Datacenter architecture. • Key Transition Milestone(s): o Refer to **Schedule D - Transition Milestones**
3	**PSP**		• The PSP datacenter operation (Headquarters) and all of its supported application workloads must be successfully migrated out of the current PSP facilities to the Offeror's Datacenter architecture. • Key Transition Milestone(s): o Refer to **Schedule D - Transition Milestones**

3.3.2.1 Transition Program Management

The TPMO function confirms the non-disruptive migration of Commonwealth information Services from current Commonwealth host locations, to the Offeror provided multi datacenter environments.

The Offeror must establish a TPMO and develop the requisite transition plans.

A transition approach and detailed transition plan for each of the Commonwealth's existing Datacenters must be developed by the Offeror and approved by the Commonwealth. The Commonwealth has over 2,000 business applications with over 50% designated mission critical. The Offeror must work with each agency to determine its application environment within each facility. The Offeror's target datacenter environment must be configured and tested prior to migration of the application.

Requirements		Describe Compliance
1.	Establish a TPMO to manage all information service transition	Offeror must describe the proposed TPMO, and discuss the mission, goals and objectives, and the roles and responsibilities of the

	activities. The Office will be jointly administered by Offeror and Commonwealth staff. Provide a communication plan that will provide an information vehicle for all interested parties.	Offeror. Offeror must provide at least one sample where Offeror has successfully created an office similar to the required TPMO.
2.	Provide a functional organization chart for the TPMO, including an estimate of the type and number of full time Offeror resources that will be required to ensure the successful transition of Services from current multiple datacenters to the Offeror's datacenter Services.	Offeror must describe the TPMO structure including but not limited to the number of full time resources and the role of the TPMO in the transition.
3.	Analyze applications and design the required computing architecture to migrate Commonwealth datacenters to Offeror datacenter environments. Hardware, software, network, etc. Work with Commonwealth technical staff to ascertain the requirements to successfully migrate processing to Offeror datacenter environments	Offeror must describe solution and approach to meet this requirement. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.
4.	Optimize Current Process and Procedures – Coordinate with Commonwealth agencies to review and plan for a transition of processes and procedures.	Offeror must describe its overall plan for optimization of the existing processes, procedures, tools, etc. to provide more efficient and effective Services. The description must include approach, plan, and methodologies.
5.	Revise datacenter DR plans on the occasion of major changes to the datacenter hardware, software, or network portfolio to reflect those major changes.	Offeror must describe solution and approach to meet this requirement.
6.	Establish an IT infrastructure that	Offeror must describe solution and approach

	meets all application processing requirements. The Offeror must confirm that the target IT infrastructure meets or exceeds current computing requirements. Work with Commonwealth technical staff to design and build the infrastructure required to support the applications being migrated to the Offeror multi datacenter environment.	to meet this requirement. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.
7.	A multi-faceted Transition Strategy will be required: • Comprehensive; • Non-disruptive; and • Compliant with Commonwealth requirements. The Strategy will address the transition of: • Shared infrastructure elements, as appropriate; and • Specific information Services. • Disparate Agency application architectures and impacts to move to the new environment(s) The Strategy must also address the following: • Cost/Benefit for the Agency • Risks and Risk Mitigation Plan The migration order of the Commonwealth datacenters will be provided by the Commonwealth.	Offeror must describe the transition (interim and steady state strategies) and transition plans that it has employed during other similar size engagements.
8.	Identify mandatory requirements and critical success factors that will have	Offeror must describe the 3-5 characteristics, conditions, or variables it believes will have

	a direct impact on developing a successful transition plan	a direct and critical impact on the effectiveness, efficiency, and viability of the Offeror's solution. Offeror must describe its approach to mitigating risks and ensuring these critical factors are successfully addressed.
9.	Create a Transition Timeline that outlines the overall timeline starting at effective date and continues through delivering transition Services for each of the targeted datacenters.	Offeror must describe the overall timeline from the start of pre-Transition activities through the point at which the Offeror expects it will be delivering predictable, repeatable Managed Service Results that meet the requirements of the RFP. The schedule must include a description of the critical milestones related to Transition efforts for each targeted Commonwealth datacenter. Any critical milestones identified must be included in the Transition Project Plan.
10.	Create a generic Infrastructure Element Transition Plan that may be readily adapted to accommodate specific infrastructure element transitions. Create a prospective Infrastructure Element Transition Plan. Appropriate [redacted] DPH and other Agency Datacenter hardware elements may be re-purposed wherever possible.	Offeror must describe a realistic Transition Project Plan to transition the Commonwealth's datacenters to the proposed architecture.
11.	The [redacted] Managed Services datacenter assets must be managed and maintained by the Offeror until they are transitioned to the Offeror's managed Services. The current maintenance contract for the [redacted] servers is scheduled to expire on June 30, 2014.	Offeror must describe its transition approach to address the transition of operations and management of the [redacted] infrastructure from the Commonwealth to the Offeror's support Services and how it intends to address the server maintenance expiration issue.

12.	Create, manage and execute an application / infrastructure migration plan. The Offeror has the primary responsibility for planning and executing the transition of infrastructure elements, with support of Commonwealth technical and business support staff. The Offeror must provide adequate tools and techniques for moving and migrating Commonwealth data to the new target storage environment. The Offeror must ensure that critical applications are not decoupled from key infrastructure components causing system latency.	Offeror must describe solution and approach to meet this requirement. Offeror must provide at least one sample where it has successfully migrated application and hardware. Offeror must describe its proposed tools and techniques for moving and migrating Commonwealth data to the new target storage environment.
13.	Create a generic Information Service Transition Plan that may be readily adapted to accommodate specific information service transitions.	Offeror must outline a prospective Information Service Transition Plan to take over support of migrated Commonwealth systems and applications. Offeror must provide at least one sample where it has successfully completed application and hardware migrated.
14.	Meet with Commonwealth to produce and execute specific Information Service Transition Plans. Select cut over windows that minimize system unavailability and coordinate approval with the affected agency. Communicate to the Commonwealth cut over date and times. Setup a special call number and support staff to take calls concerning the migration, these Services must be made available to transitioned users until the transition is officially signed off as completed. .	Offeror must describe solution and approach to meet this requirement. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

15.	Work with Commonwealth to create testing, business acceptance and fallback plans.	Offeror must describe solution and approach to meet this requirement. Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.
16.	Service Management Systems – Offeror must transition all agency system management platforms currently in place to the Offeror, consolidating all system management responsibilities. The Offeror must make available all system management platforms and tools that are currently supporting the Commonwealth infrastructure.	Offeror must describe solution and approach to meet this requirement.
17.	CMDB – Work with the Commonwealth to acquire asset information to support the asset management system and configuration management system.	Offeror must describe its approach to capturing, validating and storing all configuration information required to perform the Services within 120 days of the Effective Date of the Contract. In particular, the Offeror must address how it will identify and relate critical associations (e.g. Application to Server, Server Tier to Application, Application to Disaster Recovery Time Objective, software to server, etc.) for the enterprise. Offeror must describe its approach to transitioning the data and related processes from the existing CMDB or equivalent system/database to the Offeror's solution and how the Offeror must ensure accuracy of data across Service Management areas to ensure accurate and timely invoicing and chargeback to the Commonwealth.
18.	Chargeback – Work with the Commonwealth to	Offeror must describe its transition approach to Chargeback Management.

	interface with the Commonwealth's billing processing and validation ITSM system to provide a chargeback system for new and existing Services available on the Offeror's Service Catalog.	Offeror must describe its approach to assisting the Commonwealth in transitioning Commonwealth customers from the existing Chargeback system. The description must include an expected analysis of the current billing system environment, expected termination assistance, communications plans, strategy for testing and major milestones.
19.	Identify Options and Costs – List the appropriate different options that will satisfy the requirements of the transition scope. Communicate options with the Commonwealth and obtain approval on selected option(s) to proceed.	Offeror must describe proposed approach.
20.	Expand/reconfigure datacenter facilities to accommodate growth in Commonwealth information and information systems.	Offeror must discuss its approach; the expansion/reconfiguration plans must include the [redacted]
21.	Produce weekly reports on the progress of the information service transition initiatives.	Offeror must describe its proposed approach to providing weekly transition progress reports.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

Strong communications between the Commonwealth and the Unisys Team is critical to the success of the program. The deliverables identified in Schedule K provide good insight to Unisys on the priorities for the program. Below you will find an extension of the Unisys response to each Key Program Deliverable that provides insight into the Unisys approach for each.

1 TPMO Approach

1.A Establish a TPMO to manage all information service transition activities.

Offeror must describe the proposed TPMO, and discuss the mission, goals and objectives, and the roles and responsibilities of the Offeror.

The Transition Program Management Office (TPMO) will provide standards, oversight and cross-functional support to the project within the initial Transition and any future transition activity that may occur during steady state. This organization takes advantage of the collective experiences of Unisys, IBM, and prior experience of the staff. **Figure 3.3.2.1-1** below depicts the functions within the TPMO and the teams that will leverage these functions. The TPMO will facilitate information sharing, provide guidance, and publish lessons learned to improve communications both vertically and horizontally.

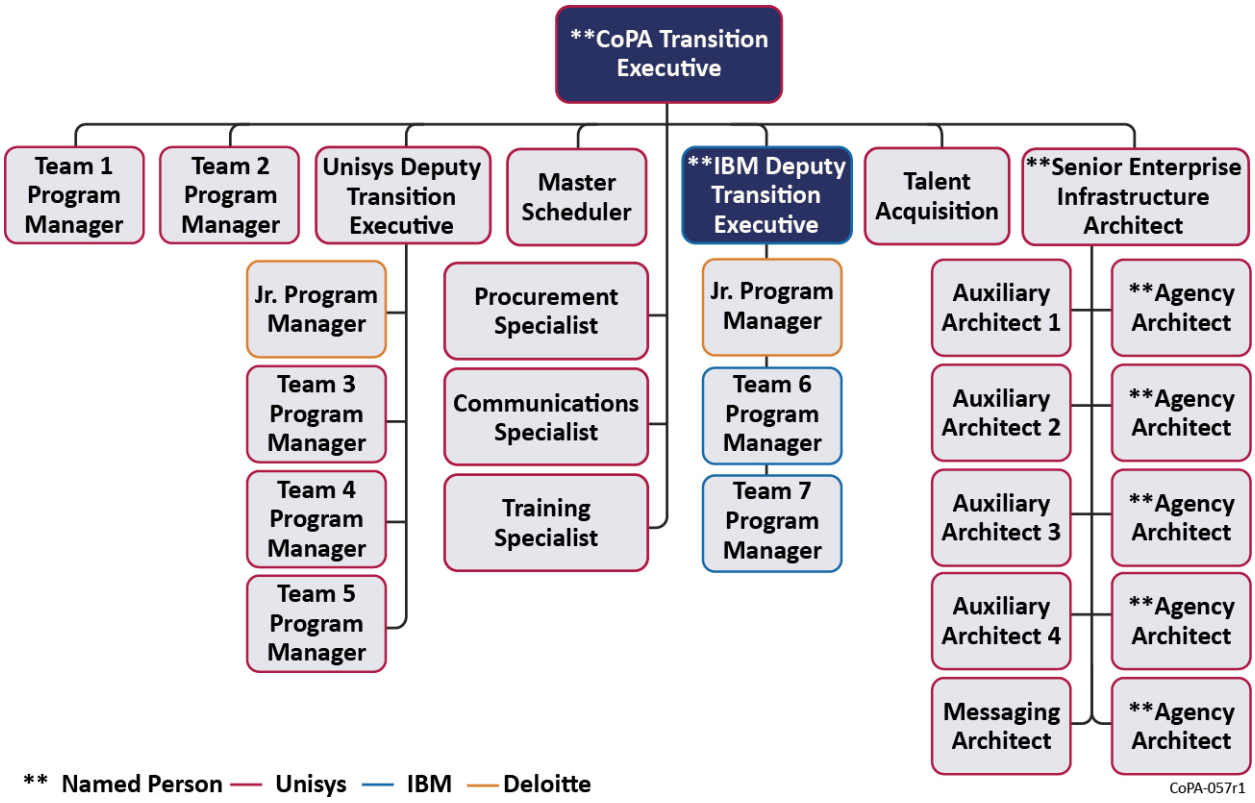

Figure 3.3.2.1-1 – TPMO Organization

The mission of the TPMO is to be the sole governance and program management organization responsible for the successful transition of all Commonwealth IT services from their internal Commonwealth IT organizations and Data PowerHouse (DPH) contract to this proposal's new contract services, organization, facilities, processes, deliverables and structure. As part of that mission, it is the TPMO's goal to accomplish this transition, as an application centric model, in accordance to the scope, requirements, deliverables and milestones set forth in Schedule D – Transition Milestones and Schedule K – Key Program Deliverables within the RFP.

The TPMO will nurture our existing working relationships with the Commonwealth to provide an efficient, coordinated, and insightful transition of services to the new contract with the objective to transition all of the Commonwealth's mainframe, midrange and SAP environments to be as close to the Commonwealth's current configuration as technically possible. Our TPMO will carefully control the changes to the current configuration through strong oversight of our teams and a close working relationship with the Commonwealth's technical and leadership teams. Our policy of open communication policy removes many of the pitfalls that disrupt transitions.

1.B Offeror must provide at least one sample where Offeror has successfully created an office similar to the required TPMO.

Key to this program's success is the strong organization and collaborating between the Commonwealth and the Unisys Team. A project of this size and complexity requires a deep level of understanding of the goals and current environment as well as diverse experiences. The Commonwealth of Pennsylvania Data Center Transition Program benefits from prior projects undertaken and led by the Unisys Team such as the American Red Cross, State of Georgia, as well as our existing Commonwealth of Pennsylvania Data PowerHouse contracts as referenced in Section 4.5 of this proposal.

1.C The Office will be jointly administered by Offeror and Commonwealth staff.

The TPMO while a standalone organization as it relates to transition will have joint administrative oversight through a Program Steering Committee. The Program Steering Committee will be comprised of senior leaders from both the Commonwealth and the Unisys Team. This committee will drive the strategic direction, tactical decisions, issue escalation, and communication with leaders within the Commonwealth Office of Administration, agencies, and bureaus.

Within each sub-project, a joint Commonwealth and Unisys oversight steering committee will be established The exact make-up and size of the steering committee will depend on the project but in general will be headed by one of the Deputy Transition Executives and include the Project Manager, Application Owners and as appropriate, an agency director's representative. These committees will be responsible for providing strategic direction to each project, decision making based on Commonwealth agency and customer requirements, resolution of project issues and communications within the agency/customer base.

1.D Provide a communication plan that will provide an information vehicle for all interested parties.

A program level Communications Plan, managed by the Transition Director, will provide overall governance and communication updates throughout the program. The Project Managers will leverage the common project level communications plan tailoring their communication plan from the common communication plan. **Figure 3.3.2.1-2** below depicts the proposed Program Level Communication Plan.

Title	Owner	Audience	Trigger	Purpose	Length (UOM)	Frequency	Format
Program Kickoff	Transition Director	Program Steering Committee and Program Sponsors	Contract Signature	To review and plan the program	4 hours	Once	Meeting
Program Steering	Transition	Program Steering	Program	Interactive review of	1 hour	Weekly	Meeting/Teleconference

Committee Reviews	Director	Committee and Program Sponsors	Kickoff	progress, risks and plans (tactical)			
Program Strategic Planning	Transition Director	Program Steering Committee and Program Sponsors	Calendar	Interactive Review of Progress, risks and plans (strategic)	4 hours	Quarterly	Meeting
Program Status Report	Transition Director	Unisys Leadership, Commonwealth Leadership	Program Kickoff	Informational Static report for wider dissemination (tactical)	2 Pages	Weekly	Report
Agency Kickoff	Transition Director	Agency Leadership, Commonwealth Sponsor, Unisys Leadership	Agency Kickoff	To review and plan agency participation	4 hours	Once	Meeting
Agency Status Review	Transition Director	Agency Leadership, Commonwealth Sponsor, Unisys Leadership	Agency Kickoff	Interactive Review Progress Risks and Plans (tactical)	2 hours	Monthly	Meeting
Milestone Signoff	Transition Director	Commonwealth Program Sponsor and Unisys Client Executive	Milestone Completion	To review results of the program; gain concurrence for successful completion of milestones	1 page	Periodic	Letter
Unisys Executive Reviews	Transition Director	Unisys: President of Global Managed Services, VP Outsourcing, VP Global Delivery, VP Commonwealth Account, VP Service Delivery, Global Director of Transitions, Commonwealth Program Manager	Contract Signature	Bi-lateral communications on issues, assistance with resolution, direction setting and course correction	1 hour	Weekly	Teleconference

Figure 3.3.2.1-2 - Sample Program Level Communication Plan

Figure 3.3.2.1-3 below depicts a sample Project Level Communication Plan.

Title	Owner	Audience	Trigger	Purpose	Length (UOM)	Frequency	Format
Project Kickoff	Project Manager	Application Owners, Agency Leader, Technical Project Team	Program Schedule	To review and plan the project	2 hours	Once	Meeting
Project Status Reviews	Project Manager	Application Owners, Technical Project Team	Project Kickoff	Interactive review of progress, risks and plans (tactical)	1 hour	Weekly	Meeting/Teleconference
Project Status Report	Project Manger	Unisys Leadership, Agency Leadership	Project Kickoff	Informational Static report for wider dissemination (tactical)	1 Page	Weekly	Report
Scope Signoff	Project Manager	Agency Leadership	Project Schedule	To document agreed upon scope and methods for project execution	1 or 2 Pages	Once	Report
30/7/2 day Notifications	Project Manager	Unisys Leadership, Agency Leadership, applications users	* 30/7/2 days prior to significant Events	To provide notification to affected parties of an event that may affect their business	1 Page	Once	Email/Letter
Event Completion Signoff	Project Manager	Commonwealth Application Owner or process owner	Completion of event + 3 days	To review the results of an event; gain concurrence for successful completion of the event / project	1 Page	Once/event	Letter

Figure 3.3.2.1-3 – Sample Project level Communications Plans

2 Transition Functional Organization Chart

2.A Provide a functional organization chart for the TPMO, including an estimate of the type and number of full time Offeror resources that will be required to ensure the successful transition of Services from current multiple datacenters to the Offeror's datacenter Services. Offeror must describe the TPMO structure including but not limited to the number of full time resources and the role of the TPMO in the transition.

Please see the response to requirement 1 in table F.3.3.2.1 for an overview of the TPMO and **Figure 3.3.2.1-1** above for the TPMO functional organization chart. Our response to Section 5.6, Staffing Plan provides additional staffing details such as the number of staff expected to participate. The TPMO structure including roles and responsibilities is described in detail below:

Transition Executive

Unisys has appointed [redacted] as the Transition Executive responsible for all aspects of delivering the transition, including milestones, communications, and the identification and assignment of transition resources. The Unisys Transition Executive will represent Unisys as the single point of contact (SPOC) during the transition, provide oversight and direction, and monitor the transition's overall status. The Unisys Transition Executive's role includes:

- Managing all aspects of the transition program, including planning, staffing, finance, and implementation of transition deliverables
- Maintaining overall business relationship with Unisys, Commonwealth and business partners as it relates to the Transition program
- Ensuring that all Transition communication is made according to the Communication Plan
- Confirming that resources participating in the transition program have a common understanding of needs of both businesses and the program's deliverables
- Agreeing on the scope, timelines, costs, and delivery timetables for each technology domain, confirming they are consistent and complementary with the transition program's objectives
- Establishing effective controls and procedures for the transition program
- Monitoring progress with all areas contributing to the program
- Reporting the transition's status to all program stakeholders
- Managing team performance to meet all transition objectives on time and within budget and quality
- Identifying and resolving conflicting transition priorities
- Managing internal and external relationships and expectations for a successful transition
- Conducting project and program implementation reviews to measure the transition's actual performance against the goals.

Deputy Transition Executive(s)

Unisys will appoint Deputy Transition Executive(s), who shall be responsible for aspects of delivering the projects within their portfolio, including milestones, communications, and the identification and assignment of transition resources. The Deputy Transition Executive(s) will

represent the Unisys Team as the single point of contact (SPOC) for their respective project portfolio during the transition, provide oversight and direction, and monitor their portfolio's overall status. The Deputy Transition Executive's role includes:

- Overseeing all aspects of the transition projects, including planning, staffing, finance, and implementation of transition deliverables
- Mentoring of Project Managers
- Providing an escalation point within each project
- Overseeing that all project portfolio communication is made according to the Communication Plan
- Confirming that resources participating in the transition project portfolio have a common understanding of needs of both businesses and the project's deliverables
- Establishing effective controls and procedures for the transition project
- Monitoring progress with all areas contributing to the project
- Facilitating reporting of their portfolio's status to the TPMO
- Identifying and resolving conflicting project priorities escalated from Project Managers
- Conducting project implementation reviews to measure the transition's actual performance against the goals and critical success factors.

Project Manager(s)

Project Managers, will be responsible for all aspects of delivering the projects, including milestones, communications, and the identification and assignment of project resources. The Project Manager(s) will represent the Unisys Team as the single point of contact (SPOC) at the individual project level, provide oversight and direction, and monitor the project's overall status. The Project Manager role includes:

- Managing all aspects of the project, including planning, staffing, finance, and implementation of deliverables
- Maintaining business relationship with Unisys, Commonwealth and business partners
- Facilitating all communication made according to the Communication Plan
- Confirming that resources participating in the project has a common understanding of needs of both businesses and the program's deliverables
- Agreeing on the scope, timelines, costs, and delivery timetables for each tower, confirming they are consistent and complementary with the transition program's objectives
- Monitoring progress with all areas contributing to the project
- Reporting the project's status to all project stakeholders
- Managing team performance to meet all project's objectives on time and within budget and quality
- Identifying and resolving conflicting project priorities.
- Managing internal and external relationships and expectations for a successful project

Project Coordinator(s) – a.k.a. Jr. Project Managers

Project Coordinators, will be appointed who shall be responsible for assisting the Project Manager in delivering a successful project. The Project Manager role includes:

- Scheduling Meetings
- Capturing, documenting and distributing meeting minutes
- Organizing project documentation
- Collecting schedule updates at the individual project level and provide those updates to the Master Scheduler

Master Scheduler

The Master Scheduler is responsible for all aspects of Project's Schedule(s). The Master Scheduler's role includes:

- Developing standards and guidelines, consistent with Unisys Project Management Best Practices, involving the Program's Master Schedule and all related schedules
- Facilitating weekly progress updates and tracking within Microsoft Project
- Detailed schedule development
- Schedule reporting as required
- Schedule issue escalation to the TPMO
- Consolidation of project schedules into the program schedule as needed.

Additional Transition Team Member Roles and Responsibilities

During the planning sessions, we will identify the Transition Subject Matter Experts (SME's). We will organize the SME's into teams to focus their work. Individually, each SME will have a role and specific responsibilities for the Transition. The team structure and functions are presented Team at the Transition Kickoff Meeting.

The following **Figure 3.3.2.1-4** provides an overview of the roles and responsibilities for each member of the Transition Team.

Team Member Role	Team Member Responsibilities
Technical Implementation Engineers	Responsible for various technical disciplines including Mainframe, AIX, x86 (Windows and Linux), Network, Security, ITSM, Storage, Backup and Monitoring. Will deliver technical knowledge of tools for implementation and processes.
Procurement Specialist	Responsible for ensuring all team members know and understand the procurement process, assist TIEs with securing BOMs, PO Approval, Order tracking, expediting and receiving. Will notify appropriate team members when orders are received.
Talent Acquisition Specialist	Responsible for ensuring all team members know and understand the staffing process, assist team members with staffing requisition tracking, expediting and receiving.
Training Specialist	Responsible for coordinating all training needs for the Commonwealth, Account PMO,

	Transition PMO and Technical Teams including use of facilities for training purposes, coordination of 3rd party training required for the transition and support in development of account specific training needs.	
Communications Specialist	Responsible to provide all communications to the Commonwealth and its Stakeholders is timely, accurate and professional.	
Senior Enterprise Infrastructure Architect	Responsible to provide overall Commonwealth Supported Architecture meets or exceeds requirements, is documented, and is implemented within quality standards.	
Agency and Auxiliary Architects	Responsible for agency and tower specific architectures as determined by the Account Lead Architect	

Figure 3.3.2.1-4 - Transition Roles and Responsibilities

3 Requirements Analysis Approach

3.A Analyze applications and design the required computing architecture to migrate Commonwealth datacenters to Offeror datacenter environments. Hardware, software, network, etc.

Offeror must describe solution and approach to meet this requirement.

The Commonwealth benefits from the 13+ years of experience the Unisys Team has supporting the Commonwealth of Pennsylvania and its key applications residing in the Data PowerHouse and Enterprise Data Center. The Transition and Data Center Methodology utilized by Unisys keeps the applications at the center of focus.

The first step in planning the Transition is to understand the applications supported within each data center. The Unisys Team will accomplish this during the Data Gathering phase leveraging [redacted] tool to understand all applications running in the environment and their relationship to each other and to the infrastructure. Additionally the Commonwealth may choose to request two additional tools from the Enterprise Services Catalog in situations where the application owners may need additional help to identify technical requirements. [redacted] the industry leading asset analytics tool, gathers detailed infrastructure information to provide the appropriate future-state infrastructure environment for each application/component. The application owners will also have at their disposal a process developed by Unisys Team members called Application Performance Impact Assessment that takes a top-down approach to identify those applications that are critical and require a deep dive. The process is supported by tools and software utilized for latency issue detection and validation.

Once the information gathering and documentation is complete, the Unisys Team will generate a draft move package grouping based on the application dependencies, the number of applications, and the number of servers. The move package groupings are reviewed at an application grouping level with representatives from the Commonwealth prior to creating the initial project schedules. The project team and application owners will provide a detailed review and input into the detailed project schedules. This input will include a review of the scope of each application, confirmation of related applications as well as input into the appropriate day, date and time of day that reduces the impact to the stakeholders who utilize the application(s).

During the project, additional attention is paid to each application to provide a smooth migration. These tasks include reviewing the applications for hard coded IP addresses, firewall rules, and other issues that may occur during the migration. Based on the information gathered

and the analysis of application requirements, the required computing architecture at the target data center environment will be reviewed and validated accordingly. Development and execution of detailed test plans both before and immediately after the migration is required to verify the application will execute as expected. Lastly, each migration project is not completed until the application owner has confirmed the application executes as expected.

3.B Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

The Commonwealth of Pennsylvania Data Center Transition Program benefits from prior projects undertaken and led by the Unisys Team such as the American Red Cross, State of Georgia, as well as our existing Commonwealth of Pennsylvania Data PowerHouse contracts as referenced in Section 4.5 of this proposal.

3.C Work with Commonwealth technical staff to ascertain the requirements to successfully migrate processing to Offeror datacenter environments

The Unisys Team recognizes the need for and value the Commonwealth technology and application support staff participation in the transition program. In particular, the application owners will perform key roles in the program and projects. These stakeholders will be involved in the planning, execution and testing of migration packages. Prior to the kickoff of migration projects, the project manager will send a questionnaire to each application owner, requesting basic information for each application. The results will form the basis for the kickoff meetings content and will be updated throughout the project as additional information becomes available.

4 Process Optimization Plan

4.A Optimize Current Process and Procedures

Offeror must describe its overall plan for optimization of the existing processes, procedures, tools, etc. to provide more efficient and effective Services.

The description must include approach, plan, and methodologies.

The Transition of Services Project(s) will be dedicated to understanding and documenting the current state environment for the Commonwealth's data centers. When these tasks are completed, the team will turn its focus to identifying the gaps between current processes and the Unisys Team's best practices in order to develop a strong detailed plan for a seamless implementation and conversion to those appropriate best practices.

The Unisys Team will apply their experience and knowledge of the Commonwealth will enhance their ability to identify opportunities for transition improvements. For a more detailed explanation please see Section 3 Attachment 9 "Schedule M: Detailed Transition Plan". Additional information on the Unisys Team's approach to Continuous Improvement can be found in Schedule F, Section 3.2.1.1.6.

4.B Coordinate with Commonwealth agencies to review and plan for a transition of processes and procedures.

During the initial transition of services project, the Unisys Team will meet with the Commonwealth and key agency representatives to gain insight needed to create an effective

plan, and then to obtain concurrence on the plan.

5 DR, Data Recovery Plan Revisions

5.A Revise datacenter DR plans on the occasion of major changes to the datacenter hardware, software, or network portfolio to reflect those major changes.

Offeror must describe solution and approach to meet this requirement.

The Unisys IT Risk Manager in the Program Management Office will oversee an Agency-by-Agency review of each Disaster Recovery Plan during transition. As part of this review, each Agency plan will be entered into the new online DR planning tool requested by the Commonwealth. This transition process populates the online DR planning tool with the DR Runbooks and provides the initial capture of the Commonwealth's Disaster Recovery capacity required.

Following transition the IT Risk Manager in the Program Management Office will oversee the maintenance of the Commonwealth's online disaster recovery tool as part of this Unisys proposal. The IT Risk Manager and Disaster Recovery Coordinators have broad oversight at the Agency level and meets with Agency leaders regularly to review, update, and maintain Agency Disaster Recovery plans within the new online DR planning tool. The addition of new Customers or new Services will also initiate an action for the IT Risk Manager to schedule an oversight review with the appropriate Agency-level leader and validate they have been incorporated into Agency-level Disaster Recovery Plans.

The Unisys operations teams that maintain the Unisys-managed Disaster Recovery configurations across our data center locations will rely on review of changes to the online Disaster Recovery planning tool, regular Disaster Recovery trend reports and new Project roster reviews to gauge and maintain adequate supply and appropriate tiers of service in the Disaster Recovery sites.

Ultimately, the DR plan is tested for quality and completeness during the two annual tests that the Commonwealth stipulates. Upon completion of each test, the Disaster Recovery Testing team will review all DR test results as part of the regular remediation and improvement cycles that follow any DR testing.

The specifics of the Commonwealth's new DR Infrastructure on Demand are detailed in the Schedule F, Section 3.2.5.3 DR Infrastructure on Demand section.

6 Infrastructure Design, Example

6.A Establish an IT infrastructure that meets all application processing requirements. The Offeror must confirm that the target IT infrastructure meets or exceeds current computing requirements.

Offeror must describe solution and approach to meet this requirement.

Using the Commonwealth's requirements defined in Schedule F, Schedule J1-3, Schedule I, and the Exhibits, Unisys has developed a multi-tenant infrastructure architecture, including hardware, software, and services; which will support the Commonwealth's applications and services. Unisys is confident the solution provided meets or exceeds all processing requirements identified. For additional information on the infrastructure architecture, please see Schedule F, Section 3.2.2.2. Unisys will work with the Commonwealth and its Agencies to validate that the infrastructure meets or exceeds the current computing requirements during the transition of services to Unisys support and management. The transition program is

designed to migrate a "like for like" environment. If a new environment such as a test environment is required, the Commonwealth can choose from the options in the Enterprise Services Catalog.

As the Commonwealth migrates to the Unisys managed data centers, the Unisys Team will work the Commonwealth's technical staff to evaluate the application requirements and recommend the components of the infrastructure architecture and the services catalog to support the migration of the services to the managed data center environment. The Unisys Team will be implementing the infrastructure architecture to support a multi-agency environment to enable the Commonwealth to select the appropriate components and services in a manner that will be flexible for both cost and technical needs. Many elements of the infrastructure will be available as a shared service and also can be implemented as a separate dedicated component when a requirement for separation is provided. As part of the evaluation, Unisys will work with the Commonwealth to understand any regulatory requirements, recommend and implement additional services to meet the regulatory requirement.

6.B Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

The Unisys Team has supported the Commonwealth's Data PowerHouse data center since 1999. This environment supports multiple agencies using both dedicated and shared technical components for many Commonwealth business critical applications. As part of the 2008 contract renewal, the Unisys Team added several technologies and services delivering flexibility to share technical resources between agencies to reduce cost and improve service for the Commonwealth.

Since 2001, the Unisys Team has provided data center hosting services to the California State University supporting the Chancellor's office and 23 campuses. The Hosting service provides infrastructure support for the University system's PeopleSoft Higher Education applications and Oracle databases using shared infrastructure and technologies while continuing to support the needs of the overall university system and individual campus operations.

6.C Work with Commonwealth technical staff to design and build the infrastructure required to support the applications being migrated to the Offeror multi datacenter environment.

Unisys will provide a network of data centers that supports relocation of Commonwealth applications. All Unisys data centers other than the [redacted] are Uptime Institute Tier 3 equivalent facilities.

The [redacted] will remain untouched except for provision of metering for the computer room. Updates to the facility infrastructure including BMS, UPS, generators, and air conditioning will be presented for Commonwealth approval. (NOTE: Because the facility is not Tier 3, configurations with SLA's requiring Tier 3 will be relocated to another facility.)

7 Multi Faceted Transition Strategy

7.A A multi-faceted Transition Strategy will be required: comprehensive, non-disruptive, and compliant with Commonwealth requirements

In general, the program will take a top-down approach to planning while each of the projects will be bottom-up. This allows the Program Steering Committee to provide strategic direction to the program to provide a successful migration while at the same time allowing the projects to focus on each agency, their applications and their stakeholder's unique requirements.

As project teams refine the application migration project plans, they will be engaging with application owners to incorporate in the plans not only blackout periods but in-flight projects and other schedule information as well. This type of information is critical to developing a plan that is least disruptive to the end user community as well as the application development and maintenance staff. For additional information, please see Section 3 Work Plan.

7.B The migration order of the Commonwealth datacenters will be provided by the Commonwealth.

The Migration Strategy will address the transition of: Shared infrastructure elements, as appropriate; and Specific information Services. Disparate Agency application architectures and impacts to move to the new environment(s)

Unisys proposes a phased and comprehensive approach in assessing and implementing data center migrations and consolidations. This approach focuses on several key areas. First, we identify risk and risk mitigation. Unisys treats these moves like a controlled disaster – every action is planned, tested, and validated with documented, rehearsed back-out and contingency plans. Second, is the business and application centric approach, we take the time to detail business requirements and understand application interdependencies disruption to the business. Finally, we use a thorough and comprehensive program management methodology to making the data center migration as smooth and non-disruptive as possible and will not short-cut planning activities.

Phase 1, Data Gathering and Analysis, will concentrate on developing a complete understanding of the current application and infrastructure inventory. Based on this information Unisys will be able to identify the requirements that will be used as inputs to the overall migration plan. A master migration plan will be negotiated with business stakeholders strives to minimize potential impacts to normal business operations. Phase 1 will concentrate on the following key areas:

- Project and resource planning
- Application inventory and physical asset inventory
- System and Application Mapping including dependencies and interdependencies
- Identification of either assets or application that will be retired, moved or consolidated
- Identification of requirements such as outage windows, change control process, validation needs, site availability and capacity constraints
- Aligning the applications and systems into move groups or migration bundles
- Selecting migration strategies and technical requirements for each application
  - Based upon Application RTO and RPO
  - Physical moves, data migrations to new "seed" equipment at the target site are two examples of migration strategies
- Building of a Master Migration Schedule

The overall goals of Phase 1 are to discover the assets to be moved and gain consensus on a migration schedule.

Phase 2 is the detailed site planning that establishes target site readiness to host the moved assets.

Design of the new storage assets, verification of network and facilities plans, and a rollout plan for new assets are completed at this time. Key goals for this period include:

- Validate that target site build-out plans will meet the time and infrastructure needs for the asset migration
- Validate that new storage infrastructure is designed appropriately and in order
- Validate that new server roll-outs are timed appropriately to meet migration schedule
- Finalize all scheduling for transportation and OEM re-certification of assets

At the conclusion of Phase 2, Unisys and the Commonwealth will agree to initiate migration activities.

Phase 3 is the execution of the move plans. For each of the move groups, Unisys creates detailed task level runbooks that choreograph every action during the move. These plans are tested via table top exercises; the actual moves are coordinated and tested by Unisys and Ingalls' resources. Key activities include:

- Finalizing detailed night of move project plans
- Completing migration workbooks containing detailed procedures for application shutdown, server power-off/power-on, and other key technical activities
- Testing and rehearsal of move activities
- Final site visits to confirm target site is ready for asset move
- Disassembly, packaging, transportation and re-assembly of all assets
- Verification of proper functionality at target site

Phase 3 concludes with the Commonwealths' acceptance of the Data Center migration.

Unisyss Data Center migration methodology has been successful in dozens of large data center moves. Key to our success is a disciplined quality assurance program. Unisys will assign a subject matter expert not directly involved in the engagement to review the project at pre-determined points in time known as "QA Gates." The QA reviewer will look for issues that create risk in several areas with an emphasis on those that may jeopardize the migration timelines or pose a threat to maintaining normal business operations. The QA reviewer will meet with a set of Client stakeholders and project sponsors to review how well Unisys is meeting expectations. Chart in **Figure 3.3.2.1-5** summarizes the steps in the methodology and the estimated QA Gate timing.

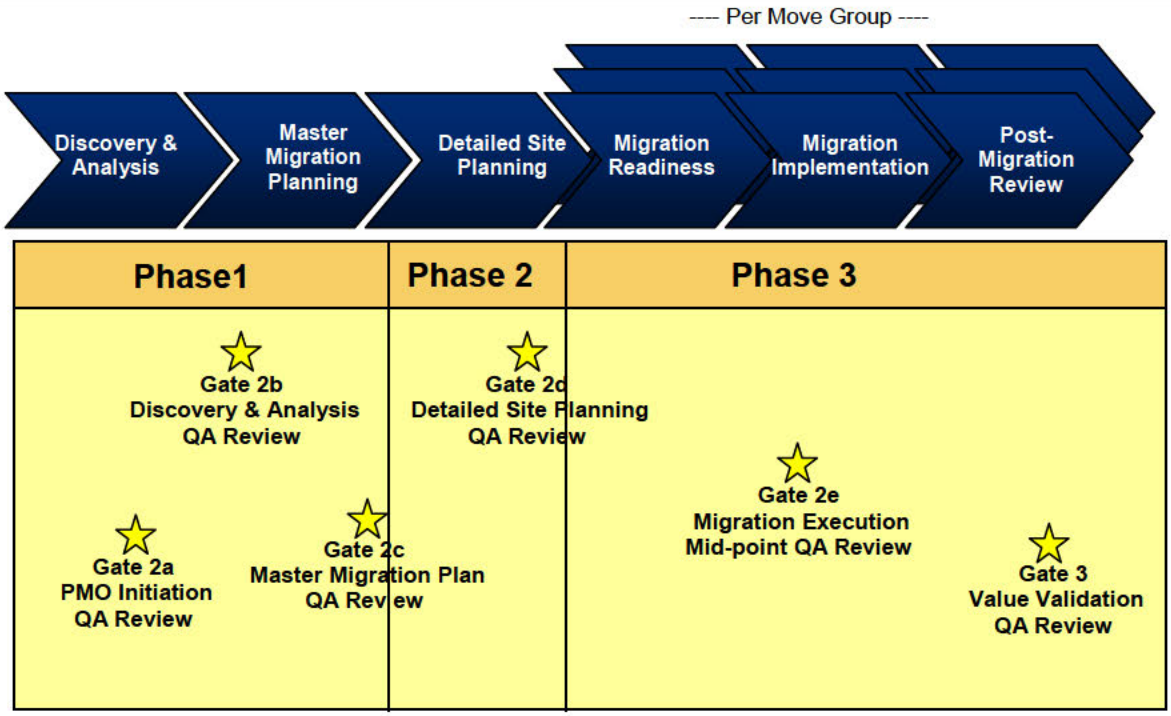

Figure 3.3.2.1-5 – Migration Phases

Once move groups are established the data center migrations will be accomplished using a variety of tools and techniques. The type of migration will be suggested by the Unisys Team but in all cases reviewed and agreed upon by the application owners.

The primary methods will be:

- Over-the-Wire – This is also known as P2P, V2V or Seed. This option will minimize the duration of the application outage required. For over-the-wire moves, seed hardware is first located in the receiving site and made production ready. A small application is placed on each server in the sending site to replicate the OS, application and application data onto the specific drives at the receiving site. Installation of the application is done during a monthly planned outage. An initial copy is executed soon after installation and sync copies are periodically executed leading up to the move event. During the move event, a final sync copy is taken after the application is shut down to verify all data and updates have been received in the new data center. Once the final sync is completed, the hardware in the sending data center is shut down and the application in the receiving data center is brought up. Once fully started, the application support team will execute the test plan created during the planning process. After a successful test, the test, the application owner will sign-off that it is ready for turnover to the end users. Using this option requires a shorter application outage. This method has low to moderate risk and a lower cost profile when utilized on assets with less than one year of expected life. As the age of the equipment increases so does the risk but the cost profile decreases due to the expectation of replacing the aging hardware.
- Lift and Shift –This option requires the applications to be shut down by the application support team, the supporting infrastructure will then be shut down and taken out of the racks, placed in shipping containers and transported to the new site via a dedicated professional moving partner. For applications that utilize shared storage, in most cases,

the data will be migrated over the wire using a data pre-application tool prior to the start of the event. In some cases, the project team may choose to ship data via tape. Once at the new site, the servers will be re-racked, cabled, and powered up according to the processes provided by the application support team. Once fully started, the application support team will be expected to execute the test plan created during the planning process. Once the team has successfully executed the test, the application owner will sign-off that it is ready for turnover to the end users. Using this option requires a longer application outage. This method has low to moderate risk and a low cost profile when utilized on assets with greater than one year of expected life. As the age of the equipment increases so does the risk and cost profile.

A third option exists which is a variation of the Over-the-Wire option.

- Seed with Greenfield – In this option, seed hardware is installed in the receiving data center, the operating system is installed directly on the hardware, the Application is installed and then the application's data is copied. Once fully started, the application support team will execute the test plan created during the planning process. Once the team has successfully executed the test, the application owner will sign-off that it is ready for turnover to the end users. Using this option requires a shorter application outage but presents a high risk profile and a higher cost profile.

In all cases, minimal changes are made to the environment to minimize the risk and expedite resolution of any incidents discovered during the migration events.

Early in the planning process, the Project Managers will work with the Application Owners to identify and agree on the migration method for each infrastructure device supporting an application being migrated. In most cases, shared services infrastructure devices such as Storage and Virtual Machines (VM) will be migrated over-the-wire to allow for flexibility in move package creation.

7.C The Migration Strategy must also address the following: Cost/Benefit for the Agency, Risks and Risk Mitigation Plan

Data Center Migrations employ three primary strategies: Over-the-Wire, Lift and Shift, and Seed with Greenfield. These strategies are defined in the previous section. Migrations may choose to employ one or all three or even combinations of the three depending on the application owner's priorities. A lift and shift strategy provides a low cost solution as no new hardware is required and labor expenses are reduced as compared to the other options. It does increase the risk due to the potential for damage during transport as well as the extended outage that would be required should a fallback need to be executed. Over-the-wire migrations increase the cost over lift and shift due to the requirement to purchase and install new hardware but are still less costly as compared to Seed with Greenfield. The risk level with Over-the-Wire is minimized by tools like [redacted] that will move bit-by-bit storage from the sending data center to the receiving data center including the operating system as configured and the application as configured.

The most risky and highest cost migration strategy is Seed with Greenfield however in some cases, this may be the best approach. For example, an application that requires an upgrade may choose this strategy if the application owner previously had planned an upgrade in place. See **Figure 3.3.2.1-6** below for cost and risk comparison for the options.

Migration Strategy	Risk Level	Cost Level
Over-the-Wire	Low	Medium
Lift and Shift	Medium	Low
Seed with Greenfield	High	High

Figure 3.3.2.1-6 – Migration Strategy Cost/Benefit and Risk Table

8 Critical Transition Plan Success Factors

8.A Identify mandatory requirements and critical success factors that will have a direct impact on developing a successful transition plan

Offeror must describe the 3-5 characteristics, conditions, or variables it believes will have a direct and critical impact on the effectiveness, efficiency, and viability of the Offeror's solution.

Critical to the success of any endeavor is the buy-in of participants. Large transition efforts such as the one the Commonwealth has initiated do not achieve the desired goals without cooperation from all levels of the organization. The list below are a few of the key characteristics and mitigation strategies:

- Resistance – Passive and Active resistance can both be roadblocks to success due to delays and misinformation.
  - Mitigation Strategies:
    - Include influential resources in the project. It will be important that we include not only resources who have specific technical skills but also a few who have influence over others in the organization. Make them a part of the solution.
    - Clear and directed communications
    - Gain buy-in from Commonwealth leaders via Steering Committees
- Clear scope and direction
  - Mitigation Strategies:
    - Include key thought leaders in planning process
    - Communicate in terms appropriate for the audience
    - Develop a strong, well thought project schedule and execute to it
    - Identify risks and plans to mitigate
- Appropriate Staffing
  - Mitigation Strategies:
    - Gain leadership's support for prioritization of project
    - Look across all organizations to find the right person for the right job at the right time

8.B Offeror must describe its approach to mitigating risks and ensuring these critical factors are successfully addressed.

Communications amongst stakeholders is the key to identifying and mitigating risk. A key component of the Program and Project plans will be maintenance of a risk register. Each project will maintain a risk register and actively work with stakeholders to identify potential risks and mitigation strategies. Within each weekly review meeting, the project managers will assess the current risk register with all team members for accuracy and input. It is the project manager's responsibility to assign mitigation task to team members and confirm progress.

9 Transition Timeline

9.A Create a Transition Timeline that outlines the overall timeline starting at effective date and continues through delivering transition Services for each of the targeted datacenters.

Any critical milestones identified must be included in the Transition Project Plan.

Figure 3.3.2.1-7 below shows a high level timeline of projects and activities as compared to the Commonwealth's Milestones. The Unisys Team is uniquely able to accomplish this accelerated timeline as a result of the close relationship our team has delivering current and prior projects with the Commonwealth. We save time on the DPH and [redacted] migrations by skipping over the major learning curve of a vendor that is not currently supporting Commonwealth environments.

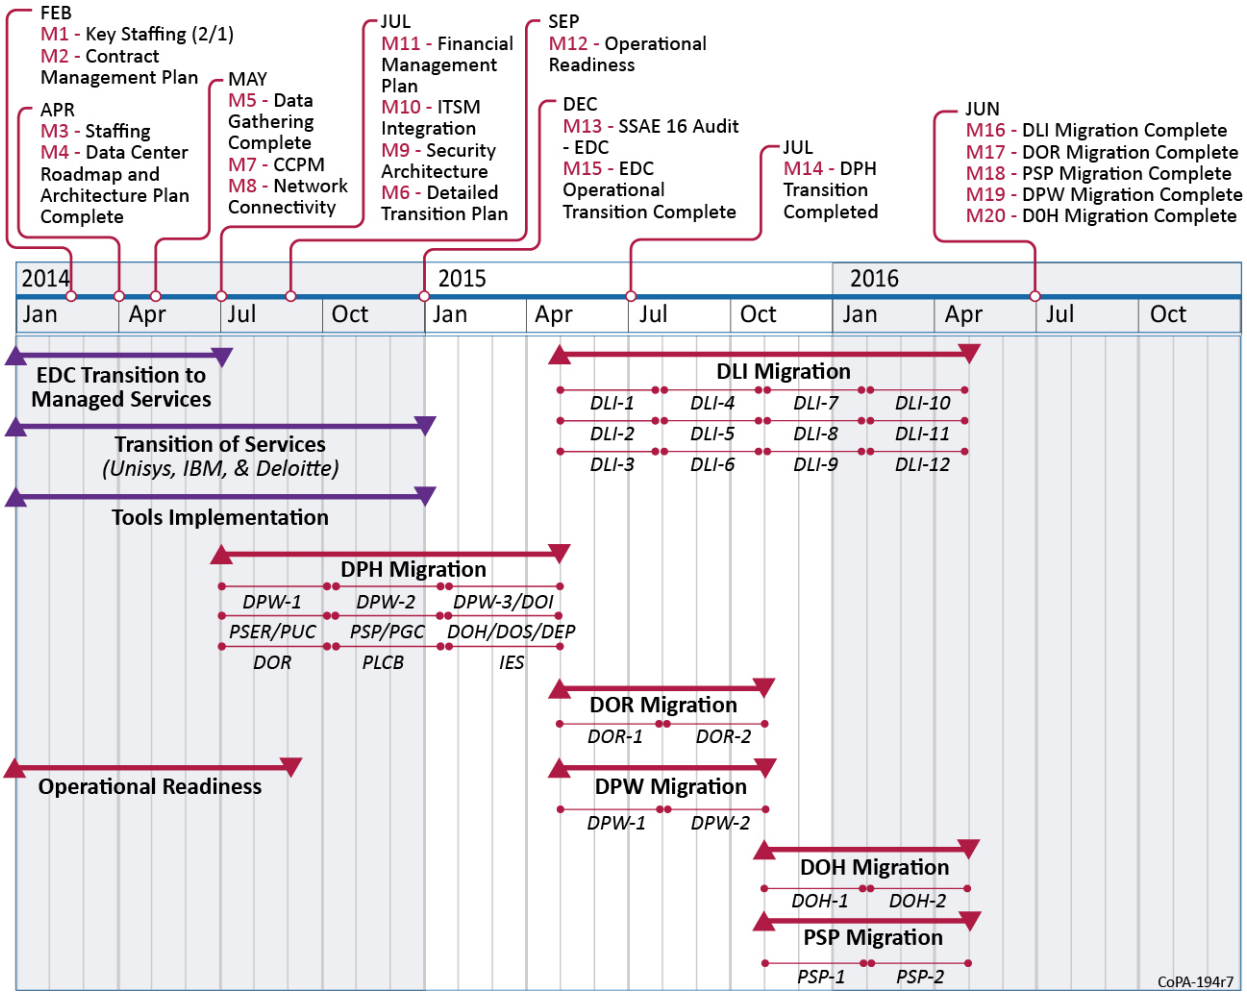

Figure 3.3.2.1-7 – Transition Program GANTT Chart

9.B Offeror must describe the overall timeline from the start of pre-Transition activities through the point at which the Offeror expects it will be delivering predictable, repeatable Managed Service Results that meet the requirements of the RFP.

The schedule must include a description of the critical milestones related to Transition efforts for each targeted Commonwealth datacenter.

The purpose of the Transition Program is to transform how the Unisys Team provides services to the Commonwealth today in order to broaden the scope and deliver high quality services in the future. Taking a top-down view of the program, it will be organized into three major categories of activity - Transition, Migration, and Program Management.

Transition activities center on the transformation and implementation of policies, processes, procedures, tools and people required to deliver services to the Commonwealth.

These activities are further broken into projects such as Account Team Set-up, Tools Implementation and Enterprise Data Center ([redacted] Transition to Managed Services. Very early in this process the Program Management Office will play a key role in establishing direction for tasks within each tower. Unisys has designed toolsets to support the implemented processes. This set of tools will greatly enable and facilitate high quality service delivery as well as facilitate improved sharing of information. Concurrent with the process and tools implementation, activities will occur to perform knowledge transfer from the existing [redacted] contract to the Managed Services agreement. In many cases, this knowledge transfer required for this transformation will occur by moving staff from the current team to the new team, providing a strong base of knowledge. Careful consideration will be given to which team members and how many will participate directly in the [redacted] Transition Activities and what positions will require backfill so as to continue to provide the high level of service the Commonwealth currently receives.

Migration. At Unisys we believe focus must always be on the application portfolio. Within the data center migration (DCM) activities, there are three major groupings.

- First, Operational Readiness provides application, infrastructure, and processes required to host the applications. Within these tasks, the Unisys Team will create detailed designs and implement the Wide Area Network (WAN), Local Area Network (LAN), Storage and Backup infrastructure, Monitoring, Tools, Server Management, Dashboard and Information Technology Service (ITSM) infrastructures.
- The second major grouping is Data Center Planning, which runs in parallel with Operational Readiness. Within the planning framework, the DCM team will be gathering and analyzing information gathered electronically as well as in meetings with the agencies and their application owners. Draft Move Packages created based on the information gathered and results of the analysis will show related applications which may have latency dependencies, schedule restrictions, size, complexity and number of applications. A typical Move Package will not exceed 100 servers and 6 applications.
- The last grouping is to execute the migration of the applications. The building of detailed plans will be a highly collaborative effort between the Commonwealth and the Unisys Team to build detailed plans. Each of these projects will have duration of approximately 3

months and will include development of test plans, detailed technology, and migration plans developed down to the minute by minute tasks required during the migration events.

Program Management drives the successful transition of all Commonwealth IT services from their internal Commonwealth IT organizations and Data PowerHouse (DPH) contract to this proposal's new contract services, organization, facilities, processes, deliverables and structure.

Figure 3.3.2.1-7 above shows the relationship of the Unisys Team's proposed project schedules to the Milestones provided by the Commonwealth. In every case the Unisys Team will meet or exceed the milestone delivery dates requested by the Commonwealth.

10 Infrastructure Element Transition Plan

10.A Create a generic Infrastructure Element Transition Plan that may be readily adapted to accommodate specific infrastructure element transitions.

Although all Transitions are similar, they are each unique. The Unisys approach to transition is based on grouping of business services, applications, and underlying infrastructure elements into logical Move Packages. **Figure 3.3.2.1-8** is a high level project schedule for a generic move package transition that needs to be executed in order to successfully transition and consolidate the Commonwealth's data centers. During the planning for each project, the project schedule will be further broken down to manageable tasks as suggested the Project Management Institutes' guidelines and scheduled specifically to the needs of each commonwealth project.

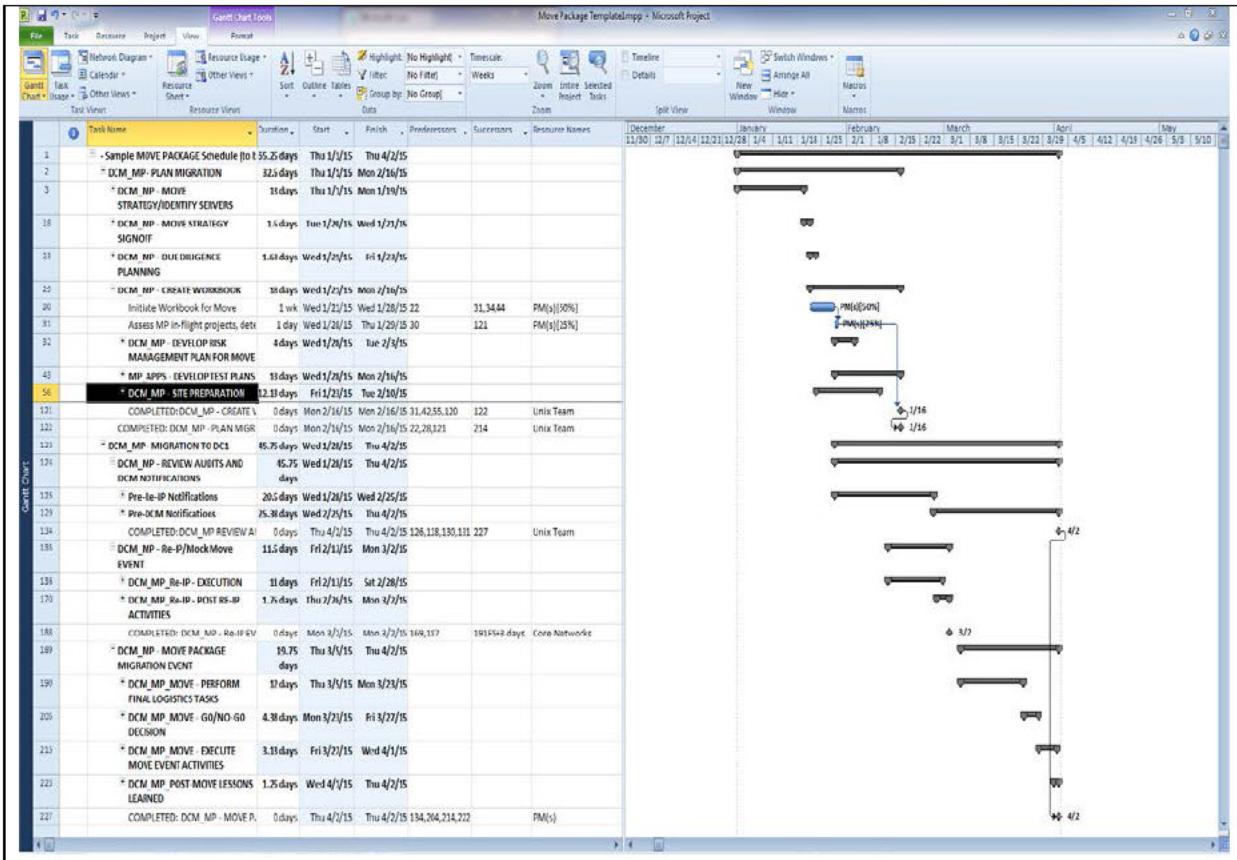

Figure 3.3.2.1-8 – Sample Application Migration Plan

10.B Create a prospective Infrastructure Element Transition Plan. Appropriate [redacted] DPH and other Agency Datacenter hardware elements may be re-purposed wherever possible.

Offeror must describe a realistic Transition Project Plan to transition the Commonwealth's datacenters to the proposed architecture.

As the Commonwealth and Unisys Team's work together developing and refining the detailed transition plans seen in **Figure 3.3.2.1-8**, hardware elements will be identified which will continue to have significant useful life remaining.

The Unisys team has proposed a realistic Transition Project Plan, as shown in **Figure 3.3.2.1-7** above, which accounts for the transition of Commonwealth's data centers and aligns with the milestones provided by the Commonwealth. See **Figure 3.3.2.1-7** – Transition Program GANTT Chart. This plan is described in detail in Schedule F, Section 3.1.2 "Work Plan Timeline" and Section 3 Attachment 9 "Schedule M: Detailed Transition Plan".

11 Infrastructure [redacted] Transition Plan

11.A The [redacted] Managed Services datacenter assets must be managed and maintained by the Offeror until they are transitioned to the Offeror's managed Services.

The current maintenance contract for the [redacted] servers is scheduled to expire on June 30, 2014.

Offeror must describe its transition approach to address the transition of operations and management of the [redacted] infrastructure from the Commonwealth to the Offeror's support Services and how it intends to address the server maintenance expiration issue.

Unisys is in a unique and strong position to execute the Transition for the Enterprise Data Center due to the current support provided by Unisys staff. This will minimize the turnover and mining of information required and eliminate much of the learning curve often associated with a Transition of Services. Transition services for the Enterprise Data Center will be the primary focus of two projects within the Commonwealth Transition Program.

The Transition of Service project will focus on gathering information and producing documentation on the current environment and processes at each data center, executing a Best Practices Assessment to identify gaps and developing a plan for each gap identified. An example of a gap during transition is the Best Practice of procuring maintenance on all devices. A complete physical and automated inventory identifies all devices in the [redacted] When the inventory is complete, the Unisys Team will analyze the information gathered along with other available information to develop a Technology Refresh Plan. As part of the Technology Refresh Plan, we will identify those infrastructure elements that will need maintenance until they are refreshed and develop an approach and estimated cost for each.

In addition, a second parallel and related project will focus on implementing a component based operating model to provide a high degree of timely and detailed support for the [redacted] environment.

12 Application and Infrastructure Migration, Example

12.A Create, manage and execute an application / infrastructure migration plan.

Offeror must describe solution and approach to meet this requirement. Offeror must provide at least one sample where it has successfully migrated application and hardware.

Attachment F-12 is an example of an Application Migration plan developed for the Commonwealth Consolidation Program, which shows a high level set of tasks that will be executed in order to migrate the Commonwealth's applications to the new data centers. The Unisys Team has planned, managed and executed many similar application migration projects including the American Red Cross and Nutreco.

12.B The Offeror has the primary responsibility for planning and executing the transition of infrastructure elements, with support of Commonwealth technical and business support staff.

The Unisys TPMO will be responsible for developing the project plans for all projects within the Transition Program. These project plans include input from the Commonwealth technical and business support staff and will be reviewed and approved by the Commonwealth. A detailed explanation of the Transition Program can be found in Section 3.1.2 and attachment 9 of Section 3.0 "Schedule M: Detailed Transition Plan".

12.C The Offeror must provide adequate tools and techniques for moving and migrating Commonwealth data to the new target storage environment. Offeror must describe its proposed tools and techniques for moving and migrating Commonwealth data to the new target storage environment.

Through a series of data gathering and analysis activities, the Unisys Team will partner with the Commonwealth to obtain asset data, locate utilization information, and map current to future state infrastructure to meet the Commonwealth's requirements. Below you will find

descriptions of analytic, planning, and risk reduction processes and tools for the transition activities.

Data Gathering and Analytics - Discovery

Data Gathering and analytics, or as they are sometimes called, discovery, activity provides the basis for verifying the current hardware and application inventories for the Commonwealth's current environment which provides the baseline data to be utilized to validate future state infrastructure and transition strategies. The data gathered during this process is crucial in developing the move groups and strategies for the transition phase. Move groups are logical groupings of business services, applications, and underlying technology that will be migrated from the current to future state. The data gathered will also provide the Commonwealth with additional knowledge of its environment, useful for planning future IT needs.

The Discovery phase starts with the collection of the currently available application and infrastructure inventory data. The Discovery activities are complete when all of the data necessary to develop a detailed plan for the migration is collected, reviewed and agreed upon with representatives of the Commonwealth and the agencies. The primary deliverable of the Discovery phase is a current and complete inventory. The inventory contains all of the components in the source data center, mapping to the applications that they support, and a list of stakeholders (application owners, support staff, and test staff).

Having a current complete hardware/software inventory is one of the prerequisites for successful migration planning and management. Validation consists of comparing the current Commonwealth supplied inventories to a list of inventories gathered during discovery and analyzing the gap.

Unisys will utilize a combination of automated discovery tools and questionnaires, interviews, and workshops to validate the hardware, software, and application inventories. The Unisys suite of data collection tools is built upon the data collection requirements. The tools use different access methods that consist of, WMI (Windows Management Instrumentation) access, secure log-on (SSH), SNMP, and network switch Span Port data. The toolsets will be reviewed with the Commonwealth; testing will be performed prior to general network deployment; the initial round of collected data will be reviewed with the Commonwealth and agency technical staff and validated for accuracy before approving the toolset.

Validation and Discovery of Current Applications Assessment – Atrium Discovery and Dependency Mapping (ADDM)

Unisys will utilize a combination of interviews, workshops, questionnaires, and automated discovery tools in the application discovery process to acquire data about applications and their dependencies. Unisys will conduct a review of the data provided with the RFP Exhibits to determine move strategies.

Application Discovery starts with the identification of the applications, underlying infrastructure and business requirements that the application supports. Using a combination of automated application dependency tools such as [redacted] and workshops Unisys will build a list of applications and dependencies to plan and support the migration activities. All of the application discovery information will be stored in the [redacted]. The CMDB will capture the assets for tracking and updating as they

migrate to the future state environment.

After the initial ADDM discovery, Unisys will capture the discovered information in an Application Questionnaire distributed to the agency application stakeholders in order to collect additional information. The information that will be validated and updated through the Application Questionnaires includes: business constraints, availability requirements (Service Level Agreements (SLAs)), maintenance windows, performance requirements, current functional baseline, upcoming releases, mapping to infrastructure, databases, internal / external users, application to application dependencies, SAN / database connections, and test plans. We will identify applications that could be decommissioned prior to the migration.

The ADDM tool allows for automated discovery of physical and virtual servers, applications, and network devices—and their interdependencies—to determine the move groups and strategies to be utilized in the transition activities. The output of the application discovery process is a clear and concise picture of how the IT infrastructure supports the applications and the overlying citizen services.

An essential step in providing low risk transition processes is the development of application maps that show the relationships among the applications and the underlying IT infrastructure components that support services. Some of the challenges in developing these maps include dealing with the complexity of multi-tiered applications and continuous change in the IT infrastructure. The use of ADDM will allow the Unisys Team to work with the Commonwealth application owners to map applications to their underlying infrastructure and define business services. Once input and validated in the CMDB, the team will add other information, such as users, policies, deployment blueprints, and service level key performance indicators (KPIs) to create a complete picture of the application dependencies which will be utilized during move planning.

Figure 3.3.2.1-9 below shows a sample Application Dependency Diagram provided by ADDM.

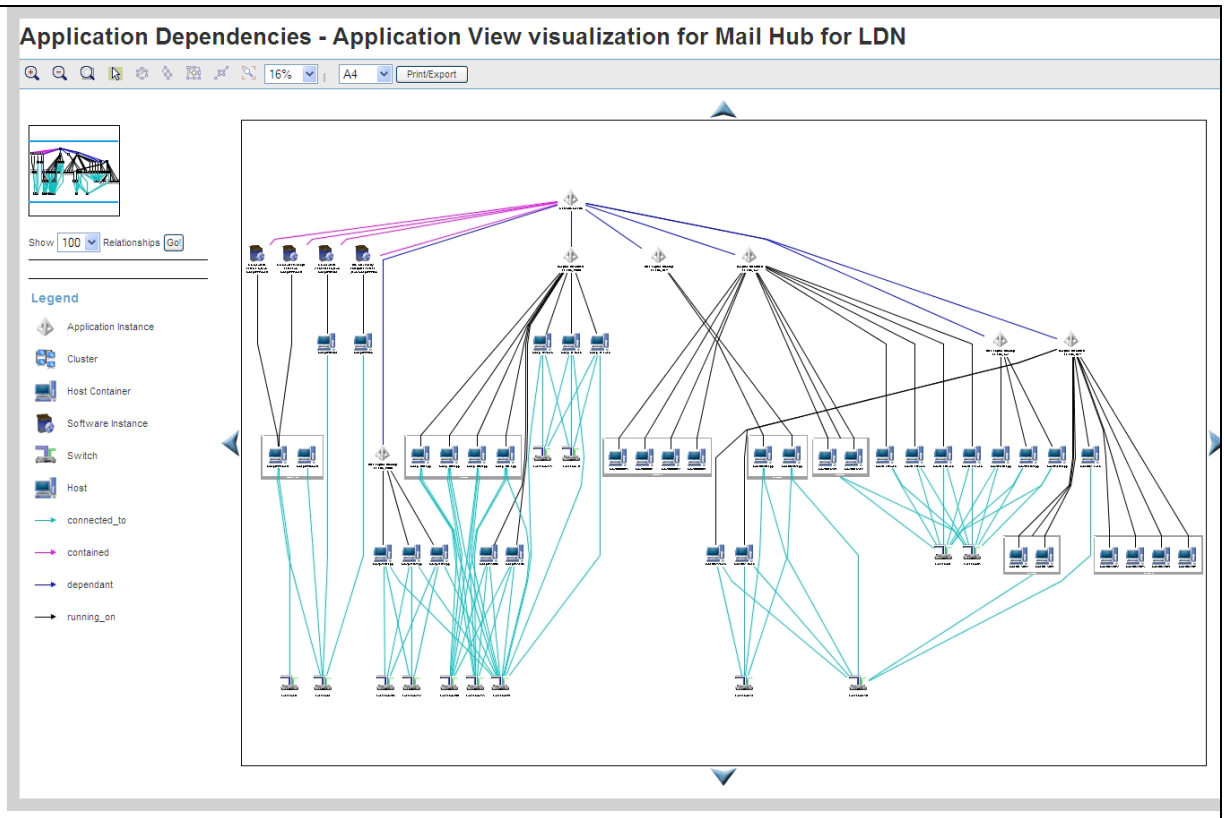

Figure 3.3.2.1-9 - Sample Application Map

The application dependency mapping for the Commonwealth will be based on the following steps:

1) Automatic discovery and dependency mapping

   a. An initial map of the dependencies and relationships of the applications is created. While providing an initial view of the application environment a complete picture is typically not possible without interaction with the application owners.

2) Analysis and reporting

   a. Reports are generated based on the initial application dependency map.

3) Collaboration

   a. The initial maps and reports are reviewed with the application owners and are validated as to the accuracy and completeness of the application map. Based on this review the maps are changed as appropriate.

4) Continual update

   a. As the IT infrastructure is constantly changing within the Commonwealth the

application maps are adjusted each time a change is made to the IT infrastructure.

The ADDM data collection tool is deployed within the [redacted] as part of their roll out of the [redacted] In **Figure 3.3.2.1-10** below you will see the ADDM Architectural diagram describing how these tools will work together.

Figure 3.3.2.1-10 – ADDM Architectural Diagram

After completion of the Discovery activities and creation of the Move Groups, the Unisys Team will utilize their proven solution to migrate the current workloads to the new environment. This solution has been proven in the Commonwealth and other clients and has reduced risk and minimized downtime. For both the physical to physical migrations (P2P) and virtual to Virtual (V2V), Unisys will utilize [redacted] provided by NetIQ corporation.

Physical to Physical and Virtual to Virtual Migrations – [redacted]

[redacted] is a workload mobility solution that automates the process of moving server workloads over the network between physical servers, virtual hosts and image archives. [redacted] decouples workloads from the underlying server hardware and streams them to and from physical or virtual hosts—all from a single point of control. Using [redacted] Unisys has been able to capture, test and migrate mission critical workloads from physical to virtual, physical to physical and virtual to virtual environments.

[redacted] provides the ability to migrate Windows and Linux workloads from and to disparate hardware platforms removing hardware dependent device drivers and utilities as part of the

migration process. Using a centralized migration control server migrations are tested and then scheduled for final cutover in an automated manner. [redacted] will automatically configure any server workload to operate on a new target environment making driver, kernel and other necessary changes as part of the process. [redacted] provides multiple replication types supporting both dynamic transactional workloads as well as more static environments using synchronization technologies.

Using [redacted], Unisys will establish physical to virtual, physical to physical and virtual to virtual transition environments that will allow multiple migrations to occur supporting the defined Move Groups within the Commonwealth. These environments will allow Unisys to capture the source environments within the [redacted] repository and to test the migrations. Once testing is complete automated workflows are created for each Move Group to ensure that the final migration process is completed against each move group. These workflows will accelerate workload migration activities and reduce manual errors using automation. Automation provides a process of configuring migration jobs and moving, copying and deploying workloads repeatable and reduces risks during migrations.

To reduce the downtime associated with workload relocation Unisys will utilize the Server Sync function within [redacted] Server Sync will allow the initial transfer to the target site or host, testing of the workload in the new location, and then perform a final sync before cutting over the workload—all while continuing to run the source. **Figure 3.3.2.1-11** below provides a view of the architecture that will be utilized in the implementation of [redacted]

Figure 3.3.2.1-11– [redacted] Architectural Diagram

12.D The Offeror must ensure that critical applications are not decoupled from key infrastructure components causing system latency.

The Unisys Team will collaborate with the Application Owners to identify applications affected by the latency. Using the tools described above in 12-C, efforts will be made to group closely

related applications in the same move packages. In the event application owners are unsure of relationships, The Unisys Team can offer an Application Performance Impact Assessment (APOC) which is intended to identify risks and mitigations.

13 Generic Information Service Transition Plan, Example

13. A Offeror must describe its proposed tools and techniques for moving and migrating Commonwealth data to the new target storage environment.

As described in Section 12.3 above, the Unisys Team will use a combination of tools and techniques to migrate data from the existing data centers to the new data centers. Please see response 12.C for an explanation.

Offeror must outline a prospective Information Service Transition Plan to take over support of migrated Commonwealth systems and applications. Offeror must provide at least one sample where it has successfully completed application and hardware migrated.

Unisys has created a generic Information Services Transition plan which can be viewed in its entirety in Section 3.0, Schedule M.

As referenced in Section 4.5, Unisys has recently executed similar application migrations including application and hardware migration at the American Red Cross.

14.A Meet with Commonwealth to produce and execute specific Information Service Transition Plans.

As described above in requirement 13 and Section 3.0 Work Plan; the Commonwealth Data Center Transition Program will have many touch points into the Commonwealth's IT Organizations. This includes the Transition and consolidation governance plan outlined in Schedule B Governance and depicted in **Figure 3.3.2.1-12** below, as well as active participation by Commonwealth subject matter experts who will be needed to providing technical, business and scheduling input for the various projects.

The Program Steering Committee will be comprised of senior leaders from both the Commonwealth and the Unisys Team. This committee will be responsible for approving strategic direction, decision approvals, significant issue escalation and communication with the senior leaders within the Commonwealth Agencies and Bureaus and the Unisys Team respectively.

Each project will have an oversight steering committee assigned as well. The exact make-up and size of the steering committee will depend on the project but in general will be headed by one of the Deputy Transition Executives and include the Project Manager, Application Owners and as appropriate, an agency director's representative. These committees will be responsible for providing strategic direction for each project, decision making based on agency and customer requirements, resolution of project issues and communications within the agency/customer set.

Figure 3.3.2.1-12 – Transition Governance Model

14.B Select cut over windows that minimize system unavailability and coordinate approval with the affected agency.

Unisys will work with the Commonwealth and Agency representatives to determine the appropriate timeframe within which an agency's applications will be migrated. Agency applications will be allocated to move packages based on information gathered during the Data Gathering portion of the transition and known blackout periods. As move package projects are initiated, the project managers will work with application owners to identify the best times of the day, week and month to execute testing and the migrations. If a particular application has unique requirements that do not fit the initial packages, Unisys will work with application owner's to identify another work package to which to move the application.

14.C Communicate to the Commonwealth cut over date and times.

Unisys will work with the Commonwealth and Agency representatives to identify the appropriate communications, method and timeframes. In general, these communications will occur approximately thirty, seven and two days prior to each major migration event such as a re-IP, mock move or actual migration event.

14.D Setup a special call number and support staff to take calls concerning the migration, these Services must be made available to transitioned users until the transition is officially signed off as completed. Offeror must describe solution and approach to meet this requirement.

During migration events, The Unisys Team will establish "war rooms" to monitor progress of the events and allow collaboration amongst team members. A "meet-me" or "bridge" line will be established and manned throughout the duration of the event. All critical members of the migration team will be present on the line until released by the project manager. The event is not complete until all application owners have provided a verbal signoff on the bridge.

14. E Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

Recently Unisys executed a similar application migration project at the American Red Cross. For

more details on this effort, please see Section 4.5.

15 Testing, Business Acceptance, and Fallback Plans, Examples

Work with Commonwealth to create testing, business acceptance and fallback plans.

Offeror must describe solution and approach to meet this requirement.

Offeror must provide at least one relevant example from a prior engagement, in which it was engaged, that is similar to the needs of the Commonwealth.

One of the most important tasks of any transition plan is creating a full and robust test plan. The Commonwealth application owners will be expected to work with the application support teams to develop a test plan for each application as required by the Commonwealth. This test is executed prior to any significant activities to create a baseline of expected results and application performance. The results are compared to the test execution after each significant activity to validate acceptable results. The application owners confirm the plan is complete and executable. In addition the application owner is expected to use the results of the test to sign off on acceptance of the event.

The hour-by-hour (HxH) detailed plans that are developed for each application will include tasks required to fall back to the existing data center.

This level of planning and risk mitigation is standard in migration projects. Recently Unisys executed a similar application migration project at the American Red Cross. For more details on this effort, please see Section 4.5.

16 Service Management System Transition Approach

Offeror must transition all agency system management platforms currently in place to the Offeror, consolidating all system management responsibilities.

Offeror must describe solution and approach to meet this requirement.

The Offeror must make available all system management platforms and tools that are currently supporting the Commonwealth infrastructure.

The Unisys approach will be to transition existing system management platforms currently in place (e.g., SCOM in EDC and DPH) into the [redacted] event management and single pane of glass platform for system management to accelerate Agency Transition into the target data center platforms. The Unisys System Management Team will migrate these current systems management tools to the standards as outlined in the Site Operations Plan and toolsets and summarized below. By standardizing on these ITSM/ESM tools, the Commonwealth benefits from consistent standards and reduction in costs as toolsets that exist today in the agencies are consolidated onto one consistent and standard set of tools for systems management. If the Commonwealth does not desire to migrate systems management to the standard platform Unisys has proposed Enterprise Services Catalog options (e.g., SCOM) that will be available for the Commonwealth to select as alternatives to the standards.

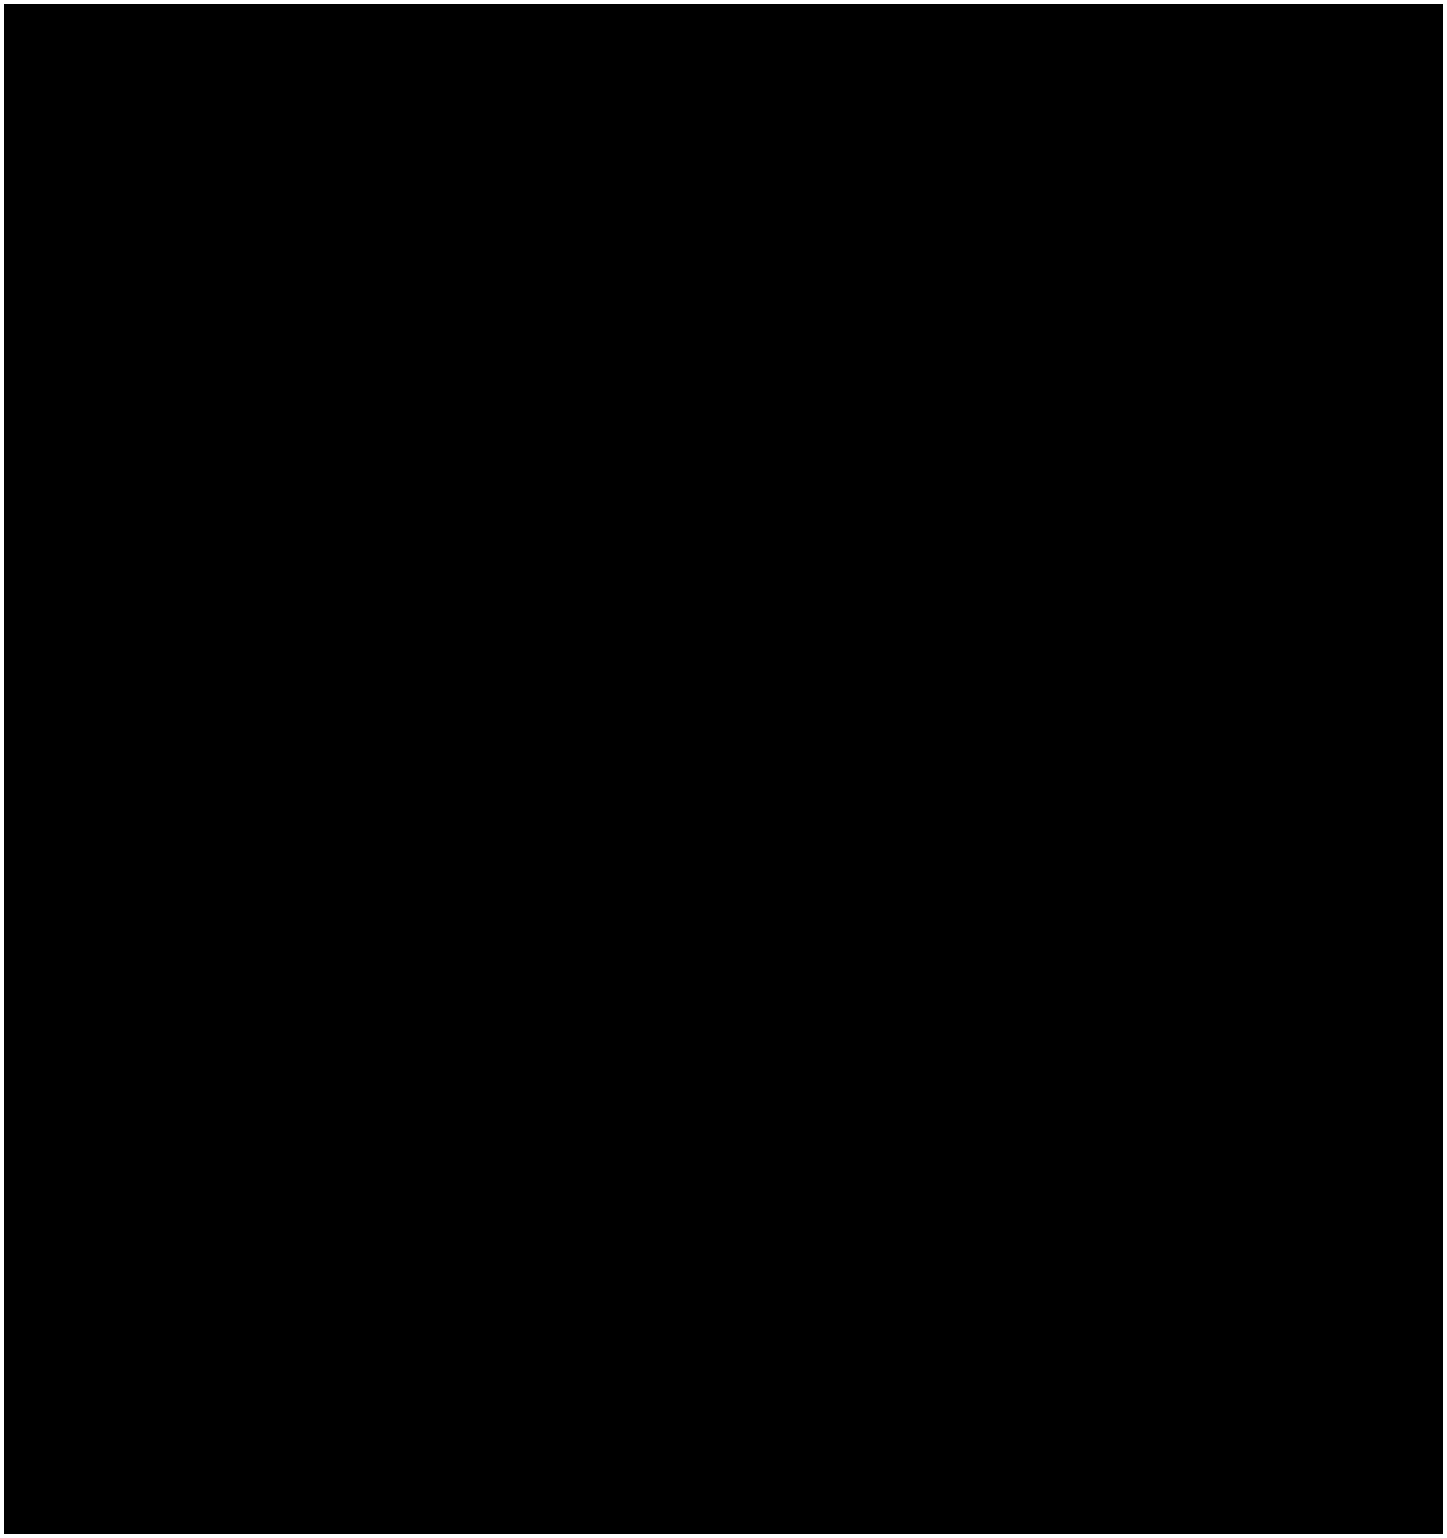
For applications outside of the DPH and EDC, the systems management tools will be migrated at the same time the agency's applications are migrated to the new data centers.

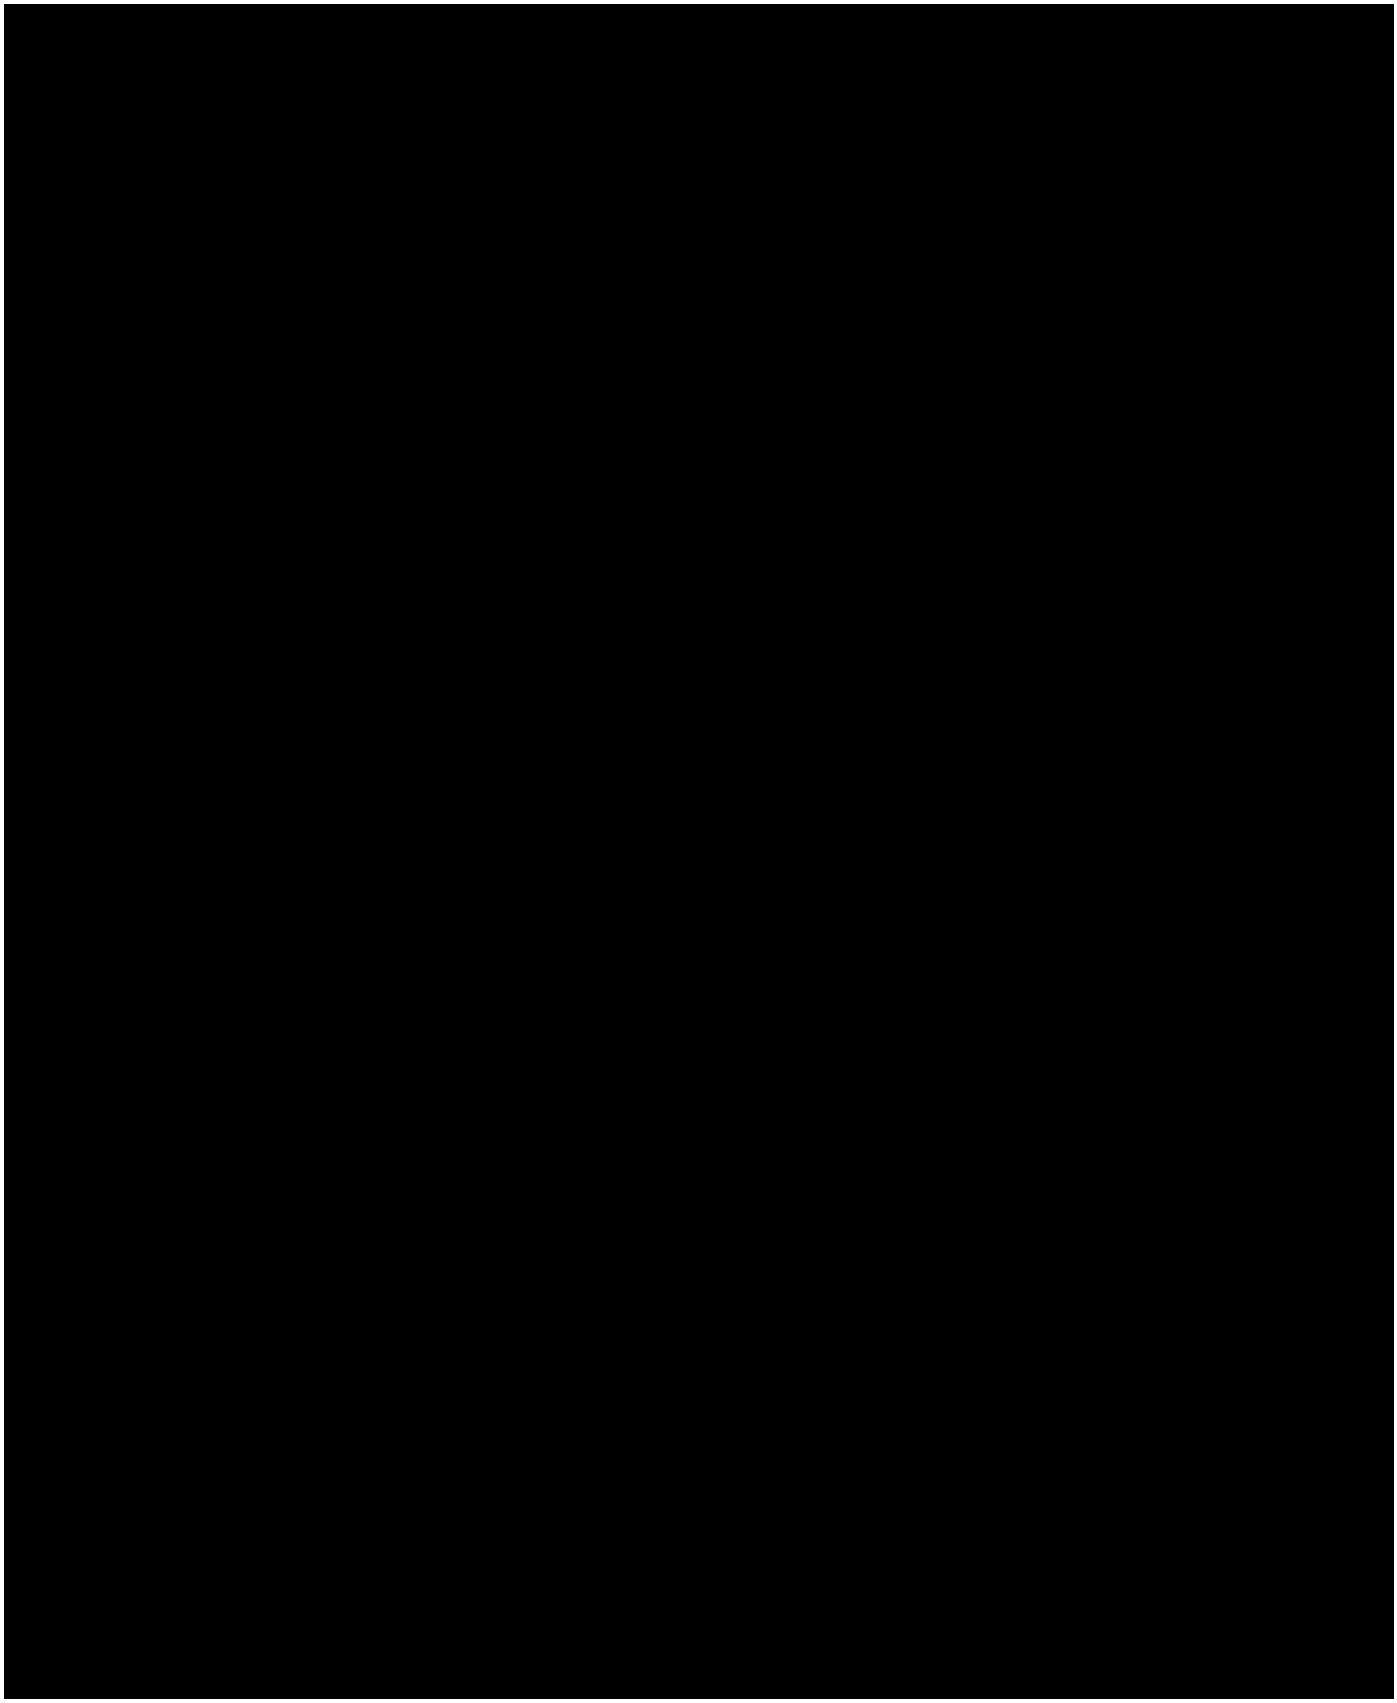
The following are the standards for ITSM/ESM systems management that Unisys intends to migrate to support lower costs and more consistent systems management after agencies are migrated.

Unisys will implement, support, and operate a comprehensive and integrated Information Technology Service Management (ITSM) architecture dedicated to the cross functional process support for all services provided to the Commonwealth for this contract. The proposed ITSM Architecture, shown in **Figure 3.3.2.1-13**, will provide an effective and efficient operational platform to support the Commonwealth's agencies application infrastructure for the following ITIL V3 (Information Technology Infrastructure Library) Service Management Processes.

Figure 3.3.2.1-13 - Proposed Unisys ITSM Integrated Architecture

The Integrated ITSM Management Platform software tools are summarized in the **Figure 3.3.2.1-14.**





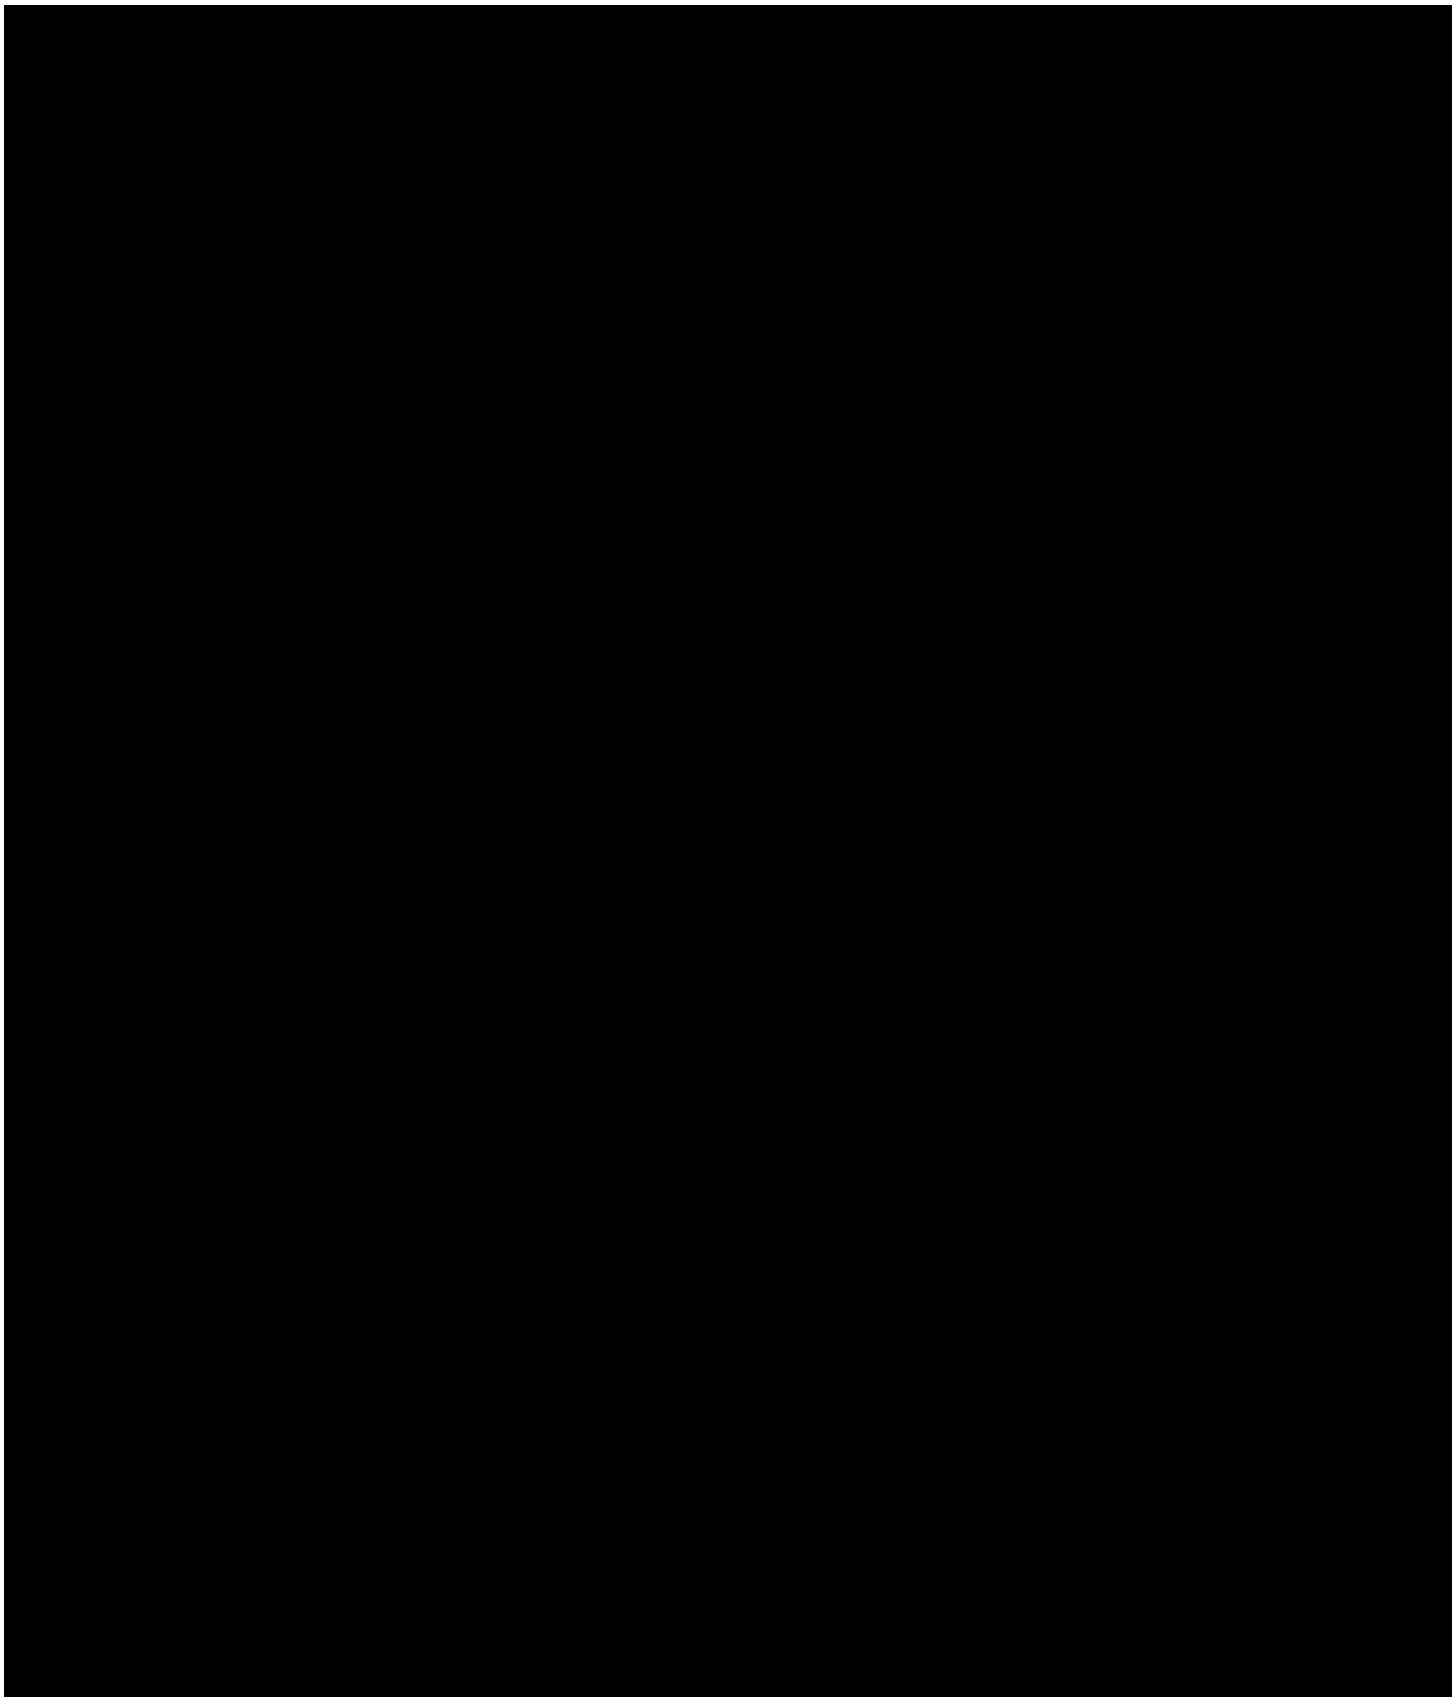


Figure 3.3.2.1-14 - Unisys ITSM Tools

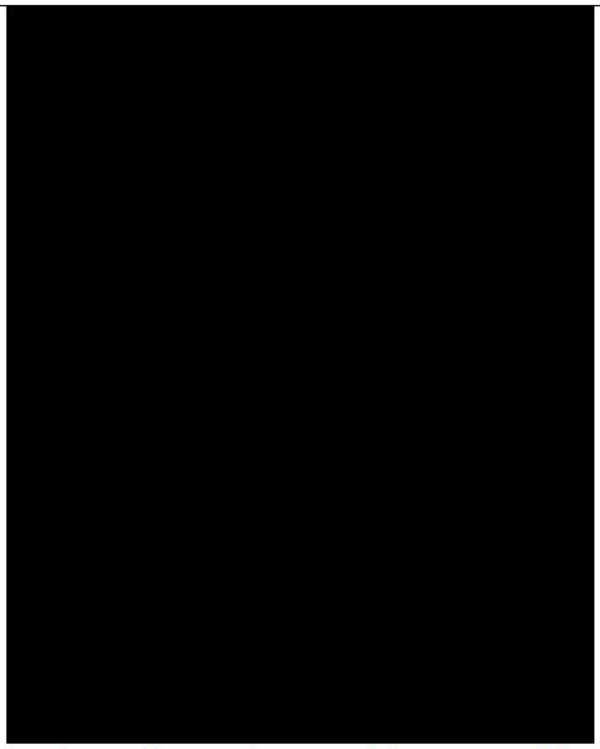
Unisys will assess the Commonwealth's current ITSM toolsets during transition. Assessment results determine which tools will be supported within this overall target ITSM proposed architecture, replaced, or eventually migrated to the target environment ITSM tools shown in **Figure 3.3.2.1-14** above. Some of the tools that will be evaluated and assessed during transition include:

- [redacted]



The resulting architectural decisions will be reviewed and approved by the Commonwealth's agencies. Some identified tools will continue to offer the functionality they currently provide, but will be integrated into the overall ITSM proposed architecture.

ITSM Processes

Unisys is proposing an integrated set of ITSM processes to support the Commonwealth's requirements and goals for:

- ITIL V3
- ISO20000
- Integrated service processes in support of the Commonwealth Agencies and application teams from a service level driven perspective
- Efficiency and Effectiveness of service operations across the Commonwealth's agencies.

Service Operations

Service Operations involves the day-to-day operations management of Information Technology (IT) services. It includes guidance for achieving effectiveness and efficiency in the delivery and support of services that offer value for the customer and for the service provider. Service Operations provides a framework for maintaining stability in service operations that allow for changes in design, scale, scope, and service levels. Managers are provided with knowledge that facilitates making better decisions in areas such as managing the availability of services, controlling demand, optimizing capacity utilization, scheduling operations, and correcting problems.

Service Operations can be viewed as the factory of IT. This implies a close focus on the day-to-

day activities and infrastructure to deliver services. Management of infrastructure and operational activities supports Service Operations. Within the Commonwealth, this means satisfying service requests through the Request Fulfillment process, the handling of service interruptions through the Incident Management process, eliminating recurring incidents through the Problem Management process, and keeping a vigilant eye on the environment through the Event Management process. The processes are described below.

Management Portal

The Management Portal facilitates a common presentation across the Commonwealth's IT environment. The portal provides an integrated high-level dashboard for overall performance, Service Level Agreements (SLAs), and detailed metrics. Secure access is provided for content-based user-specific roles and permissions.

Because of the architecture's flexibility, information can be captured from any type of source such as reporting databases, monitoring tools, or even spreadsheets. The assembly layer of the solution allows data from multiple sources to be combined into an aggregated presentation to streamline information viewing.

The Management Portal is depicted in three diagrams – **Figures 3.3.2.1-15** Management Portal – Administrator Access, **Figure 3.3.2.1-16** Management Portal – User Access and **Figure 3.3.2.1-17** Management Portal – Service Dashboard.

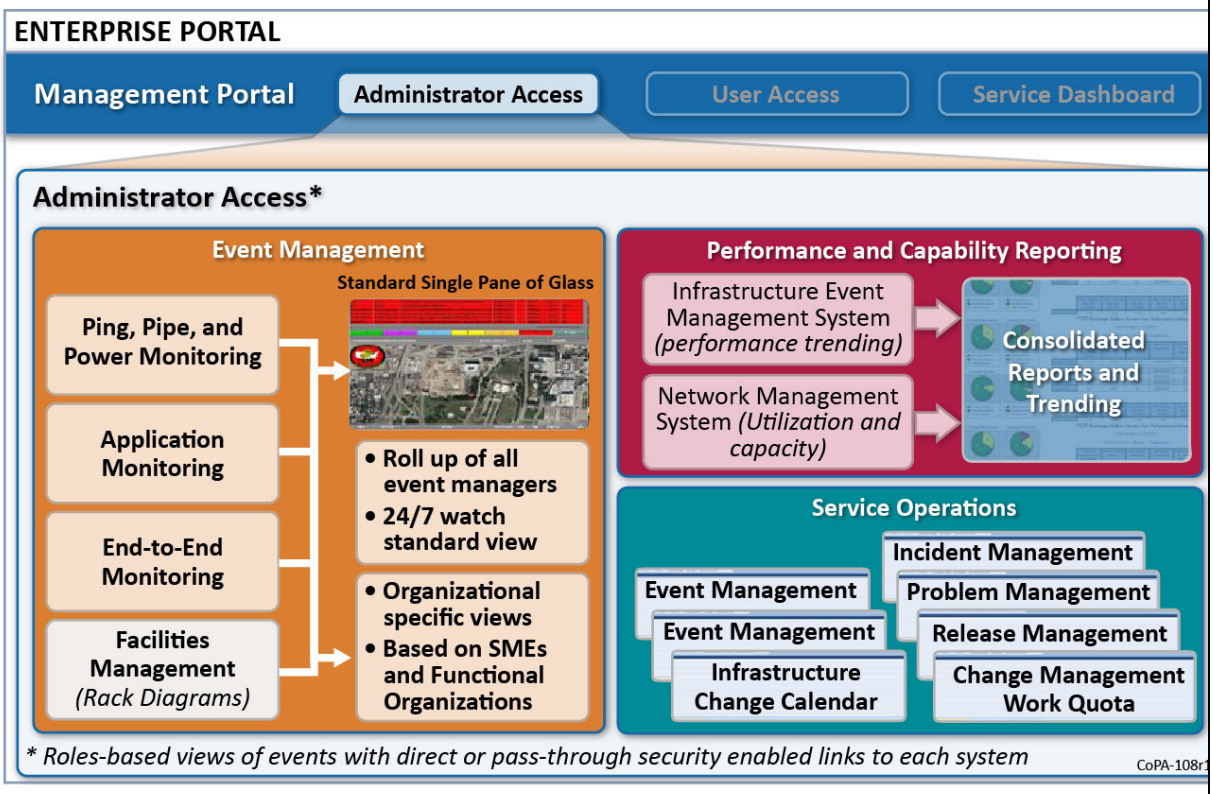


Figure 3.3.2.1-15 - Management Portal Example – Administrator Access

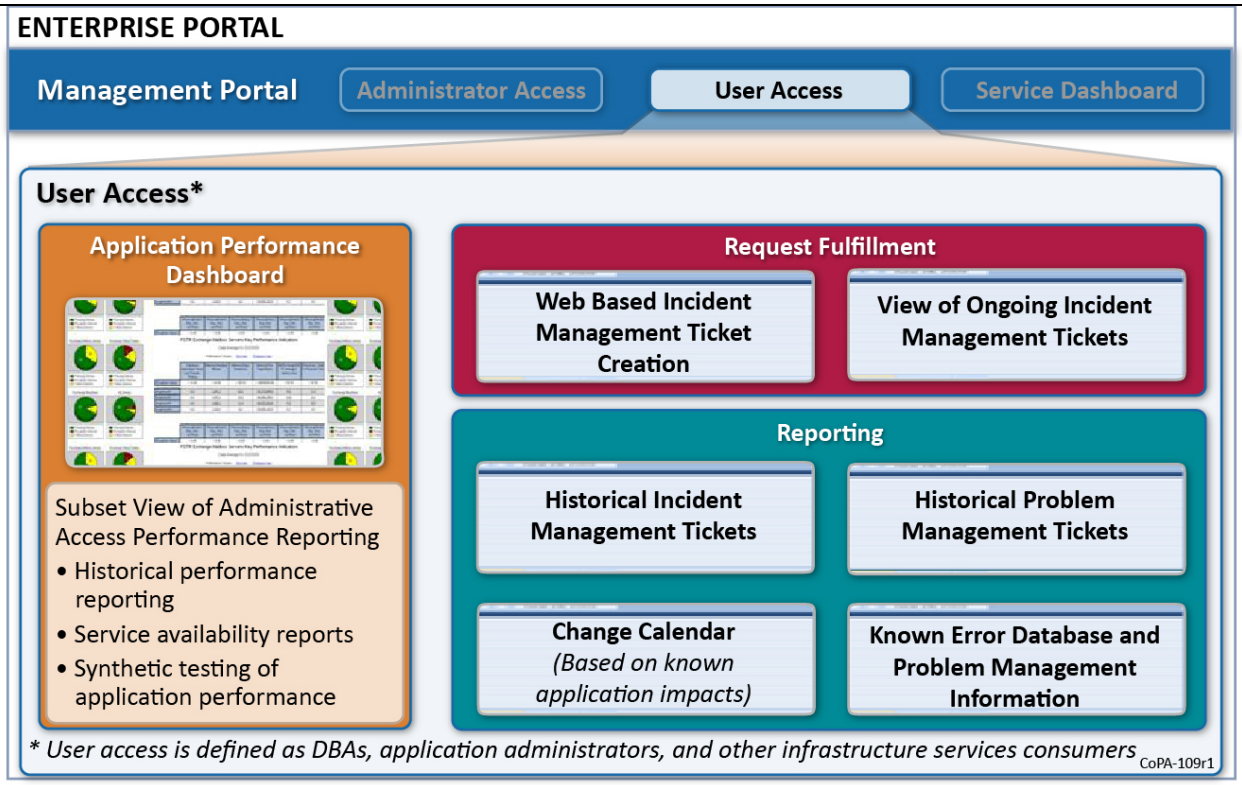

Figure 3.3.2.1-16 - Management Portal Example – User Access

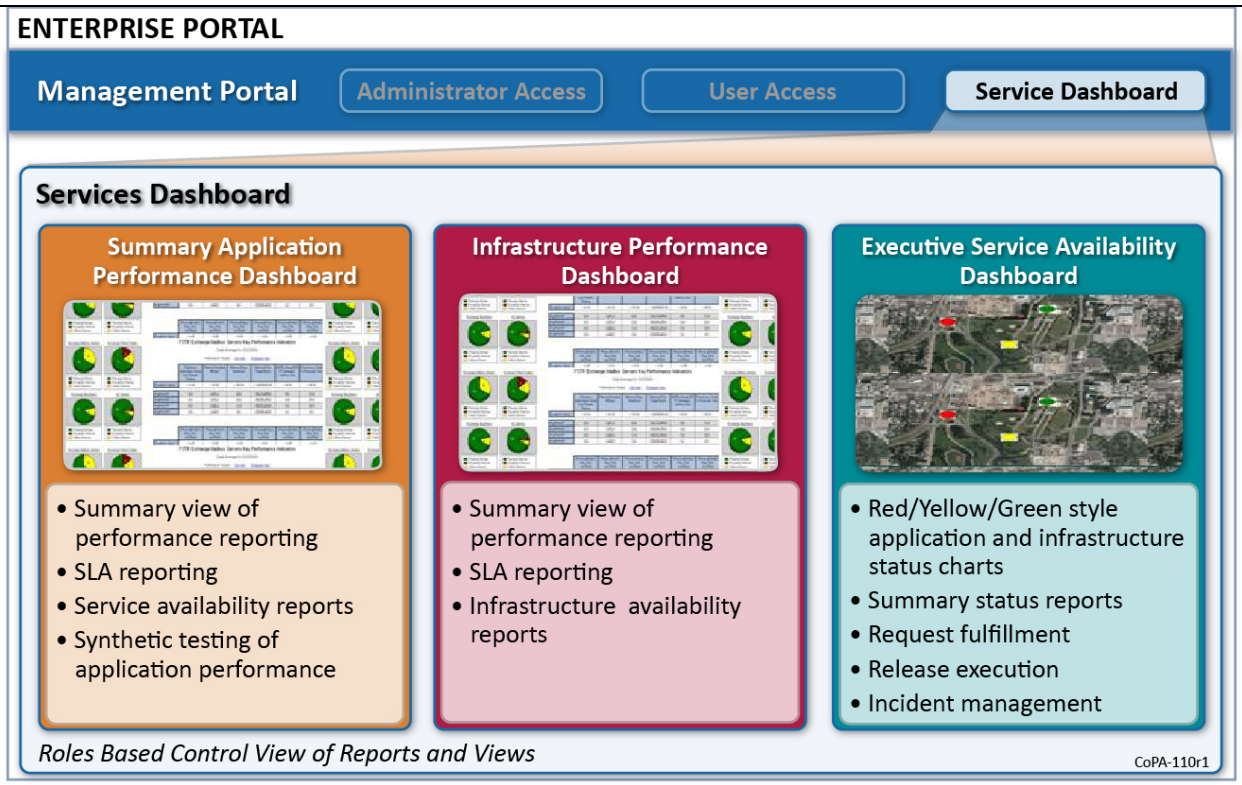

Figure 3.3.2.1-17 - Management Portal Example – Service Dashboard

Request Fulfillment

Description: Request Fulfillment is the process for handling and fulfilling service requests.

Activities:

Submit Service Request Using Self-Help – The requestor searches the Enterprise Services Catalog, selects the service needed, and submits the request.

Non-Catalog Request Fulfillment – Fulfills non-Enterprise Services Catalog item requests (e.g. Request for Information, Request for Administration, or an RFC submitted on behalf of a user).

Perform Service Item Request Approval –Approves Enterprise Services Catalog Requests.

Request Service Item Provisioning – Provisions requested service item.

Validate Service Deliverable – The requestor validates that the service request has been properly provisioned-- completing the fulfillment process when accepted.

Accept or Reject Service – Captures the requestor's acceptance or rejection of the provisioned service.

Inform Stakeholders About the Service – Communicates information to stakeholders about the service provisioned.

Event Management

Description: The Event Management process (refer to **Figure 3.3.2.1-18**), monitors the IT infrastructure for events that arise from servers, network components, and other devices, and provides event tracking, correlation, and disposition.

Events can be generated for Configured Items (CIs), environmental conditions, software, security, and standard operating activities.

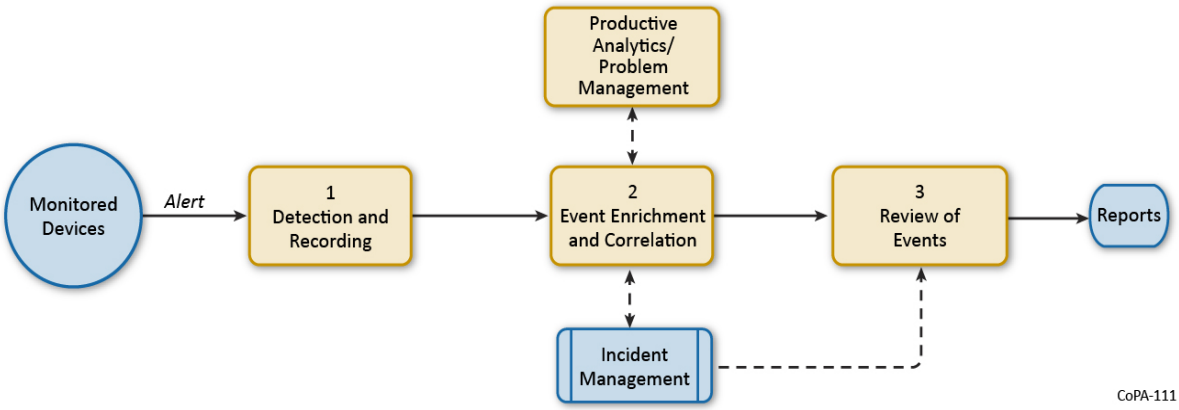

Figure 3.3.2.1-18 - Event Management Process Flow - Overview

Activities:

1. Event Detected and Recorded – Monitors the status of the various IT infrastructure items in the environment to detect when various thresholds are exceeded or events occur that should be reported.

2. Event Enrichment, Filtering & Correlation – Eliminates duplicates or suppresses events that are not significant in order to make event reporting more meaningful and manageable. Event correlation matches events that are related to root cause analysis.

   Auto Incident Ticketing – Created an automatic incident response based on the event detected.

3. Review of Events – Review events to determine if any action is required. It also reviews automated and manual actions taken to respond to events and to determine whether those actions were effective in improving the overall Event Management process.

   Reporting and Closing Event – Report and properly closes all events after appropriate review and action has been taken.

Incident Management

Description: Incident Management is the process (see **Figure 3.3.2.1-19**) of handling all incidents. This can include failures, issues or questions reported by users or by technical staff, or automatically detected events that automatically create incident records.

The purpose of Incident Management is to restore normal service as quickly as possible, to minimize any adverse impact on business operations. Incidents are categorized to identify who should work on them and for trend analysis. They are prioritized according to urgency and business impact.

There are three levels of support in the Incident Management process. Service desk agents provide the first level of support with general expertise across many disciplines in order to restore a service. If first level service desk agents cannot restore the service, then a second level service desk agent – who has deeper expertise and more experience resolving incidents – is engaged. Third level escalations involve subject matter experts (e.g., vendors) who generally reside in external organizations (e.g., other IT disciplines or vendors) in order to restore a service.

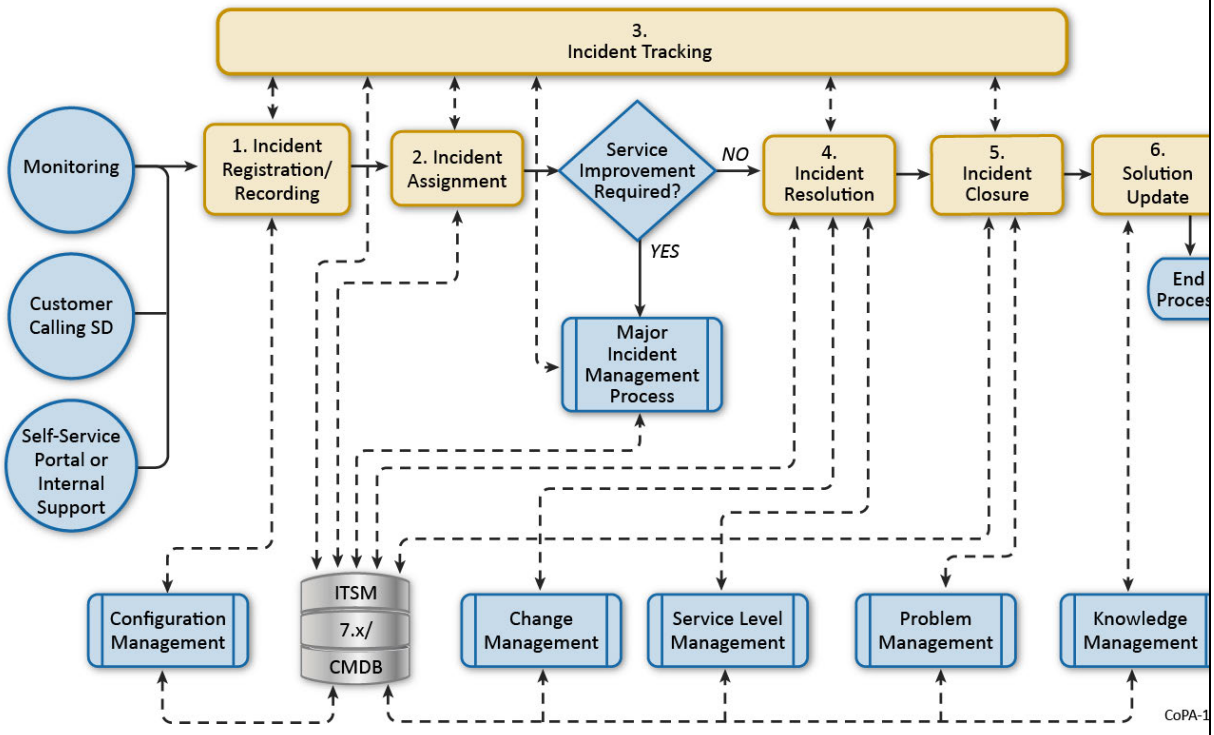

Figure 3.3.2.1-19 - Incident Management Process Flow

Activities:

1. Incident Registration and Recording – Verifies that all reported incidents and service calls are properly logged and validated.

2. Incident Assignment – Verifies that all incidents are assigned to the proper support team and level (e.g., 2nd/3rd level support)

3. Perform Escalation Management – Triggered when an incident has met the criteria for a valid escalation, such as:

   1) SLA commitments are breached (e.g., time to restore service)

   2) Priority of an incident has changed to a critical status

   3) A different support group is required to restore service

   This activity assigns ownership for an incident that has been identified as requiring escalation or transfer, validates the requirement, and facilitates the transfer to the identified support team after verifying that the incident priorities and requirements are understood, and that the identified support team accepts ownership for restoring service.

   Major Incident Process – Invoke the major incident process for Priority 1 (widespread) incident impacting enterprise wide service(s).

4. Incident Resolution – Resolver (team) determines how to restore service and completes restoration of service.

5. Incident Closure – Service Desk contacts impacted users to determine if service is restored satisfactorily and closes incident ticket.

6. Solution Update – Problem Manager determines if there is a solution, or temporary fix, to these types of incidents and then processes a problem and change ticket appropriately or adds a workaround to the knowledge management repository.

Problem Management

Description: The Problem Management process works to eliminate chronic incidents in the services infrastructure. It is a process focused on diagnostics and reconciliation of problems in the IT infrastructure to obtain stability in IT service delivery. It is focused on proactive and reactive IT infrastructure defect elimination to help reduce service impacting incidents.

The objective of Problem Management (refer to **Figure 3.3.2.1-20** Problem Management Process Flow) is to identify the root cause of an incident.

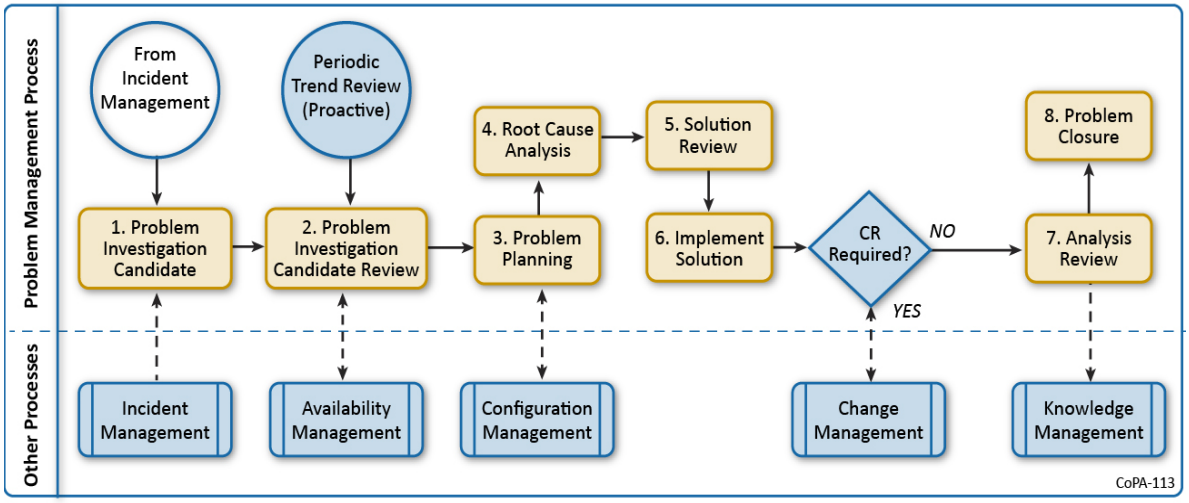

Figure 3.3.2.1-20 - Problem Management Process Flow

Activities:

1. Problem Investigation – Identifies a problem either proactively or reactively.

2. Problem Investigation Candidate Review – Records all relevant details of the problem so that an accurate problem record exists.

3. Problem Planning – Planning to support work around until the root cause if found and how to approach root cause analysis

4. Problem Root Cause Analysis –Performs a root cause analysis to determine the underlying cause of the problem. In order to restore service quickly in the future, workarounds may be developed and recorded to support the Incident Management process. Once the root cause is determined, a change request is submitted to eliminate the root cause of the problem.

5. Solution Review – The Problem Manager schedules a review of the proposed solution with key stakeholders to gain acceptance of the draft change request to eliminate the defect.

6. Implement Solution– Resolves the problem by approving and successfully testing and initiating the change request to eliminate the defect.

7. Problem Closure – Formally closes the problem record when any change has been completed and successfully reviewed, and the resolution has been applied. The status of any related known error record is updated to show that the resolution has been applied.

Service Transition

Service Transition provides guidance for the development and improvement of capabilities that are promoted into the production environment.

Service Transition processes are initiated as the result of a forthcoming change to the Commonwealth's production environment. Any change must first go through the Change Management (CM) process, which identifies valid changes through the review and approval of Request for Change (RFCs). RFCs can promote new or modified services, or modifications to the supporting software or hardware infrastructure. In many cases the change is categorized and prioritized for subsequent Service Transition processes.

As part of the acceptance of a change into the overall ITSM life cycle, the Service Asset and Configuration Management process is invoked. This process includes entering the service and all associated artifacts into the Configuration Management System (CMS) as an accepted CI. The artifacts associated with a service include software, documentation and test plans. Additionally, the artifacts are added to the Digital Media Library (DML) for initial archiving. The DML is used as the authoritative source of software, documentation and test plans for a baseline release. It can be used to restore the operational environment to the baseline or to assist in the release of software execution objects into the production environment following the Release and Deployment process.

Once the CIs are available in the DML, the Release and Deployment Management process and the Service Validation and Testing processes begin. Depending on the release strategy, objectives, risk assessment, etc., changes can, and most likely are, aggregated into a release – the defined unit of deployment for changes as they flow through the ITSM life cycle. Once a change is in the system, depending on the category and priority of the change, the change may go directly to the Service Validation and Testing process or be required to go through the more detailed Release and Deployment Management process. For example, if the change is minor and does not affect any other services, like a time setting, the change can go directly to the Service Validation and Testing process. If the change is more complicated and affects multiple services or platforms, it goes through the more detailed Release and Deployment Management process. Examples of more complicated changes include an application inclusion or an OS service pack change.

A release cannot be deployed into production without Change Management approval after review of the Service Validation and Testing results. The Service Validation and Testing process mitigates the risk of changes bundled in the release, and helps to verify that the release meets service utility (i.e., functionality to the user) and service (i.e. SLAs) requirements.

Change Management

Description: The Change Management process (see **Figure 3.3.2.1-21**) is responsible for controlling the life cycle of all changes. The goal is to respond to changing business requirements while maximizing value and reducing incidents, disruption, and rework. The objectives of this process are:

- To enable beneficial changes to be implemented with minimum disruption to IT service
- To verify that changes are recorded and evaluated, authorized, prioritized, scheduled, tested, implemented, documented, and reviewed in a controlled manner

The Change Management process drives service assets and CI planning, management, and reviews prior to their implementation and release.

The Change Management process and the Release and Deployment Management process closely govern the daily activities of the testing environment shared between Unisys and the

Commonwealth's agency application testing environments for testing, evaluating, and deploying applications and services to the production data centers. This forms the basis for establishing an operational capability and serves as the foundation for other ITSM processes that guide the day-to-day operation.

A *normal change* is a change that follows the normal Change Management process, requiring review and approval, etc. A *standard change* is a minor change with low risk that has been preapproved by the Change Manager because it follows a well-known and established procedure.

Refer to **Figure 3.3.2.1-21** for an overview of the Change Management Process Flow.

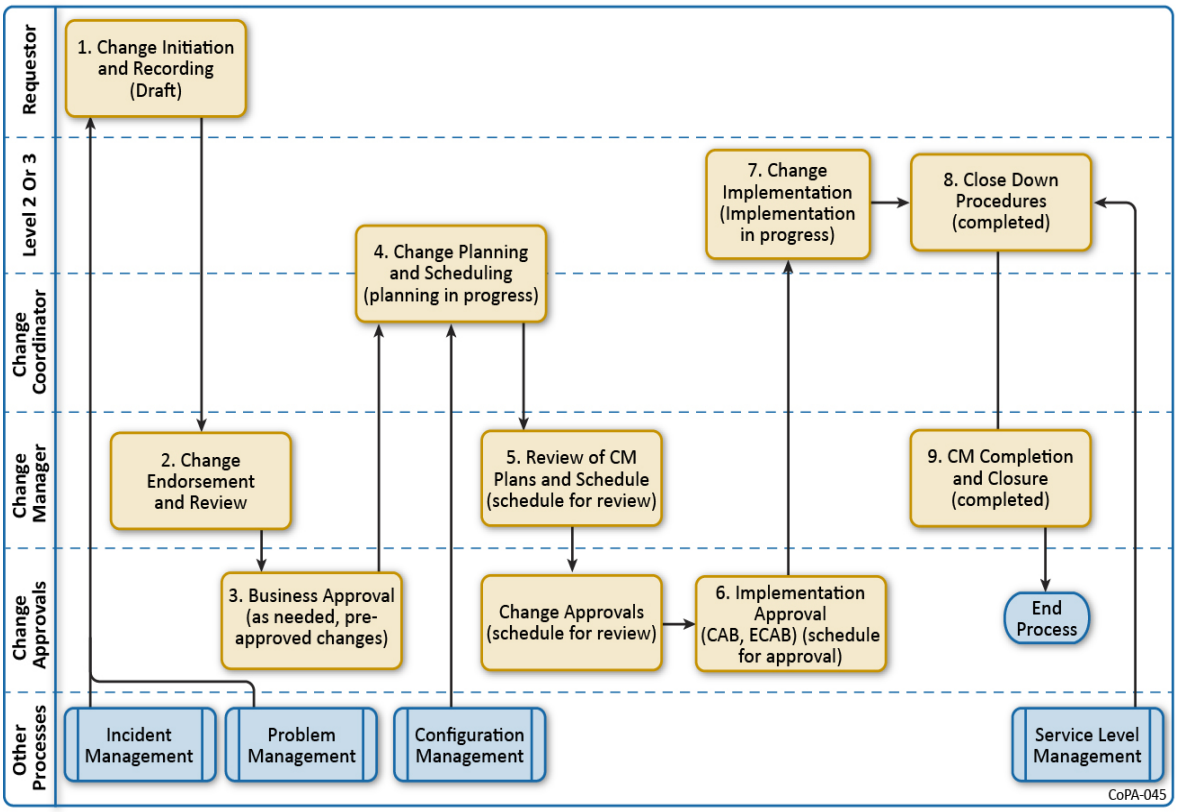

Figure 3.3.2.1-21 - Change Management Process Flow

Activities:

1. Change Initiation - Receives RFCs from requestors. In some cases RFCs are logged on the requestor's behalf.

2. Change Review - All RFCs are reviewed for completeness and accuracy.

3. Change Approvals – Changes are approved at the proper level and with appropriate personnel depending on whether the change requests types are standard, emergency, expedited, latent or normal, and their potential impact and priority.

4. Change Planning and Scheduling – Reviews the change to define planning and scheduling for implementation. A forward schedule of changes is maintained for stakeholder review and approval.

5. Emergency Change Management Approval – An emergency change requires Emergency (CAB) approval to implement changes to the production environment during an emergency due to a service outage. This expedited Change Management process proactively prevents an ongoing, serious service outage.

6. Change Implementation Approval – Reviews and approves the testing results and the release and deployment plans.

7. Change Implementation Review – Reviews the change implementation results including if it followed the release and deployment plan and was completed within the release window.

8. Change Closure - Reviews with the change stakeholders to determine satisfaction and success with the change implementation, lessons learned, and closure of the change.

Release and Deployment Management

Description:

The Release and Deployment Management process (see **Figure 3.3.2.1-22**) delivers significant business value by delivering changes at optimized speed, risk and cost, and offering a consistent, appropriate and auditable implementation of usable and useful business services.

The Release and Deployment Management process covers the whole assembly and implementation of new/changed services for operational use, from release planning through Early Life Support (ELS).

As previously stated, the Release and Deployment Management process and the Change Management process closely govern the daily activities of Unisys and the Commonwealth's agencies testing, evaluating, and deploying applications and services to the production data centers.

Refer to **Figure 3.3.2.1-22** for an overview of the Release Management Process Flow.

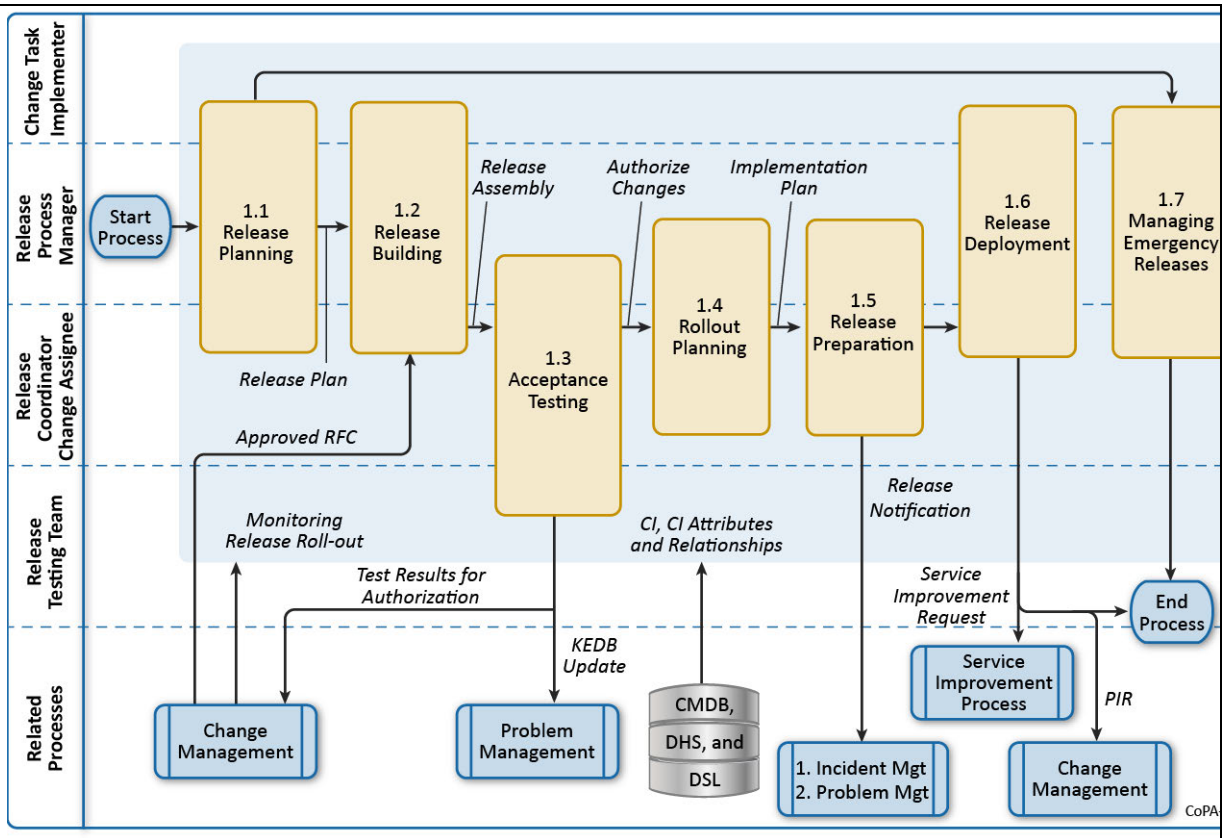

Figure 3.3.2.1-22 - Release and Deployment Management Process Flow

Activities:

1.1 - Release Planning – The Release and Deployment Manager and the planning and support teams work on the service transition package to establish, review, and periodically update the release policy document and schedule for releases.

1.2 - Release Building – After an RFC is validated and approved as part of the Change Management process, this activity begins the process of preparation for the release that includes supports one or several RFC's. This activity evaluates the service design baseline to verify the service release build and test begins with a stable, base-lined and approved design.

1.3 - Acceptance Testing – Coordinated through Test Management, which plans and controls the testing execution. Testing aims to build confidence in the service capability prior to final acceptance during the pilot or Early Life Service Support. Testing is based on the test strategy and model for the service being changed.

1.5 - Release Preparation – Prepares the organization and people for change, including the development of a detailed implementation plan that includes training, assigning individuals to specific process activities, etc.

1.6 - Release Deployment – Transfer assets, transfer/transition businesses and organizations, deploy processes and materials, deploy Service Management capabilities, transfer services, deploy services, decommission services, and retire services.

Provide Early Life Support (ELS) – Provides a smooth transition for the new or changed service to Service Operations in a controlled manner and establishes the new service capability and resources.

Verify Deployment – After the deployment and ELS activities are completed, this activity verifies that users, Service Operations and other staff and stakeholders are capable of using or operating the service.

Review and Close Deployment – Reviews the deployment against the requirement. Deployment is completed with a handover of the support for the deployment group or target environment to Service Operations.

Service Asset and Configuration Management

Description:

The Service Asset and Configuration Management Process addresses service assets throughout the entire service life cycle. It provides a complete inventory of assets, and identifies the individuals responsible for their control. It includes:

- Full life cycle management of IT and service assets, from the point of acquisition through disposal
- Maintenance of the asset inventory

The Service Asset and Configuration Management (SACM) process (**Figure 3.3.2.1-23**) provides a configuration model of the services, assets, and infrastructure that will contribute to meeting the ITSM objectives and assist in meeting service levels, by recording the relationships between service assets that will be managed as CIs. Assets are elevated to Configuration Items (CI's) for management purposes by augmenting asset data with configuration details that will support the management goals of ITSM and assist the Unisys Team in meeting SLA's.

The SACM process verifies the selected components of a complete service, system, or product (the configuration) are:

- Identified, baselined, and maintained
- Controlled through the Change Management process
- Released into controlled environments with operational use allowed only on the basis of formal approvals

SACM's may cover non-IT assets and work products that are used to develop services, and CIs required to support a service (e.g., documentation to support ongoing operations). The SACM covers interfaces to internal and external service providers where there are assets and CIs that need to be controlled, e.g., shared assets.

Refer to **Figure 3.3.2.1-23** for an overview of the SACM Process Flow.

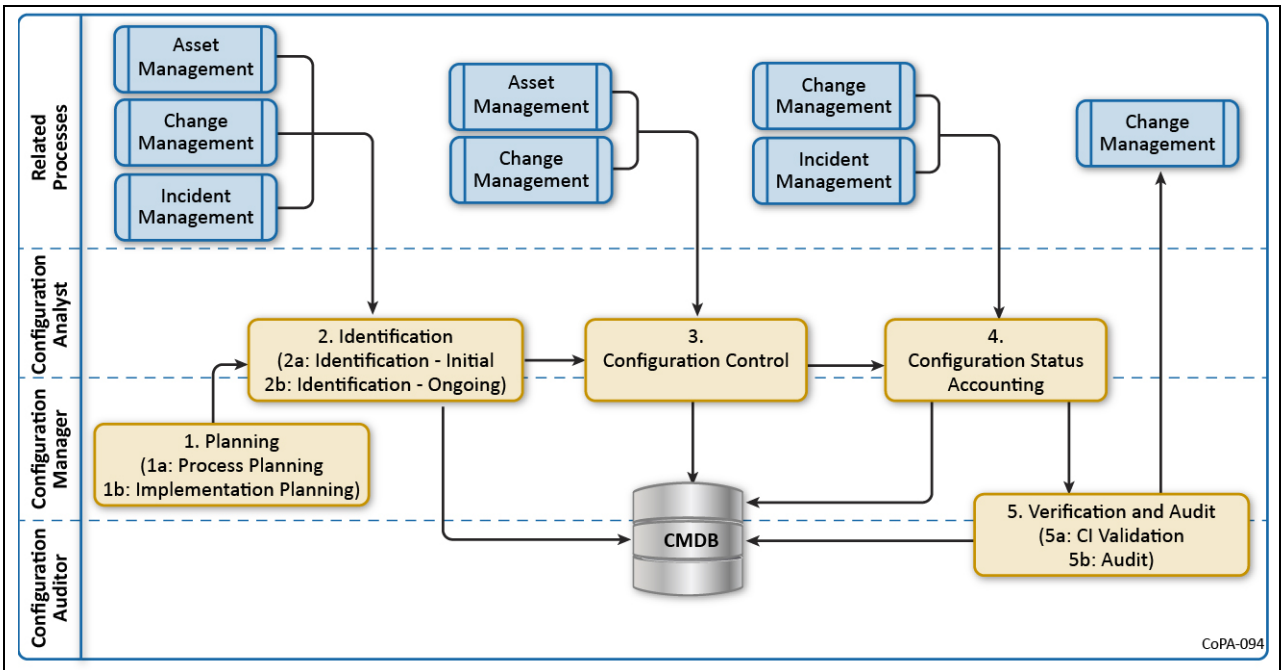

Figure 3.3.2.1-23 - Service Asset and Configuration Management Process Flow

Activities:

1. Management and Planning – This activity creates and delivers the Service Asset and Configuration Management plan.

2. Service Asset and Configuration Identification – This activity selects and identifies the configuration structures for all of the infrastructure's CIs, including identification of CI owners, CI interrelationships, and configuration documentation. This includes allocating identifiers and version numbers for CIs, labeling each item, and entering it into the Configuration Management Database (CMDB).

3. Configuration Control – This activity confirms authorized and identifiable CIs are accepted and recorded and confirms the existence of the appropriate controlling documentation (e.g., an approved RFC or an updated specification) to drive configuration changes. These activities happen throughout the CI life cycle.

4. Status Accounting and Reporting – This activity governs the reporting of all current and historical data regarding each CI throughout its life cycle. This information allows changes to CIs and their records to be traceable (e.g., tracking the status of a CI as it moves from one state to another).

5. Verification and Audit – This activity includes a series of reviews and audits that verify the physical existence of CIs and check that they are correctly recorded in the Configuration Management system.

Service Design. Service Design provides guidance for the design and development of services and Service Management practices. It covers design principles and methods for converting

strategic objectives into portfolios of services and service assets. Service Design is not limited to new services, but also includes the changes and improvements necessary to increase or maintain value to customers over the life cycle of services, the continuity of services, achievement of service levels, and conformance to standards and regulations. It provides guidance on how to develop design capabilities for Service Management.

The main purpose of Service Design is to design IT services, using governing IT practices, processes and policies, to facilitate the introduction of these services into the live environment while ensuring quality service delivery, customer satisfaction and cost-effective service provision. Service Design for the Commonwealth contract will focus on availability, capacity and service level management and is depicted in the following sections.

Enterprise Services Catalog Management

Maintaining the Enterprise Services Catalog includes:

- Managing the service definition and service component descriptions
- Updating the Enterprise Services Catalog
- Coordinating changes to the Configuration Management Database (CMDB) to reflect the Enterprise Services Catalog changes

Availability Management

Description: The Availability Management process (**Figure 3.3.2.1-24**) manages the availability of a service and plans, measures, monitors, and continuously strives to improve the availability of the IT infrastructure, services, and supporting organization and to confirm that service availability requirements are met consistently.

Availability Management helps to deliver a cost-effective and sustained level of availability that enables Commonwealth's agencies to satisfy its business objectives.

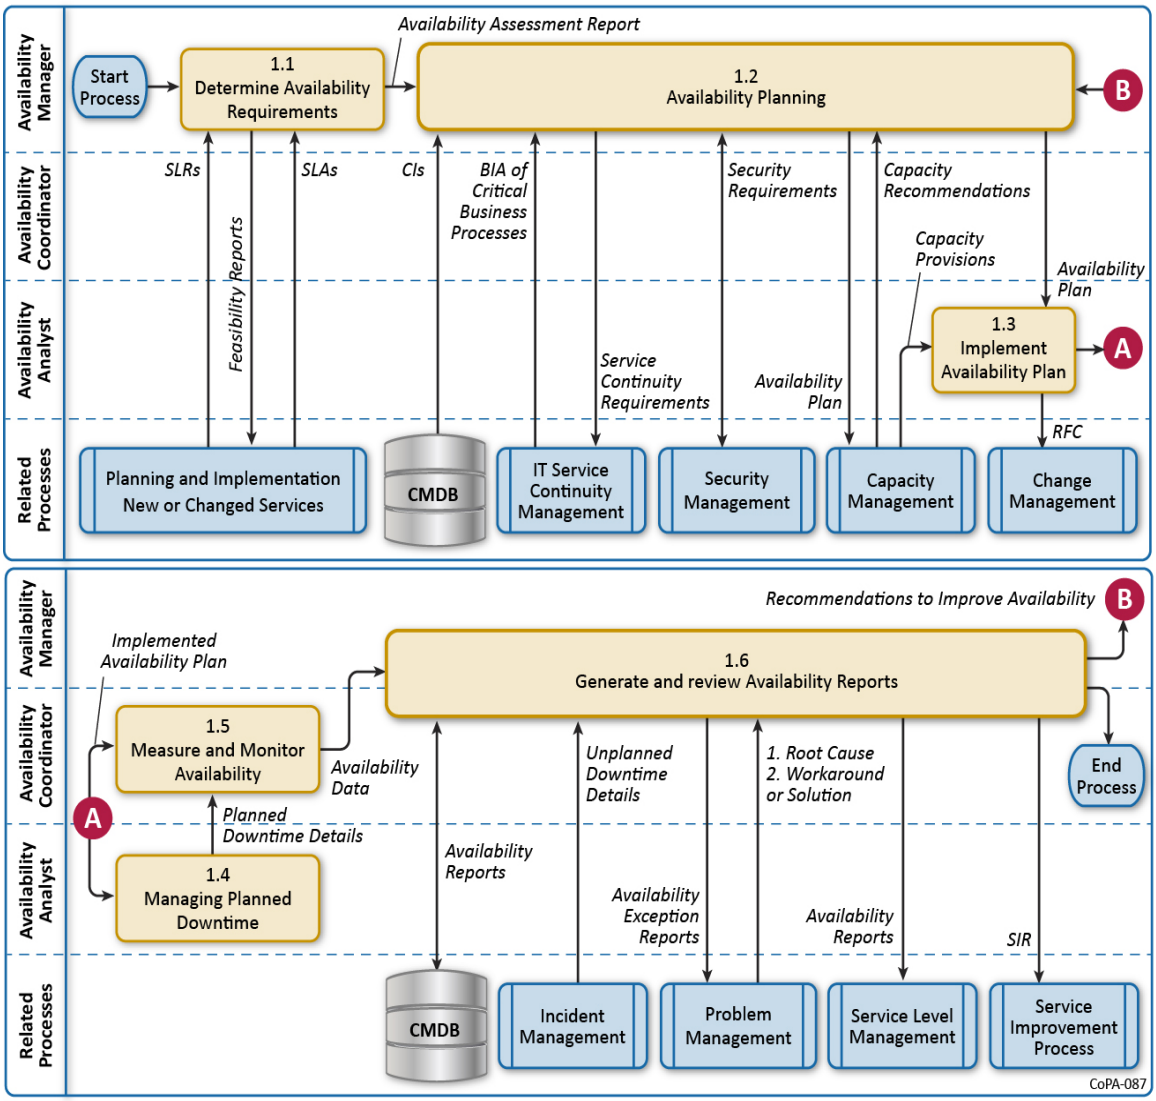

Figure 3.3.2.1-24 - Availability Management Process Flow

Activities:

1.1 - Determine Availability Requirements – This key activity confirms that the required level of availability for a new or changed IT service can be achieved, and is performed in conjunction with the Change Management process for a service being implemented or modified. It includes reviewing SLAs and availability requirements, availability incidents, and planning for meeting these requirements and addressing availability outages to determine how they can be avoided in the future.

1.2 - Availability Planning – Plans solutions to meet the availability requirements. This includes preparing cost effective solution, analyzing risks associated with the solutions, and obtaining approvals for the plans.

1.3 - Implement Availability Plan – Oversees the implementation of availability requirement solutions and tests those requirements against new or changed services.

1-4 - Manage Planned Downtime – Schedules and manages service downtime and the impact of availability and unavailability on services.

1.5 - Measure and Monitor Availability – Monitors, manages, measures, analyzes and reports on availability of services.

1.6 - Generate and Review Availability Reports – Preparation, review, and distribution of availability reports and actions for continuous improvement.

Capacity Management

Description: The Capacity Management process defines, tracks, and controls service capacities to meet forecasted demand at an agreed upon service level performance. It should be noted that considerations such as system capacity and network capacity are vital components that foster overall service capacity. **Figure 3.3.2.1-25** below shows the flow of information in the Capacity Management Process.

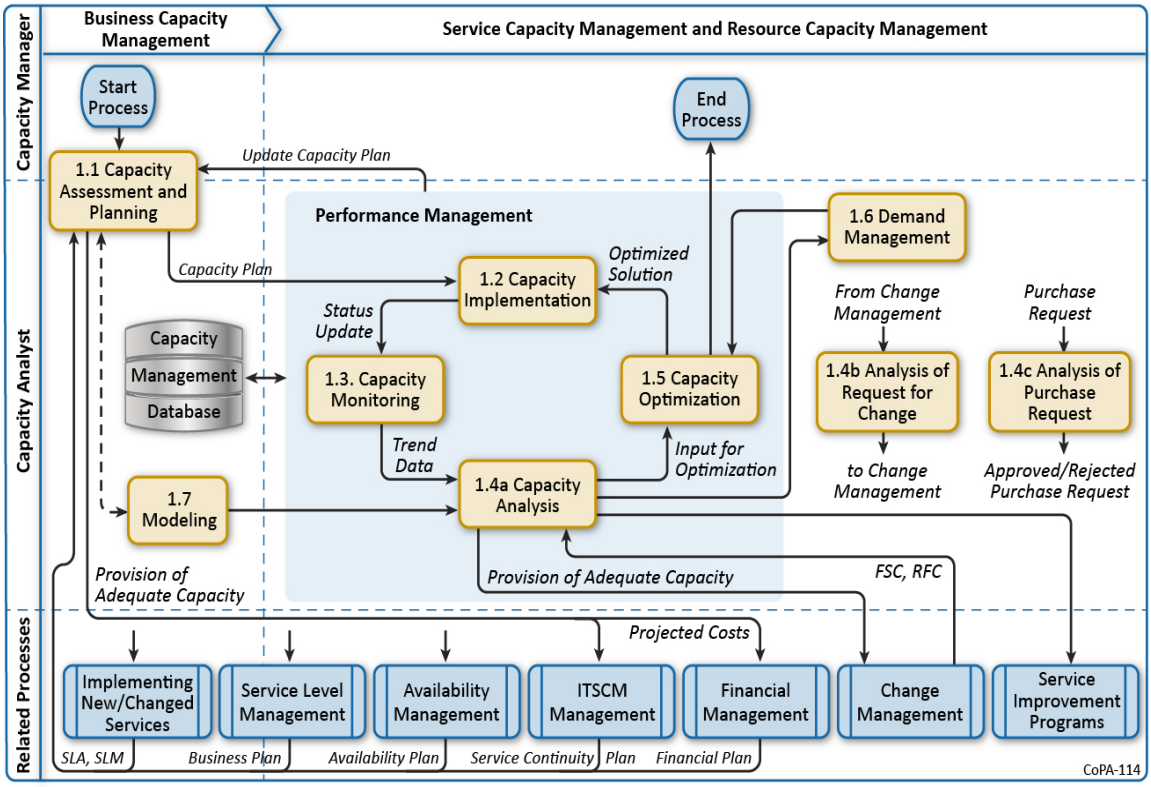

Figure 3.3.2.1-25 - Capacity Management Process Flow

Activities:

Capacity Assessment and Planning – This operational activity analyzes the current performance and capacity, reports obtained from the Service Level Reporting process, change requests, and current and future workload to identify requirements for capacity-related service availability and performance requirements.

Modeling – Models solutions to meet availability requirements and analyzes the advantages and disadvantages and costs of each alternative modeled solution. The Capacity Manager will present a recommended modeled solution for approval.

Performance Management – Implementation of the approved capacity plan, overseeing the implementation, monitoring and management of service availability and performance and recommending and implementing adjustments based on analysis and review.

Demand Management – Analysis of service consumption in the enterprise and recommending actions to shift demand for services, alter services, or eliminate services based on an overall enterprise view of services, demand, costs, and other factors.

Service Level Management

Description: The Service Level Management (SLM) process (**Figure 3.3.2.1-26**) is responsible for negotiating SLAs, and ensuring that SLAs are met. SLM is responsible for ensuring that all IT Service Management processes, Operational Level Agreements (OLAs), and Underpinning Contracts (UCs), are appropriate for the agreed service level targets. SLM monitors and reports on service levels and holds regular customer reviews.

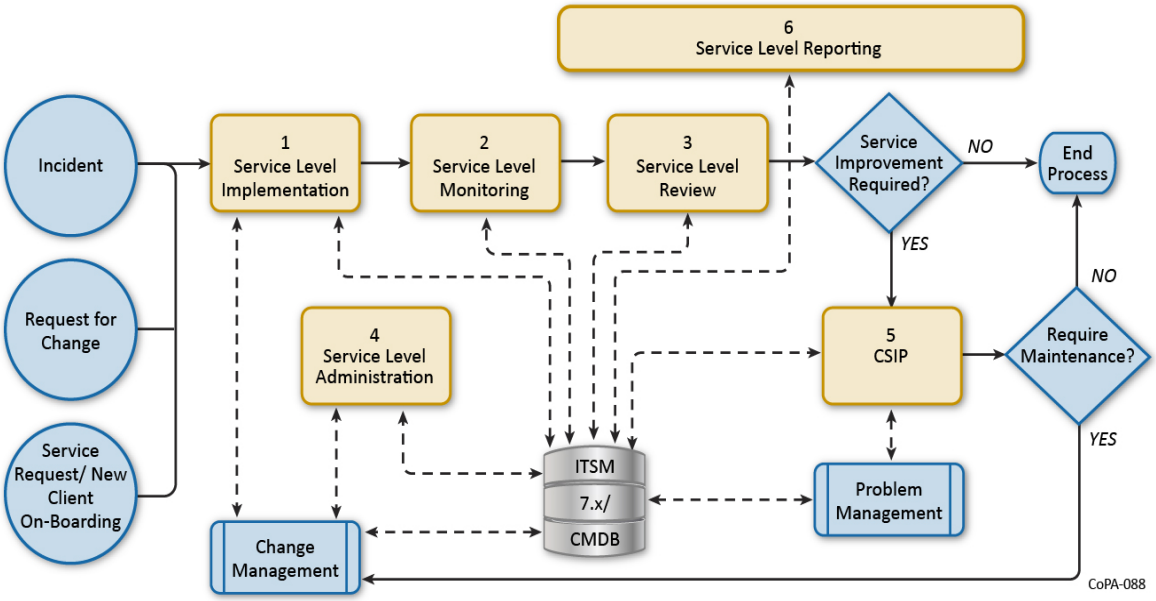

Figure 3.3.2.1-26 - Service Level Management Process Flow

Activities:

Service Level Implementation

Design SLA Framework – Use the Enterprise Services Catalog as an aid and designs the most appropriate SLA structure to confirm that all services and customers are covered in a

manner best suited to the organization's needs.

Determine, Document, and Agree to Requirements and Produce Service Level Requirements (SLRs) – Once the Enterprise Services Catalog has been produced and the SLA framework has been agreed to, this activity drafts the SLRs.

Review, Negotiate and Sign OLAs – Determines and negotiates the OLA requirements necessary for service delivery, and develops OLAs and obtains signatures for OLAs that support the SLA.

Review, Negotiate & Sign UCs – Reviews, negotiates, develops, and has signed the UCs that supports the SLAs and OLAs.

Create Service Level Agreement and Negotiate Terms – Drafts and negotiates the SLA that is needed to meet specified SLRs and objectives.

Activate the SLA – Oversees the signing and activating of the SLA.

Monitor Service Performance Against SLA and Produce Service Reports – Monitors performance in an ongoing manner and reports on specified service level measurement.

Perform Service Level Review – Performs periodic reviews of service level performance.

Service Level Administration – conduct periodic reviews of SLA's with stakeholders to review SLA's and determine if any changes are required to support existing or modified SLA's

Create a Service Improvement Plan – Creates a Service Improvement Plan (SIP) that is a formal plan to implement improvements to a process or IT service. A SIP is managed as part of the Continual Service Improvement (CSI) element of ITSM.

Service Level Reporting – produce SLA reports and make accessible to stakeholders with capabilities to drill down into details.

17 CM, CMDB Data collection and input

17.A Work with the Commonwealth to acquire asset information to support the asset management system and configuration management system.

Offeror must describe its approach to capturing, validating and storing all configuration information required to perform the Services within 120 days of the Effective Date of the Contract.

The Unisys Team recognizes that the Configuration Management Database (CMDB) is the key system of record for support of Services for the environment.

Unisys will take the following approach to capturing, validating and storing all configuration information required to perform Services within 120 days of the Effective Date of the Contract:

- Obtain all Configuration Information for infrastructure assets (this can be electronic, paper documents, etc.).
- Validate the configuration information through a Unisys/Commonwealth audit of the information.
- Unisys will store the configuration either in electronic or paper form to be stored in

appropriate electronic or paper form in order to perform required Services beginning on day 120 after effective date of contract.

- Billing will be reconciled to this captured, audited, and maintained store of configuration item before submitted to the Commonwealth.

Unisys plans to implement at 160 days a fully operational ITSM platform to support the Commonwealth agencies for transition as required in Schedule D. At the time the information gathered above will be loaded into the [redacted] for EDC and DPH Configuration Items with appropriate relationships. The ADDM tool will be fully operational and discovering CI's and relationships for infrastructure items. Unisys will have available an Application Mapping Catalog Service to map infrastructure items to the CMDB.

Figure 3.3.2.1-27 below represents how the maintenance of the [redacted] will be maintained through automated discovery of the transitioned environments in order to support Services.

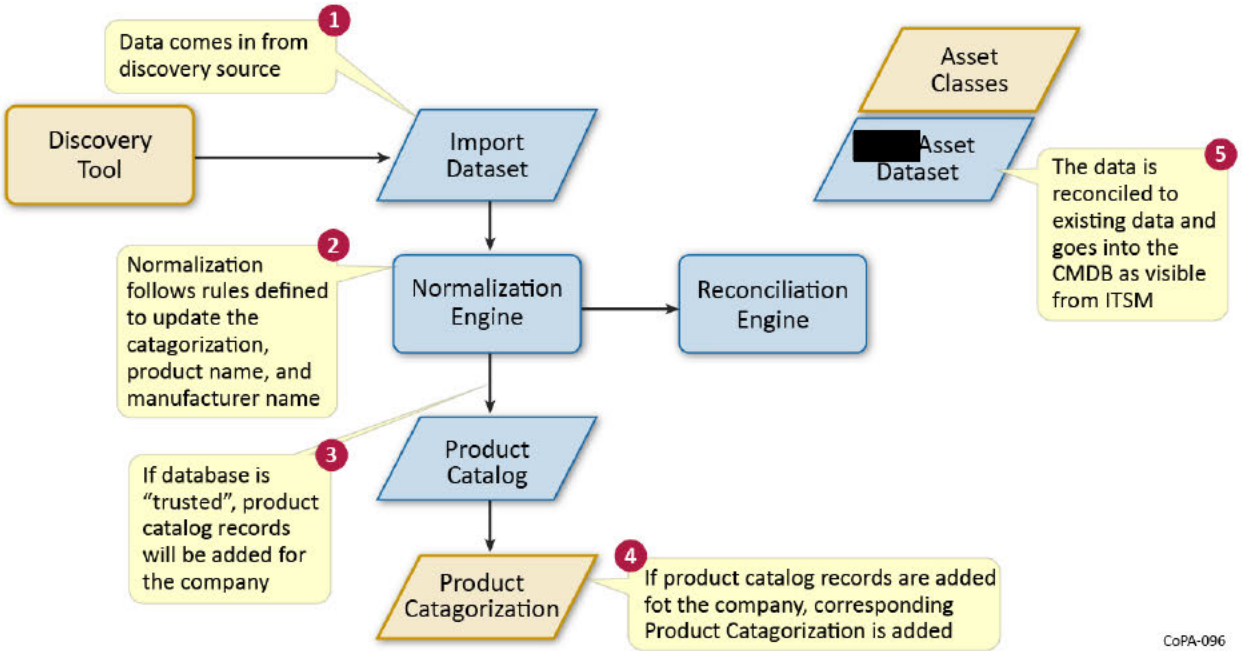

Figure 3.3.2.1-27 - [redacted]

The Unisys Configuration Management Team will have detailed processes and procedures to support and compliment the automated discovery, normalization and reconciliation processes outlined above. Refer to Schedule F, Section 3.2.1.7 Configuration Management for a complete description of the Configuration Management Process.

17.B In particular, the Offeror must address how it will identify and relate critical associations (e.g. Application to Server, Server Tier to Application, Application to Disaster Recovery Time Objective, software to server, etc.) for the enterprise.

Offeror must describe its approach to transitioning the data and related processes from the

existing CMDB or equivalent system/database to the Offeror's solution and how the Offeror must ensure accuracy of data across Service Management areas to ensure accurate and timely invoicing and chargeback to the Commonwealth.

Please refer to Configuration Management Schedule F, Section 3.2.1.7 for an overview of the CMDB processes and application infrastructure supporting relationships.

The approach to transition for the CMDB is as follows:

1. Determine requirements to support availability SLA's for each application transitioned using the Schedule J.3 definition for Infrastructure Availability

2. Determine the alternatives to establish the CMDB relationships to support these availability SLAs including:

    a. Utilizing the Commonwealth / Agency CMDB sources

    b. Discovery using [redacted]

    c. Using the [redacted] to finalize the mapping labels, relationships etc. to support the SLAs

    d. Obtaining the Commonwealth approval for the mapping during transition

Please Refer also the Financial Management Schedule F, Section 3.2.1.1.1 for an overview of how the Billing application uses the Enterprise Services Catalog and CMDB to provide accurate billing of provisioned services that are accurately reflected in the CMDB.

18 Chargeback Management

Work with the Commonwealth to interface with the Commonwealth's billing processing and validation ITSM system to provide a chargeback system for new and existing Services available on the Offeror's Service Catalog.

Offeror must describe its approach to assisting the Commonwealth in transitioning Commonwealth customers from the existing Chargeback system.

Offeror must describe its transition approach to Chargeback Management.

The description must include an expected analysis of the current billing system environment, expected termination assistance, communications plans, strategy for testing and major milestones.

Unisys has a good understanding and experience with billing by Agency. We will leverage the financial management component within the Enterprise Services Catalog ordering system to pull monthly data by agency for specific services ordered during that billing month. By utilizing the same tool for both Enterprise Services Catalog and invoicing, we will have the ability to manage the expenses at the level of the services. This solution will provide the Commonwealth with the ability to gain greater understanding of its IT costs through visibility into the usage details of the IT resources.

There are four facts needed to be known about a resource in order to charge for it; Who, What, When and How Much. This data will all be contained in the Enterprise Services Catalog system.

Once an Agency has ordered a service; the service is provisioned and verified through the Change Management process, then the units and Enterprise Services Catalog rates will be used to generate a monthly fee to the Agency. Invoicing is configured to provide various funding streams by general ledger accounts as identified by each agency during implementation. This system will provide reporting capabilities that will enable the agencies to manage both their IT utilization and costs at a level they define. The Unisys Team will work with the Commonwealth to develop the appropriate interface format for input into the Commonwealth Chargeback system. Refer to Schedule F, Section 3.2.1.1.1 for more detail on the Financial Management function.

During the transition period, Unisys will work with each agency to identify the various general ledger accounts they utilize in the Commonwealth system. A comparison to current billing will be done to provide consistency where it is needed. With the Agency's input, the system will then be set up per their requirements. Training will be provided to show the agency how the system will work from ordering of services through the billing process, and will be provided with available report formats.

Implementation of the Enterprise Services Catalog will be done as tasks within the Transition Project and will be managed in accordance with the standards establish for project management within the program including communications, testing, and schedule adherence.

During the transition described above, the Unisys Team will leverage the interim invoicing procedures defined in Schedule F, Section 3.2.1.1.1 Financial Management.

19 Options and Costs

List the appropriate different options that will satisfy the requirements of the transition scope.

Communicate options with the Commonwealth and obtain approval on selected option(s) to proceed.

Offeror must describe proposed approach

Throughout this document, the Unisys Team has provided options and suggested approaches to be discussed after contract award. Based on the options selected by the Commonwealth, costs and timelines may need to be altered. For additional details please see Section 3.0 Attachment 9 "Schedule M: Detailed Transition Plan".

20 EDC Expansion and Reconfiguration Options

20.A Expand/reconfigure datacenter facilities to accommodate growth in Commonwealth information and information systems.

Offeror must discuss its approach; the expansion/reconfiguration plans must include the EDC.

The Unisys Team's plan is to leave the [redacted] "as is" during transition/migration to mitigate risk and focus on transition activities. In addition to the [redacted] the Unisys Team is establishing infrastructure for the Commonwealth in [redacted] to provide the services outlined in this proposal and to accommodate existing applications as well as future growth. Unisys data center architecture is designed to flex with the Commonwealth's need for growth or reduction in data center hosted services. Refer to Section 3.1.1 "Multi Data Center Environment" for further details on the proposed Unisys Data Centers.

21 Transition Weekly Reports

21.A Produce weekly reports on the progress of the information service transition initiatives.

Offeror must describe its proposed approach to providing weekly transition progress reports.

The Commonwealth Transition Program will produce several weekly status reports during the life of the program. These reports will be tailored to the audience for whom they are intended including the program and project steering committees. Communications through these reports should have three facets.

1. Reviewing results from the past period
2. Expected results for the next period
3. Items for management attention. These items will be further categorized into those requiring action from the leadership team and those for information only. It is also expected this will not be the first leadership will be aware of these items' but rather is intended to keep these items in the forefront of leaders thoughts.

Status reports will be posted to a portal accessible to those recipients authorized to receive them. See response to 1-D "Communication Plan" above for further details.

Unisys Team Experience

Unisys, IBM and Deloitte are industry leaders in data center outsourcing. They have transitioned and migrated countless data centers into their support models and facilities. As an example, Unisys has recently provided similar services for the American Red Cross. Within the Commonwealth, the Unisys Team has successfully migrated multiple data centers into the Willow Oak data center. In addition, Unisys currently provides over half of the resources for the [redacted]

Section 4 will provide much more depth into several of these efforts.

Benefits to the Commonwealth

Unisys, IBM and Deloitte know the Commonwealth, know many of their environments and have strong relationships with the agencies. This knowledge and the relationships that have been forged over the years of working together give this team a significant advantage. We know what to expect from each other, we know how each other works and we have large, strong companies behind us with a strong understanding of the industry and technologies. Throughout the program you will no doubt see this team bringing in new team members who bring with them industry experience from other large companies. The synergies of combining the Commonwealth, Unisys, IBM, Deloitte and the diverse experience of the new team members will no doubt provide a world class solution for the Commonwealth which we believe can be achieved faster, with higher quality and a lower cost.

A Unisys Team transition provides a team already familiar with the Commonwealth and its organization, which can be more focused on the mechanics of a successful transition and meeting your needs without impact.

3.3.2.2 Security Transition Activities

To maintain continuity of Services, Offeror must provide training to Offeror's employees and subcontractors on security policies during initial phase of the Transition.

Exhibit(s) H.1 through H.8 - Department of Revenue (DOR) Exhibits

Exhibit(s) I.1 through I.13 - Commonwealth SAP Environment - Integrated Enterprise Services (IES) Exhibits

Exhibit L - Commonwealth Master Application Inventory

Exhibit(s) M.1 through M.7 Department of Corrections (DOC) and Pennsylvania Board of Probation and Parole (PBPP) Exhibits

Exhibit(s) N.1 through N.2 - PennDOT Exhibits

Requirements		Describe Compliance
1.	Baseline Security Risk and Vulnerability Assessment Conduct a security risk assessment, which includes a penetration test on the In-Scope systems, an architecture review, and a vulnerability assessment. This assessment must result in a report with recommendations for meeting the Commonwealth's baseline security standard.	Offeror must describe its proposed approach to conducting a security risk assessment including penetration test, which must result in a report with recommendations.

2.	Security Training The Offeror's security team will meet with the Commonwealth's Security teams (OA & Agency) to participate in creating a comprehensive Security Program strategy. The Offeror and the Commonwealth Security teams will develop security awareness training content consisting of the Offeror's Security Plan documentation, Commonwealth OA and agency security policy guidelines. Security training will be mandatory for employees, contractors and subcontractors assigned to work on the Commonwealth's Data Center project. Appropriate levels of training will be designated and tracked for compliance based on the specific area the employee will be working in. Both an individual's current training status and overall attainment of group training goals must be tracked and reported in the security clearance database. These levels will range from general security awareness that all employees will participate in to task-specific security and governance requirements targeted at operations, specialist, Commonwealth agency specific regulations, or working rules needed for compliance with Commonwealth or federal mandates unique to certain Commonwealth agencies and programs. This training will be delivered both during the new hire process, and on a regular schedule to be determined during Transition as new updates become necessary.	Offeror must describe its proposed approach to developing and implement a comprehensive Security Program.

3.	Initial Security Plan During the initial phase of the Transition the Offeror's security team will work with the Commonwealth's Security Team to create a Security Plan. Begin work on draft policy and procedure documents collectively known as the Security Plan during the start of the Transition Risk and Vulnerability Assessment, which will be completed one (1) month prior to Transition activities. Use best practice security standards (as outlined in the Requirements section of the RFP) along with past engagement experience to provide an outline that will address but will not be limited to the following: security strategy and technology roadmaps, security operations procedures, standard hardware and software security configurations, physical security policies and procedures, security incident management, private and protected data use standards, and audit procedures and reporting standards. This set of documents will be used as the foundation of the Offeror's master security plan for Datacenter operations which will be reviewed and updated on an annual basis.	Offeror must describe its proposed approach to performing the following: • Create a comprehensive Security Plan • Complete a Vulnerability Assessment (at the Offeror expense) • Document the agreed upon security strategy and roadmap • Document security procedures and standards • Document the security incident Management approach including o Standards o Processes o Reporting o Escalation
4.	On-boarding and off-boarding Conduct required background checks for its employees working on the Commonwealth Datacenter project. Where appropriate, use identity management tools to manage access to the systems requiring access by its	Offeror must describe its proposed approach to conducting required background checks for Offeror staff.

	employees. For systems where the Offeror is unable to use its identity management system, assign staff to manage the access. Train Offeror employees on his or her responsibilities within the contract. For logical and physical access to Commonwealth Co-location facilities and environments not managed by the Offeror, the Commonwealth's security access request process will be followed. For off-boarding, update security clearance database with the status of Offeror employee and concurrently update its identity management tool to ensure the access is revoked. Provide a monthly report describing personnel actions including but not limited to; new hires, terminations, any change in employee status/duties, etc.,	
5.	Complete DR Transition Activities Conduct knowledge transfer during the initial phase of the Transition, including review of Commonwealth DR plans and review of Third Party DR contracts. The Offeror must also update the DR plan contact information and any changes made in the first six (6) months of Transition.	Offeror must describe proposed approach to support the Tiered DR Services.

Deliverables

Deliverables are defined in **Schedule K – Key Program Deliverables**

Offeror Response

Introduction

The Unisys Team will conduct key security-related activities during the Transition phase to maintain continuity of Services. These services include a Baseline Security Risk and

Vulnerability Assessment, Security Training, development of an Initial Security Plan and On-boarding and Off-boarding procedures, and Disaster Recovery transition.

1 Security, Risk and Vulnerability Assessment

1.A Conduct a security risk assessment, which includes a penetration test on the In-Scope systems, an architecture review, and a vulnerability assessment. Offeror must describe its proposed approach to conducting a security risk assessment including penetration test, which must result in a report with recommendations.

The Unisys Team uses our demonstrated methodology and our deep experience in serving multiple agencies of Commonwealth and other public sector clients to perform the baseline security risk and vulnerability assessment. We use our experience in delivering security risk and vulnerability assessment projects for several public sector clients including the Commonwealth to deliver this assessment. Using state-of-the-art tools that are consistent with leading industry practices such as National Institute of Standards and Technology (NIST) standard, Open Web Application Security Project (OWASP) and System Administration, Audit, Network, Security (SANS) guidelines, we will tailor our assessment to meet the Commonwealth timelines and deliverable milestones.

In addition, the Unisys Team uses our public sector security risk framework to develop the data center security risk framework (during the initial security plan). A framework customized to the data center, helps integrate several relevant regulatory requirements and perform a one-time risk assessment to identify the data center security posture with relevant regulations and Commonwealth policies. The Unisys Team performs the following steps as part of the baseline security risk and vulnerability assessment:

- Step 1: Scope and Plan
- Step 2: Conduct vulnerability assessment
- Step 3: Perform penetration testing
- Step 4: Perform security risk assessment and architecture review
- Step 5: Perform security configuration risk review

We will work with the Commonwealth to perform the following activities described in the table below in **Figure 3.3.2.2-1.**

Steps	Unisys Team performs the following activities to identify potential security risks and vulnerabilities within the existing data center infrastructure
Step 1: Scope and Plan	Conduct two meetings with the data center stakeholders and the Commonwealth's "Trusted Agent" to • Document project requirements, scope and objectives • Identify Commonwealth's point of Contact ("Trusted Agent"). • Identify and document the time frame for conducting baseline security risk and vulnerability assessment.

Step 2: Conduct Vulnerability Assessment	• Identify the Commonwealth's target IT and application infrastructure using passive scanning (from public resources such as Search Engines) • Work with the Commonwealth's stakeholders to understand the architecture, business logic/functionality, external dependencies, user roles and privileges within the target IT infrastructure and application • Identify, using passive scanning techniques, the technology and infrastructure dependencies • Perform active reconnaissance and identify network protocols present on the target infrastructure and web applications using network discovery (SolarWinds, Ping and Xprobe2) • Identify well-known open TCP ports and services present on the target infrastructure using leading port scanning tools (Nmap and SuperScan) • Perform infrastructure vulnerability tests using automated vulnerability scanning tools (Tenable Nessus and Rapid7 Nexpose) on Commonwealth selected IT infrastructure. The tests will include performing vulnerability scans to meet the Payment Card Industry (PCI) Data Security Standard (DSS) vulnerability scanning requirements • Perform database vulnerability testing, using automated database vulnerability scanners (AppDetectivePro) on a total of Commonwealth selected standard database instances of Oracle, Microsoft SQL Server, MySQL and IBM DB2 • Conduct manual assimilation of the vulnerability scan results to identify false positives and manually verify the vulnerabilities identified by the vulnerability scanning tools.
Step 3: Perform Penetration Testing	• Analyze the vulnerabilities in order to identify the penetration testing steps that can be performed – based on the identified hosts with vulnerabilities • Research, develop and prepare custom penetration test scripts methods for system vulnerabilities • Communicate the penetration test activity with the trusted agent and obtain the confirmation before performing the tests on the target environment • Support the Commonwealth to select the IT infrastructure to perform the penetration testing. The selected IT infrastructure for further analysis will help provide a representative view of the data center IT environment (e.g., different server OS levels, HW vendors, and server functions). We will document and discuss the appropriate exploitation steps with the Commonwealth before performing the tests • Perform the controlled penetration testing on Commonwealth selected IT infrastructure to exploit the identified vulnerabilities. We will use Rapid7 Metasploit to perform the penetration tests Note: The Unisys Team performs the vulnerability assessment and penetration testing on Commonwealth selected data center's IT network infrastructure. The vulnerability assessment and penetration testing does not include web application vulnerability testing and social engineering assessment

Step 4: Perform Risk Assessment and Security Architecture Review	• Develop a data center security risk framework that includes an integration of relevant security regulations and commonwealth policies including, • Commonwealth Security Information Technology Bulletins (ITBs) • National Institute of Standards and Technology (NIST) Special Publication (SP) 800-53 revision 4 • Health Information Portability and Accountability Act (HIPAA) – Security and privacy rule • Internal Revenue Services (IRS) publication 1075 • Payment Card Industry (PCI) Data Security Standard (DSS) • Criminal Justice Information Services (CJIS) v5.1 • PA Criminal History Record Information Act (CHRIA),and • United States Social Security Administration (SSA). • Conduct a security risk assessment and IT architecture review of the existing seven data center IT infrastructures using the data center risk framework developed NIST SP800-53 rev4. The IT security architecture review includes specific components such as, • Trust Zone Architecture. • User Role Design. • Authentication and Authorization. • Data Protection. • Security Audit Logs and SIEM. • Data Privacy.
Step 5: Perform Security Configuration Risk Review	• Perform security configuration risk review using the IRS 1075 based Safeguard Computer Security Evaluation Matrix (SCSEM) on Commonwealth selected IT infrastructure handling Federal Taxpayer Information (FTI). We will work with the Commonwealth to select the IT infrastructure that includes a representative view of the information technology environment of the data center such as • Web servers • Application servers • Database instances • Standard operating systems (SCO UNIX,Tru64 UNIX, HP-UX, IBM AIX, Linux – Red Hat, SUSE, Microsoft Windows 2000, 2003 and 2008) • Boundary protection devices: perimeter firewalls, Intrusion Prevention System (IPS), routers and switches.

Figure 3.3.2.2-1 - Risk and Vulnerability Assessment Steps

1.B This assessment must result in a report with recommendations for meeting the Commonwealth's baseline security standard.

We document the results of the baseline security vulnerability and risk assessment as part of key deliverable D-09.01 – Baseline Security Risk and Vulnerability Assessment Report, and submit to the Commonwealth. In addition, we will work with data center stakeholders and the

Commonwealth stakeholders to develop a remediation plan.

We use the data center's defect tracking tool, to record the identified security vulnerabilities and risks. This enables the Commonwealth to monitor the vulnerability remediation status on a continuous basis. As part of this effort, we perform the reporting and remediation process through the following three steps:

- Step 1 – Prepare baseline security vulnerability assessment reports
- Step 2 – Assist infrastructure owners to determine infrastructure and business impacts
- Step 3 – Develop remediation plan

We describe the three steps of the remediation process below.

Step 1 – Prepare security risk and vulnerability assessment reports: We prepare and submit the report (Key Deliverable D-09.01) that includes the outline described in the table below in **Figure 3.3.2.2-2**:

Baseline Security Risk and Vulnerability Assessment Report Sections	Our Activities Addresses Baseline Security Risk and Vulnerability Assessment Details	Stakeholder	Tools/ Techniques
Security Vulnerability and Risk Description	• Describes the identified security vulnerability, vulnerability location(s), number of instances where identified and vulnerability severity (high, medium and low) • Provide the suggested vulnerability mitigation upon analyzing the root cause • Map each vulnerability identified to a system specific vulnerability ID, to track root cause and reemergence of vulnerabilities • Benchmarks the vulnerabilities identified with leading industry practices for network security and architecture.	• Unisys Team.	• Baseline security risk and vulnerability assessment
Vulnerability Categorization/ Business Impact	• Describes the infrastructure and business criticality of the security vulnerabilities identified and user groups impacted	• Commonwealth data center stakeholders /owners • Unisys Team	• IT Infrastructure Business Impact Analysis
Mitigation	• Provides the PCRs recorded for	• Commonwea	• Commonwealt

timeline	each vulnerability identified to monitor for mitigation during SAT phase of SDM • Tracks the mitigation status when submitted to the DPW CISO.	lth data center stakeholders /owners • Unisys Team	h data center standard defect tracking system

Figure 3.3.2.2-2 - Security Risk and Vulnerability Assessment report Outline

Figure **3.3.2.2-3** below illustrates a sample vulnerability assessment dashboard provided as part of the report. This dashboard provides a graphical representation of the vulnerability severity identified on the IT infrastructure.

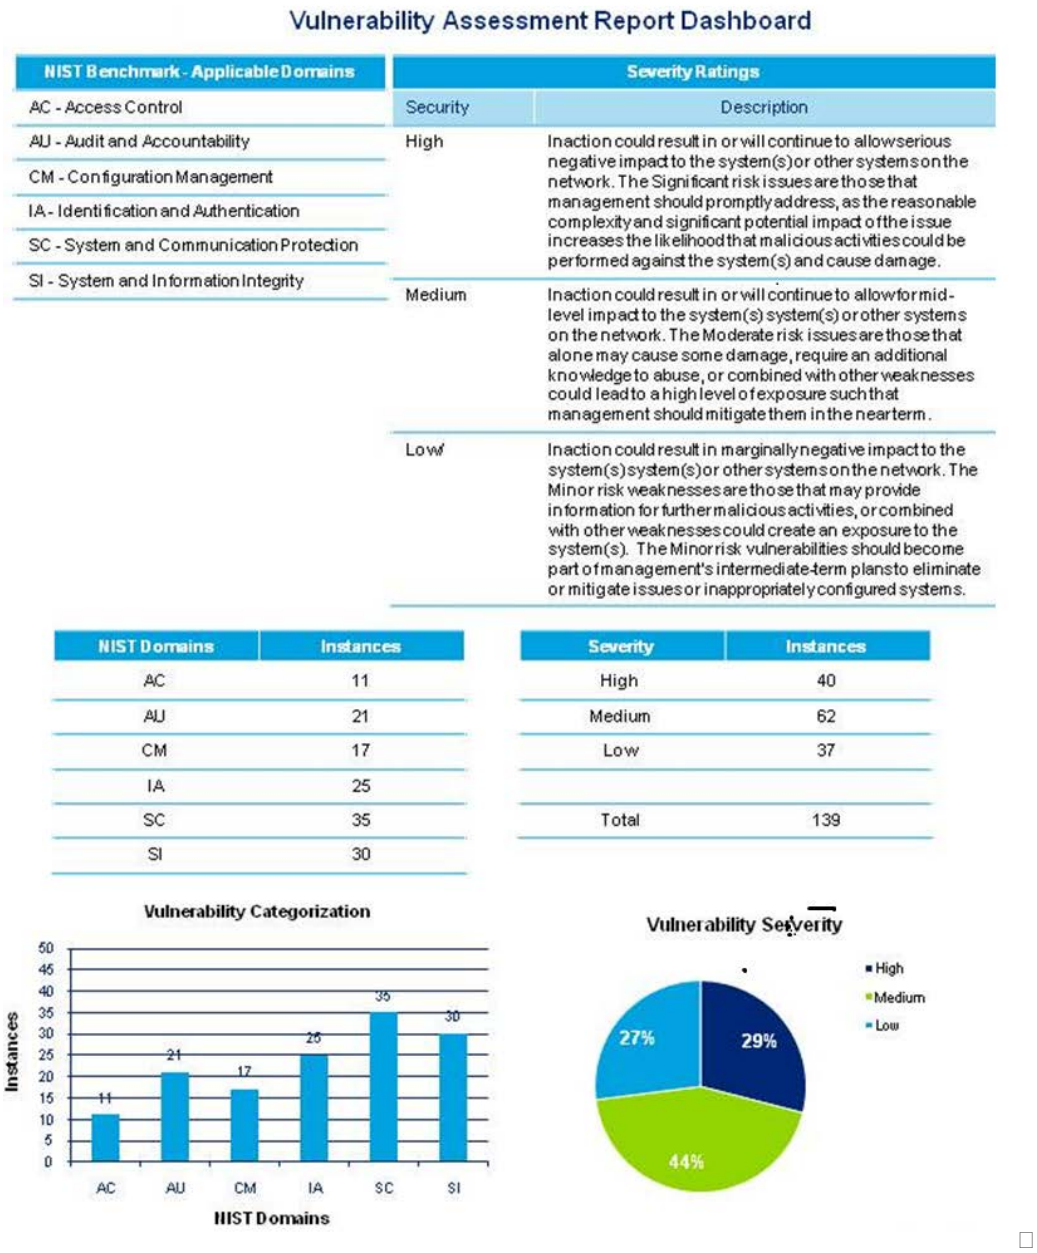

Figure 3.3.2.2-3 - Sample Vulnerability Assessment Dashboard

Step 2 –Identify potential business impacts from the identified security risks and vulnerabilities: We work with the Commonwealth and the data center stakeholders to identify the business impacts from the identified security risks and vulnerabilities including:

- Security risks for the identified vulnerabilities
- Infrastructure and business criticality for the vulnerable instances based on the risks identified
- Effort required to mitigate the vulnerability

- Remediation time frame.

Step 3 – Develop Remediation Plan: We work with the Commonwealth and the data center stakeholders to develop a remediation plan and help prioritize remediation efforts. We use the data center's standard defect tracking tool to record the identified vulnerabilities. This enables the Commonwealth to monitor the vulnerability remediation status on a continuous basis.

The Unisys Team's collaborative approach to work with the Commonwealth to perform baseline security risk and vulnerability assessment:

We work with the Commonwealth to identify a "Trusted Agent" to help facilitate the security risk and vulnerability assessment. The Trusted Agent is responsible to:

- Define scope, identify and prioritize the IT assets for the assessment
- Make decisions to proceed with applicable testing
- Coordinate the testing activity with stakeholders like IT infrastructure, application and data center service providers
- Coordinate with other commonwealth agencies (if applicable) during the testing activities
- Review the vulnerability reports and owns limited "as needed" distribution of the reports. The sensitive nature of information contained in the reports requires a specific stakeholder being responsible for managing the communication aspects
- Identify mission critical systems of the Commonwealth, business partners or affiliates, and third parties, as applicable
- Identify the time period for communication to the appropriate stakeholders for high severity security vulnerabilities identified in production environment
- Coordinate and authorize the vulnerability assessment team access to the Commonwealth data center's information technology components considered for vulnerability assessment. In order to avoid interruptions, we recommend running many of the assessment tasks during non-business hours. At the Trusted Agent's direction, we execute as many of these tasks as practical during non-business hours
- Select the servers for the baseline security risk and vulnerability assessment based on business and security criticality.

We will coordinate with the Commonwealth and the data center stakeholders to perform a backup of all data and servers for the environments, in addition to performing recovery procedures of systems, servers and applications.

In addition, we will use leading industry vulnerability scanning tools that supports PCI scanning – Tenable Nessus and Rapid 7 Nexpose in addition to using Rapid 7 Metasploit to perform penetration test. We use AppDetectivePro Pro to perform database security vulnerability assessment in addition to performing a security configuration review using leading industry standards such as IRS defined SCSEMs

2	***Training, Security***
2.A	***The Offeror's security team will meet with the Commonwealth's Security teams (OA & Agency) to***

participate in creating a comprehensive Security Program strategy. Offeror must describe its proposed approach to developing and implement a comprehensive Security Program.

We understand the importance and emphasis on security awareness training. We will work closely with the Commonwealth stakeholders to construct formal security training programs to help verify that data center personnel have a strong understanding of the Commonwealth and data center information security program, roles and responsibilities. **Figure 3.3.2.2-4** below illustrates our four phase approach (sample) to develop and deliver security training and awareness.

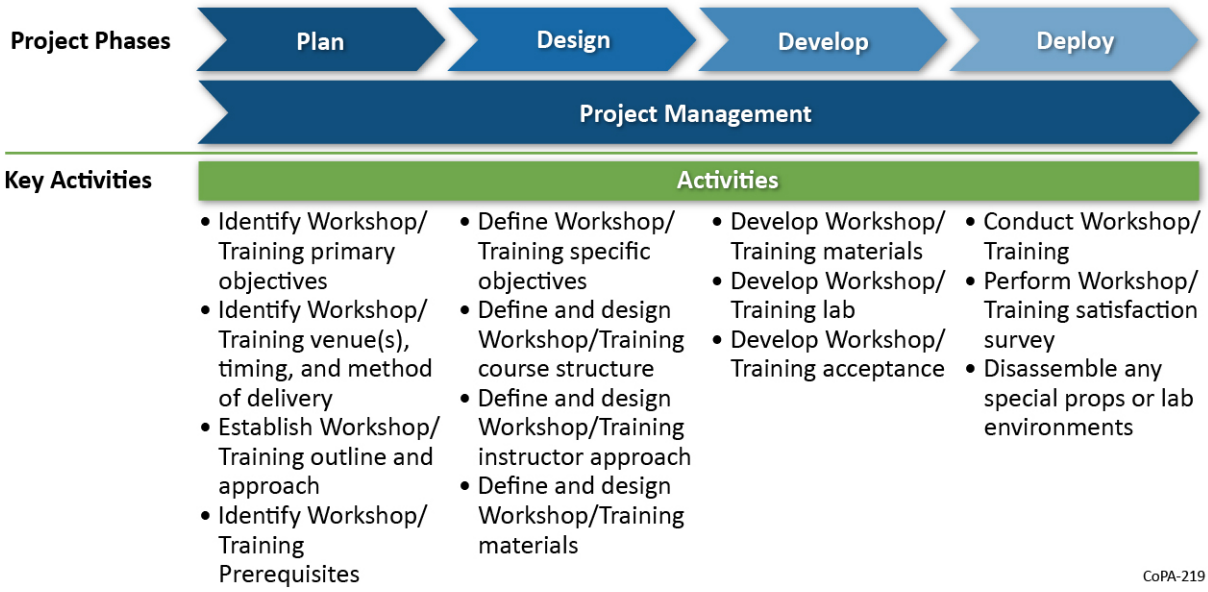

Figure 3.3.2.2-4 - Our Sample Approach to Conducting Security Training and Awareness

2.B The Offeror and the Commonwealth Security teams will develop security awareness training content consisting of the Offeror's Security Plan documentation, Commonwealth OA and agency security policy guidelines.

We will develop and deliver tailored security-related education and awareness workshops and specialized security training materials and instruction, that include:

- **"Train the trainer" program – Security Training for data center trainers –** design, develop, and conduct security training for the Commonwealth data center trainers. We will perform the following activities as part of this step:
  - Work with the Commonwealth to define the training requirements for the data center and create a comprehensive Security Program strategy
  - Identify the relevant security training requirements from the applicable regulations and standards such as IRS 1075, HIPAA and Commonwealth's Information Technology Bulletins (ITBs)

- Develop specialized security training material that describe the Commonwealth data center information security program and the individual's responsibility to protect Commonwealth data

- Work with the data center Information Security Manager, [redacted] to deliver a one-time security training session to the Unisys trainers who will train the other data center staff ("Train the Trainer" approach).

2.C Security training will be mandatory for employees, contractors and subcontractors assigned to work on the Commonwealth's Datacenter project.

Appropriate levels of training will be designated and tracked for compliance based on the specific area the employee will be working in.

Both an individual's current training status and overall attainment of group training goals must be tracked and reported in the security clearance database. These levels will range from general security awareness that all employees will participate in to task-specific security and governance requirements targeted at operations, specialist, Commonwealth agency specific regulations, or working rules needed for compliance with Commonwealth or federal mandates unique to certain Commonwealth agencies and programs. This training will be delivered both during the new hire process, and on a regular schedule to be determined during Transition as new updates become necessary.

- **Security Training for data center staff** – Conduct security training for Commonwealth data center staff. We will perform the following activities as part of this step:

  - Conduct mandatory training for all data center staff (i.e. employees, contractors and subcontractors) assigned to work on the Commonwealth's Data Center project on security awareness including Security Plan documentation and Commonwealth OA and agency security policy guidelines. Training will occur during the new hire process and at periodic intervals as deemed appropriate and necessary.

  - Designate and track appropriate levels of training for compliance per the individual staff member's role.

  - Track and report individual's current training status and overall attainment of group training goals in the security clearance database.

3 Initial Security Plan

Initial Security Plan, During the initial phase of the Transition the Offeror's security team will work with the Commonwealth's Security Team to create a Security Plan.

Begin work on draft policy and procedure documents collectively known as the Security Plan during the start of the Transition Risk and Vulnerability Assessment, which will be completed one (1) month prior to Transition activities.

Use best practice security standards (as outlined in the Requirements section of the RFP) along with past engagement experience to provide an outline that will address but will not be limited to the following: security strategy and technology roadmaps, security operations procedures, standard hardware and software security configurations, physical security policies and procedures, security incident management, private and protected data use standards, and audit procedures and reporting standards.

Offeror must describe its proposed approach to performing the following: Create a comprehensive Security Plan

Complete a Vulnerability Assessment (at the Offeror expense)

Document the agreed upon security strategy and roadmap

Document security procedures and standards

Document the security incident Management approach including (Standards, Processes, Reporting, and Escalation)

This set of documents will be used as the foundation of the Offeror's master security plan for Datacenter operations which will be reviewed and updated on an annual basis.

The Unisys Team understands that it is essential to establish the data center security plan during the initial phase of the transition. The table below in **Figure 3.3.2.2-5** illustrates how we have our custom approach to meet the appropriate RFP requirements:

Steps to develop initial security plan and related deliverables	Unisys Team's steps and activities are customized to meet the following RFP requirements
Step 1: Scope and Planning *Deliverable D-05.01: Transition Management Plan*	• Document the timelines and milestones to establish the data center initial security plan

Step 2: Create Commonwealth data center security plan *Deliverable D-07.01: Security Management Plan*	• Activity 1: Document security procedures and standards that includes o Security incident Management approach including ▪ Standards ▪ Processes ▪ Reporting ▪ Escalation o Draft policy and procedure documents collectively known as the Security Plan during the start of the Transition Risk and Vulnerability Assessment, which will be completed one (1) month prior to Transition activities. Use best practice security standards (as outlined in the Requirements section of the RFP) along with past engagement experience to provide an outline that will address but will not be limited to the following: ▪ Security strategy and technology roadmaps ▪ Security operations procedures ▪ Standard hardware and software security configurations ▪ Physical security policies and procedures ▪ Security incident management ▪ Private and protected data use standards, and ▪ Audit procedures and reporting standards. • Activity 2: Document the agreed upon security strategy and roadmap • Activity 3: Document the data center IT asset inventory • Activity 4: Define the data center security risk framework • Activity 5: Establish the initial security plan
Step 3: Perform vulnerability assessment *Deliverable D-09.01: Baseline Security Risk and Vulnerability Assessment Report*	Complete a Vulnerability Assessment
Step 4: Perform data discovery and classification to indicate level of sensitivity *Deliverable D-07.01: Security Management Plan*	Commonwealth responses to Q37 and Q46 of round 1 part 1 include data classification and identifying the data centers' data encryption requirements. The related activities include: • Activity 1: Data Classification and • Activity 2: Data Discovery.

Figure 3.3.2.2-5 - Customer Security Plan Approach

We have described our approach to perform the steps for establishing the initial security plan below:

Step 1 – Scope and Planning: During this first step, we will work with the Commonwealth to identify key data center stakeholders and document the security plan requirements, scope, objectives, milestones and timelines.

Step 2 – Create Commonwealth Data center Security Plan: As part of this step, we work with the Commonwealth to define and establish the data center's initial security plan that includes the following activities:

a. Activity 1: Establish the data center information security procedures and standards

b. Activity 2: Document the security strategy and roadmap

c. Activity 3: Document the data center IT asset inventory

d. Activity 4: Define data center security risk framework

e. Activity 5: Document and establish the data center initial security plan

Activity 1: Establish the data center information security procedures and standards

The Unisys Team will develop and establish the Commonwealth data center's information security policy framework that documents the appropriate security procedures and standards. The data center's information security policy framework will play an important role in the effective implementation of the data center information security programs and its security plan. Information security policy framework helps provide security risks are minimized and that security incidents are effectively responded to. This framework will assist the data center personnel to participate in the Commonwealth's efforts to secure its information assets and people. The effectiveness of the information security policy framework is dependent on the awareness within the data center personnel. As part of this project, we use the following leading industry practices to help establish an effective data center information policy framework:

Have you heard?

Unisys Teaming partner, Deloitte has established a Center for Cyber Innovation (CCI) that develops cyber solutions for clients in the public and private sectors who are seeking to improve information sharing, collaboration and performance by harnessing the power of increasingly interdependent networks.

- U.S. Department of the Interior's Information Technology Security Policy Handbook based on NIST SP 800-53 Recommended Information Security Controls for Federal Information Systems
- SANS Institute's Information Security Policy – A Development Guide for Large and Small Companies.

We use the Commonwealth's established security policy framework – Information

Technology Bulletins (ITBs) to help establish the data center's information policy framework. **Figure 3.3.2.2-6** below illustrates the high level information security policy framework.

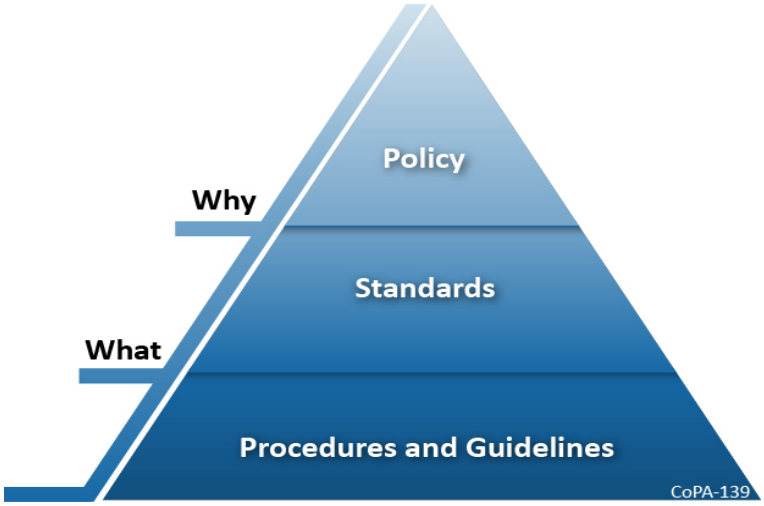

Figure 3.3.2.2-6 - Proposed data center Information Security Policy Framework

We have described the proposed structure of data center's information security policy framework in the table below along with sample policies, standards and procedures.

Information security policy framework	Definition	Sample policies, standards and procedures
"Policy" for identified and prioritized security domain	Policies are high-level statements regarding principles and requirements that set the tone and temperament of management's risk tolerance. A policy is a governing principle that provides the basis for standards and carries the highest authority in the organization.	• IT Risk Management • IT Compliance Management • Identity and Access Management (IAM) • Asset Management • Threat and Vulnerability Management
"Standards" for prioritized domain	Information Security Policy, Encryption Policy, Data Retention Policy, Privacy Policy	Sample IAM standards • Account provisioning • Role management • Entitlement review • Access management.

"Procedures and Guidelines"	Procedures are detailed step-by-step activities and tasks that personnel are to follow when performing certain aspects of their job responsibilities. They may include corporate, local and business unit specific procedures.	Sample Role management procedures • Role definition guidelines • Role decommissioning procedure

Key procedures and standards: The information security policy framework described above will include the following key policies, standards and procedures.

- Security operations procedures
- Standard hardware and software security configurations
- Physical security policies and procedures
- Security incident management
- Private and protected data use standards
- Audit procedures and reporting standards.

Security Incident Management Approach: As part of this activity, we will work with the Commonwealth to define the security incident management approach that includes establishing supporting standards, processes, reporting and escalation procedures. We will use guidance established by the leading industry standards and Commonwealth policy that includes and leading industry standards including

- Commonwealth Information Technology Bulletin (ITB)-SEC024 – IT Security Incident Reporting Policy
- NIST SP800-61 rev 2 – Computer Security Incident Handling Guide
- Internal Revenue Service (IRS) publication 1075
- US Social Security Administration (SSA)
- Criminal Justice Information System (CJIS) and
- Payment Card Industry (PCI) Data Security Standards (DSS).

Activity 2 – Develop the data center security strategy and roadmap

In addition to the information security policy framework, we will analyze the results of the baseline security risk and vulnerability assessment to help develop a security strategy and technology roadmap. A sample security and technology roadmap is illustrated in **Figure 3.3.2.2-7** below:

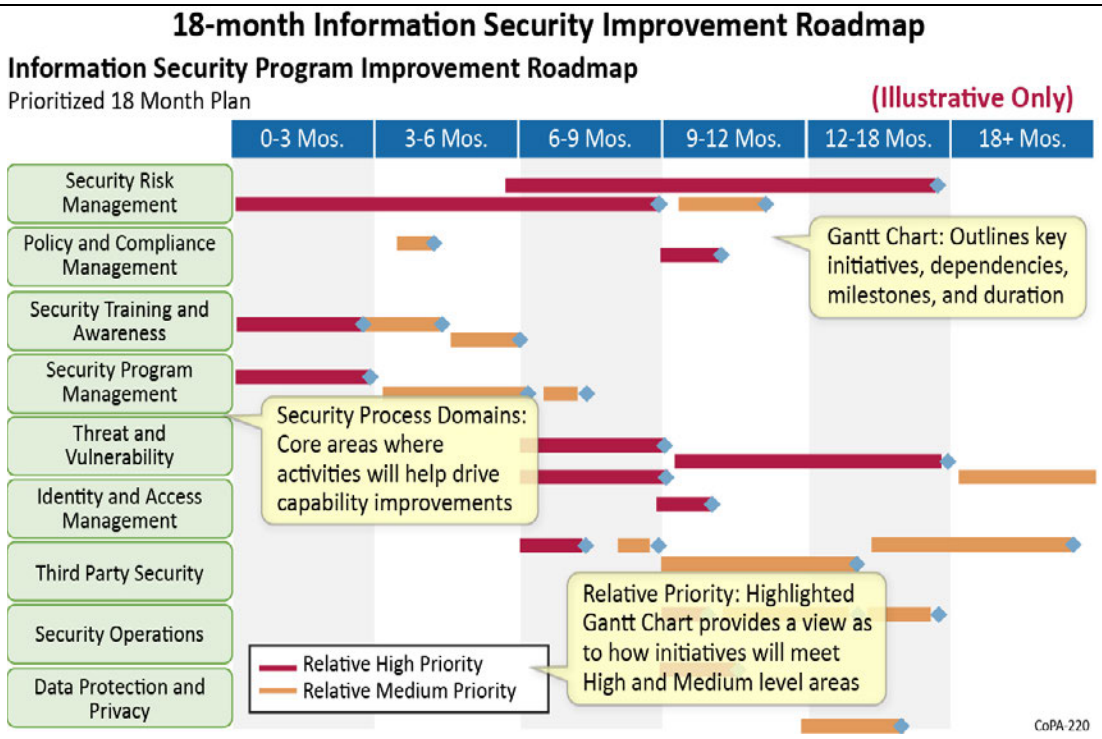

Figure 3.3.2.2-7 - Sample Information Security Improvement Roadmap

Activity 3: Document the data center IT asset inventory

We will document and establish the Commonwealth data center IT asset inventory that includes the current hardware and software security configuration. The Unisys Team will maintain IT asset current as part of ongoing data center operations and document it as part of the annual security management plan.

Activity 4: Define data center security risk framework by rationalizing individual security requirements from Commonwealth and Federal regulations, policies and standards.

From our experience of working with the Commonwealth, we understand that the data center needs to appropriately protect the citizen information using relevant regulations, policies and standards. The citizen information includes sensitive datasets such as social security numbers (SSNs), personal health information (PHI), child abuse data and criminal history records. Each of these sensitive datasets requires appropriate protection measures from several disparate regulations and standards as illustrated in **Figure 3.3.2.2-8** below.

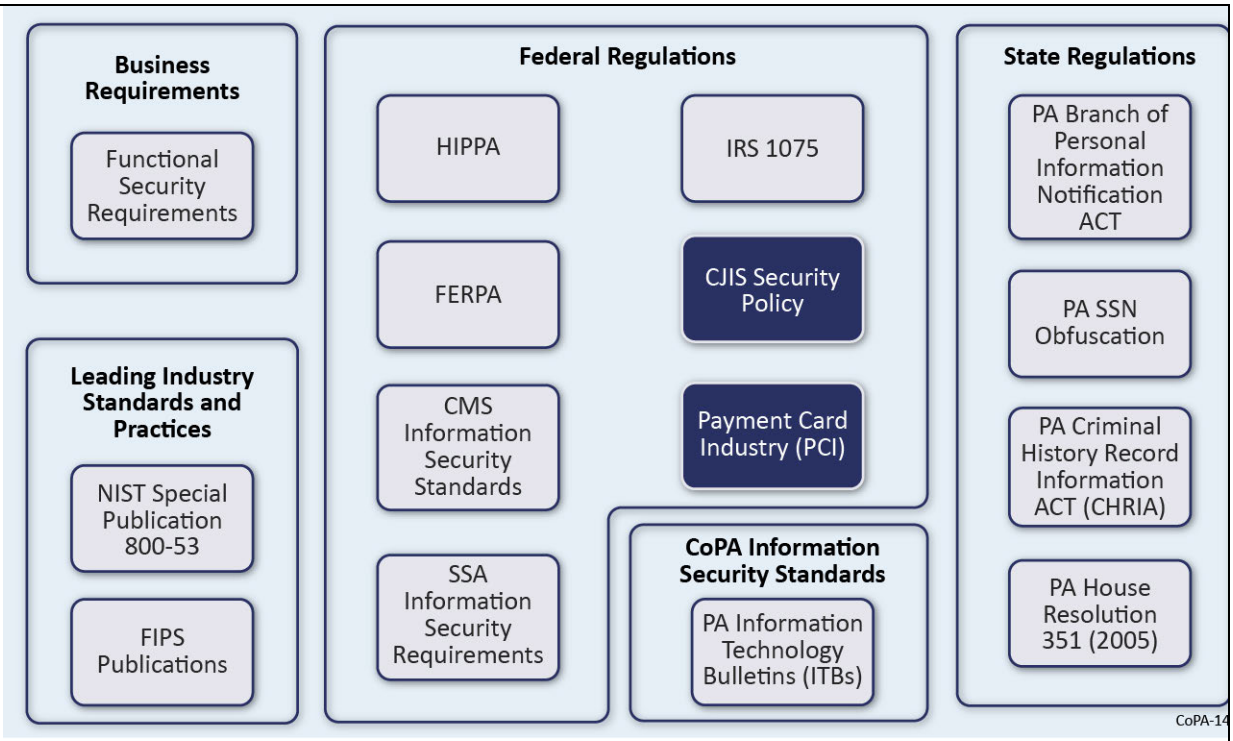

Figure 3.3.2.2-8 - Sample List of Applicable Regulations, Industry Standards and Leading Industry Practices

The Unisys Team will establish the data center's initial security risk framework based on the known security and privacy requirements. These requirements are integrated from the relevant Commonwealth policies, industry standards, and State and Federal regulations (illustrated in the above figure). During data center transition, we use this security risk framework to define the security plan and design data protection controls that meets the relevant regulations and business requirements.

We use our Unisys Teaming partner Deloitte's existing public sector security risk framework with the Commonwealth's specific regulations and standards. The use of such an accelerator allows us to "hit" the ground running. **Figure 3.3.2.2-9** below illustrates our approach to identify, correlate and integrate security regulatory requirements to define the data center security risk framework.

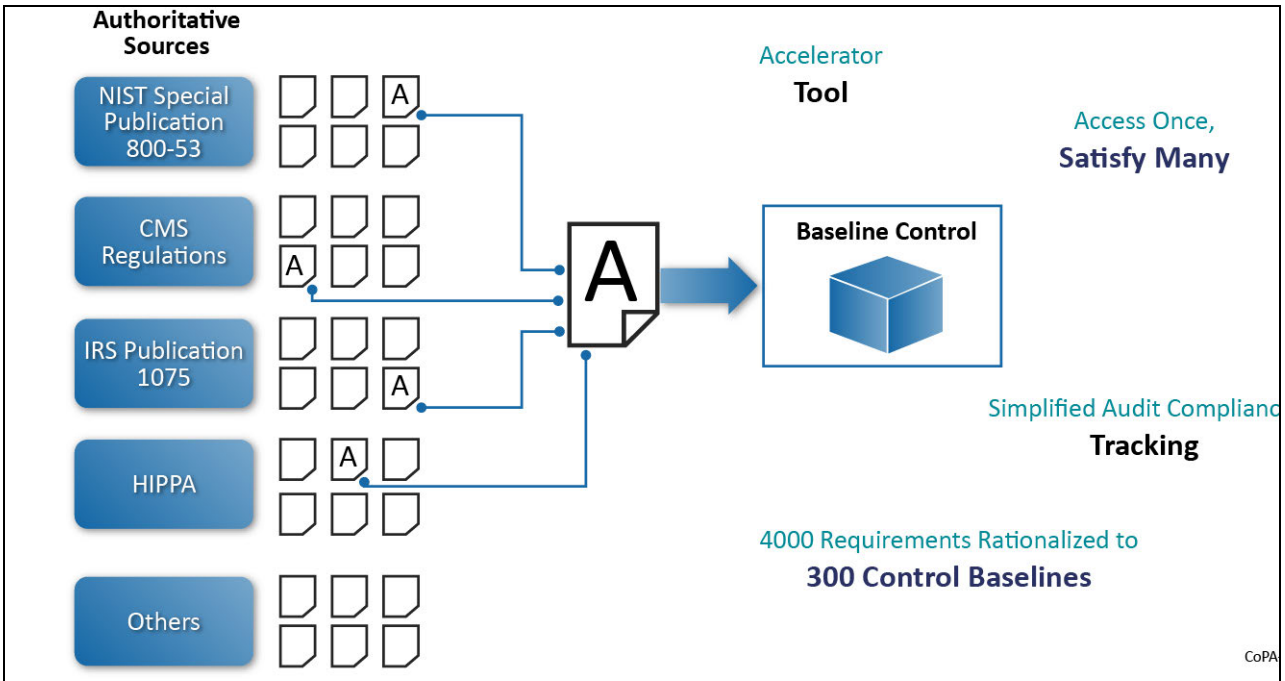

Figure 3.3.2.2-9 - Our approach to identify data protection requirements using the data center security risk framework

Activity 5: Document and establish the data center initial security plan

We will develop a data center security plan based on leading industry standards; NIST SP800-18 (a RFP requirement specified by Q50 of round 1 part 2) and NIST SP800-53 rev 4. We work with the Commonwealth to identify the applicable security domains that comprise the breadth of the data center's information security plan, based on the security domains listed by NIST SP800-53 rev 4. The data center security plan includes (but not limited to) the following information security domains illustrated in the **Figure 3.3.2.2-10**. In addition, we also use the Centers for Medicare and Medicaid Services (CMS) security plan template to define and maintain the appropriate security controls.

Figure 3.3.2.2-10 - Sample data center security plan domains

After identification of the information security domains, we work with the Commonwealth to determine individual security areas that drive corresponding information security domains. The maturity of information security domains and the program are dependent on the effectiveness of metrics established to monitor the security controls to address corresponding information security areas. As an example, the key individual security controls for three of the security domains include:

Information Security Domain	Information security controls	
Access Control	•□Access Control Policy and Procedures •□Account Management •□Access Enforcement •□Information Flow Enforcement •□Separation of Duties •□Least Privilege	•□Unsuccessful Login Attempts •□System Use Notification •□Concurrent Session Control •□Remote Access •□Wireless Access •□Access Control for Mobile Devices
Incident Response	•□Incident Response Policy and Procedures •□Incident Response Training	•□Incident Handling •□Incident Monitoring •□Incident Reporting

Physical and Environmental Protection	• Physical and Environmental Protection Policy and Procedures • Physical Access Authorizations • Physical Access Control • Monitoring Physical Access • Visitor Control	• Access Records • Emergency Lighting • Fire Protection • Temperature and Humidity Controls • Water Damage Protection • Delivery and Removal

Annual update of data center security plan: Using the initial security plan as base, we will perform an annual review of the data center security plan and update the security controls based on updates to regulations, policies, standards and leading industry practices.

Step 3 – Perform Vulnerability Assessment: We will conduct a one-time security vulnerability assessment on the data center's IT infrastructure to help identify potential security vulnerabilities and suggest mitigation controls, as part of baseline security risk and vulnerability assessment, described earlier in this section.

Step 4 – Perform data discovery and classification to indicate level of sensitivity: We perform data discovery and data classification assessment to indicate level of sensitivity of Commonwealth's PII and identify presence of PII data at rest. This step includes the following activities – Data classification and Data discovery, as illustrated below:

Activity 1 – Data Classification: We will conduct and facilitate five workshops with the Commonwealth stakeholders to define a data classification standard for the Commonwealth's Personally Identifiable Information (PII) based on sensitivity of PII. For example, some of the categories include

- Special handling PII (that contains SSN, driver license number, FEIN, and Medicare ID)
- Protected Health Information
- Individual information
- Sensitive PII (i.e. racial or ethnic origins, religious or philosophical beliefs, trade-union membership, and criminal convictions).

Activity 2 – Data Discovery: We perform a one-time assessment using the Symantec Data Loss Prevention (DLP) solution's data discovery tool on the Commonwealth selected data center IT infrastructure consisting of servers and databases to identify the PII data at rest. We perform the following tasks as part of this activity:

- Document the results of the data discovery assessment in the IT asset inventory
- Use the data center security risk framework to identify appropriate data encryption requirements to appropriately protect the PII data and meet the relevant regulations, policies and standards.

4 Staff Background Checks

4.A Conduct required background checks for its employees working on the Commonwealth Datacenter project.

Offeror must describe its proposed approach to conducting required background checks for Offeror staff.

In accordance with Appendix A section 44, the Unisys Team will perform fingerprint background checks consistent with ITB-SEC009 and CJIS policy on all Unisys Team personnel providing support or services for the Commonwealth. As part of our ISO27001 certification, we perform an annual 3rd party/subcontractor review as well. Unisys has been completing Commonwealth specific background checks since the beginning of the Data PowerHouse contract. The Unisys Team will provide written confirmations to the Commonwealth when the background checks are conducted. Please refer to Schedule F, Section 3.2.1.1.3 Subcontractor Management for more details on our process for performing background checks. The onboarding procedure described in this section details the background check process.

4.B Where appropriate, use identity management tools to manage access to the systems requiring access by its employees.

For systems where the Offeror is unable to use its identity management system, assign staff to manage the access.

Train Offeror employees on his or her responsibilities within the contract. For logical and physical access to Commonwealth Co-location facilities and environments not managed by the Offeror, the Commonwealth's security access request process will be followed.

The Unisys Team takes a layered approach to security. Each facility has both physical and logical security in place. Physical security prevents unauthorized personnel from gaining access to the systems. Perimeter security includes cameras and an active physical security presence. All facilities include guard-controlled access to interior spaces. Access control systems include access to and within the facilities in all data centers. Access control includes a combination of identity management tools, namely keycard, keypad and biometric devices. In addition, access control systems including keypad and biometric authentication capabilities are available.

The Unisys Team provides dedicated network/security support staff at its facilities 24x7x365, coupled with automated tools that provide real-time notification of suspected security intrusion events. Unisys Security Operations Center (SOC) is comprised of security support staff and a suite of automated tools that provide comprehensive 24x7x365 monitoring, alerting, and response to security events.

The Unisys Team will use innovative identity management tools, i.e. password vaults and remote administration, for system administrators. These tools allow Unisys to actively control and limit the number and use of system administrator passwords that exist for Commonwealth privileged access and easily monitor and block the actions of system administrators.

All employees and subcontractors are trained regarding proper physical and logical access to Commonwealth facilities, environments, and systems.

In support of the Commonwealth's security needs, Unisys will establish an On-boarding and Off-boarding procedure documented within the CCPM.

The Unisys Team On-boarding procedure will cover the following activities:

1) Conduct background checks for members of the program team in accordance with Appendix A Section 44 as defined within ITB-SEC009. Access will not be granted to new members until successful completion of the background check.

2) Provide the team member with the program's security training

3) Submit requests to add the user with the required privileges to the appropriate identity management system or, if not supported by an identity management system, individual systems.

4) Submit requests to permit user access to the Unisys Team and Commonwealth's facilities as required by the team member's responsibilities and tasks. For Commonwealth facilities, the Unisys Team will submit the request through the Commonwealth's security access request process.

4.C For off-boarding, update security clearance database with the status of Offeror employee and concurrently update its identity management tool to ensure the access is revoked.

Provide a monthly report describing personnel actions including but not limited to; new hires, terminations, any change in employee status/duties, etc.,

The Off-boarding procedure will include the following activities.

1) Notification of the team member's change of status and request updates to the security clearance database.

2) Submit user permission revocation change requests for all identity management tools and individual systems to remove the team member's access to the Commonwealth systems.

The Unisys Team will also provide a monthly report for the Commonwealth regarding onboard and off-boarding activities, including new team members, terminations, and changes in employee duties.

5 DR, Data Recovery Transition Activities

5.A Conduct knowledge transfer during the initial phase of the Transition, including review of Commonwealth DR plans and review of Third Party DR contracts.

Offeror must describe proposed approach to support the Tiered DR Services.

5.B The Offeror must also update the DR plan contact information and any changes made in the first six (6) months of Transition.

The Unisys Team will conduct knowledge transfer during the initial phase of the Transition, including review of Commonwealth DR plans and review of Third Party DR contracts.

1. Review Existing Agency DRPs. The Commonwealth seeks a regular reviews of the Agency DRPs. The Unisys IT Risk Manager will take charge of completing Agency-by-Agency reviews of existing DR plans and Third Party DR contracts as part of transition activities. Unisys expects the reviews will likely coalesce into a broadly comprehensive Disaster Recovery strategy that utilizes the Unisys-maintained Disaster Recovery site with Tiers of DR services. The DR

solution includes not only the same components available in the Production environment but also a rich diversity of DR Tiers which will allow the Commonwealth to build sufficient high availability through the Disaster Recovery offering to match the Production equivalent for any application. For more details on the Tiered DR solution, refer to Schedule F, Section 3.1.3 Data Center Architecture and Technology.

The Unisys IT Risk Manager expects that the Commonwealth is currently served by a wide variety of Disaster Recovery plans maintained by each Agency. On average Unisys expects that many agencies have adequate plans but within the variety Unisys expects to discover under-funded plans with significant gaps and over-funded plans that likely protect non-critical assets. Unisys has deep experience supporting current DPH disaster recovery plans. By choosing Unisys as a partner the Commonwealth benefits both from this experience as well as the Unisys-implemented [redacted]. Unisys seeks to bring all Agency DRPs within the proposed LDRPS framework so that Unisys can help the Commonwealth arrive at a standardized agency approach to DR.

2. Online Disaster Recovery Tool. The Commonwealth has appropriately identified a need for an easy-to-use Online Disaster Recovery Tool that will allow all agencies to maintain their diverse DRPs within a single tool. The Unisys IT Risk Manager will also coordinate the input of existing Agency DRPs into this single tool as part of transition activities.

The Commonwealth is familiar with the LDPRS tool which is currently in place to manage the DRP related to IBM Mainframe services at the [redacted] facility. The Unisys Team will exploit the full capabilities of the tool to build strong:

- Crisis management plans to fit each Agency's operational structure.
- Technology recovery plans to match a matrix management approach, including dependency mapping for the infrastructure supporting your applications.
- Critical application recovery plans to smoothly interface with your infrastructure recovery plans.
- Process or departmental recovery plans to support your planning decisions and strategies and to identify dependencies between critical business processes.
- Site event management plans to document how to deal with a specific incident at a particular business location.

Working with the Unisys Team, the LDRPS tool reduces the time needed to train users by providing step-by-step guidance to plan builders.

We will also update the DR plan contact information and any changes made in the first six (6) months of Transition. More detailed information about the DR Plan can be found in Schedule F, Section 3.2.2.4 DR Plan and Schedule F, Section 3.2.5.3 DR Infrastructure on Demand.

Unisys Team Experience

Unisys has managed and maintained the full data center operations of De Beers, the world's leading diamond company, since 2011. A De Beers executive stated, "We are pleased with the role Unisys has played in this effort. Unisys ability to fully manage our data center environment, and provide various levels of technical and end user support, will play an important role in

enabling business and IT strategies well into the future." As part of taking over data center operations for De Beers, Unisys conducted a risk assessment which identified that the company's current IT model contained a number of single points of failure – where the disruption of mission-critical components could significantly hinder operations. After conducting the risk assessment, Unisys transformed their IT infrastructure to be more available, resilient, and flexible and also provided proven disaster recovery capability."

Unisys has provided staff security training for countless clients including the Board of Airline Representatives New Zealand (BARNZ) which represents international airlines which fly into New Zealand, including Qantas, Cathay Pacific, Air Pacific, Emirates, Malaysian Airlines and Singapore.

Unisys has successfully supported the Department of Justice (DOJ) Asset Forfeiture Management System (AFMS) since our initial engagement in 1995, and we continue to provide the AFMS program's Consolidated Asset Tracking System (CATS) Program Management Office with comprehensive system security for INFOSEC applications support. Unisys tailored the Certification and Accreditation process to consider the specific mission, threat environment, and the development and/or implementation of necessary countermeasures to mitigate threats. We developed the System Security Plan, Security Test and Evaluation (ST&E) Plan, Rules of Behavior (RoB), IT Contingency Plan (ITCP), Security Awareness and Training Plan (SATP), Incident Response Plan (IRP), and Configuration Management Plan (CMP), as required to certify and accredit the system. Included was a risk assessment which required completion of a vulnerability scan and penetration test.

The Data PowerHouse complies with applicable INFOSEC requirements specified by the Commonwealth, DOJ, FBI, IRS, and the HIPAA, including secure configuration of Commonwealth operating systems, installation and maintenance of security management software, change management procedures, problem resolution and escalation procedures, and semi-annual background checks and security awareness training for Unisys employees assigned to support the Commonwealth. Unisys established a security management infrastructure to oversee the development and implementation of security policy, procedures, and guidelines. This infrastructure enables participation in security implementation at all levels within the project and serves a vital part in security risk mitigation.

Benefits to the Commonwealth

The deep, diverse security experience the Unisys Team has acquired over years supporting both federal and state governments and commercial partners will be leveraged, along with the extensive security experience of Deloitte, to provide comprehensive security transition support for the Commonwealth. Planning is a key for any successful transition; therefore the Unisys Team will follow its proven methodology for developing and implementing a security plan for the Commonwealth. The Unisys Team will draw upon the expertise it has gained from mitigating a wide gamut of security vulnerabilities in various environments to protect the Commonwealth and its assets. The Unisys Team's security experts will provide understandable, practical security training to properly train Commonwealth staff.

Security Management Plan Workbook

Date:
Version Number:

(This Page Intentionally Blank)

Access Control (AC) – *Technical*

AC-1 – Access Control Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented access control policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the access control policy and associated access controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-2 – Account Management (Moderate)	
Control The organization manages information system accounts, including: a. Identifying account types (i.e., individual, group, system, application, guest/anonymous, and temporary); b. Establishing conditions for group membership; c. Identifying authorized users of the information system and specifying access privileges; d. Requiring appropriate approvals for requests to establish accounts; e. Establishing, activating, modifying, disabling, and removing accounts; f. Specifically authorizing and monitoring the use of guest/anonymous and temporary accounts; g. Notifying account managers when temporary accounts are no longer required and when information system users are terminated, transferred, or information system usage or need-to-know/need-to-share changes; h. Deactivating: (i) temporary accounts that are no longer required; and (ii) accounts of terminated or transferred users; i. Granting access to the system based on: (i) a valid access authorization; (ii) intended system usage; and (iii) other attr butes as required by the organization or associated missions/business functions; and j. Reviewing accounts using the frequency specified in Implementation Standard 1. For FTI: The agency must ensure that only authorized employees or contractors (as allowed by statute) of the agency receiving the information has access to FTI. (Pub 1075, Ref 9.2) **Implementation Standard(s)** 1. Review information system accounts within every one hundred eighty (180) days and require annual certification. 2. Remove or disable default user accounts. Rename active default accounts. 3. Implement centralized control of user access administrator functions. 4. Regulate the access provided to contractors and define security requirements for contractors.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-2(1) – Enhancement (Moderate)	
Control The organization employs automated mechanisms to support the management of information system accounts.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-2(2) – Enhancement (Moderate)	
Control The information system automatically terminates emergency accounts within twenty-four (24) hours and temporary accounts with a fixed duration not to exceed three hundred sixty-five (365) days.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-2(3) – Enhancement (Moderate)	
Control The information system automatically disables inactive accounts after one hundred eighty (180) days.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-2(4) – Enhancement (Moderate)	
Control The information system automatically audits account creation, modification, disabling, and termination actions and notifies, as required, appropriate individuals.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-2(7) – Enhancement (Moderate)	
Control The organization: (a) Establishes and administers privileged user accounts in accordance with a role-based access scheme that organizes information system and network privileges into roles; (b) Tracks and monitors privileged role assignments; and (c) Inspects administrator groups, root accounts and other system related accounts on demand, but at least once every fourteen (14) days to ensure that unauthorized accounts have not been created.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or*

	Common; Indicate All Control Provider(s)]

AC-3 – Access Enforcement (Moderate)

Control

The information system enforces approved authorizations for logical access to the system in accordance with applicable policy.

Implementation Standard(s)

1. If encryption is used as an access control mechanism it must meet approved (FIPS 140-2 compliant and a NIST validated module) encryption standards (see SC-13).
2. If e-authentication is utilized in connection to access enforcement, refer to ARS Appendix D: E-authentication Standard.
3. Configure operating system controls to disable public "read" and "write" access to files, objects, and directories that may directly impact system functionality and/or performance, or that contain sensitive information.
4. Data stored in the information system must be protected with system access controls.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-3(1) – Enhancement (Moderate)

Control

[Withdrawn: Incorporated into AC-6].

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-4 – Information Flow Enforcement (Moderate)

Control

The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems in accordance with applicable policy.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-5 – Separation of Duties (Moderate)

Control

The organization:
a. Separates duties of individuals as necessary, to prevent malevolent activity without collusion;
b. Documents separation of duties; and
c. Implements separation of duties through assigned information system access authorizations.

Implementation Standard(s)
1. Ensure that audit functions are not performed by security personnel responsible for administering access control.
2. Maintain a limited group of administrators with access based upon the users' roles and responsibilities.
3. Ensure that critical mission functions and information system support functions are divided among separate individuals.
4. Ensure that information system testing functions (i.e., user acceptance, quality assurance, information security) and production functions are divided among separate individuals or groups.
5. Ensure that an independent entity, not the Business Owner, System Developer(s)/Maintainer(s), or System Administrator(s) responsible for the information system, conducts information security testing of the information system.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-6 – Least Privilege (Moderate)

Control

The organization employs the concept of least privilege, allowing only authorized accesses for users (and processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with missions and business functions.

For FTI: Access to FTI must be strictly on a need-to-know basis. FTI must never be indiscriminately disseminated, even within the recipient agency, body or commission. No person should be given more FTI than is needed for performance of his/her duties.

Implementation Standard(s)
1. Disable all file system access not explicitly required for system, application, and administrator functionality.
2. Contractors must be provided with minimal system and physical access, and must agree to and support the security requirements. The contractor selection process must assess the contractor's ability to adhere to and support security policy.
3. Restrict the use of database management utilities to only authorized database administrators. Prevent users from accessing database data files at the logical data view, field, or field-value level. Implement table-level access control.
4. Ensure that only authorized users are permitted to access those files, directories, drives, workstations, servers, network shares, ports, protocols, and services that are expressly required for the performance of job duties.
5. Disable all system and removable media boot access unless it is explicitly authorized by the CIO for compelling operational needs. If authorized, boot access is password protected.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-6(1) – Enhancement (Moderate)	
Control The organization explicitly authorizes access to privileged functions (e.g., system-level software, administrator tools, scripts, utilities) deployed in hardware, software, and firmware; and security relevant information is restricted to explicitly authorized individuals.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-6(2) – Enhancement (Moderate)	
Control The organization requires that users of information system accounts, or roles, with access to administrator accounts or security functions, use non-privileged accounts, or roles, when accessing other system functions, and if feas ble, audits any use of privileged accounts, or roles, for such functions.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-7 – Unsuccessful Login Attempts (Moderate)	
Control The information system: a. Enforces the limit of consecutive invalid login attempts by a user specified in Implementation Standard 1 during the time period specified in Implementation Standard 1; and b. Automatically disables or locks the account/node until released after the time period specified in Implementation Standard 1 when the maximum number of unsuccessful attempts is exceeded. The control applies regardless of whether the login occurs via a local or network connection. **Implementation Standard(s)** 1. Configure the information system to lock out the user account automatically after three (3) failed log-on attempts by a user. For FTI: Automatically lock the account/node until an authorized system administrator reinstates the account (Pub 1075 Ref. Exhibit 8)	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-8 – System Use Notification (Moderate)

Control

The information system:
a. Displays an approved system use notification message or banner before granting access to the system that provides privacy and security notices consistent with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance. The approved banner for information systems is:
- You are accessing a U.S. Government information system, which includes: (1) this computer, (2) this computer network, (3) all computers connected to this network, and (4) all devices and storage media attached to this network or to a computer on this network. This information system is provided for U.S. Government-authorized use only.
- Unauthorized or improper use of this system may result in disciplinary action, as well as civil and criminal penalties.
- By using this information system, you understand and consent to the following:
  * You have no reasonable expectation of privacy regarding any communication or data transiting or stored on this information system. At any time, and for any lawful Government purpose, the Government may monitor, intercept, and search and seize any communication or data transiting or stored on this information system.
  * Any communication or data transiting or stored on this information system may be disclosed or used for any lawful Government purpose.

b. Retains the notification message or banner on the screen until users take explicit actions to log on to or further access the information system; and
c. For publicly accessible systems: (i) displays the system use information when appropriate, before granting further access; (ii) displays references, if any, to monitoring, recording, or auditing that are consistent with privacy accommodations for such systems that generally prohibit those activities; and (iii) includes in the notice given to public users of the information system, a description of the authorized uses of the system.

For FTI: The warning banner must contain reference to the civil and criminal penalty sections of Title 26 Sections 7213, 7213A and 7431. (Pub 1075, Sec 9.2; Exhibit 13)

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-10 – Concurrent Session Control (Moderate)

Control

The information system limits the number of concurrent sessions for each system account to one (1) session. The number of concurrent application/process sessions is limited and enforced to the number of sessions expressly required for the performance of job duties and any requirement for more than one (1) concurrent application/process session is documented in the security plan.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-11 – Session Lock (Moderate)

Control

The information system:
a. Prevents further access to the system by initiating a session lock after fifteen (15) minutes of inactivity; and
b. Retains the session lock until the user reestablishes access using established identification and authentication procedures.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-12 – Session Termination (Moderate)	
Control [Withdrawn: Incorporated into SC-10].	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-13 – Supervision and Review--Access Control (Moderate)	
Control [Withdrawn: Incorporated into AC-2 and AU-6].	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-14 – Permitted Actions without Identification or Authentication (Moderate)	
Control The organization: a. Documents and provides supporting rationale in the security plan for the information system, user actions not requiring identification and authentication; and b. Configures Information systems to permit public access only to the extent necessary to accomplish mission objectives, without first requiring individual identification and authentication. **Implementation Standard(s)** 1. Identify and document specific user actions that can be performed on the information system without identification or authentication.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-14(1) – Enhancement (Moderate)	
Control The organization permits actions to be performed without identification and authentication only to the extent necessary to accomplish mission/business objectives.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-15 – Automated Marking (Moderate)	
Control [Withdrawn: Incorporated into MP-3].	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-17 – Remote Access (Moderate)	
Control Remote access for privileged functions shall be permitted only for compelling operational needs, shall be strictly controlled, and must be explicitly authorized, in writing, by the CIO or his/her designated representative. If authorized, the organization: a. Documents allowed methods of remote access to the information system; b. Establishes usage restrictions and implementation guidance for each allowed remote access method; c. Monitors for unauthorized remote access to the information system; d. Authorizes remote access to the information system prior to connection; and e. Enforces requirements for remote connections to the information system. **Implementation Standard(s)** 1. Require callback capability with re-authentication to verify connections from authorized locations when the Medicare Data Communications Network (MDCN) or Multi-Protocol Label Switching (MPLS) service network cannot be used. 2. If e-authentication is implemented as a remote access solution or associated with remote access, refer to ARS Appendix D: E-authentication Standard. For FTI, complete Safeguard Procedures Report (SPR) section 9.20.3.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-17(1) – Enhancement (Moderate)	
Control The organization employs automated mechanisms to facilitate the monitoring and control of remote access methods.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-17(2) – Enhancement (Moderate)	
Control The organization uses cryptography to protect the confidentiality and integrity of remote access sessions.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or*

	Common; Indicate All Control Provider(s)]
AC-17(3) – Enhancement (Moderate)	
Control The information system routes all remote accesses through a limited number of managed access control points.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-17(4) – Enhancement (Moderate)	
Control The organization authorizes the execution of privileged commands and access to security-relevant information via remote access only for compelling operational needs and documents the rationale for such access in the security plan for the information system.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-17(5) – Enhancement (Moderate)	
Control The organization monitors for unauthorized remote connections to the information system at least quarterly, and takes appropriate action if an unauthorized connection is discovered.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-17(7) – Enhancement (Moderate)	
Control The organization ensures that remote sessions used for remote administration employ additional security measures (e.g., Secure Shell [SSH], Virtual Private Networking [VPN] with blocking mode enabled) and the approved encryption standard (see SC-13), and the sessions are audited.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-17(8) – Enhancement (Moderate)	
Control The organization disables Bluetooth and peer-to-peer networking protocols within the information system except for explicitly identified components in support of specific operational requirements.	

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-18 – Wireless Access (Moderate)

Control

The organization prohibits the installation of wireless access points (WAP) to information systems unless explicitly authorized, in writing, by the CIO or his/her designated representative. If authorized, the organization:
a. Monitors for unauthorized wireless access to the information system; and
b. Enforces requirements for wireless connections to the information system.

Implementation Standard(s)
1. If wireless access is explicitly approved, wireless device service set identifier broadcasting is disabled and the following wireless access controls are implemented:
(a) Encryption protection is enabled;
(b) Access points are placed in secure areas;
(c) Access points are shut down when not in use (i.e., nights, weekends);
(d) A firewall is implemented between the wireless network and the wired infrastructure;
(e) MAC address authentication is utilized;
(f) Static IP addresses, not DHCP, is utilized;
(g) Personal firewalls are utilized on all wireless clients;
(h) File sharing is disabled on all wireless clients;
(i) Intrusion detection agents are deployed on the wireless side of the firewall; and
(j) Wireless activity is monitored and recorded, and the records are reviewed on a regular basis.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-18(1) – Enhancement (Moderate)

Control

If wireless access is explicitly approved, the information system protects wireless access to the system using authentication and encryption.

For FTI: The agency shall authorize, document, and monitor all wireless access to the information system in accordance with NIST 800-48 Revision 1 (Pub 1075 Ref. 9.2)

For FTI, complete SPR section 9.20.3.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-18(2) – Enhancement (Moderate)

Control

The organization monitors for unauthorized wireless connections to the information system, including scanning for unauthorized wireless access points quarterly, and takes

appropriate action if an unauthorized connection is discovered.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-19 – Access Control for Mobile Devices (Moderate)

Control

The organization prohibits the connection of portable and mobile devices (e.g., notebook computers, personal digital assistants [PDA], cellular telephones, and other computing and communications devices with network connectivity and the capability of periodically operating in different physical locations) to information systems unless explicitly authorized, in writing, by the CIO or his/her designated representative. If authorized, the organization:
a. Employs an approved method of cryptography (see SC-13) to protect information residing on portable and mobile information devices, and utilizes whole-disk encryption solution for laptops;
b. Monitors for unauthorized connections of mobile devices to information systems;
c. Enforces requirements for the connection of mobile devices to information systems;
d. Disables information system functionality that provides the capability for automatic execution of code on mobile devices without user direction;
e. Issues specially configured mobile devices to individuals traveling to locations that the organization deems to be of significant risk in accordance with organizational policies and procedures; and
f. Protects the storage and transmission of information on portable and mobile information devices with activities such as scanning the devices for malicious code, virus protection software.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-19(1) – Enhancement (Moderate)

Control

The organization restricts the use of writable, removable media in information systems.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-19(2) – Enhancement (Moderate)

Control

The organization prohibits the use of personally owned, removable media in information systems.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-19(3) – Enhancement (Moderate)

Control

The organization prohibits the use of removable media in information systems when the media has no identifiable owner.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-20 – Use of External Information Systems (Moderate)

Control

The organization proh bits the use of external information systems, including but not limited to, Internet kiosks, personal desktop computers, laptops, tablet personal computers, personal digital assistant (PDA) devices, cellular telephones, facsimile machines, and equipment available in hotels or airports to store, access, transmit, or process sensitive information, unless explicitly authorized, in writing, by the CIO or his/her designated representative. If authorized, the organization establishes strict terms and conditions for their use. The terms and conditions shall address, at a minimum:
a. The types of applications that can be accessed from external information systems;
b. The maximum FIPS 199 security category of information that can be processed, stored, and transmitted;
c. How other users of the external information system will be prevented from accessing federal information;
d. The use of virtual private networking (VPN) and firewall technologies;
e. The use of and protection against the vulnerabilities of wireless technologies;
f. The maintenance of adequate physical security controls;
g. The use of virus and spyware protection software; and
h. How often the security capabilities of installed software are to be updated.

Implementation Standard(s)
1. Instruct all personnel working from home to implement fundamental security controls and practices, including passwords, virus protection, and personal firewalls. Limit remote access only to information resources required by home users to complete job duties. Require that any government-owned equipment be used only for business purposes by authorized employees.
2. (For PII only) Only organization owned computers and software can be used to process, access, and store PII.

For FTI:
3. If the agency allows alternative work sites, such as employee's home or other non-traditional work sites, the FTI remains subject to the same safeguard requirements as the agency's offices. (Pub. 1075, Ref 4.7)
4. Only agency-owned computers, media and software will be used to receive, process, access and store FTI. The agency must retain ownership and control for the security configuration of all hardware, software and end-point equipment connecting to public communication networks including encryption keys. (Pub. 1075, Ref 4.7.1)

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AC-20(1) – Enhancement (Moderate)

Control

The organization permits authorized individuals to use an external information system to access the information system or to process, store, or transmit organization-controlled information only when the organization:
(a) Can verify the implementation of required security controls on the external system as specified in the organization's information security policy and security plan; or
(b) Has approved information system connection or processing agreements with the organizational entity hosting the external information system.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or*

	Common; Indicate All Control Provider(s)]
AC-20(2) – Enhancement (Moderate)	
Control The organization limits the use of organization-controlled portable storage media by authorized individuals on external information systems.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AC-22 – Publicly Accessible Content (Moderate)	
Control The organization: a. Designates individuals authorized to post information onto an information system that is publicly accessible; b. Trains authorized individuals to ensure that publicly accessible information does not contain nonpublic information; c. Reviews the proposed content of publicly accessible information for nonpublic information prior to posting onto the information system; d. Reviews the content on the publicly accessible information system for nonpublic information monthly; and e. Removes nonpublic information from the publicly accessible information system, if discovered.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Access Control Family (AC) Security Controls Detail and Comment

Awareness and Training (AT) – *Operational*

AT-1 – Security Awareness and Training Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented security awareness and training policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the security awareness and training policy and associated security awareness and training controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AT-2 – Security Awareness (Moderate)	
Control The organization provides basic security awareness training to all information system users (including managers, senior executives, and contractors) as part of initial training for new users prior to accessing any system's information, when required by system changes, and within every three hundred sixty-five (365) days thereafter. For FTI: Awareness training specific to protecting FTI and the sanctions for misuse of FTI must be provided initially prior to granting access to FTI and annually thereafter. (Pub. 1075 Ref. 6.2, 9.4)	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AT-3 – Security Training (Moderate)	
Control The organization provides role-based security-related training: (i) before authorizing access to the system or performing assigned duties; (ii) when required by system changes; and (iii) refresher training within every three hundred sixty-five (365) days thereafter. For FTI: The disclosure awareness requirements apply to all agency employees with access to FTI, including program and information technology personnel and contractors, such as case workers, managers, system administrators, database administrators and application developers. (Pub. 1075, Ref 6.2 and 9.4) **Implementation Standard(s)** 1. Require personnel with significant information security roles and responsibilities to undergo appropriate information system security training prior to authorizing access to networks, systems, and/or applications; when required by system changes; and refresher training within every three hundred sixty-five (365) days thereafter.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AT-4 – Security Training Records (Moderate)	
Control The organization: a. Documents and monitors individual information system security training activities including basic security awareness training and specific information system security training; and b. Retains individual training records for three (3) years. For FTI: Granting employees or contractors access to FTI must be preceded by each employee or contractor certifying his/her understanding of the agency's security policy and procedures for safeguarding FTI. The certification must be maintained for 5 years. (Pub 1075, section 6.2)	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Awareness and Training Family (AT) Security Controls Detail and Comment

Audit and Accountability (AU) – *Technical*

AU-1 – Audit and Accountability Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented audit and accountability policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the audit and accountability policy and associated audit and accountability controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AU-2 – Auditable Events (Moderate)

Control

The organization:
a. Determines, based on a risk assessment and mission/business needs, that the information system must be capable of auditing the list of auditable events specified in the Implementation Standards;
b. Coordinates the security audit function with other organizational entities requiring audit-related information to enhance mutual support and to help guide the selection of auditable events; and
c. Determines, based on current threat information and ongoing assessment of risk, which events require auditing on a continuous basis and which events require auditing in response to specific situations.

For FTI: Audit logs must enable tracking activities taking place on the system. Pub 1075, Exh bit 9, System Audit Management Guidelines, contains requirements for creating audit-related processes at both the application, auditing must be enabled to the extent necessary to capture access, modification, deletion and movement of FTI by each unique user. This auditing requirement also applies to data tables or databases embedded in or residing outside of the application that contain FTI. (Pub 1075 9.3, Ref. Exhibit 9)

Implementation Standard(s)
1. Generate audit records for the following events:
(a) User account management activities,
(b) System shutdown,
(c) System reboot,
(d) System errors,
(e) Application shutdown,
(f) Application restart,
(g) Application errors,
(h) File creation,
(i) File deletion,
(j) File modification,
(k) Failed and successful log-ons,
(l) Security policy modifications, and
(m) Use of administrator privileges.
2. Enable logging for perimeter devices, including firewalls and routers.
(a) Log packet screening denials originating from un-trusted networks,
(b) Packet screening denials originating from trusted networks,
(c) User account management,
(d) Modification of packet filters,
(e) Application errors,
(f) System shutdown and reboot,
(g) System errors, and
(h) Modification of proxy services.
3. Verify that proper logging is enabled in order to audit administrator activities.

For FTI: Generate audit records for the following events in addition to those specified in other controls, plus those bolded above:
(a) All successful and unsuccessful authorization attempts.
(b) All changes to logical access control authorities (e.g., rights, permissions).
(c) All system changes with the potential to compromise the integrity of audit policy configurations, security policy configurations and audit record generation services.
(d) The audit trail shall capture the enabling or disabling of audit report generation services.

(e) The audit trail shall capture command line changes, batch file changes and queries made to the system (e.g., operating system, application, and database).

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-2(1) – Enhancement (Moderate)	
Control [Withdrawn: Incorporated into AU-12].	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-2(2) – Enhancement (Moderate)	
Control [Withdrawn: Incorporated into AU-12].	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-2(3) – Enhancement (Moderate)	
Control The organization reviews and updates the list of auditable events within every three hundred sixty-five (365) days.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-2(4) – Enhancement (Moderate)	
Control The organization includes execution of privileged functions in the list of events to be audited by the information system, including administrator and user account activities, failed and successful log-on, security policy modifications, use of administrator privileges, system shutdowns, reboots, errors and access authorizations.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AU-3 – Content of Audit Records (Moderate)	
Control The information system produces audit records that contain sufficient information to, at a minimum, establish what type of event occurred, when (date and time) the event occurred, where the event occurred, the source of the event, the outcome (success or failure) of the event, and the identity of any user/subject associated with the event. **Implementation Standard(s)** 1. (For PHI only) Record disclosures of sensitive information, including protected health and financial information. Log information type, date, time, receiving party, and releasing party. Verify within every ninety (90) days for each extract that the data is erased or its use is still required.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-3(1) – Enhancement (Moderate)	
Control The information system includes the capability to include more detailed information in the audit records for audit events identified by type, location, or subject.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-4 – Audit Storage Capacity (Moderate)	
Control The organization allocates audit record storage capacity and configures auditing to reduce the likelihood of such capacity being exceeded.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-5 – Response to Audit Processing Failures (Moderate)	
Control The information system: a. Alerts designated organizational officials in the event of an audit processing failure; and b. Takes the following additional actions in response to an audit failure or audit storage capacity issue: - Shutdown the information system, - Stop generating audit records, or - Overwrite the oldest records, in the case that storage media is unavailable. For FTI: Shutting down the system, stopping the generation of audit reports or overwriting the oldest records is not an appropriate action. (Pub 1075 section 3.0)	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AU-6 – Audit Review, Analysis, and Reporting (Moderate)	
Control The organization: a. Reviews and analyzes information system audit records regularly for indications of inappropriate or unusual activity, and reports findings to designated organizational officials; and b. Adjusts the level of audit review, analysis, and reporting within the information system when there is a change in risk to operations, assets, individuals, other organizations, or the Nation based on law enforcement information, intelligence information, or other credible sources of information. For FTI: All requests for return information, including receipt and/or disposal of returns or return information, shall be maintained in a log. (see IRS Pub. 1075, section 3.0) **Implementation Standard(s)** 1. Review system records for initialization sequences, log-ons and errors; system processes and performance; and system resources utilization to determine anomalies on demand but no less than once within a twenty-four (24) hour period. Generate alert notification for technical personnel review and assessment. 2. Review network traffic, bandwidth utilization rates, alert notifications, and border defense devices to determine anomalies on demand but no less than once within a twenty-four (24) hour period. Generate alerts for technical personnel review and assessment. 3. Investigate suspicious activity or suspected violations on the information system, report findings to appropriate officials and take appropriate action. 4. Use automated utilities to review audit records at least once every seven (7) days for unusual, unexpected, or suspicious behavior. 5. Inspect administrator groups on demand but at least once every fourteen (14) days to ensure unauthorized administrator accounts have not been created. 6. Perform manual reviews of system audit records randomly on demand but at least once every thirty (30) days.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-6(1) – Enhancement (Moderate)	
Control The information system integrates audit review, analysis, and reporting processes to support organizational processes for investigation and response to suspicious activities.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-6(2) – Enhancement (Moderate)	
Control [Withdrawn: Incorporated into SI-4].	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AU-7 – Audit Reduction and Report Generation (Moderate)	
Control The information system provides an audit reduction and report generation capability.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-7(1) – Enhancement (Moderate)	
Control The information system provides the capability to automatically process audit records for events of interest based on selectable event criteria.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-8 – Time Stamps (Moderate)	
Control The information system uses internal system clocks to generate time stamps for audit records.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-8(1) – Enhancement (Moderate)	
Control The information system synchronizes internal information system clocks daily and at system boot.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
AU-9 – Protection of Audit Information (Moderate)	
Control The information system protects audit information and audit tools from unauthorized access, modification, and deletion.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AU-10 – Non-Repudiation (Moderate)

Control

The information system protects against an individual falsely denying having performed a particular action.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AU-11 – Audit Record Retention (Moderate)

Control

The organization retains audit records for ninety (90) days and archive old records for one (1) year to provide support for after-the-fact investigations of security incidents and to meet regulatory and information retention requirements.

For FTI:
1. Employ a permanent system of standardized records of request for disclosure of FTI and maintain the records for five (5) years or the applicable records control schedule, whichever is longer. (Pub 1075 Ref. 3.1)
2. To support the audit of FTI activities, all organizations must ensure that audit information is archived for six (6) years to enable the recreation of computer-related accesses to both the operating system and to the application wherever FTI is stored. (Pub 1075 Ref. 9.3)

Implementation Standard(s)
1. (For PII only) Audit inspection reports, including a record of corrective actions, shall be retained by the organization for a minimum of three (3) years from the date the inspection was completed.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AU-12 – Audit Generation (Moderate)

Control

The information system:
a. Provides audit record generation capability for the following events in addition to those specified in other controls:
- All successful and unsuccessful authorization attempts.
- All changes to logical access control authorities (e.g., rights, permissions).
- All system changes with the potential to compromise the integrity of audit policy configurations, security policy configurations and audit record generation services.
- The audit trail shall capture the enabling or disabling of audit report generation services.
- The audit trail shall capture command line changes, batch file changes and queries made to the system (e.g., operating system, application, and database).

b. Allows designated organizational personnel to select which auditable events are to be audited by specific components of the system; and
c. Generates audit records for the list of audited events defined in AU-2 with the content as defined in AU-3.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

AU-12(1) – Enhancement (Moderate)	
Control The information system compiles audit records from multiple components throughout the system into a system-wide (logical or physical) time-correlated audit trail.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Audit and Accountability Family (AU) Security Controls Detail and Comment

Security Assessment and Authorization (CA) – *Management*

CA-1 – Security Assessment and Authorization Policies and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. Formal, documented security assessment and authorization policies that address purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the security assessment and authorization policies and associated security assessment and authorization controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CA-2 – Security Assessments (Moderate)	
Control The organization: a. Develops a security assessment plan that describes the scope of the assessment including: - Security controls and control enhancements under assessment; - Assessment procedures to be used to determine security control effectiveness; and - Assessment environment, assessment team, and assessment roles and responsibilities; b. Assesses the security controls in the information system within every three hundred sixty-five (365) days in accordance with the Information Security (IS) Acceptable Risk Safeguards (ARS) Including Minimum Security Requirements (CMSR) Standard, to determine the extent to which the controls are implemented correctly, operating as intended, and producing the desired outcome with respect to meeting the security requirements for the system; c. Produces a security assessment report that documents the results of the assessment; and d. Provides the results of the security control assessment within every three hundred sixty-five (365) days, in writing, to the Business Owner who is respons ble for reviewing the assessment documentation and updating system security documentation where necessary to reflect any changes to the system. For FTI: The agency shall conduct, periodically, but at least annually, an assessment of the security controls in the systems that receive, store, process or transmit FTI. (Pub 1075, Ref. 9.4) **Implementation Standard(s)** 1. A security assessment of all security controls must be conducted prior to issuing the initial authority to operate for all newly implemented systems. 2. The annual security assessment requirement mandated by OMB requires all CMSRs attributable to a system or application to be assessed over a 3-year period. To meet this requirement, a subset of the CMSRs shall be tested each year so that all security controls are tested during a 3-year period. 3. The Business Owner notifies the CISO within thirty (30) days whenever updates are made to system security authorization artifacts or significant role changes occur (e.g., Business Owner, System Developer/Maintainer, ISSO).	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CA-2(1) – Enhancement (Moderate)	
Control The organization employs an independent assessor or assessment team to conduct an assessment of the security controls in the information system.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CA-3 – Information System Connections (Moderate)	
Control The organization: a. Authorizes connections from the information system to other information systems outside of the authorization boundary through the use of Interconnection Security Agreements; b. Documents, for each connection, the interface characteristics, security requirements, and the nature of the information communicated; and c. Monitors the information system connections on an ongoing basis verifying enforcement of security requirements. **Implementation Standard(s)** 1. Record each system interconnection in the Security Management Plan (SMP) and Information Security (IS) Risk Assessment (RA) for the system that is connected to the remote location.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CA-4 – Security Certification (Moderate)	
Control [Withdrawn: Incorporated into CA-2].	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CA-5 – Plan of Action and Milestones (POA&M) (Moderate)	
Control The organization: a. Develops and submits a Plan of Action and Milestones (POA&M) for the information system within thirty (30) days of the final results for every internal/external audit/review or test (e.g., ST&E, penetration test) to document the organization's planned remedial actions to correct weaknesses or deficiencies noted during the assessment of the security controls and to reduce or eliminate known vulnerabilities in the system; and b. Updates and submits existing POA&M monthly until all the findings are resolved based on the findings from security controls assessments, security impact analyses, and continuous monitoring activities. **Implementation Standards** For FTI: The agency must submit an updated Corrective Action Plan (CAP) twice each year to address corrective actions identified during an on-site safeguards review until all findings are closed. The CAP is submitted as an attachment to the SAR, and on the CAP due date which is six months from the scheduled SAR due date. (Pub 1075, Ref. 7.5)	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CA-5(1) – Enhancement (Moderate)	
Control The organization employs automated mechanisms to help ensure that the POA&M for the information system is accurate, up to date, and readily available.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CA-6 – Security Authorization (Moderate)

Control

The organization updates the security authorization:
- At least every three (3) years;
- When substantial changes are made to the system;
- When changes in requirements result in the need to process data of a higher sensitivity;
- When changes occur to authorizing legislation or federal requirements;
- After the occurrence of a serious security violation which raises questions about the validity of an earlier security authorization; and
- Prior to expiration of a previous security authorization.

For FTI: Owners of FTI shall accredit the security controls used to protect FTI before initiating operations. This shall be done for any infrastructure associated with FTI. The authorization shall occur every three (3) years or whenever there is a significant change to the control structure. A senior agency official shall sign and approve the authorization. (Pub 1075, Ref 9.5)

Note: For Federal agencies that receive FTI, a NIST compliant systems certification (C&A) is required in accordance with FISMA. For state agencies that receive FTI, a third-party accreditation is not required. Instead, these agencies may internally attest in writing that the security controls have been adequately implemented to protect FTI. The accreditation shall occur every three (3) years or whenever there is a significant change to the control structure. (Pub 1075, Ref. 9.5)

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CA-7 – Continuous Monitoring (Moderate)

Control

The organization establishes a continuous monitoring strategy and implements a continuous monitoring program that includes:
a. A configuration management process for the information system and its constituent components;
b. A determination of the security impact of changes to the information system and environment of operation;
c. Ongoing security control assessments in accordance with the organizational continuous monitoring strategy; and
d. Reporting the security state of the information system to appropriate organizational officials within every three hundred sixty-five (365) days.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CA-7(1) – Enhancement (Moderate)

Control

The use of independent security assessment agents or teams to monitor security controls is not required. However, if the organization employs an independent assessor or assessment team to monitor the security controls in the information system on an ongoing basis, this can be used to satisfy ST&E requirements.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CA-7(2) – Enhancement (Moderate)	
Control plans, schedules, and conducts automated or manual assessments on a continuous and unannounced basis, of all information systems and information systems that are processing data on behalf of or directly for including, but not limited to, in-depth monitoring of systems and networks, vulnerability and configuration scanning, and announced penetration testing to ensure compliance with all vulnerability mitigation procedures.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Security Assessment and Authorization Family (CA) Security Controls Detail and Comment

Configuration Management (CM) – *Operational*

CM-1 – Configuration Management Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented configuration management policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the configuration management policy and associated configuration management controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CM-2 – Baseline Configuration (Moderate)	
Control The organization develops, documents, and maintains under configuration control, a current baseline configuration of the information system.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CM-2(1) – Enhancement (Moderate)	
Control The organization reviews and updates the baseline configuration of the information system: (a) At least once every three hundred sixty-five (365) days; (b) When required due to major system changes/upgrades; and (c) As an integral part of information system component installations and upgrades.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CM-2(3) – Enhancement (Moderate)	
Control The organization retains older versions of baseline configurations as deemed necessary to support rollback.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CM-2(4) – Enhancement (Moderate)	
Control The organization: (a) Develops and maintains a list of software programs authorized (white list) or unauthorized (black list) to execute on the information system; and	

(b) Employs an allow-all, deny-by-exception authorization policy to identify software allowed to execute on the information system.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CM-3 – Configuration Change Control (Moderate)

Control

The organization:
a. Determines the types of changes to the information system that are configuration controlled;
b. Approves configuration-controlled changes to the system with explicit consideration for security impact analyses;
c. Documents approved configuration-controlled changes to the system;
d. Retains and reviews records of configuration-controlled changes to the system;
e. Audits activities associated with configuration-controlled changes to the system; and
f. Coordinates and provides oversight for configuration change control activities through change request forms which must be approved by an organizational and/or change control board which meets frequently enough to accommodate proposed change requests, and other appropriate organization officials including, but not limited to, the System Developer/Maintainer and information system support staff.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CM-3(2) – Enhancement (Moderate)

Control

The organization tests, validates, and documents changes to the information system before implementing the changes on the operational system.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CM-4 – Security Impact Analysis (Moderate)

Control

The organization analyzes changes to the information system to determine potential security impacts prior to change implementation. Activities associated with configuration changes to the information system are audited.

Fully explain control implementation ***(or fully explain why control requirement is not applicable)***	Responsible for Control Implementation *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CM-4(1) – Enhancement (Moderate)

Control

The organization analyzes new software in a separate test environment before installation in an operational environment, looking for security impacts due to flaws, weaknesses, incompatibility, or intentional malice.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	Responsible for Control Implementation *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CM-4(2) – Enhancement (Moderate)	
Control The organization, after the information system is changed, checks the security functions to verify that the functions are implemented correctly, operating as intended, and producing the desired outcome with regard to meeting the security requirements for the system.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CM-5 – Access Restrictions for Change (Moderate)	
Control The organization defines, documents, approves, and enforces physical and logical access restrictions associated with changes to the information system. Records reflecting all such changes shall be generated, reviewed, and retained.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CM-6 – Configuration Settings (Moderate)	
Control The organization: a. Establishes and documents mandatory configuration settings for information technology products employed within the information system using the latest security configuration guidelines listed in Implementation Standard 1 that reflect the most restrictive mode consistent with operational requirements; b. Implements the configuration settings; c. Identifies, documents, and approves exceptions from the mandatory configuration settings for individual components within the information system based on explicit operational requirements; and d. Monitors and controls changes to the configuration settings in accordance with organizational policies and procedures. For FTI: Establish mandatory configuration settings for systems that receive, store, process and transmit FTI using the Safeguards Computer Security Evaluation Matrices (SCSEMs). (Pub 1075, Ref 9.6) **Implementation Standard(s)** 1. Security configuration guidelines may be developed by different agencies, so it is possible that a guideline could include configuration information that conflicts with another agency or guideline. To resolve configuration conflicts among multiple security guidelines, the hierarchy for implementing all security configuration guidelines is as follows: (a) NIST (b) DISA (c) OMB For FTI: SCSEMs – All agency information systems used for receiving, processing, storing and transmitting FTI must be hardened in accordance with the requirements of Publication 1075. Agency information systems include the equipment, facilities, and people that collect, process, store, display and disseminate information. This includes computers, hardware, software, and communications, as well as policies and procedures for their use. Safeguard Computer Security Evaluation Matrices (SCSEMs) provide hardening guidance for specific technologies and are publicly available on the Office of Safeguards IRS.gov website, keyword: safeguards program.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CM-6(3) – Enhancement (Moderate)	
Control The organization incorporates detection of unauthorized, security-relevant configuration changes into the organization's incident response capability to ensure that such detected events are tracked, monitored, corrected, and available for historical purposes.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CM-7 – Least Functionality (Moderate)	
Control The organization configures the information system to provide only essential capabilities and specifically disables, proh bits, or restricts the use of system services, ports, network protocols, and capabilities that are not explicitly required for system or application functionality. A list of specifically needed system services, ports, and network protocols will be maintained and documented in the SMP; all others will be disabled.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CM-7(1) – Enhancement (Moderate)	
Control The organization reviews the information system within every three hundred sixty-five (365) days to identify and eliminate unnecessary functions, ports, protocols, and/or services.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CM-8 – Information System Component Inventory (Moderate)	
Control The organization develops, documents, and maintains an inventory of information system components that: a. Accurately reflects the current information system; b. Is consistent with the authorization boundary of the information system; c. Is at the level of granularity deemed necessary for tracking and reporting; d. Includes manufacturer, model/type, serial number, version number, location (i.e., physical location and logical position within the information system architecture), and ownership; and e. Is available for review and audit by designated organizational officials.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CM-8(1) – Enhancement (Moderate)	
Control The organization updates the inventory of information system components as an integral part of component installations, removals, and information system updates.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CM-8(5) – Enhancement (Moderate)	
Control The organization verifies that all components within the authorization boundary of the information system are either inventoried as a part of the system or recognized by another system as a component within that system.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CM-9 – Configuration Management Plan (Moderate)	
Control The organization develops, documents, and implements a configuration management plan for the information system that: a. Addresses roles, responsibilities, and configuration management processes and procedures; b. Defines the configuration items for the information system and when in the system development life cycle the configuration items are placed under configuration management; and c. Establishes the means for identifying configuration items throughout the system development life cycle and a process for managing the configuration of the configuration items.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Configuration Management Family (CM) Security Controls Detail and Comment

Contingency Planning (CP) – *Operational*

CP-1 – Contingency Planning Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented contingency planning policy that addresses purpose, scope, roles, respons bilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the contingency planning policy and associated contingency planning controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-2 – Contingency Plan (Moderate)	
Control The organization: a. Develops a Contingency Plan (CP) for the information system that: - Identifies essential missions and business functions and associated contingency requirements; - Provides recovery objectives, restoration priorities, and metrics; - Addresses contingency roles, responsibilities, assigned individuals with contact information; - Addresses maintaining essential missions and business functions despite an information system disruption, compromise, or failure; - Addresses eventual, full information system restoration without deterioration of the security measures originally planned and implemented; and - Is reviewed and approved by designated officials within the organization; b. Distributes copies of the CP plan to key contingency personnel (identified by name and/or by role) and organizational elements; c. Coordinates contingency planning activities with incident handling activities; d. Reviews the CP for the information system annually; (Pub 1075, Ref 9.7) e. Revises the CP to address changes to the organization, information system, or environment of operation and problems encountered during CP implementation, execution, or testing; and f. Communicates CP changes to key contingency personnel (identified by name and/or by role) and organizational elements.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-2(1) – Enhancement (Moderate)	
Control The organization coordinates contingency plan development with organizational elements responsible for related plans. Enhancement Supplemental Guidance: Examples of related plans include Business Continuity Plan, Disaster Recovery Plan, Continuity of Operations Plan, Crisis Communications Plan, Critical Infrastructure Plan, Cyber Incident Response Plan, and Occupant Emergency Plan.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CP-2(2) – Enhancement (Moderate)	
Control The organization conducts capacity planning so that necessary capacity for information processing, telecommunications, and environmental support exists during contingency operations.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-3 – Contingency Training (Moderate)	
Control The organization trains operational and support personnel (including managers and users of the information system) in their contingency roles and responsibilities with respect to the information system and provides refresher training within every three hundred sixty-five (365) days.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-4 – Contingency Plan Testing and Exercises (Moderate)	
Control The organization: a. Tests and/or exercises the contingency plan for the information system within every three hundred sixty-five (365) days using defined tests and exercises, such as the tabletop test in accordance with the current contingency plan procedure to determine the plan's effectiveness and the organization's readiness to execute the plan; and b. Documents and reviews the contingency plan test/exercise results and initiates reasonable and appropriate corrective actions to close or reduce the impact of contingency plan failures and deficiencies.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-4(1) – Enhancement (Moderate)	
Control The organization coordinates contingency plan testing and/or exercises with organizational elements responsible for related plans.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-5 – Contingency Plan Update (Moderate)	
Control [Withdrawn: Incorporated into CP-2].	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or*

	Common; Indicate All Control Provider(s)]
CP-6 – Alternate Storage Site (Moderate)	
Control The organization establishes an alternate storage site including necessary agreements to permit the storage and recovery of information system backup information. For FTI: The agency must identify alternative storage sites and initiate necessary agreements to permit the secure storage of information system and FTI backups and ensure the alternative storage sites meet FTI secure storage requirements. (Pub 1075 section 9.7)	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-6(1) – Enhancement (Moderate)	
Control The organization identifies an alternate storage site that is separated from the primary storage site so as not to be susceptible to the same hazards. Enhancement Supplemental Guidance: Hazards of concern to the organization are typically defined in an organizational assessment of risk.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-6(3) – Enhancement (Moderate)	
Control The organization identifies potential accessibility problems to the alternate storage site in the event of an area-wide disruption or disaster and outlines explicit mitigation actions. Enhancement Supplemental Guidance: Explicit mitigation actions include, for example, duplicating backup information at another alternate storage site if access to the first alternate site is hindered; or, if electronic accessibility to the alternate site is disrupted, planning for physical access to retrieve backup information	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CP-7 – Alternate Processing Site (Moderate)

Control

The organization:
a. Establishes an alternate processing site including necessary agreements to permit the resumption of information system operations for essential missions and business functions within the time period specified in Implementation Standard 1 when the primary processing capabilities are unavailable; and
b. Ensures that equipment and supplies required to resume operations are available at the alternate site or contracts are in place to support delivery to the site in time to support the time period for resumption specified in Implementation Standard 1.

Implementation Standard(s)
1. Ensure all equipment and supplies required for resuming system operations at the alternate processing site are available, or contracts are in place to support delivery to the site, to permit resumption of essential missions and business functions within one (1) week of contingency plan activation.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CP-7(1) – Enhancement (Moderate)

Control

The organization identifies an alternate processing site that is separated from the primary processing site so as not to be susceptible to the same hazards.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CP-7(2) – Enhancement (Moderate)

Control

The organization identifies potential accessibility problems to the alternate processing site in the event of an area-wide disruption or disaster and outlines explicit mitigation actions.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CP-7(3) – Enhancement (Moderate)

Control

The organization develops alternate processing site agreements that contain priority-of-service provisions in accordance with the organization's availability requirements.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CP-7(5) – Enhancement (Moderate)

Control

The organization ensures that the alternate processing site provides information security measures equivalent to that of the primary site.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-8 – Telecommunications Services (Moderate)	
Control The organization establishes alternate telecommunications services including necessary agreements to permit the resumption of information system operations for essential missions and business functions within the resumption time period specified in Implementation Standard 1 when the primary telecommunications capabilities are unavailable. **Implementation Standard(s)** 1. Ensure alternate telecommunications service agreements are in place to permit resumption of information system operations for essential missions and business functions within one (1) week of contingency plan activation when primary telecommunications capabilities are unavailable.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-8(1) – Enhancement (Moderate)	
Control The organization develops primary and alternate telecommunications service agreements that contain priority-of-service provisions in accordance with the organization's availability requirements. And b) Requests Telecommunications Service Priority for all telecommunications services used for national security emergency preparedness in the event that the primary and/or alternate telecommunications services are provided by a common carrier.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-8(2) – Enhancement (Moderate)	
Control The organization obtains alternate telecommunications services with consideration for reducing the likelihood of sharing a single point of failure with primary telecommunications services.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CP-9 – Information System Backup (Moderate)

Control

The organization:
a. Conducts backups of user-level information contained in the information system in accordance with the frequency specified in Implementation Standard 1;
b. Conducts backups of system-level information contained in the information system in accordance with the frequency specified in Implementation Standard 1;
c. Conducts backups of information system documentation including security-related documentation and other forms of data, including paper records; and
d. Protects the confidentiality and integrity of backup information at the storage location.

Implementation Standard(s)
1. Perform full backups weekly to separate media. Perform incremental or differential backups daily to separate media. Backups to include user-level and system-level information (including system state information). Three (3) generations of backups (full plus all related incremental or differential backups) are stored off-site. Off-site and on-site backups must be logged with name, date, time and action.
2. (For PII only) Ensure that a current, retrievable, copy of PII is available before movement of servers.

For FTI: Back-up tapes must be labeled as containing FTI, must be logged, must be transported securely using two barriers and a transmittal, and must be inventoried on a semi-annual basis. (Pub 1075 sections 3.0, 4.0)

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CP-9(1) – Enhancement (Moderate)

Control

The organization tests backup information following each backup to verify media reliability and information integrity.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

CP-10 – Information System Recovery and Reconstitution (Moderate)

Control

The organization provides for the recovery and reconstitution of the information system to a known state after a disruption, compromise, or failure. Recovery of the information system after a failure or other contingency shall be done in a trusted, secure, and verifiable manner.

Implementation Standard(s)
1. Secure information system recovery and reconstitution includes, but not limited to:
(a) Reset all system parameters (either default or organization-established),
(b) Reinstall patches,
(c) Reestablish configuration settings,
(d) Reinstall application and system software, and
(e) Fully test the system.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or*

	Common; Indicate All Control Provider(s)]
CP-10(2) – Enhancement (Moderate)	
Control The information system implements transaction recovery for systems that are transaction-based. Enhancement Supplemental Guidance: Database management systems and transaction processing systems are examples of information systems that are transaction-based. Transaction rol back and transaction journaling are examples of mechanisms supporting transaction recovery.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
CP-10(3) – Enhancement (Moderate)	
Control The organization provides compensating security controls for circumstances that inhibit recovery and reconstitution to a known state.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Contingency Planning Family (CP) Security Controls Detail and Comment

Identification and Authentication (IA) – *Technical*

IA-1 – Identification and Authentication Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented identification and authentication policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the identification and authentication policy and associated identification and authentication controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IA-2 – Identification and Authentication (Organizational Users) (Moderate)	
Control The information system uniquely identifies and authenticates organizational users (or processes acting on behalf of organizational users). **Implementation Standard(s)** 1. Require the use of system and/or network authenticators and unique user identifiers. 2. Help desk support requires user identification for any transaction that has information security implications. For FTI: Complete section 2.10 (e-Authentication level) in the SMP Template.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IA-2(1) – Enhancement (Moderate)	
Control The information system uses multifactor authentication for network access to privileged accounts. For FTI: Two-factor authentication is required whenever FTI is being accessed from an alternative work location or if accessing FTI via agency's web portal by an employee or contractor.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IA-2(2) – Enhancement (Moderate)	
Control The information system uses multifactor authentication for network access to non-privileged accounts.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or ~~Common; Indicate All Control Provider(s)~~]*

IA-2(3) – Enhancement (Moderate)	
Control The information system uses multifactor authentication for local access to privileged accounts.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IA-2(8) – Enhancement (Moderate)	
Control The information system uses replay resistant authentication mechanisms for network access to privileged accounts. Enhancement Supplemental Guidance: An authentication process resists replay attacks if it is impractical to achieve a successful authentication by recording and replaying a previous authentication message. Techniques used to address this include protocols that use nonces or challenges (e.g., TLS), and time synchronous or challenge-response one-time authenticators.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IA-3 – Device Identification and Authentication (Moderate)	
Control The information system uniquely identifies and authenticates specific and/or types of devices before establishing a connection.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IA-4 – Identifier Management (Moderate)	
Control The organization manages information system identifiers for users and devices by: a. Receiving authorization from a designated organizational official to assign a user or device identifier; b. Selecting an identifier that uniquely identifies an individual or device; c. Assigning the user identifier to the intended party or the device identifier to the intended device; d. Preventing reuse of user or device identifiers until all previous access authorizations are removed from the system, including all file accesses for that identifier but not before a period of at least three hundred sixty-five (365) days has expired; and e. Disabling the user identifier after the time period of inactivity specified in Implementation Standard 1 and deleting disabled accounts during the annual re-certification process. **Implementation Standard(s)** 1. Disable user identifiers after one hundred eighty (180) days of inactivity. For FTI: Disable user identifier after ninety (90) days of inactivity.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation**

	[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]

IA-5 – Authenticator Management (Moderate)

Control

The organization manages information system authenticators for users and devices by:
a. Verifying, as part of the initial authenticator distribution, the identity of the individual and/or device receiving the authenticator;
b. Establishing initial authenticator content for authenticators defined by the organization;
c. Ensuring that authenticators have sufficient strength of mechanism for their intended use;
d. Establishing and implementing administrative procedures for initial authenticator distribution, for lost/compromised or damaged authenticators, and for revoking authenticators;
e. Changing default content of authenticators upon information system installation;
f. Establishing minimum and maximum lifetime restrictions and reuse conditions for authenticators (if appropriate);
g. Changing/refreshing password authenticators as defined in IA-5(1);
h. Protecting authenticator content from unauthorized disclosure and modification; and
i. Requiring users to take, and having devices implement, specific measures to safeguard authenticators.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

IA-5(1) – Enhancement (Moderate)

Control

The information system, for password-based authentication:
(a) Automatically forces users (including administrators) to change user account passwords every sixty (60) days and system account passwords every one hundred eighty (180) days;
(b) Prohibits the use of dictionary names or words;
(c) Enforces minimum password complexity consisting of at least eight (8) alphanumeric (i.e., upper- and lower-case letters, and numbers) and/or special characters;
(d) Enforces at least a minimum of four (4) changed characters when new passwords are created;
(e) Encrypts passwords in storage and in transmission;
(f) Enforces password minimum and maximum lifetime restrictions of one (1) day for the minimum, and sixty (60) days for a user account and one hundred eighty (180) days for a system account maximum; and
(g) Prohibits password reuse for six (6) generations prior to reuse.

For FTI: Change/refresh authenticators every 90 days, at a minimum, for a standard user account, every 60 days, at a minimum, for privileged users. (Pub 1075, Ref Exhibit 8)

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

IA-5(2) – Enhancement (Moderate)

Control

The information system, for PKI-based authentication:
(a) Validates certificates by constructing a certification path with status information to an accepted trust anchor;
(b) Enforces authorized access to the corresponding private key; and
(c) Maps the authenticated identity to the user account.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IA-5(3) – Enhancement (Moderate)	
Control The organization requires that the registration process to receive hardware tokens be verified in person before a designated registration authority with authorization by a designated organizational official (e.g., a supervisor).	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IA-6 – Authenticator Feedback (Moderate)	
Control The information system obscures feedback of authentication information during the authentication process to protect the information from possible exploitation/use by unauthorized individuals.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IA-7 – Cryptographic Module Authentication (Moderate)	
Control The information system uses mechanisms for authentication to a cryptographic module that meet the requirements of applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance for such authentication.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IA-8 – Identification and Authentication (Non-Organizational Users) (Moderate)	
Control The information system uniquely identifies and authenticates non-organizational users (or processes acting on behalf of non-organizational users).	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Identification and Authentication Family (IA) Security Controls Detail and Comment

Incident Response (IR) – *Operational*

IR-1 – Incident Response Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented incident response policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the incident response policy and associated incident response controls. For FTI: Policies and procedures must cover both physical and information security relative to the protection of FTI. For FTI: Complete SPR section 9.11.1	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IR-2 – Incident Response Training (Moderate)	
Control The organization: a. Trains personnel in their incident response roles and responsibilities with respect to the information system; and For FTI: Provides refresher training prior to access of FTI and annually thereafter on incident response policy and procedure regarding FTI. (Pub 1075, section 6.2, 9.9) **Supplemental Guidance**: Incident response training includes user training in the identification and reporting of suspicious activities, both from external and internal sources. For FTI: Complete SPR section 9.11.2	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IR-3 – Incident Response Testing and Exercises (Moderate)	
Control The organization tests and/or exercises the incident response capability for the information system annually using reviews, analyses, and simulations to determine the incident response effectiveness and documents the results. For FTI: Include procedures to exercise responding o unauthorized FTI access and reporting unauthorized FTI access to IRS and TIGTA. (Pub 1075, Ref 9.9) Complete SPR section 9.11.3.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or*

	Common; Indicate All Control Provider(s)]
IR-4 – Incident Handling (Moderate)	
Control The organization: a. Implements an incident handling capability using Information Security Incident Handling and Breach Notification Procedures; b. Coordinates incident handling activities with contingency planning activities; and c. Incorporates lessons learned from ongoing incident handling activities into incident response procedures, training, and testing/exercises, and implements the resulting changes accordingly. For FTI: The agency's incident response policy and procedures must include specific guidance relative to a data incidents involving FTI. (Pub 1075 Section 9.9) **Implementation Standard(s)** 1. Document relevant information related to a security incident according to Information Security Incident Handling and Breach Notification Procedures. 2. Preserve evidence through technical means, including secured storage of evidence media and "write" protection of evidence media. Use sound forensics processes and utilities that support legal requirements. Determine and follow chain of custody for forensic evidence. 3. Identify vulnerability exploited during a security incident. Implement security safeguards to reduce risk and vulnerability exploit exposure. For FTI: Complete SPR section 9.11.4	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IR-4(1) – Enhancement (Moderate)	
Control The organization employs automated mechanisms to support the incident handling process. Enhancement Supplemental Guidance: An online incident management system is an example of an automated mechanism.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

IR-5 – Incident Monitoring (Moderate)	
Control The organization tracks and documents information system security incidents. Supplemental Guidance: Documenting information system security incidents includes, for example, maintaining records about each incident, the status of the incident, and other pertinent information necessary for forensics, evaluating incident details, trends, and handling. Incident information can be obtained from a variety of sources including, for example, incident reports, incident response teams, audit monitoring, network monitoring, physical access monitoring, and user/administrator reports. For FTI: Once the incident has been addressed, the agency will conduct a post-incident review to ensure the incident response policies and procedures provide adequate guidance. (Pub 1075 section 10.3) For FTI: Complete SPR section 9.11.5	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IR-6 – Incident Reporting (Moderate)	
Control The organization: a. Requires personnel to report suspected security incidents to the organizational incident response capability within timeframe established in the current Information Security Incident Handling and Breach Analysis/Notification Procedure; and b. Reports security incident information to designated authorities. For FTI: Any data incident potentially involving FTI must immediately be reported to the Treasury Inspector General for Tax Administration (TIGTA) and the IRS Office of Safeguards immediately, but no later than 24-hours after identification of a possible issue involving FTI. (Pub. 1075, Ref 9.9, 10.4) Supplemental Guidance: The intent of this control is to address both specific incident reporting requirements within an organization and the formal incident reporting requirements for federal agencies and their subordinate organizations. The types of security incidents reported, the content and timeliness of the reports, and the list of designated reporting authorities are consistent with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance. Current federal policy requires that all federal agencies (unless specifically exempted from such requirements) report security incidents to the United States Computer Emergency Readiness Team (US-CERT) within specified time frames designated in the US-CERT Concept of Operations for Federal Cyber Security Incident Handling. Related controls: IR-4, IR-5. For FTI: Complete SPR section 9.11.6	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IR-6(1) – Enhancement (Moderate)	
Control The organization employs automated mechanisms to assist in the reporting of security incidents.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or*

	Common; Indicate All Control Provider(s)]

IR-7 – Incident Response Assistance (Moderate)	
Control The organization provides an incident response support resource, integral to the organizational incident response capability, that offers advice and assistance to users of the information system for the handling and reporting of security incidents. Supplemental Guidance: Poss ble implementations of incident response support resources in an organization include a help desk or an assistance group and access to forensics services, when required. For FTI: Complete SPR section 9.11.7	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
IR-7(1) – Enhancement (Moderate)	
Control The organization employs automated mechanisms to increase the availability of incident response-related information and support. Enhancement Supplemental Guidance: Automated mechanisms can provide a push and/or pull capability for users to obtain incident response assistance. For example, individuals might have access to a website to query the assistance capability, or conversely, the assistance capability may have the ability to proactively send information to users (general distribution or targeted) as part of increasing understanding of current response capabilities and support.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

IR-8 – Incident Response Plan (Moderate)	
Control The organization: a. Develops an incident response plan that: - Provides the organization with a roadmap for implementing its incident response capability; - Describes the structure and organization of the incident response capability; - Provides a high-level approach for how the incident response capability fits into the overall organization; - Meets the unique requirements of the organization, which relate to mission, size, structure, and functions; - Defines reportable incidents; - Provides metrics for measuring the incident response capability within the organization. - Defines the resources and management support needed to effectively maintain and mature an incident response capability; and - Is reviewed and approved by designated officials within the organization; b. Distributes copies of the incident response plan to incident response personnel and organizational elements; c. Reviews the incident response plan within every three hundred sixty-five (365) days; d. Revises the incident response plan to address system/organizational changes or problems encountered during plan implementation, execution, or testing; and e. Communicates incident response plan changes to incident response personnel and organizational elements. Supplemental Guidance: It is important that organizations have a formal, focused, and coordinated approach to responding to incidents. The organization's mission, strategies, and goals for incident response help determine the structure of its incident response capability. For FTI: Complete SPR section 9.11.8.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Incident Response Family (IR) Security Controls Detail and Comment

Maintenance (MA) – *Operational*

MA-1 – System Maintenance Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented information system maintenance policy that addresses purpose, scope, roles, respons bilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the information system maintenance policy and associated system maintenance controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MA-2 – Controlled Maintenance (Moderate)	
Control The organization: a. Schedules, performs, documents, and reviews records of maintenance and repairs on information system components in accordance with manufacturer or vendor specifications and/or organizational requirements; b. Controls all maintenance activities, whether performed on site or remotely and whether the equipment is serviced on site or removed to another location; c. Requires that a designated official explicitly approve the removal of the information system or system components from organizational facilities for off-site maintenance or repairs; d. Sanitizes equipment to remove all information from associated media prior to removal from organizational facilities for off-site maintenance or repairs; and e. Checks all potentially impacted security controls to verify that the controls are still functioning properly following maintenance or repair actions. **Implementation Standard(s)** 1. (For PII only) In facilities where PII is stored or accessed, document repairs and modifications to the physical components of a facility which are related to security (for example, hardware, walls, doors, and locks).	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MA-2(1) – Enhancement (Moderate)	
Control the organization maintains maintenance records for the information system that include: - date and time of maintenance; - name of the individual performing the maintenance; - name of escort, if necessary; - a description of the maintenance performed; - a list of equipment removed or replaced (including identification numbers, if applicable).	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MA-3 – Maintenance Tools (Moderate)	
Control The organization approves, controls, monitors the use of, and maintains on an ongoing basis, information system maintenance tools.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
MA-3(1) – Enhancement (Moderate)	
Control The organization inspects all maintenance tools carried into a facility by maintenance personnel for obvious improper modifications. Enhancement Supplemental Guidance: Maintenance tools include, for example, diagnostic and test equipment used to conduct maintenance on the information system.	
Fully explain control implementation (or fully explain why control requirement is not applicable)	**Responsible for Control Implementation** [Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]
MA-3(2) – Enhancement (Moderate)	
Control The organization checks all media containing diagnostic and test programs for malicious code before the media are used in the information system.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
MA-4 – Non-Local Maintenance (Moderate)	
Control The organization prohibits non-local system maintenance unless explicitly authorized, in writing, by the CIO or his/her designated representative. If authorized, the organization: a. Monitors and controls non-local maintenance and diagnostic activities; b. Allows the use of non-local maintenance and diagnostic tools only as consistent with organizational policy and documented in the security plan for the information system; c. Employs strong identification and authentication techniques in the establishment of non-local maintenance and diagnostic sessions; d. Maintains records for non-local maintenance and diagnostic activities; and e. Terminates all sessions and network connections when non-local maintenance is completed. **Implementation Standard(s)** 1. If password-based authentication is used during remote maintenance, change the passwords following each remote maintenance service.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MA-4(1) – Enhancement (Moderate)	
Control The organization audits non-local maintenance and diagnostic sessions and designated organizational personnel review the maintenance records of the sessions.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
MA-4(2) – Enhancement (Moderate)	
Control The organization documents, in the security plan for the information system, the installation and use of non-local maintenance and diagnostic connections.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
MA-4(3) – Enhancement (Moderate)	
Control The organization: (a) Requires that non-local maintenance and diagnostic services be performed from an information system that implements a level of security at least as high as that implemented on the system being serviced; or (b) Removes the component to be serviced from the information system and prior to non-local maintenance or diagnostic services, sanitizes the component (with regard to sensitive information) before removal from organizational facilities, and after the service is performed, inspects and sanitizes the component (with regard to potentially malicious software and surreptitious implants) before reconnecting the component to the information system.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
MA-5 – Maintenance Personnel (Moderate)	
Control The organization: a. Establishes a process for maintenance personnel authorization and maintains a current list of authorized maintenance organizations or personnel; and b. Ensures that personnel performing maintenance on the information system have required access authorizations or designates organizational personnel with required access authorizations and technical competence deemed necessary to supervise information system maintenance when maintenance personnel do not possess the required access authorizations.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MA-6 – Timely Maintenance (Moderate)	
Control The organization obtains maintenance support and/or spare parts for critical systems and applications (including Major Applications [MA] and General Support Systems [GSS] and their components) within twenty-four (24) hours of failure.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Maintenance Family (MA) Security Controls Detail and Comment

Media Protection (MP) – *Operational*

MP-1 – Media Protection Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented media protection policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the media protection policy and associated media protection controls. **Implementation Standard(s)** 1. (For PII only) Semi-annual inventories of magnetic tapes containing PII are conducted. The organization accounts for any missing tape containing PII by documenting the search efforts and notifying the tape initiator of the loss.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
MP-2 – Media Access (Moderate)	
Control The organization restricts access to sensitive digital and non-digital media to authorized individuals using automated mechanisms to control access to media storage areas.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
MP-2(1) – Enhancement (Moderate)	
Control The organization employs automated mechanisms to restrict access to media storage areas and to audit access attempts and access granted.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MP-3 – Media Marking (Moderate)	
Control The organization: a. Marks, in accordance with organizational policies and procedures, removable information system media and information system output indicating the distribution limitations, handling caveats, and applicable security markings (if any) of the information; and b. Exempts specific types of media or hardware components, as specified, in writing, by the CIO or his/her designated representative, from marking as long as the exempted items remain within a secure environment. For FTI: The agency must label removable media and information system output containing FTI. IRS Notice 129-A or Notice 129-B are available for this purpose. (Pub. 1075, Ref. 9.11)	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MP-4 – Media Storage (Moderate)	
Control The organization: a. Physically controls and securely stores digital and non-digital media within controlled areas using safeguards prescr bed for the highest system security level of the information ever recorded on it; b. Protects information system media until the media are destroyed or sanitized using approved equipment, techniques, and procedures. **Implementation Standard(s)** 1. (For PII only) Evaluate employing an approved method of cryptography (see SC-13) to protect PII at rest, consistent with NIST SP 800-66 guidance. 2. (For PII only) If PII is recorded on magnetic media with other data, it should be protected as if it were entirely personally identifiable information.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MP-5 – Media Transport (Moderate)

Control

The organization:
a. Protects and controls digital and non-digital media containing sensitive information during transport outside of controlled areas using cryptography and tamper evident packaging and (i) if hand carried, using securable container (e.g., locked briefcase) via authorized personnel, or (ii) if shipped, trackable with receipt by commercial carrier;
b. Maintains accountability for information system media during transport outside of controlled areas; and
c. Restricts the activities associated with transport of such media to authorized personnel.

For FTI: All FTI transported through the mail or courier/messenger service must be double sealed; that is one envelope within another envelope. The inner envelope should be marked confidential with some indication that only the designated official or delegate is authorized to open it. Using sealed boxes serves the same purpose as double sealing and prevents anyone from viewing the contents thereof. (Pub 1075, Ref 4.5)

Implementation Standard(s)
1. (For PII only) Protect and control PII media during transport outside of controlled areas and restricts the activities associated with transport of such media to authorized personnel. PII must be in locked cabinets or sealed packing cartons while in transit.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MP-5(2) – Enhancement (Moderate)

Control

The organization documents activities associated with the transport of information system media.

For FTI: All shipments of FTI (including electronic media and microfilm) must be documented on a transmittal form and monitored to ensure that each shipment is properly and timely received and acknowledged. (Pub 1075, Ref 4.5)

Implementation Standard(s):

For FTI: Describe the permanent record(s) (logs) used to document requests for, receipt of, distribution of (if applicable), and disposition (return to IRS or destruction) of the FTI (including tapes, cartridges or other removable media) (e.g. FTI receipt logs, transmission logs, or destruction logs in electronic or paper format) (Please include a sample of the agency logs as an attachment).

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MP-5(4) – Enhancement (Moderate)

Control

The organization employs cryptographic mechanisms to protect the confidentiality and integrity of information stored on digital media during transport outside of controlled areas.

Enhancement Supplemental Guidance: This control enhancement also applies to mobile devices. Mobile devices include portable storage media (e.g., USB memory sticks, external hard disk drives) and portable computing and communications devices with storage capability (e.g.,notebook/laptop computers, personal digital assistants, cellular

telephones).

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MP-6 – Media Sanitization (Moderate)

Control

The organization:
a. Sanitizes information system media, both digital and non-digital, prior to disposal, release out of organizational control, or release for reuse; and
b. Employs sanitization mechanisms with strength and integrity commensurate with the classification or sensitivity of the information.

For FTI:
1. FTI furnished to the user and any paper material generated therefrom, such as extra copies, photo impressions, computer printouts, carbon paper, notes, stenographic notes, and work papers must be destroyed by burning, mulching, pulping, shredding, or disintegrating. (See Pub 1075, Ref 8.3 for detailed procedures)
2. FTI must never be disclosed to an agency's agents or contractors during disposal unless authorized by the Internal Revenue Code. Generally, destruction should be witnessed by an agency employee.

Implementation Standard(s)
1. Finely shred, using a minimum of cross-cut shredding, hard-copy documents, using approved equipment, techniques, and procedures.
2. (For PII only) Authorized employees of the receiving entity must be respons ble for securing magnetic tapes/cartridges before, during, and after processing, and they must ensure that the proper acknowledgment form is signed and returned. Inventory records must be maintained for purposes of control and accountability. Tapes containing PII, any hard-copy printout of a tape, or any file resulting from the processing of such a tape will be recorded in a log that identifies:
- date received
- reel/cartridge control number contents
- number of records, if available
- movement, and
- if disposed of, the date and method of disposition.

For FTI, complete SPR section 8.1.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MP-6(1) – Enhancement (Moderate)

Control

The organization tracks, documents, and verifies media sanitization and disposal actions.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MP-6(2) – Enhancement (Moderate)	
Control The organization tests sanitization equipment and procedures to verify correct performance periodically.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
MP-6(5) – Enhancement (Moderate)	
Control The organization sanitizes information system media containing sensitive information using National Security Agency (NSA) guidance (www.nsa.gov/ia/government/mdg.cfm) and NIST SP 800-88, Guidelines for Media Sanitization. For FTI: Electronic media containing FTI must not be made available for reuse by other offices or released for destruction without first being subject to electromagnetic erasing. If reuse is not intended, the electronic media should be destroyed. Whenever physical media leaves the physical or systemic control of the agency for maintenance, exchange or other servicing, any FTI on it must be cleared completely by overwriting all data tracks a minimum of three times. (Pub 1075 section 8.4)	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
MP-6(6) – Enhancement (Moderate)	
Control The organization destroys media containing sensitive information that cannot be sanitized. For FTI: Paper FTI may be burned, cross-cut shredded to 5/16" wide or small strips or pulped.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

MP-EDC-1 – Media Related Records (Moderate)	
Control Inventory and disposition records for information system media shall be maintained to ensure control and accountability of Commonwealth of PA information. The media related records shall contain sufficient information to reconstruct the data in the event of a breach. **Implementation Standard(s)** 1. The media records must, at a minimum, contain: (a) The name of media recipient; (b) Signature of media recipient; (c) Date/time media received; (d) Media control number and contents; (e) Movement or routing information; and (f) If disposed of, the date, time, and method of destruction.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Media Protection Family (MP) Security Controls Detail and Comment

Physical and Environmental Protection (PE) – *Operational*

PE-1 – Physical and Environmental Protection Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented physical and environmental protection policy that addresses purpose, scope, roles, respons bilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the physical and environmental protection policy and associated physical and environmental protection controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-2 – Physical Access Authorizations (Moderate)	
Control The organization: a. Develops and keeps current a list of personnel with authorized access to the facility where the information system resides (except for those areas within the facility officially designated as publicly accessible); b. Issues authorization credentials; c. Reviews and approves the access list and authorization credentials in accordance with the frequency specified in Implementation Standard 1, removing from the access list personnel no longer requiring access. For FTI: A visitor access log containing specific data elements will be used to authenticate and authorize visitor's access to any facility where FTI resides, either electronically or in paper, at the location where the outside (2nd) barrier is breached. (See IRS Pub. 1075, sections 4.3.2) **Implementation Standard(s)** 1. Review and approve lists of personnel with authorized access to facilities containing information systems at least once every one hundred eighty (180) days. 2. (For PII only) Create a restricted area, security room, or locked room to control access to areas containing PII. These areas will be controlled accordingly. 3. (For FTI) Complete SPR section 5.2.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-3 – Physical Access Control (Moderate)

Control

The organization:
a. Enforces physical access authorizations for all physical access points (including designated entry/exit points) to the facility where the information system resides (excluding those areas within the facility officially designated as publicly accessible);
b. Verifies individual access authorizations before granting access to the facility;
c. Controls entry to the facility containing the information system using physical access devices and/or guards;
d. Controls access to areas officially designated as publicly access ble in accordance with the organization's assessment of risk;
e. Secures keys, combinations, and other physical access devices;
f. Inventories physical access devices within every three hundred sixty-five (365) days; and
g. Changes combinations and keys when keys are lost, combinations are compromised, or individuals are transferred or terminated.

For FTI:
h. Minimum protection standards require two physical barriers between FTI and an individual not authorized to access FTI. This may be achieved through secured perimeter/locked container, locked perimeter/secured interior or locked perimeter/security container. FTI must be containerized in areas where other than authorized employees or authorized contractors may have access after-hours. (See IRS Pub. 1075, sections 4.2)
i. A security guard, custodial services worker or landlord may have access to a locked building or a locked room if FTI is in a locked container. If FTI is in a locked room, but not in a locked container, the guard, janitor or landlord may have a key to the building but not to the room. (See IRS Pub. 1075, sections 4.2)
j. During business hours, if authorized personnel serve as the second barrier between FTI and unauthorized individuals, the authorized personnel must wear an identification badge or credential clearly displayed, preferably work above the waist. (See IRS Pub. 1075, sections 4.2)
k. Unauthorized access to areas containing FTI during duty and non-duty hours must be denied. This can be done utilizing a combination of methods: secured or locked perimeter, secured area or containerization. (See IRS Pub. 1075, sections 4.3)
l. The physical security and control of computers and electronic media must be addressed. Computer operations must be in a secure area with restricted access. . (See IRS Pub. 1075, sections 4.6)

Implementation Standard(s)
1. Control data center/facility access by use of door and window locks, and security personnel or physical authentication devices, such as biometrics and/or smart card/PIN combination.
2. Store and operate servers in physically secure environments, and grant access to explicitly authorized personnel only. Access is monitored and recorded.
3. Restrict access to grounds/facilities to authorized persons only.
4. (For PII only) Require two barriers to access PII under normal security: secured perimeter/locked container, locked perimeter/secured interior, or locked perimeter/security container. Protected information must be containerized in areas where other than authorized employees may have access after-hours.

For FTI: Complete SPR sections 5.3.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-4 – Access Control for Transmission Medium (Moderate)	
Control The organization controls physical access to information system distr bution and transmission lines within organizational facilities. **Implementation Standard(s)** 1. Permit access to telephone closets and information system distribution and transmission lines within organizational facilities only to authorized personnel. 2. Disable any physical ports (e.g., wiring closets, patch panels, etc) not in use. For FTI: Complete SPR section 5.4.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-5 – Access Control for Output Devices (Moderate)	
Control The organization controls physical access to information system output devices to prevent unauthorized individuals from obtaining the output. For FTI: Output from printers and fax machines should be in a controlled area and secured when not in use. Physical access to monitors displaying FTI should be controlled to prevent unauthorized access to the display output. (Pub. 1075, Ref 4.3, 4.3.2) For FTI: Complete SPR section 5.5.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-6 – Monitoring Physical Access (Moderate)	
Control The organization: a. Monitors physical access to the information system to detect and respond to physical security incidents; b. Reviews physical access logs in accordance with the frequency specified in Implementation Standard 1; and c. Coordinates results of reviews and investigations with the organization's incident response capability. **Implementation Standard(s)** 1. Review physical access logs every at least once every two (2) months. For FTI: Complete SPR section 5.6.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-6(1) – Enhancement (Moderate)	
Control The organization monitors real-time physical intrusion alarms and surveillance equipment.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
PE-7 – Visitor Control (Moderate)	
Control The organization controls physical access to the information system by authenticating visitors before authorizing access to the facility where the information system resides other than areas designated as publicly accessible. For FTI: A restricted area visitor log will be maintained at a designated entrance to the restricted area and all visitors (persons not assigned to the area) entering the area shall be directed to the designated entrance. The entry control monitor should verify the identify of visitors by comparing the name and signature entered into the register with some type of photo identification card. For FTI: Complete SPR section 5.7.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
PE-7(1) – Enhancement (Moderate)	
Control The organization escorts visitors and monitors visitor activity, when required.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
PE-8 – Access Records (Moderate)	
Control The organization: a. Maintains visitor access records to the facility where the information system resides (except for those areas within the facility officially designated as publicly accessible); and b. Reviews visitor access records monthly. For FTI: The restricted area visitor log shall include the visitor's name, signature, assigned work area, escort, purpose of entry, and time and date of entry. For FTI: Complete SPR section 5.8.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or*

	Common; Indicate All Control Provider(s)]

PE-9 – Power Equipment and Power Cabling (Moderate)

Control

The organization protects power equipment and power cabling for the information system from damage and destruction.

Implementation Standard(s)
1. Permit only authorized maintenance personnel to access infrastructure assets, including power generators, HVAC systems, cabling, and wiring closets.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-10 – Emergency Shutoff (Moderate)

Control

The organization:
a. Provides the capability of shutting off power to the information system or individual system components in emergency situations;
b. Places emergency shutoff switches or devices in a location that does not require personnel to approach the equipment to facilitate safe and easy access for personnel; and
c. Protects emergency power shutoff capability from unauthorized activation.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-11 – Emergency Power (Moderate)

Control

The organization provides a short-term uninterruptible power supply to facilitate an orderly shutdown of the information system in the event of a primary power source loss.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-12 – Emergency Lighting (Moderate)

Control

The organization employs and maintains automatic emergency lighting for the information system that activates in the event of a power outage or disruption and that covers emergency exits and evacuation routes within the facility.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-13 – Fire Protection (Moderate)	
Control The organization employs and maintains fire suppression and detection devices/systems for the information system that are supported by an independent energy source.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
PE-13(1) – Enhancement (Moderate)	
Control The organization employs fire detection devices/systems for the information system that activate automatically and notify the organization and emergency responders in the event of a fire.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
PE-13(2) – Enhancement (Moderate)	
Control The organization employs fire suppression devices/systems for the information system that provide automatic notification of any activation to the organization and emergency responders.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
PE-13(3) – Enhancement (Moderate)	
Control The organization employs an automatic fire suppression capability for the information system when the facility is not staffed on a continuous basis.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-14 – Temperature and Humidity Controls (Moderate)	
Control The organization: a. Maintains temperature and humidity levels within the facility where the information system resides within acceptable vendor-recommended levels; and b. Monitors temperature and humidity levels. **Implementation Standard(s)** 1. Evaluate the level of alert and follow prescribed guidelines for that alert level. 2. Alert component management of possible loss of service and/or media. 3. Report damage and provide remedial action. Implement contingency plan, if necessary.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-15 – Water Damage Protection (Moderate)	
Control The organization protects the information system from damage resulting from water leakage by providing master shutoff valves that are access ble, working properly, and known to key personnel.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-16 – Delivery and Removal (Moderate)	
Control The organization authorizes, monitors, and controls the flow of information system-related components entering and exiting the facility and maintains records of those items. For FTI: All transportation or shipments of FTI (including electronic media or microfilm) must be documented on a transmittal form and monitored to ensure that each shipment is properly and timely received and acknowledged. All FTI transported through the mail or courier/messenger service must be double-sealed; that is one envelope within another envelope. The inner envelope should be marked confidential with some indication that only the designed official or delegate is authorized to open it. (Pub. 1075, sections 4.5) For FTI: Complete SPR section 5.9.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-17 – Alternate Work Site (Moderate)	
Control The organization: a. Employs appropriate security controls at alternate work sites to include, but not limited to, laptop cable locks, recording serial numbers and other identification information about laptops, and disconnecting modems; b. Assesses as feasible, the effectiveness of security controls at alternate work sites; and c. Provides a means for employees to communicate with information security personnel in case of security incidents or problems. For FTI: Descr be the policies and procedures for meeting the minimum protection standards for alternative work sites (e.g. employee's homes or other non-traditional work sites). (Pub 1075, Ref 5.3). For FTI: Complete SPR section 5.10.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PE-18 – Location of Information System Components (Moderate)	
Control The organization positions information system components within the facility to minimize potential damage from physical and environmental hazards and to minimize the opportunity for unauthorized access. For FTI: Complete SPR section 5.11.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Physical and Environmental Protection Family (PE) Security Controls Detail and Comment

Planning (PL) – *Management*

PL-1 – Security Planning Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented security planning policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the security planning policy and associated security planning controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PL-2 – Security Management Plan (SMP) (Moderate)

Control

The organization:
a. Develops a security plan for the information system that:
- Is consistent with the Security Management Plan (SMP) Procedure;
- Is consistent with the organization's enterprise architecture;
- Explicitly defines the authorization boundary for the system;
- Describes the operational context of the information system in terms of missions and business processes;
- Provides the security categorization of the information system including supporting rationale;
- Describes the operational environment for the information system;
- Describes relationships with or connections to other information systems;
- Provides an overview of the security requirements for the system;
- Describes the security controls in place or planned for meeting those requirements including a rationale for the tailoring and supplementation decisions; and
- Is reviewed and approved by the authorizing official or designated representative prior to plan implementation;
b. Reviews the security plan for the information system within every three hundred sixty-five (365) days; and
c. Updates the plan, minimally every three (3) years, to address changes to the information system/environment of operation or problems identified during plan implementation or security control assessments.

For FTI:
1. When FTI is incorporated into a Data Warehouse, the controls descr bed in IRS Pub. 1075, Exh bit 11 are to be followed, in addition to those specified in other controls.
2. Develop and submit a Safeguard Procedures Report (SPR) that describes the procedures established and used by the organization for ensuring the confidentiality of the information received from the IRS. Annually thereafter, the organization must file a Safeguard Activity Report (SAR). The SAR advises the IRS of minor changes to the procedures or safeguards described in the SPR. It also advises the IRS of future actions that will affect the organization's safeguard procedures, summarizes the organization's current efforts to ensure the confidentiality of FTI, and finally, certifies that the organization is protecting FTI pursuant to IRC Section 6103(p)(4) and the organization's own security requirements. Whenever significant changes occur in the safeguard program the SPR will be updated and resubmitted. (See IRS Pub. 1075, sections 7.0 and 9.13)

Implementation Standard(s)
1. (For PHI only) Retain documentation of policies and procedures relating to HIPAA 164.306 for six (6) years from the date of its creation or the date when it last was in effect, whichever is later. (See HIPAA 164.316(b).)

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PL-3 – System Security Plan Update (Moderate)

Control

[Withdrawn: Incorporated into PL-2].

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PL-4 – Rules of Behavior (ROB) (Moderate)	
Control The organization: a. Establishes and makes readily available to all information system users, the rules that descr be their respons bilities and expected behavior with regard to information, information system, and network use; and b. Receives signed acknowledgment from users indicating that they have read, understand, and agree to abide by the rules of behavior, before authorizing access to information and the information system.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PL-5 – Privacy Impact Assessment (PIA) (Moderate)	
Control The organization conducts a Privacy Impact Assessment (PIA) on the information system in accordance with OMB policy.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PL-6 – Security-Related Activity Planning (Moderate)	
Control The organization plans and coordinates security-related activities affecting the information system before conducting such activities in order to reduce the impact on operations (i.e., mission, functions, image, and reputation), assets, and individuals. **Implementation Standard(s)**	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Planning Family (PL) Security Controls Detail and Comment

Personnel Security (PS) – *Operational*

PS-1 – Personnel Security Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented personnel security policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the personnel security policy and associated personnel security controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PS-2 – Position Categorization (Moderate)	
Control The organization: a. Assigns a criticality/sensitivity risk designation to all positions; b. Establishes screening criteria for individuals filling those positions; and c. Reviews and revises position criticality/sensitivity risk designations within every three hundred sixty-five (365) days.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PS-3 – Personnel Screening (Moderate)	
Control The organization: a. Screens individuals prior to authorizing access to the information system; and b. Rescreens individuals periodically, consistent with the criticality/sensitivity rating of the position. For FTI: Individuals must be screened before authorizing access to information systems and devices containing FTI. (Pub 1075, Ref. 9.12) **Implementation Standard(s)** 1. Perform criminal history check for all persons prior to employment. 2. Require appropriate personnel to obtain and hold a moderate-risk security clearance as defined in the DHHS Personnel Security/Suitability Handbook.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PS-4 – Personnel Termination (Moderate)	
Control The organization, upon termination of individual employment: a. Revokes system and physical access immediately following employee termination; b. Conducts exit interviews; c. Retrieves all security-related information system-related property; d. Retains access to information and information systems formerly controlled by terminated individual; and e. Immediately escorts employees terminated for cause out of the organization. **Implementation Standard(s)** 1. System access must be revoked prior to or during the employee termination process.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PS-5 – Personnel Transfer (Moderate)	
Control The organization reviews logical and physical access authorizations to information systems/facilities when personnel are reassigned or transferred to other positions within the organization and initiates the following transfer or reassignment actions during the formal transfer process: a. Re-issuing appropriate information system-related property (e.g., keys, identification cards, building passes); b. Notification to security management; c. Closing obsolete accounts and establishing new accounts; and d. Revocation of all system access privileges (if applicable).	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PS-6 – Access Agreements (Moderate)	
Control The organization: a. Ensures that individuals requiring access to information or information systems sign appropriate access agreements prior to being granted access; and b. Reviews/updates the access agreements as part of the system security authorization or when a contract is renewed or extended. For FTI: Agencies must review information system access authorizations and initiate appropriate actions when personnel are reassigned or transferred to other positions within the organization. (See IRS Pub. 1075, sections 9.12)	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PS-7 – Third-Party Personnel Security (Moderate)	
Control The organization: a. Establishes personnel security requirements including security roles and responsibilities for third-party providers; b. Documents personnel security requirements; and c. Monitors provider compliance. **Implementation Standard(s)** 1. Regulate the access provided to contractors and define security requirements for contractors. Contractors must be provided with minimal system and physical access, and must agree to and support the information security requirements. The contractor selection process must assess the contractor's ability to adhere to and support information security policies and standards.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
PS-8 – Personnel Sanctions (Moderate)	
Control The organization employs a formal sanctions process for personnel failing to comply with established information security policies and procedures.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Personnel Security Family (PS) Security Controls Detail and Comment

Risk Assessment (RA) – *Management*

RA-1 – Risk Assessment Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented risk assessment policy that addresses purpose, scope, roles, respons bilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the risk assessment policy and associated risk assessment controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

RA-2 – Security Categorization (Moderate)	
Control The organization: a. Categorizes information and the information system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance; b. Documents the security categorization results (including supporting rationale) in the security plan for the information system; and c. Ensures the security categorization decision is reviewed and approved by the authorizing official or authorizing official designated representative.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

RA-3 – Risk Assessment (Moderate)	
Control The organization: a. Conducts an assessment of risk, including the l kelihood and magnitude of harm, from the unauthorized access, use, disclosure, disruption, modification, or destruction of the information system and the information it processes, stores, or transmits; b. Documents risk assessment results in accordance with the Information Security (IS) Risk Assessment (RA) Procedures; c. Reviews risk assessment results within every three hundred sixty-five (365) days; and d. Updates the risk assessment within every three (3) years or whenever there are significant changes to the information system or environment of operation (including the identification of new threats and vulnerabilities), or other conditions that may impact the security or authorization state of the system.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

RA-4 – Risk Assessment Update (Moderate)	
Control [Withdrawn: Incorporated into RA-3].	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

RA-5 – Vulnerability Scanning (Moderate)	
Control The organization: a. Scans for vulnerabilities in the information system and hosted applications within every ninety (90) days and when new vulnerabilities potentially affecting the system/applications are identified and reported; b. Employs vulnerability scanning tools and techniques that promote interoperability among tools and automate parts of the vulnerability management process by using standards for: - Enumerating platforms, software flaws, and improper configurations; - Formatting and making transparent, checklists and test procedures; and - Measuring vulnerability impact; c. Analyzes vulnerability scan reports and results from security control assessments; d. Remediates legitimate vulnerabilities based on the Business Owner's risk prioritization in accordance with an organizational assessment of risk; and e. Shares information obtained from the vulnerability scanning process and security control assessments with designated personnel throughout the organization on a "need to know" basis to help eliminate similar vulnerabilities in other information systems (i.e., systemic weaknesses or deficiencies). For FTI: At a minimum, systems containing FTI shall be scanned quarterly to identify any vulnerability in the information system. (Pub. 1075, Ref 9.13) **Implementation Standard(s)** 1. Perform external network penetration testing and conduct enterprise security posture review as needed but no less than once within every three hundred sixty-five (365) days, in accordance with IS procedures.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

RA-5(1) – Enhancement (Moderate)	
Control The organization employs vulnerability scanning tools that include the capability to readily update the list of information system vulnerabilities scanned.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Risk Assessment Family (RA) Security Controls Detail and Comment

System and Services Acquisition (SA) – *Management*

SA-1 – System and Services Acquisition Policy and Procedures (Moderate)

Control

The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days:
a. A formal, documented system and services acquisition policy that includes information security considerations and that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and
b. Formal, documented procedures to facilitate the implementation of the system and services acquisition policy and associated system and services acquisition controls.

Supplemental Guidance: This control is intended to produce the policy and procedures that are required for the effective implementation of selected security controls and control enhancements in the system and services acquisition family. The policy and procedures are consistent with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance. Existing organizational policies and procedures may make the need for additional specific policies and procedures unnecessary. The system and services acquisition policy can be included as part of the general information security policy for the organization. System and services acquisition procedures can be developed for the security program in general and for a particular information system, when required. The organizational risk management strategy is a key factor in the development of the system and services acquisition policy. Related control: PM-9.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-2 – Allocation of Resources (Moderate)

Control

The organization:
a. Includes a determination of information security requirements for the information system in mission/business process planning;
b. Determines, documents, and allocates the resources required to protect the information system as part of its capital planning and investment control process;
c. Includes information security requirements in mission/business case planning, and
d. Establishes a discrete line item in programming and budgeting documentation for the implementation and management of information systems security.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-3 – Life Cycle Support (Moderate)

Control

The organization:
a. Manages the information system using the information security steps of IEEE 12207.0 standard for SDLC, as provided in the Integrated IT Investment & System Life Cycle Framework (ILC);
b. Defines and documents information system security roles and responsibilities throughout the system development life cycle; and
c. Identifies individuals having information system security roles and responsibilities.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-4 – Acquisitions (Moderate)

Control

The organization includes the following requirements and/or specifications, explicitly or by reference, in information system acquisition contracts based on an assessment of risk and in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards:
a. Security functional requirements/specifications;
b. Security-related documentation requirements; and
c. Developmental and evaluation-related assurance requirements.

Supplemental Guidance: The acquisition documents for information systems, information system components, and information system services include, either explicitly or by reference, security requirements that describe: (i) required security capabilities (i.e., security needs and, as necessary, specific security controls and other specific FISMA requirements); (ii) required design and development processes; (iii) required test and evaluation procedures; and (iv) required documentation. The requirements in the acquisition documents permit updating security controls as new threats/vulnerabilities are identified and as new technologies are implemented. Acquisition documents also include requirements for appropriate information system documentation. The documentation addresses user and system administrator guidance and information regarding the implementation of the security controls in the information system. The level of detail required in the documentation is based on the security categorization for the information system. In addition, the required documentation includes security configuration settings and security implementation guidance. FISMA reporting instructions provide guidance on configuration requirements for federal information systems.

Implementation Standard(s)
1. Each contract and Statement of Work (SOW) that requires development or access to information must include language requiring adherence to security policies and standards, define security roles and responsibilities, and receive approval from officials.

For FTI:
1. Whenever information systems contain FTI, the agency shall include security requirements and/or security specifications, either explicitly or by reference, in information system acquisition contracts based on an assessment of risk. The contract for the acquisition must contain Exhibit 7 language. (Pub 1075 section 9.15)
2. Agencies using a consolidated data center must implement appropriate controls to ensure the protection of FTI, including a Service Level Agreement (SLA) between the agency authorized to receive FTI and the data center. (Pub 1075, section 5.5.2)

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-4(1) – Enhancement (Moderate)

Control

The organization requires in acquisition documents that vendors/contractors provide information descr bing the functional properties of the security controls to be employed within the information system, information system components, or information system services in sufficient detail to permit analysis and testing of the controls.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-4(4) – Enhancement (Moderate)

Control

The organization ensures that each information system component acquired is explicitly assigned to an information system, and that the owner of the system acknowledges this

assignment.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-5 – Information System Documentation (Moderate)

Control

The organization:
a. Obtains, protects as required, and makes available to authorized personnel, administrator documentation for the information system that describes:
- Secure configuration, installation, and operation of the information system;
- Effective use and maintenance of security features/functions; and
- Known vulnerabilities regarding configuration and use of administrative (i.e., privileged) functions; and
b. Obtains, protects as required, and makes available to authorized personnel, user documentation for the information system that describes:
- User-accessible security features/functions and how to effectively use those security features/functions;
- Methods for user interaction with the information system, which enables individuals to use the system in a more secure manner; and
- User responsibilities in maintaining the security of the information and information system; and
c. Documents attempts to obtain information system documentation when such documentation is either unavailable or nonexistent.

Supplemental Guidance: The inability of the organization to obtain necessary information system documentation may occur, for example, due to the age of the system and/or lack of support from the vendor/contractor. In those situations, organizations may need to recreate selected information system documentation if such documentation is essential to the effective implementation and/or operation of security controls.

Implementation Standard(s)
1. Develop system documentation to describe the system and to specify the purpose, technical operation, access, maintenance, and required training for administrators and users.
2. Maintain an updated list of related system operations and security documentation.
3. Update documentation upon changes in system functions and processes. Must include date and version number on all formal system documentation.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-5(1) – Enhancement (Moderate)

Control

The organization obtains, protects as required, and makes available to authorized personnel, vendor/manufacturer documentation that describes the functional properties of the security controls employed within the information system with sufficient detail to permit analysis and testing.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-5(3) – Enhancement (Moderate)

Control

The organization obtains, protects as required, and makes available to authorized personnel, vendor/manufacturer documentation that describes the high-level design of the

information system in terms of subsystems and implementation details of the security controls employed within the system with sufficient detail to permit analysis and testing.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-6 – Software Usage Restrictions (Moderate)

Control

The organization:
a. Uses software and associated documentation in accordance with contract agreements and copyright laws;
b. Employs tracking systems for software and associated documentation protected by quantity licenses to control copying and distribution; and
c. Controls and documents the use of peer-to-peer file sharing technology to ensure that this capability is not used for the unauthorized distr bution, display, performance, or reproduction of copyrighted work.

Supplemental Guidance: Tracking systems can include, for example, simple spreadsheets or fully automated, specialized applications depending on the needs of the organization.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-7 – User-Installed Software (Moderate)

Control

The organization prohibits users from downloading or installing software, unless explicitly authorized, in writing, by the CIO or his/her designated representative. If authorized, explicit rules govern the installation of software by users.

Supplemental Guidance: If provided the necessary privileges, users have the ability to install software. The organization identifies what types of software installations are permitted (e.g., updates and security patches to existing software) and what types of installations are prohibited (e.g., software whose pedigree with regard to being potentially malicious is unknown or suspect). Related control: CM-2.

Implementation Standard(s)
1. If user installed software is authorized, ensure that business rules and technical controls enforce the documented authorizations and prohibitions.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-8 – Security Engineering Principles (Moderate)	
Control The organization applies information system security engineering principles in the specification, design, development, implementation, and modification of the information system. **Supplemental Guidance:** The application of security engineering principles is primarily targeted at new development information systems or systems undergoing major upgrades and is integrated into the system development life cycle. For legacy information systems, the organization applies security engineering principles to system upgrades and modifications to the extent feasible, given the current state of the hardware, software, and firmware within the system. Examples of security engineering principles include, for example: (i) developing layered protections; (ii) establishing sound security policy, architecture, and controls as the foundation for design; (iii) incorporating security into the system development life cycle; (iv) delineating physical and logical security boundaries; (v) ensuring system developers and integrators are trained on how to develop secure software; (vi) tailoring security controls to meet organizational and operational needs; and (vii) reducing risk to acceptable levels, thus enabling informed risk management decisions.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-9 – External Information System Services (Moderate)

Control

The organization:
a. Requires that providers of external information system services comply with organizational information security requirements and employ appropriate security controls in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance;
b. Defines and documents government oversight and user roles and responsibilities with regard to external information system services; and
c. Monitors security control compliance by external service providers.
d. Prohibits service providers from outsourcing any system function outside the U.S. or its territories.

For FTI: FTI may not be accessed by agency employees, agents, representatives or contractors located "off-shore", outside of the United States or its territories. FTI may not be received, stored, processed or disposed via information technology systems located off-shore.

Supplemental Guidance: An external information system service is a service that is implemented outside of the authorization boundary of the organizational information system (i.e., a service that is used by, but not a part of, the organizational information system). Relationships with external service providers are established in a variety of ways, for example, through joint ventures, business partnerships, outsourcing arrangements (i.e., contracts, interagency agreements, lines of business arrangements), licensing agreements, and/or supply chain exchanges. The responsibility for adequately mitigating risks arising from the use of external information system services remains with the authorizing official. Authorizing officials require that an appropriate chain of trust be established with external service providers when dealing with the many issues associated with information security. For services external to the organization, a chain of trust requires that the organization establish and retain a level of confidence that each participating provider in the potentially complex consumer-provider relationship provides adequate protection for the services rendered to the organization. The extent and nature of this chain of trust varies based on the relationship between the organization and the external provider. Where a sufficient level of trust cannot be established in the external services and/or service providers, the organization employs compensating security controls or accepts the greater degree of risk. The external information system services documentation includes government, service provider, and end user security roles and responsibilities, and any service-level agreements. Service-level agreements define the expectations of performance for each required security control, descr be measurable outcomes, and identify remedies and response requirements for any identified instance of noncompliance.

Implementation Standard(s)
1. (For PHI only) A covered entity under HIPAA may permit a business associate to create, receive, maintain, or transmit EPHI on the covered entity's behalf only if the covered entity obtains satisfactory assurances, in accordance with HIPAA regulations. Such assurances must be documented and meet the requirements set forth in HIPAA regulations. (See HIPAA 164.308(b) and 164.314(a).)

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-10 – Developer Configuration Management (Moderate)	
Control The organization requires that information system developers/integrators: a. Perform configuration management during information system design, development, implementation, and operation; b. Manage and control changes to the information system; c. Implement only organization-approved changes; d. Document approved changes to the information system; and e. Track security flaws and flaw resolution. **Supplemental Guidance:** Related controls: CM-3, CM-4, CM-9	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SA-11 – Developer Security Testing (Moderate)	
Control The organization requires that information system developers/integrators, in consultation with associated security personnel (including security engineers): a. Create and implement a security test and evaluation plan in accordance with, but not limited to the, current procedures; b. Implement a verifiable flaw remediation process to correct weaknesses and deficiencies identified during the security control assessment process; and c. Document the results of the security control assessment and flaw remediation processes. For FTI: The agency must submit a request to the IRS Office of Safeguards for authority to use live data for testing, providing a detailed explanation of the safeguards in place to protect the FTI over the Internet to a customer (Pub 1075, Ref. 9.18.8) **Supplemental Guidance:** Developmental security test results are used to the greatest extent feasible after verification of the results and recognizing that these results are impacted whenever there have been security-relevant modifications to the information system subsequent to developer testing. Test results may be used in support of the security authorization process for the delivered information system. Related control: CA-2, SI-2. **Implementation Standard(s)** 1. If the security control assessment results are used in support of the security authorization process for the information system, ensure that no security relevant modifications of the information systems have been made subsequent to the assessment and after selective verification of the results. 2. Use hypothetical data when executing test scripts or in a test environment that is configured to comply with the security controls as if it is a production environment.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

System and Services Acquisition Family (SA) Security Controls Detail and Comment

System and Communications Protection (SC) – *Technical*

SC-1 – System and Communications Protection Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented system and communications protection policy that addresses purpose, scope, roles, respons bilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the system and communications protection policy and associated system and communications protection controls. **Supplemental Guidance:** This control is intended to produce the policy and procedures that are required for the effective implementation of selected security controls and control enhancements in the system and communications protection family. The policy and procedures are consistent with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance. Existing organizational policies and procedures may make the need for additional specific policies and procedures unnecessary. The system and communications protection policy can be included as part of the general information security policy for the organization. System and communications protection procedures can be developed for the security program in general and for a particular information system, when required. The organizational risk management strategy is a key factor in the development of the system and communications protection policy. Related control: PM-9.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-2 – Application Partitioning (Moderate)	
Control The information system separates user functionality (including user interface services [e.g., web services]) from information system management (e.g., database management systems) functionality. **Supplemental Guidance:** Information system management functionality includes, for example, functions necessary to administer databases, network components, workstations, or servers, and typically requires privileged user access. The separation of user functionality from information system management functionality is either physical or logical and is accomplished by using different computers, different central processing units, different instances of the operating system, different network addresses, combinations of these methods, or other methods as appropriate. An example of this type of separation is observed in web administrative interfaces that use separate authentication methods for users of any other information system resources. This may include isolating the administrative interface on a different domain and with additional access controls.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-4 – Information in Shared Resources (Moderate)

Control

The information system prevents unauthorized and unintended information transfer via shared system resources.

Supplemental Guidance: The purpose of this control is to prevent information, including encrypted representations of information, produced by the actions of a prior user/role (or the actions of a process acting on behalf of a prior user/role) from being available to any current user/role (or current process) that obtains access to a shared system resource (e.g., registers, main memory, secondary storage) after that resource has been released back to the information system. Control of information in shared resources is also referred to as object reuse. This control does not address: (i) information remanence which refers to residual representation of data that has been in some way nominally erased or removed; (ii) covert channels where shared resources are manipulated to achieve a violation of information flow restrictions; or (iii) components in the information system for which there is only a single user/role.

Implementation Standard(s)
1. Ensure that users of shared system resources cannot intentionally or unintentionally access information remnants, including encrypted representations of information, produced by the actions of a prior user or system process acting on behalf of a prior user. Ensure that system resources shared between two (2) or more users are released back to the information system, and are protected from accidental or purposeful disclosure.

For FTI: When authorized to make further disclosures is present (e.g., agents/contractors), information disclosed outside the organization must be recorded on a separate list that reflects to whom the disclosure was made, what was disclosed, and why and when it was disclosed. Organizations transmitting FTI from one computer to another need only identify the bulk records transmitted. This identification will contain the approximate number of personal records, the date of the transmissions, the best possible description of the records, and the name of the individual making/receiving the transmission.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-5 – Denial of Service Protection (Moderate)

Control

The information system protects against or limits the effects of the following types of denial of service attacks defined on the following sites or in the following documents:
- SANS Organization www.sans.org/dosstep;
- SANS Organization's Roadmap to Defeating DDoS www.sans.org/dosstep/roadmap.php; and
- NIST CVE List http://checklists.nist.gov/home.cfm.

Supplemental Guidance: A variety of technologies exist to limit, or in some cases, eliminate the effects of denial of service attacks. For example, boundary protection devices can filter certain types of packets to protect devices on an organization's internal network from being directly affected by denial of service attacks. Employing increased capacity and bandwidth combined with service redundancy may reduce the susceptibility to some denial of service attacks. Related control: SC-7.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-7 – Boundary Protection (Moderate)	
Control The information system: a. Monitors and controls communications at the external boundary of the system and at key internal boundaries within the system; and b. Connects to external networks or information systems only through managed interfaces consisting of automated boundary protection devices arranged in accordance with a organizational security architecture. **Supplemental Guidance:** Restricting external web traffic only to organizational web servers within managed interfaces and prohibiting external traffic that appears to be spoofing an internal address as the source are examples of restricting and proh biting communications. Managed interfaces employing boundary protection devices include, for example, proxies, gateways, routers, firewalls, guards, or encrypted tunnels arranged in effective security architecture (e.g., routers protecting firewalls and application gateways residing on protected subnetworks commonly referred to as a demilitarized zone or DMZ). The organization considers the intrinsically shared nature of commercial telecommunications services in the implementation of security controls associated with the use of such services. Commercial telecommunications services are commonly based on network components and consolidated management systems shared by all attached commercial customers, and may include third-party provided access lines and other service elements. Consequently, such interconnecting transmission services may represent sources of increased risk despite contract security provisions. Therefore, when this situation occurs, the organization either implements appropriate compensating security controls or explicitly accepts the additional risk. Related controls: AC-4, IR-4, SC-5. **Implementation Standard(s)** 1. Ensure that access to all proxies is denied, except for those hosts, ports, and services that are explicitly required. 2. Utilize stateful inspection/application firewall hardware and software. 3. Utilize firewalls from at least two (2) different vendors at the various levels within the network to reduce the poss bility of compromising the entire network.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SC-7(1) – Enhancement (Moderate)	
Control The organization physically allocates publicly accessible information system components to separate subnetworks with separate physical network interfaces. Enhancement Supplemental Guidance: Publicly accessible information system components include, for example, public web servers.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SC-7(2) – Enhancement (Moderate)	
Control The information system prevents public access into the organization's internal networks except as appropriately mediated by managed interfaces employing boundary protection devices.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-7(3) – Enhancement (Moderate)	
Control The organization limits the number of access points to the information system (e.g., proh biting desktop modems) to allow for more comprehensive monitoring of inbound and outbound communications and network traffic. Enhancement Supplemental Guidance: The Trusted Internet Connection (TIC) initiative is an example of limiting the number of managed network access points.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SC-7(4) – Enhancement (Moderate)	
Control The organization: (a) Implements a managed interface for each external telecommunication service; (b) Establishes a traffic flow policy for each managed interface; (c) Employs security controls as needed to protect the confidentiality and integrity of the information being transmitted; (d) Documents each exception to the traffic flow policy with a supporting mission/business need and duration of that need; (e) Reviews exceptions to the traffic flow policy within every three hundred sixty-five (365) days; and (f) Removes traffic flow policy exceptions that are no longer supported by an explicit mission/business need.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SC-7(5) – Enhancement (Moderate)	
Control The information system at managed interfaces, denies network traffic by default and allows network traffic by exception (i.e., deny all, permit by exception).	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SC-7(6) – Enhancement (Moderate)	
Control The organization prevents the unauthorized release of information outside of the information system boundary or any unauthorized communication through the information system boundary when there is an operational failure of the boundary protection mechanisms.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-7(7) – Enhancement (Moderate)	
Control The information system prevents remote devices that have established a non-remote connection with the system from communicating outside of that communications path with resources in external networks.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-8 – Transmission Integrity (Moderate)	
Control The information system protects the integrity of transmitted information. **Implementation Standard(s)** 1. Employ appropriate approved mechanisms (e.g., digital signatures, cryptographic hashes) to protect the integrity of data while in transit from source to destination outside of a secured network (see SC-13). 2. For FTI: All FTI in transit must be encrypted when moving across a Wide Area Network (WAN) and within the agency's Local Area Network (LAN). If encryption is not used, the agency must use other compensating mechanisms (e.g. switched VLAN technology, f ber optic medium, etc.) to ensure FTI is not accessible to unauthorized users. (Pub 1075, ref. 9.18.2) 3. For FTI: FTI should not be transmitted or used on the agency's internal e-mail systems. If transmittal of FTI within the agency's e-mail system is necessary, specific precautions must be taken to protect the FTI. FTI must not be transmitted outside of the agency, either in the body of an e-mail or as an attachment. (Pub. 1075, Ref 9.18.5) 4. For FTI: The agency must follow specific precautions when faxing FTI. (Pub 1075 section 9.18.6) **Supplemental Guidance:** This control applies to communications across internal and external networks. If the organization is relying on a commercial service provider for transmission services as a commodity item rather than a fully dedicated service, it may be more difficult to obtain the necessary assurances regarding the implementation of needed security controls for transmission integrity. When it is infeasible or impractical to obtain the necessary security controls and assurances of control effectiveness through appropriate contracting vehicles, the organization either implements appropriate compensating security controls or explicitly accepts the additional risk. Related controls: AC-17, PE-4.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-8(1) – Enhancement (Moderate)	
Control The organization employs cryptographic mechanisms to recognize changes to information during transmission unless otherwise protected by alternative physical measures.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-9 – Transmission Confidentiality (Moderate)

Control

The information system protects the confidentiality of transmitted information.

For FTI:
1. All FTI in transit must be encrypted when moving across a Wide Area Network (WAN) and within the agency's Local Area Network (LAN). If encryption is not used, the agency must use other compensating mechanisms (e.g. switched VLAN technology, fiber optic medium, etc.) to ensure FTI is not accessible to unauthorized users. (Pub 1075, ref. 9.18.2)
2. FTI should not be transmitted or used on the agency's internal e-mail systems. If transmittal of FTI within the agency's e-mail system is necessary, specific precautions must be taken to protect the FTI. FTI must not be transmitted outside of the agency, either in the body of an e-mail or as an attachment. (Pub. 1075, Ref 9.18.5)
3. The agency must follow specific precautions when faxing FTI. (Pub. 1075, Ref. 9.18.6)

Supplemental Guidance: This control applies to communications across internal and external networks. If the organization is relying on a commercial service provider for transmission services as a commodity item rather than a fully dedicated service, it may be more difficult to obtain the necessary assurances regarding the implementation of needed security controls for transmission confidentiality. When it is infeasible or impractical to obtain the necessary security controls and assurances of control effectiveness through appropriate contracting vehicles, the organization either implements appropriate compensating security controls or explicitly accepts the additional risk. Related controls: AC-17, PE-4.

Implementation Standard(s)
1. (For PII only) When sending or receiving faxes containing PII: (i) fax machines must be located in a locked room with a trusted staff member having custodial coverage over outgoing and incoming transmissions or fax machines must be located in a secured area; (ii) accurate broadcast lists and other preset numbers of frequent fax recipients must be maintained; and (iii) a cover sheet must be used that explicitly provides guidance to the recipient that includes: a notification of the sensitivity of the data and the need for protection, and a notice to unintended recipients to telephone the sender (collect if necessary) to report the disclosure and confirm destruction of the information.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-9(1) – Enhancement (Moderate)

Control

The organization employs cryptographic mechanisms to prevent unauthorized disclosure of information during transmission unless otherwise protected by alternative physical measures. **[*Assignment: organization-defined alternative physical measures*].**

Enhancement Supplemental Guidance: Alternative physical protection measures include, for example, protected distribution systems. Related control: SC-13.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-10 – Network Disconnect (Moderate)	
Control The information system automatically terminates the network connection associated with a communications session at the end of the session, or: a. Forcibly de-allocates communications session Dynamic Host Configuration Protocol (DHCP) leases after seven (7) days; and b. Forcibly disconnects inactive Virtual Private Network (VPN) connections after thirty (30) minutes of inactivity. For FTI: Forcibly disconnects inactive VPN connections after 15 minutes of inactivity. (Pub 1075 section 9.16) **Supplemental Guidance:** This control applies to both internal and external networks. Terminating network connections associated with communications sessions include, for example, de-allocating associated TCP/IP address/port pairs at the operating-system level, or de-allocating networking assignments at the application level if multiple application sessions are using a single, operating system-level network connection. The time period of inactivity may, as the organization deems necessary, be a set of time periods by type of network access or for specific accesses.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SC-12 – Cryptographic Key Establishment and Management (Moderate)	
Control When cryptography is required and used within the information system, the organization establishes and manages cryptographic keys for required cryptography employed within the information system. **Supplemental Guidance:** Cryptographic key management and establishment can be performed using manual procedures or automated mechanisms with supporting manual procedures. In addition to being required for the effective operation of a cryptographic mechanism, effective cryptographic key management provides protections to maintain the availability of the information in the event of the loss of cryptographic keys by users.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SC-13 – Use of Cryptography (Moderate)	
Control When cryptographic mechanisms are used, the information system implements required cryptographic protections using cryptographic modules that comply with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-13(1) – Enhancement (Moderate)	
Control When cryptographic mechanisms are used, the organization employs, at a minimum, FIPS 140-2 compliant and NIST-validated cryptography to protect unclassified information.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-14 – Public Access Protections (Moderate)	
Control The information system protects the integrity and availability of publicly available information and applications. **Supplemental Guidance:** The purpose of this control is to ensure that organizations explicitly address the protection needs for public information and applications with such protection likely being implemented as part of other security controls. **Implementation Standard(s)** 1. Ensure that network access controls, operating system file permissions, and application configurations protect the integrity of information stored, processed, and transmitted by publicly accessible systems, as well as the integrity of publicly accessible applications. 2. If e-authentication is required and implemented in conjunction with or related to public access protections, refer to ARS Appendix D: E-authentication Standard.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-15 – Collaborative Computing Devices (Moderate)	
Control The organization prohibits running collaborative computing mechanisms, unless explicitly authorized, in writing, by the CIO or his/her designated representative. If authorized, the authorization shall specifically identify allowed mechanisms, allowed purpose, and the information system upon which the mechanisms can be used. The information system: a. Prohibits remote activation of collaborative computing devices; and b. Provides an explicit indication of use to users physically present at the devices. **Supplemental Guidance:** Collaborative computing devices include, for example, networked white boards, cameras, and microphones. Explicit indication of use includes, for example, signals to users when collaborative computing devices are activated.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-15(1) – Enhancement (Moderate)
Control If collaborative computing is authorized, the information system provides physical disconnect of collaborative computing devices in a manner that supports ease of use.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-17 – Public Key Infrastructure Certificates (Moderate)

Control

The organization issues public key certificates under an appropriate certificate policy or obtains public key certificates under an appropriate certificate policy from an approved service provider.

Supplemental Guidance: For user certificates, each organization attains certificates from an approved, shared service provider, as required by OMB policy. For federal agencies operating a legacy public key infrastructure cross-certified with the Federal Bridge Certification Authority at medium assurance or higher, this Certification Authority will suffice. This control focuses on certificates with a visibility external to the information system and does not include certificates related to internal system operations, for example, application-specific time services.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-18 – Mobile Code (Moderate)

Control

The organization:
a. Defines acceptable and unacceptable mobile code and mobile code technologies;
b. Establishes usage restrictions and implementation guidance for acceptable mobile code and mobile code technologies; and
c. Authorizes, monitors, and controls the use of mobile code within the information system.

Supplemental Guidance: Decisions regarding the employment of mobile code within organizational information systems are based on the potential for the code to cause damage to the system if used maliciously. Mobile code technologies include, for example, Java, JavaScript, ActiveX, PDF, Postscript, Shockwave movies, Flash animations, and VBScript. Usage restrictions and implementation guidance apply to both the selection and use of mobile code installed on organizational servers and mobile code downloaded and executed on individual workstations. Policy and procedures related to mobile code, address preventing the development, acquisition, or introduction of unacceptable mobile code within the information system.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-19 – Voice Over Internet Protocol (Moderate)	
Control The organization prohibits the use of Voice over Internet Protocol (VoIP) technologies, unless explicitly authorized, in writing, by the CIO or his/her designated representative. If authorized, the organization: a. Establishes usage restrictions and implementation guidance for VoIP technologies based on the potential to cause damage to the information system if used maliciously; and b. Authorizes, monitors, and controls the use of VoIP within the information system. For FTI: The agency must meet specific technical requirements to utilize a VoIP network that provides FTI to a customer (Pub 1075, Ref. 9.18.13) For FTI: Complete SPR section 9.28.3.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SC-20 – Secure Name /Address Resolution Service (Authoritative Source) (Moderate)	
Control The information system provides additional data origin and integrity artifacts along with the authoritative data the system returns in response to name/address resolution queries. **Supplemental Guidance:** This control enables remote clients to obtain origin authentication and integrity verification assurances for the host/service name to network address resolution information obtained through the service. A domain name system (DNS) server is an example of an information system that provides name/address resolution service. Digital signatures and cryptographic keys are examples of additional artifacts. DNS resource records are examples of authoritative data. Information systems that use technologies other than the DNS to map between host/service names and network addresses provide other means to assure the authenticity and integrity of response data. The DNS security controls are consistent with, and referenced from, OMB Memorandum 08-23.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SC-20(1) – Enhancement (Moderate)	
Control The information system, when operating as part of a distributed, hierarchical namespace, provides the means to indicate the security status of child subspaces and (if the child supports secure resolution services) enable verification of a chain of trust among parent and child domains.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-22 – Architecture and Provisioning for Name /Address Resolution Service (Moderate)	
Control The information systems that collectively provide name/address resolution service for an organization are fault-tolerant and implement internal/external role separation. **Supplemental Guidance:** A domain name system (DNS) server is an example of an information system that provides name/address resolution service. To eliminate single points of failure and to enhance redundancy, there are typically at least two authoritative domain name system (DNS) servers, one configured as primary and the other as secondary. Additionally, the two servers are commonly located in two different network subnets and geographically separated (i.e., not located in the same physical facility). With regard to role separation, DNS servers with an internal role, only process name/address resolution requests from within the organization (i.e., internal clients). DNS servers with an external role only process name/address resolution information requests from clients external to the organization (i.e., on the external networks including the Internet). The set of clients that can access an authoritative DNS server in a particular role is specified by the organization (e.g., by address ranges, explicit lists).	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SC-23 – Session Authenticity (Moderate)	
Control The information system provides mechanisms to protect the authenticity of communications sessions. **Supplemental Guidance:** This control focuses on communications protection at the session, versus packet, level. The intent of this control is to establish grounds for confidence at each end of a communications session in the ongoing identity of the other party and in the validity of the information being transmitted. For example, this control addresses man-in-the-middle attacks including session hijacking or insertion of false information into a session. This control is only implemented where deemed necessary by the organization (e.g., sessions in service-oriented architectures providing web-based services).	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SC-28 – Protection of Information at Rest (Moderate)	
Control The information system protects the confidentiality and integrity of information at rest. **Supplemental Guidance:** This control is intended to address the confidentiality and integrity of information at rest in non-mobile devices and covers user information and system information. Information at rest refers to the state of information when it is located on a secondary storage device (e.g., disk drive, tape drive) within an organizational information system. Configurations and/or rule sets for firewalls, gateways, intrusion detection/prevention systems, and filtering routers and authenticator content are examples of system information I kely requiring protection. Organizations may choose to employ different mechanisms to achieve confidentiality and integrity protections, as appropriate.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-32 – Information System Partitioning (Moderate)

Control

The organization partitions the information system into components residing in separate physical domains (or environments) as deemed necessary.

Supplemental Guidance: Information system partitioning is a part of a defense-in-depth protection strategy. An organizational assessment of risk guides the partitioning of information system components into separate physical domains (or environments). The security categorization also guides the selection of appropriate candidates for domain partitioning. Managed interfaces restrict or proh bit network access and information flow among partitioned information system components. Related controls: AC-4, SC-7.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SC-EDC-1 – Electronic Mail (Moderate)

Control

Controls shall be implemented to protect EDC sensitive information (such as FTI or Privacy Act protected information) that is sent via email.

Implementation Standard(s)

1. Prior to sending an email, place all EDC sensitive information in an encrypted attachment.

Guidance

A good place to obtain recommended security practices for handling sensitive information via e-mail is NIST SP 800-45 (as amended), Guidelines on Electronic Mail Security.

Applicability: All	**Reference(s):**	**Related Controls Requirement(s):**

ASSESSMENT PROCEDURE: SC-EDC-1.1

Assessment Objective

Determine if:
(i) the organization effectively implements protections for EDC sensitive information that is sent via e-mail;
(ii) the organization meets all the requirements specified in the applicable implementation standard(s).

Assessment Methods And Objects

Examine: Email policy and procedures; other relevant documents or records.

System and Communications Protection Family (SC) Security Controls Detail and Comment

System and Information Integrity (SI) – *Operational*

SI-1 – System and Information Integrity Policy and Procedures (Moderate)	
Control The organization develops, disseminates, and reviews/updates within every three hundred sixty-five (365) days: a. A formal, documented system and information integrity policy that addresses purpose, scope, roles, responsibilities, management commitment, coordination among organizational entities, and compliance; and b. Formal, documented procedures to facilitate the implementation of the system and information integrity policy and associated system and information integrity controls. **Supplemental Guidance:** This control is intended to produce the policy and procedures that are required for the effective implementation of selected security controls and control enhancements in the system and information integrity family. The policy and procedures are consistent with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance. Existing organizational policies and procedures may make the need for additional specific policies and procedures unnecessary. The system and information integrity policy can be included as part of the general information security policy for the organization. System and information integrity procedures can be developed for the security program in general and for a particular information system, when required. The organizational risk management strategy is a key factor in the development of the system and information integrity policy. Related control: PM-9.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-2 – Flaw Remediation (Moderate)

Control

The organization:
a. Identifies, reports, and corrects information system flaws;
b. Tests software updates related to flaw remediation for effectiveness and potential side effects on information systems before installation; and
c. Incorporates flaw remediation into the organizational configuration management process.

Supplemental Guidance: The organization identifies information systems containing software affected by recently announced software flaws (and potential vulnerabilities resulting from those flaws) and reports this information to designated organizational officials with information security responsibilities (e.g., senior information security officers, information system security managers, information systems security officers). The organization (including any contractor to the organization) promptly installs security-relevant software updates (e.g., patches, service packs, and hot fixes). Flaws discovered during security assessments, continuous monitoring, incident response activities, or information system error handling, are also addressed expeditiously. Organizations are encouraged to use resources such as the Common Weakness Enumeration (CWE) or Common Vulnerabilities and Exposures (CVE) databases in remediating flaws discovered in organizational information systems. By requiring that flaw remediation be incorporated into the organizational configuration management process, it is the intent of this control that required/anticipated remediation actions are tracked and verified. An example of expected flaw remediation that would be so verified is whether the procedures contained in US CERT guidance and Information Assurance Vulnerability Alerts have been accomplished. Related controls: CA-2, CA-7, CM-3, MA-2, IR-4, RA-5, SA-11, SI-11.

Implementation Standard(s)
1. Correct identified information system flaws on production equipment in a timeframe based on the National Vulnerability Database (NVD) Vulnerability Severity Rating of the flaw: flaws rated as High severity within seven (7) calendar days; Medium severity within fifteen (15) calendar days; and all others within thirty (30) calendar days.
(a) Evaluate system security patches, service packs, and hot fixes in a test bed environment to determine the effectiveness and potential side effects of such changes, and
(b) Manage the flaw remediation process centrally.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-2(1) – Enhancement (Moderate)

Control

The organization centrally manages the flaw remediation process and installs software updates automatically.

Enhancement Supplemental Guidance: Due to information system integrity and availability concerns, organizations give careful consideration to the methodology used to carry out automatic updates.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-2(2) – Enhancement (Moderate)

Control

The organization employs automated mechanisms monthly to determine the state of information system components with regard to flaw remediation.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-3 – Malicious Code Protection (Moderate)

Control

The organization:
a. Employs malicious code protection mechanisms at information system entry and exit points and at workstations, servers, or mobile computing devices on the network to detect and eradicate malicious code:
- Transported by electronic mail, electronic mail attachments, web accesses, removable media, or other common means; or
- Inserted through the exploitation of information system vulnerabilities;
b. Updates malicious code protection mechanisms (including signature definitions) whenever new releases are available in accordance with configuration management policy and procedures;
c. Configures malicious code protection mechanisms to:
- Perform critical system file scans during system boot, information system scans using the frequency specified in Implementation Standard 1, and real-time scans of files from external sources as the files are downloaded, opened, or executed in accordance with organizational security policy; and
- Block and quarantine malicious code and send alert to administrator in response to malicious code detection; and
d. Addresses the receipt of false positives during malicious code detection and eradication and the resulting potential impact on the availability of the information system.

Supplemental Guidance: Information system entry and exit points include, for example, firewalls, electronic mail servers, web servers, proxy servers, and remote-access servers. Malicious code includes, for example, viruses, worms, Trojan horses, and spyware. Malicious code can also be encoded in various formats (e.g., UUENCODE, Unicode) or contained within a compressed file. Removable media includes, for example, USB devices, diskettes, or compact disks. A variety of technologies and methods exist to limit or eliminate the effects of malicious code attacks. Pervasive configuration management and strong software integrity controls may be effective in preventing execution of unauthorized code. In addition to commercial off-the-shelf software, malicious code may also be present in custom-built software. This could include, for example, logic bombs, back doors, and other types of cyber-attacks that could affect organizational missions and business functions. Traditional malicious code protection mechanisms are not built to detect such code. In these situations, organizations must rely instead on other risk mitigation measures to include, for example, secure coding practices, trusted procurement processes, configuration management and control, and monitoring practices to help ensure that software does not perform functions other than those intended. Related controls: SA-4, SA-8, SA-12, SA-13, SI-4, SI-7.

Implementation Standard(s)
1. Desktop malicious code scanning software is configured to perform critical system file scans every twenty (24) hours.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-3(1) – Enhancement (Moderate)

Control

The organization centrally manages malicious code protection mechanisms.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-3(2) – Enhancement (Moderate)	
Control The information system automatically updates malicious code protection mechanisms (including signature definitions).	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-3(3) – Enhancement (Moderate)	
Control The information system prevents non-privileged users from circumventing malicious code protection capabilities.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-4 – Information System Monitoring (Moderate)	
Control The organization: a. Monitors events on the information system in accordance with Information Security Incident Handling and Breach Analysis/Notification Procedure and detects information system attacks; b. Identifies unauthorized use of the information system; c. Deploys monitoring devices: (i) strategically within the information system to collect organization-determined essential information; and (ii) at ad hoc locations within the system to track specific types of transactions of interest to the organization; d. Heightens the level of information system monitoring activity whenever there is an indication of increased risk to organizational operations and assets, individuals, other organizations, or the Nation based on law enforcement information, intelligence information, or other credible sources of information; and e. Obtains legal opinion with regard to information system monitoring activities in accordance with applicable federal laws, Executive Orders, directives, policies, or regulations. **Supplemental Guidance:** Information system monitoring includes external and internal monitoring. External monitoring includes the observation of events occurring at the system boundary (i.e., part of perimeter defense and boundary protection). Internal monitoring includes the observation of events occurring within the system (e.g., within internal organizational networks and system components). Information system monitoring capability is achieved through a variety of tools and techniques (e.g., intrusion detection systems, intrusion prevention systems, malicious code protection software, audit record monitoring software, network monitoring software). Strategic locations for monitoring devices include, for example, at selected perimeter locations and near server farms supporting critical applications, with such devices typically being employed at the managed interfaces associated with controls SC-7 and AC-17. The Einstein network monitoring device from the Department of Homeland Security is an example of a system monitoring device. The granularity of the information collected is determined by the organization based on its monitoring objectives and the capability of the information system to support such activities. An example of a specific type of transaction of interest to the organization with regard to monitoring is Hyper Text Transfer Protocol (HTTP) traffic that bypasses organizational HTTP proxies, when use of such proxies is required. Related controls: AC-4, AC-8, AC-17, AU-2, AU-6, SI-3, SI-7. **Implementation Standard(s)** 1. Install IDS devices at network perimeter points and host-based IDS sensors on critical servers.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-4(1) – Enhancement (Moderate)	
Control The organization interconnects and configures individual intrusion detection tools into a system wide intrusion detection system using common protocols.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SI-4(2) – Enhancement (Moderate)	
Control The organization employs automated tools to support near real-time analysis of events.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SI-4(4) – Enhancement (Moderate)	
Control The information system monitors inbound and outbound communications for unusual or unauthorized activities or conditions. Enhancement Supplemental Guidance: Unusual/unauthorized activities or conditions include, for example, internal traffic that indicates the presence of malicious code within an information system or propagating among system components, the unauthorized export of information, or signaling to an external information system. Evidence of malicious code is used to identify potentially compromised information systems or information system components.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SI-4(5) – Enhancement (Moderate)	
Control The information system provides near real-time alerts when the following indications of compromise or potential compromise occur: (a) Presence of malicious code, (b) Unauthorized export of information, (c) Signaling to an external information system, or (d) Potential intrusions. Enhancement Supplemental Guidance: Alerts may be generated, depending on the organization defined list of indicators, from a variety of sources, for example, audit records or input from malicious code protection mechanisms, intrusion detection or prevention mechanisms, or boundary protection devices such as firewalls, gateways, and routers	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-4(6) – Enhancement (Moderate)	
Control The information system prevents non-privileged users from circumventing intrusion detection and prevention capabilities.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SI-5 – Security Alerts, Advisories, and Directives (Moderate)	
Control The organization: a. Receives information system security alerts, advisories, and directives from designated external organizations on an ongoing basis; b. Generates internal security alerts, advisories, and directives as deemed necessary; c. Disseminates security alerts, advisories, and directives to appropriate personnel; and d. Implements security directives in accordance with established time frames, or notifies the degree of noncompliance. **Supplemental Guidance:** Security alerts and advisories are generated by the United States Computer Emergency Readiness Team (US-CERT) to maintain situational awareness across the federal government. Security directives are issued by OMB or other designated organizations with the responsibility and authority to issue such directives. Compliance to security directives is essential due to the critical nature of many of these directives and the potential immediate adverse affects on organizational operations and assets, individuals, other organizations, and the Nation should the directives not be implemented in a timely manner.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SI-7 – Software and Information Integrity (Moderate)	
Control The information system detects unauthorized changes to software and information. **Supplemental Guidance:** The organization employs integrity verification applications on the information system to look for evidence of information tampering, errors, and omissions. The organization employs good software engineering practices with regard to commercial off-the-shelf integrity mechanisms (e.g., parity checks, cyclical redundancy checks, cryptographic hashes) and uses tools to automatically monitor the integrity of the information system and the applications it hosts.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SI-7(1) – Enhancement (Moderate)	
Control The organization reassesses the integrity of software and information by performing daily integrity scans of the information system.	

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SI-8 – Spam Protection (Moderate)	
Control The organization: a. Employs spam protection mechanisms at information system entry and exit points and at workstations, servers, or mobile computing devices on the network to detect and take action on unsolicited messages transported by electronic mail, electronic mail attachments, web accesses, or other common means; and b. Updates spam protection mechanisms (including signature definitions) when new releases are available in accordance with configuration management policy and procedures. **Supplemental Guidance:** Information system entry and exit points include, for example, firewalls, electronic mail servers, web servers, proxy servers, and remote-access servers. Related controls: SC-5, SI-3.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SI-8(1) – Enhancement (Moderate)	
Control The organization centrally manages spam protection mechanisms.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*
SI-9 – Information Input Restrictions (Moderate)	
Control The organization restricts the capability to input information to the information system to authorized personnel. **Supplemental Guidance:** Restrictions on organizational personnel authorized to input information to the information system may extend beyond the typical access controls employed by the system and include limitations based on specific operational/project responsibilities. Related controls: AC-5, AC-6.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-10 – Information Input Validation (Moderate)	
Control The information system uses automated mechanisms to check the validity of information inputs for accuracy, completeness, validity, and authenticity as close to the point of origin as possible. **Supplemental Guidance:** Rules for checking the valid syntax and semantics of information system inputs (e.g., character set, length, numerical range, acceptable values) are in place to verify that inputs match specified definitions for format and content. Inputs passed to interpreters are prescreened to prevent the content from being unintentionally interpreted as commands.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-11 – Error Handling (Moderate)	
Control The information system: a. Identifies potentially security-relevant error conditions; b. Generates error messages that provide information necessary for corrective actions without revealing information that could be exploited by adversaries in error logs and administrative messages that could be exploited by adversaries; and c. Reveals error messages only to authorized personnel. For FTI: Generates error messages that provide information necessary for corrective actions in error logs and administrative messages. (Pub 1075 section 9.17) **Supplemental Guidance:** The structure and content of error messages are carefully considered by the organization. The extent to which the information system is able to identify and handle error conditions is guided by organizational policy and operational requirements. Sensitive information includes, for example, account numbers, social security numbers, and credit card numbers.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

SI-12 – Information Output Handling and Retention (Moderate)	
Control The organization handles and retains both information within and output from the information system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements. **Supplemental Guidance:** The output handling and retention requirements cover the full life cycle of the information, in some cases extending beyond the disposal of the information system. The National Archives and Records Administration provides guidance on records retention. Related controls: MP-2, MP-4. **Implementation Standard(s)** 1. Retain output, including, but not limited to audit records, system reports, business and financial reports, and business records, from the information system in accordance with Policy and all applicable National Archives and Records Administration (NARA) requirements.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *[Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

System and Information Integrity Family (SI) Security Controls Detail and Comment

Project Management (PM) – *Management*

PM-1 INFORMATION SECURITY PROGRAM PLAN	
Control	
The organization: a. Develops and disseminates an organization-wide information security program plan that: - Provides an overview of the requirements for the security program and a description of the security program management controls and common controls in place or planned for meeting those requirements; - Provides sufficient information about the program management controls and common controls (including specification of parameters for any assignment and selection operations either explicitly or by reference) to enable an implementation that is unambiguously compliant with the intent of the plan and a determination of the risk to be incurred if the plan is implemented as intended; - Includes roles, responsibilities, management commitment, coordination among organizational entities, and compliance; - Is approved by a senior official with responsibility and accountability for the risk being incurred to organizational operations (including mission, functions, image, and reputation), organizational assets, individuals, other organizations, and the Nation; b. Reviews the organization-wide information security program plan [Assignment: organization defined frequency]; and c. Revises the plan to address organizational changes and problems identified during plan implementation or security control assessments. **Supplemental Guidance**: The information security program plan can be represented in a single document or compilation of documents at the discretion of the organization. The plan documents the organization-wide program management controls and organization-defined common controls. The security plans for individual information systems and the organization-wide information security program plan together, provide complete coverage for all security controls employed within the organization. Common controls are documented in an appendix to the organization's information security program plan unless the controls are included in a separate security plan for an information system (e.g., security controls employed as part of an intrusion detection system providing organization-wide boundary protection inherited by one or more organizational information systems). The organization-wide information security program plan will indicate which separate security plans contain descriptions of common controls. Organizations have the flexibility to describe common controls in a single document or in multiple documents. In the case of multiple documents, the documents descr bing common controls are included as attachments to the information security program plan. If the information security program plan contains multiple documents, the organization specifies in each document the organizational official or officials respons ble for the development, implementation, assessment, authorization, and monitoring of the respective common controls. For example, the organization may require that the Facilities Management Office develop, implement, assess, authorize, and continuously monitor common physical and environmental protection controls from the PE family when such controls are not associated with a particular information system but instead, support multiple information systems. Related control: PM-8.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PM-2 SENIOR INFORMATION SECURITY OFFICER
Control:
The organization appoints a senior information security officer with the mission and resources to coordinate, develop, implement, and maintain an organization-wide information security program. **Supplemental Guidance:** The security officer described in this control is an organizational official. For a federal agency (as defined in applicable federal laws, Executive Orders, directives, policies, or regulations) this official is the Senior Agency Information Security Officer. Organizations may also refer to this organizational official as the Senior

Information Security Officer or Chief Information Security Officer.

Control Enhancements: None.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PM-3 INFORMATION SECURITY RESOURCES

Control:

The organization:
a. Ensures that all capital planning and investment requests include the resources needed to implement the information security program and documents all exceptions to this requirement;
b. Employs a business case/Exhibit 300/Exhibit 53 to record the resources required; and
c. Ensures that information security resources are available for expenditure as planned.

Supplemental Guidance: Organizations may designate and empower an Investment Review Board (or similar group) to manage and provide oversight for the information security-related aspects of the capital planning and investment control process. Related controls: PM-4, SA-2.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation**
	Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]

PM-4 PLAN OF ACTION AND MILESTONES PROCESS

Control:

The organization implements a process for ensuring that plans of action and milestones for the security program and the associated organizational information systems are maintained and document the remedial information security actions to mitigate risk to organizational operations and assets, individuals, other organizations, and the Nation. Supplemental Guidance: The plan of action and milestones is a key document in the information security program and is subject to federal reporting requirements established by OMB. The plan of action and milestones updates are based on the findings from security control assessments, security impact analyses, and continuous monitoring activities. OMB FISMA reporting guidance contains instructions regarding organizational plans of action and milestones. Related control:
CA-5.

Control Enhancements: None.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PM-5 INFORMATION SYSTEM INVENTORY

Control:

The organization develops and maintains an inventory of its information systems.

Supplemental Guidance: This control addresses the inventory requirements in FISMA. OMB provides guidance on developing information systems inventories and associated reporting requirements.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PM-6 INFORMATION SECURITY MEASURES OF PERFORMANCE

Control:

The organization develops, monitors, and reports on the results of information security measures of performance.

Supplemental Guidance: Measures of performance are outcome-based metrics used by an organization to measure the effectiveness or efficiency of the information security program and the security controls employed in support of the program. Control Enhancements: None.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PM-7 ENTERPRISE ARCHITECTURE

Control:

The organization develops an enterprise architecture with consideration for information security and the resulting risk to organizational operations, organizational assets, individuals, other organizations, and the Nation.

Supplemental Guidance: The enterprise architecture developed by the organization is aligned with the Federal Enterprise Architecture. The integration of information security requirements and associated security controls into the organization's enterprise architecture helps to ensure that security considerations are addressed by organizations early in the system development life cycle and are directly and explicitly related to the organization's mission/business processes. This also embeds into the enterprise architecture, a integral security architecture consistent with organizational risk management and information security strategies. Security requirements and control integration are most effectively accomplished through the application of the Risk Management Framework and supporting security standards and guidelines. The Federal Segment Architecture Methodology provides guidance on integrating information security requirements and security controls into enterprise architectures. Related controls: PL-2, PM-11, RA-2.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PM-8 CRITICAL INFRASTRUCTURE PLAN

Control:

The organization addresses information security issues in the development, documentation, and updating of a critical infrastructure and key resources protection plan.
Supplemental Guidance: The requirement and guidance for defining critical infrastructure and key resources and for preparing an associated critical infrastructure protection plan are found in applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance. Related controls: PM-1, PM-9, PM-11, RA-3.

Control Enhancements: None.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PM-9 RISK MANAGEMENT STRATEGY

Control:

The organization:
a. Develops a comprehensive strategy to manage risk to organizational operations and assets, individuals, other organizations, and the Nation associated with the operation and use of information systems; and
b. Implements that strategy consistently across the organization. Supplemental Guidance: An organization-wide risk management strategy includes, for example, an unambiguous expression of the risk tolerance for the organization, acceptable risk assessment methodologies, risk mitigation strategies, a process for consistently evaluating risk across the organization with respect to the organization's risk tolerance, and approaches for monitoring risk over time. The use of a risk executive function can facilitate consistent, organization-wide application of the risk management strategy. The organization-wide risk management strategy can be informed by risk-related inputs from other sources both internal and external to the organization to ensure the strategy is both broad-based and comprehensive. Related control: RA-3.

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PM-10 SECURITY AUTHORIZATION PROCESS	
Control:	
The organization: a. Manages (i.e., documents, tracks, and reports) the security state of organizational information systems through security authorization processes; b. Designates individuals to fulfill specific roles and responsibilities within the organizational risk management process; and c. Fully integrates the security authorization processes into an organization-wide risk management program. **Supplemental Guidance:** The security authorization process for information systems requires the implementation of the Risk Management Framework and the employment of associated security standards and guidelines. Specific roles within the risk management process include a designated authorizing official for each organizational information system. Related control: CA-6.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

PM-11 MISSION/BUSINESS PROCESS DEFINITION	
Control:	
The organization: a. Defines mission/business processes with consideration for information security and the resulting risk to organizational operations, organizational assets, individuals, other organizations, and the Nation; and b. Determines information protection needs arising from the defined mission/business processes and revises the processes as necessary, until an achievable set of protection needs is obtained. **Supplemental Guidance:** Information protection needs are technology-independent, required capabilities to counter threats to organizations, individuals, or the Nation through the compromise of information (i.e., loss of confidentiality, integrity, or availability). Information protection needs are derived from the mission/business needs defined by the organization, the mission/business processes selected to meet the stated needs, and the organizational risk management strategy. Information protection needs determine the required security controls for the organization and the associated information systems supporting the mission/business processes. Inherent in defining an organization's information protection needs is an understanding of the level of adverse impact that could result if a compromise of information occurs. The security categorization process is used to make such potential impact determinations. Mission/business process definitions and associated information protection requirements are documented by the organization in accordance with organizational policy and procedure. Related controls: PM-7, PM-8, RA-2.	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Project Management (PM) Security Controls Detail and Comment

ADDITIONAL CONTROLS REQUIRED BY IRS PUBLICATION 1075 – Protection of FTI in Virtual Environments	
Control:	
Notification Requirements • The agency must notify the IRS Office of Safeguards 45 days prior to putting FTI in a virtual environment. • If the agency's approved SPR is less than six years old and reflects the agency's current process, procedures and systems, the agency must submit the Virtualization Notification (see Exh bit 15), which will serve as an addendum to their SPR. • If the agency's SPR is more than six years old or does not reflect the agency's current process, procedures and systems, the agency must submit a new SPR and the Virtualization Notification (see Exhibit 15). Technical Requirements • When FTI is stored in a shared location, the agency must have policies in place to restrict access to FTI to authorized users. • Programs that control the hypervisor should be secured and restricted to authorized administrators only. • FTI data transmitted via hypervisor management communication systems on untrusted networks must be encrypted using FIPS-approved methods, provided by either the virtualization solution or third party-solution, such as a virtual private network (VPN) that encapsulates the management traffic. • Separation between virtual machines (VMs) must be enforced, and functions which allow one VM to share data with the hypervisor or another VM, such as clipboard sharing or shared disks, must be disabled. • Virtualization providers must be able to monitor for threats and other activity that is occurring within the virtual environment. This includes being able to monitor the movement of FTI into and out of the virtual environment. • The VMs and hypervisor/ host OS software for each system within the virtual environment that receives, processes, stores or transmits FTI must be hardened in accordance with the requirements of Publication 1075 and be subject to frequent vulnerability testing. • Special VM functions available to system administrators in a virtualized environment that can leverage the shared memory space in a virtual environment between the hypervisor and VM should be disabled. • Virtual systems are configured to prevent FTI from being dumped outside of the VM when system errors occur. • Vulnerability assessment must be performed on systems in a virtualized environment prior to system implementation. • Backups (virtual machine snapshot) must be properly secured and must be stored in a logical location where the backup is only accessible to those with a need to know. For FTI: Complete SPR section 9.28.2	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

ADDITIONAL CONTROLS REQUIRED BY IRS PUBLICATION 1075 – Protection of FTI in Voice over IP (VOIP) Networks	
Control:	
• VoIP traffic that contains FTI should be segmented off from non-VoIP traffic via a virtual Local Area Network (vLAN) or other segmentation method. If complete segmentation is not feasible, the agency must have compensating controls in place and properly applied which restrict access to VoIP traffic which contains FTI. • When FTI is in-transit across the network (either Internet or state agency's network) the VoIP traffic must be encrypted using a NIST-approved method operating in a NIST-approved mode. • VoIP network hardware (servers, routers, switches, firewalls) must be physically protected in accordance with the minimum protection standards for physical security outlined in IRS Publication 1075, section 4.0, Secure Storage. • Each system within the agency's network that transmits FTI to an external customer through the VoIP network is hardened in accordance with the requirements of Publication 1075 and is subject to frequent vulnerability testing. • VoIP-ready firewalls must be used to filter VoIP traffic on the network. • Security testing must be conducted on the VoIP system prior to implementation with FTI and annually thereafter. • VoIP phones must be logically protected and agencies must be able to track and audit all FTI-applicable conversations and access For FTI: Complete SPR section 9.28.3	
Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

ADDITIONAL CONTROLS REQUIRED BY IRS PUBLICATION 1075 – Protection of FTI in Cloud Computing Environments
Control:
Notification Requirements • The agency must notify the IRS Office of Safeguards 45 days prior to putting FTI in a cloud environment. • If the agency's approved SPR is less than six years old and reflects the agency's current process, procedures and systems, the agency must submit the Cloud Computing Notification (see Exhibit 16), which will serve as an addendum to their SPR. • If the agency's SPR is more than six years old or does not reflect the agency's current process, procedures and systems, the agency must submit a new SPR and the Cloud Computing Notification (see Exhibit 16). Technical Requirements • Data Isolation. Software, data, and services that receive, transmit, process, or store FTI must be isolated within the cloud environment so that tenants sharing physical space cannot access their neighbors' physically co-located data and applications. • Service Level Agreements (SLA). The agency must establish security policies and procedures based on IRS Publication 1075 for how FTI is stored, handled, and accessed inside the cloud through a legally binding contract or Service Level Agreement (SLA) with their third party cloud provider. • Data Encryption in Transit. FTI must be encrypted in transit within the cloud environment. All mechanisms used to encrypt FTI must be FIPS 140-2 compliant, and operate utilizing the FIPS 140-2 compliant module. This requirement must be included in the SLA. • Data Encryption at Rest. FTI must be encrypted while at rest in the cloud. All mechanisms used to encrypt FTI must be FIPS 140-2 compliant, and operate utilizing the FIPS 140-2 compliant module. This requirement must be included in the SLA. • Security Control Validation. Agencies must validate security control implementation claims made by cloud providers through a security plan and security control assessments. For FTI: Complete SPR section 9.28.4

Fully explain control implementation *(or fully explain why control requirement is not applicable)*	**Responsible for Control Implementation** *Indicate System-specific, Hybrid, or Common; Indicate All Control Provider(s)]*

Attachment F-10 – Sample Security Assessment Report

In this attachment Unisys provides a sample quarterly Vulnerability Analyses (VA) and penetration testing report.

□□□ □ □□□ □□□□

1. Overview

Prov des an overview about the project listing the scope details, time line and vulnerability sever ty matrix.

1.1 Scope & Objective

The Scope of ClientX assessment was to perform vulnerability assessment and Penetration Testing on selected external systems and web appl cations. The primary objective of this engagement was to:

- Identify potential vulnerabilities that may compromise the integr ty, conf dentiality and reliabil ty of ClientX's IT infrastructure
- Prov de technical recommendat ons to ClientX to mitigate risks associated with the identified vulnerabilities and improve the secur ty posture of the in-scope systems and web appl cations

The external systems, web applicat ons, databases and wireless instances that are in the scope of the assessment are listed in the table below:

External IP addresses in-scope for network assessment

IP Ranges	Network Block	Number of IP Addresses
XX.XX.26.0 - XX.XX.26.255	XX.XX.26.0/24	256

Internal IP addresses in-scope for network assessment

IP Ranges	Network Block	Number of IP Addresses
XX.XX.81.0 - XX.XX.81.255	XX.XX.80.0/24	256

Appl cations in-scope for appl cation assessment

Appl cation	User Details
Appl cation1	DttAdmin (Administrator) DttTest (Normal User)
Appl cation2	
Appl cation3	DttAdmin1 (Administrator) DttTest1 (Normal User)
Appl cation4	

1. Overview

Database Instances in-scope:

Database Name:
Database 1
Database 2
Database 3

Wireless Access points in-scope:

Access point:
Access point1
Access point2

List of devices in-scope for configurat on

Dev ce Name:
Dev ce1
Dev ce2

1.2 Timeline

The ons te and remote vulnerabil ty assessment activ ties were conducted from xx-May-2013 through xx-June-2013. The specific fieldwork performed for the vulnerabil ty assessments included non-intrusive testing of the selected ClientX's external network systems, web applications, databases and wireless infrastructure is described in the tables below:

IP addresses in-scope for network assessment

IP Ranges	Location	Date	Local Time(EDT)	India Time(IST)
XX.XX.26.0 - XX.XX.26.255	Location1 (Internal)	xx-Dec-2009	9:30 PM	7:00 AM
XX.XX.81.0 - XX.XX.81.255	Locat on2 (External)	xx-Dec-2009	9:30 PM	7:00 AM

Appl cations in-scope for appl cation assessment

Applicat ons	Location	Date	Local Time(EDT)	India Time(IST)
Appl cation1	Location1	xx-Dec-2009	9:30 PM	7:00 AM
Appl cation2	Location2	xx-Dec-2009	9:30 PM	7:00 AM
Appl cation3	Location2	xx-Dec-2009	9:30 PM	7:00 AM
Appl cation4	Location3	xx-Dec-2009	9:30 PM	7:00 AM

1.3 Vulnerability Severity & Effort of Fix Rating Matrix

Vulnerabil ties dentified in the target IT infrastructure are pr oritized by assigning severity to the vulnerabil ties based on factors associated w th the vulnerabil ty (such as impact, exploitability, affected users, ease of explo tation etc.). Another factor that helps in pr oritizing the vulnerability and developing the m tigat on strategy is the effort required to fix the vulnerability. The definition of the severity parameter and effort to fix the vulnerability is detailed below:

Severity	Definit ons
High	Exploitat on of the vulnerabil ty will result in super user access (i.e., Administrator) or unauthorized access to the privileged information.
Medium	Exploitat on of the vulnerabil ty could gain access to the sens tive information on the host or unauthorized access to non-sensitive data.
Low	Exploitat on of the vulnerabil ty could result in unauthorized access to informat onal data only.

These risk ratings are based on our judgment. The decis on as to the risk and implementat on of any remediation is the responsibility of ClientX management.

1. Overview

1.4 Confirmed vs. Probable Findings

As part of our analysis the team conducted add t onal manual tests to confirm vulnerabil ties, where vulnerabil ties cannot be positively confirmed they were categorized as probable.

Draft - Representative Sample Only

End of Report

2. Assessment Summary

Summary of the vulnerabilities identified, vulnerabil ty implicat ons, tactical and strateg c recom mendat ons to mitigate the vulnerabilities.

2.1 Assessment Findings

As part of the internal, external and application security assessment activities, Delo tte identified a total of 10 vulnerabilities including the following:

- Improper data val dat on is present in multiple instances of the internet facing web portal of ClientX. The data val dat on issue may allow malicious users to execute database and HTML script commands through the web appl cation. This may lead to disclosure of sens tive information such as user credentials and database details, affecting the confidentiality and integrity of the applicat on and related infrastructure

- Insecure remote access services were found enabled on the Internet facing systems. This service is susceptible to confidential ty breaches as data is transmitted in clear text over the Internet
- SSL certif cate pol cy implemented on the systems enables the use of obsolete SSL vers ons w th known weaknesses that have demonstrated SSL based attacks
- Obsolete and vulnerable vers ons of operating system and software technology was found running on the target systems. This may affect the availability of the applicat ons running on the vulnerable systems
- Technology information and system details are revealed through service banner of the system and application error page
- Printing serv ce and HTTP method was found enabled on the Internet facing web servers of ClientX.

Of the 10 vulnerabilities, the team was not able to confirm 3 vulnerabilities due to the nature of the vulnerabil ties and considering the scope of assessment activ ties. These vulnerabil ties were categorized as probable.

The vulnerabilities along with their severity are presented in the table below.

Assessment Area	Vulnerabil ty Instances			TOTAL
	High	Medium	Low	
External	1	1	2	3
Internal		2	1	4
Appl cation	1	1	1	3
Database	0	1	1	
Wireless	0	1	1	
Total	2	6	6	10

2. Assessment Summary

2.2 Root Cause Analysis

The testing team analyzed the possible root causes associated with the confirmed and probable vulnerabilities. After the analysis, team devised root cause categories by organizing them based on common attributes and issues. The results of this analysis are depicted below.

	Improper Configuration	Improper Patch Management	Insecure Deployment	Application Programming Flaw
High	0	1	0	1
Medium	1	1	3	1
Low	4	0	1	1

2.3 Detailed-Level Recommendations for Remediation

In order to improve ClientX's security posture and m tigate the potential risks from the observed vulnerabil ties, Deloitte suggests ClientX to implement following tact cal and strategic measures.

Tactical Recommendations

The tact cal steps are associated with the resolut on of specific vulnerabilities observed during this engagement. These activities typ cally focus on addressing the vulnerabilities in a timely and pr oritized manner, and involve following activ ties:

- Implement a central library for input validations to ensure that all the input and output parameters are validated both at the client side and server s de, before they are used and transm tted
- Use secure services such as SecureFTP and TelnetS wh ch use encrypted communication channel to transmit informat on
- Secure the systems by disabling the outdated and deprecated SSL protocols, and enforce the use of strong ciphers
- Implement effective patch management in order to ensure that target operating system and software are running w th latest versions
- Customize the service banner information of the systems so that technology and system details are not disclosed to the end users
- Handle all the errors and exceptions generated by the appl cation and redirect the user to a customized error page without disclosing technology and system details
- Ensure that only required services and HTTP methods are enabled on the Internet systems

At a minimum, ClientX should prior tize and remediate the technical observat ons in this report. Deloitte recommends that the vulnerabil ties observed should be treated in order of their risk significance to ClientX namely - High severity vulnerabilities should be addressed immediately, followed by the Medium severity findings, followed by Low sever ty ones.

2. Assessment Summary

Strategic Recommendations

In addition to solving the technical issues, ClientX should also consider resolution of the system root causes that may have led to the individual vulnerabilities observed. ClientX should provide a more strategic focus to preventing similar issues from recurring and negatively impacting the organization's security posture in the future. Some security areas that ClientX may want to consider as part of its strategic efforts should include secure application design and development, network architecture planning and deployment, configuration management, patch management, security assessments and other similar items.

In summary, ClientX should consider implementing the following strategic actions:

- Lifecycle based vulnerability management solution that integrates closely with ClientX's processes, capable of timely discovery, remediation of vulnerabilities and prepares ClientX to face and respond to new threats. An effective vulnerability management solution is well-aligned with applicable industry standards, regulations and requirements such as, but not limited to: ISO/IEC 27001, COBIT, PCI-DSS and ITIL.
- Proactive and comprehensive secure development solution to enable incorporating security activities to identify, prioritize and mitigate application/database security vulnerabilities during development, deployment and maintenance processes. Security activities including application foot printing, information classification and periodic vulnerability testing enable development of appropriate access control guidelines for ClientX in order to maintain the security posture of the respective applications and databases.
- An effective configuration management and change management process should be established and appropriately publicized. This should include proactive monitoring of configuration violations and unauthorized changes to the environment.
- Periodic infrastructure risk assessments should be performed, especially where ClientX is deploying extensions to their trusted environment. ClientX should consider as part of its periodic risk assessments external infrastructure such as routers, firewalls, application, risks associated with internal infrastructure devices, servers and databases, and any extensions of its network through leased or dedicated partner networks.
- An information security awareness program to train all end-users (technical and non-technical) of relevant information security policies and procedures.

Draft - Representative Sample Only

End of Report

3. External Active Hosts

Detailed results from our Intelligence gathering effort to identify active hosts within the ranges, ports/serv ces open on these active systems, applicat ons hosted other protocol specif c information.

3.1 Open TCP / UDP Ports List

		Open Ports					
IP address	Host Name	123/UDP (NTP)	22/TCP (ssh)	23/TCP (telnet)	443/TCP (https)	80/TCP (http)	Grand Total
XX.XX.26.1	Not resolved			1		1	2
XX.XX.26.3	Not resolved		1				1
XX.XX.26 51	Not resolved		1		1		2
XX.XX.26 52	Not resolved		1				1
XX.XX.26 53	www.xxx.com	1		1		1	3
Grand Total		1	3	2	1	2	9

3.2 Operating System Details

		Operating System version			
IP address	Host Name	Linux	Not Found	Windows	Grand Total
XX.XX.26.1	Not resolved			1	1
XX.XX.26.3	Not resolved	1			1
XX.XX.26 51	Not resolved		1		1
XX.XX.26 52	Not resolved			1	1
XX.XX.26 53	www.xxx.com			1	1
Grand Total		1	1	3	5

4.3 Service Version Details

		Service Vers on Cisco IOS administrative httpd				
IP address	Host Name		Cisco SSH 1.25	Not Found	OpenSSH 3.2.3p1	Grand Total
XX.XX.26.1	Not resolved	1				1
XX.XX.26.3	Not resolved			1		1
XX.XX.26 51	Not resolved		1			1
XX.XX.26 52	Not resolved				1	1
XX.XX.26 53	www.xxx.com				1	1
Grand Total		1	1	1	2	5

4.4 ICMP Details

		ICMP Enabled (Yes/No)		
IP address	Host Name	No	Yes	Grand Total
XX.XX.26.1	Not resolved		1	1
XX.XX.26.3	Not resolved	1		1
XX.XX.26 51	Not resolved		1	1
XX.XX.26 52	Not resolved		1	1
XX.XX.26 53	www.xxx.com		1	1
Grand Total		1	4	5

Draft - Representative Sample Only

End of Report

4. External Vulnerabilities

Detailed list of vulnerabilities identified on the Internet facing hosts along w th description, impact, severity and recommendat ons.

4.1 External Network Vulnerability List

	External Vulnerabilities			
IP address / Host Name	Insecure Services were found running	Microsoft IIS 5 .printer ISAPI Filter Enabled	PHP Mail Funct on Header Spoofing Vulnerability	Grand Total
XX.XX.26.1	**1**			**1**
XX.XX.26.51		**1**	**1**	**2**
XX.XX.26.52			**1**	**1**
XX.XX.26.53			**1**	**1**
Grand Total	1	1	3	5

4.2 External Network Vulnerability Details

IP address	Vulnerabil ty ID	Vulnerability	Vulnerabil ty Description & Explo tation Steps (if appl cable)	Vulnerability Remediation	Severity	Likelihood	Effort to Fix
XX.XX.26.1	V_1	Insecure Services were found running	FTP, Telnet are application layer protocols, that either use clear text communication channel to exchange information or weak symmetric encryption. This type of communication is susceptible to sniffing attacks and man-in-the-middle attack. Also, these protocols are inherently vulnerable to bruteforce and session hijacking attacks.	Deloitte & Touche recommends following measures to prevent the existence of this vulnerability : • Implement secure service like Secure FTP, SSH (Secure Shell) and/or TelnetS, which are ciphered and support cryptographic functions. • Implement two-factor authentication system to evade brute-force attacks.	Medium	Low	Medium
XX.XX 26.51 XX.XX 26.52 XX.XX 26.53	V_2	PHP Mail Function Header Spoofing Vulnerability	PHP is a scripting language for producing dynamic web based applications and sites. Nessus vulnerability scanner reported that the remote host is running a outdated and vulnerable version of PHP (<= 4.2 2). This version of PHP has a vulnerable mail() function which does not properly sanitize user input. This allows users to forge email to make it look like it is coming from a different source other than the server. Attackers can exploit this vulnerability to forge emails to any entity, even if SAFE_MODE is enabled **References**: CVE: 2002-0985 [redacted]	Deloitte & Touche recommends following measures to prevent the existence of this vulnerability : • Implement a Patch Management system, which enforces the system to apply released patches for vulnerabilities and ensure all Internet Systems are fully patched and updated till the latest version of the application, base technology and Operating System being used • Implement a perimeter based deterrent technology (i.e. firewall, IDS/IPS, etc) to restricts, blocks malicious packets from reaching the vulnerable services	Medium	Low	Medium
XX.XX 26.51	V_3	Microsoft IIS 5 printer ISAPI Filter Enabled	IPP Facilitates printing over an IP based network and for managing print requests over the Internet, WAN, LAN and other types of IP based networks. This service allows users to print jobs by queuing several jobs simultaneously. IPP on IIS 5 0 is implemented as an extension of ISAPI filter. This service/extension has been reported by "publicly disclosed vulnerability lists" to be vulnerable to several buffer overflow attacks. It is possible to perform a Denial-of Service attack on the host(s) by sending numerous print jobs from the Internet. An attacker can also exploit this vulnerable service/extension to gain unauthorized access. **References:** CVE: 2001-0241 [redacted]	Deloitte & Touche recommends following measures to prevent the existence of this vulnerability : • Disable the Internet Printing Protocol (IPP) if there is no business requirement • Enable proper application boundary controls to allow only white listed hosts to use the service In order to disable the IPP service, Delete the Internet Print Provider Registry Key: - Go to Administrative Tools - Double-click Services - Stop the Print Spooler service - Use the Microsoft Registry Editor (Regedit exe) to delete the following key from the registry: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Print\Providers\Internet Print Provider - Restart the Print Spooler service	Low	Low	Low

Draft - Representative Sample Only

End of Report

5. Database Vulnerabilities

Detailed list of vulnerabilities identified on the in-scope database instances along w th description, impact, severity and recommendat ons.

5.1 Database Vulnerability List

IP Address / Database instance Name	Database Vulnerabil ties			
	Default, blank or weak (Insecure) Password	Improper input validation leading to SQL Injection	Extensive user and group previlages	Grand Total
Database 1			**1**	**1**
Database 2	**1**	**1**		**2**
Database 3			**1**	**1**
Grand Total	1	1	2	4

5.2 Database Vulnerability Details

IP address/ Database Instance Name	Vulnerabil ty ID	Vulnerability	Vulnerability Descript on & Exploitat on Steps (if applicable)	Vulnerabil ty Remediation	Status	Severity	Likelihood	Effort to Fix
Application1	V_8	Default, blank or weak (Insecure) password			Confirmed	High	Medium	High
Application1	V_9	Improper input validation leading to SQL Injection	SQL Injection is a technique where SQL queries injected through the web application are executed in the backend database, due to lack of appropriate input validation in the web application. The attacker sends a specially crafted SQL scripts in order to modify queries being sent to the database. SQL Injection is possible in the “Search” and “Advanced Search” modules of the “xxxx.com” application by tampering the form parameter “Search Name”. Team was able to exploit the vulnerability by entering malicious SQL commands in the form parameter. Exploitation The steps that are required to exploit the vulnerability on the “Search” module are detailed below, Steps 1. Access “xxxx.com” web application by browsing the URL http://www.xxxx com/homePage.aspx 2. Click the “Search” tab on “Members” menu (URL is http://www.xxxx com/formularySearch_2009.aspx) 3. In “Search” page, enter invalid search criteria (along with single quotes – for example, “test'”) for the form parameter “Search Name”. This will generate a SQL error message, as the application is not properly validating the value of “Search name” form parameter. 4. After confirming the existence of SQL Injection, team	Deloitte recommends following measures to prevent the existence of this vulnerability: • Implement a central library for input validations (both at the client side and server side) and ensure that all the input/output parameters are validated before they are used/transmitted • Do not send or receive parts of SQL statement to/from client browser	Confirmed	Medium	Medium	Medium

5. Database Vulnerabilities

Detailed list of vulnerabilities identified on the in-scope database instances along w th description, impact, severity and recommendat ons.

5.1 Database Vulnerability List

IP Address / Database instance Name	Database Vulnerabil ties			
	Default, blank or weak (Insecure) Password	Improper input validation leading to SQL Injection	Extensive user and group previlages	Grand Total
Database 1			**1**	**1**
Database 2	**1**	**1**		**2**
Database 3			**1**	**1**
Grand Total	1	1	2	4

5.2 Database Vulnerability Details

IP address/ Database Instance Name	Vulnerabil ty ID	Vulnerability	Vulnerability Descript on & Exploitat on Steps (if applicable)	Vulnerabil ty Remediation	Status	Severity	Likelihood	Effort to Fix
Application2 Application3	V_10	Extensive user and group previlages			Confirmed	Low	Low	Low

Draft - Representative Sample Only

End of Report

6. Application Vulnerabilities

Detailed list of vulnerabil ties dentified on the in-scope web applicat ons along w th descript on, impact, severity and recommendations.

6.1 Web Application Vulnerability List

	Application Vulnerabil ties			
IP Address / Applicat on Name	Improper input val dat on leading to SQL Injection	Improper Input/Output val dat on leading to Cross S te Scripting attack	Applicat on error page reveals technology and system details	Grand Total
Application1	**1**	**1**		**2**
Application2			**1**	**1**
Application3			**1**	**1**
Grand Total	1	1	2	4

6.2 Web Application Vulnerability Details

IP address/ Applicat on Name	Vulnerability ID	Vulnerabil ty	Vulnerability Description & Exploitation Steps (if appl cable)	Vulnerabil ty Remediation	Severity	Likelihood	Effort to Fix
Application1	V_8	Improper input validation leading to SQL Injection	SQL Injection is a technique where SQL queries injected through the web application are executed in the backend database, due to lack of appropriate input validation in the web application. The attacker sends a specially crafted SQL scripts in order to modify queries being sent to the database. SQL Injection is possible in the “Search” and “Advanced Search” modules of the “xxxx com” application by tampering the form parameter “Search Name”. Team was able to exploit the vulnerability by entering malicious SQL commands in the form parameter. Exploitation The steps that are required to exploit the vulnerability on the “Search” module are detailed below, Steps 1. Access “xxxx.com” web application by browsing the URL http://www xxxx.com/homePage aspx 2. Click the “Search” tab on “Members” menu (URL is http://www xxxx.com/formularySearch_2009.aspx) 3. In “Search” page, enter invalid search criteria (along with single quotes – for example, “test’”) for the form parameter “Search Name”. This will generate a SQL error message, as the application is not properly validating the value of “Search name” form parameter. 4. After confirming the existence of SQL Injection, team injected the SQL command “‘ and 1=convert(int,db_name(0)) --” for the “Search Name” form parameter. This resulted in a SQL error	Deloitte recommends following measures to prevent the existence of this vulnerability: • Implement a central library for input validations (both at the client side and server side) and ensure that all the input/output parameters are validated before they are used/transmitted • Do not send or receive parts of SQL statement to/from client browser • Do not use dynamic SQL statements • Use parameterized stored procedures that enforce the data type to be accepted from the client and will not allow modifications to the syntax of the SQL query.	High	Medium	High
Application1	V_9	Improper Input/Output validation leading to Cross Site Scripting attack	Cross site scripting (XSS) is caused by the failure of the application to properly validate user input before returning it to the client’s web browser. This weakness allows attackers to embed malicious HTML-based content, such as JavaScript, within client HTTP requests. Cross site scripting has been identified in different areas of the web application. One instance is on the Search module (‘searchresults aspx’) of the application. There is no proper input validation on ‘searchtext’ query string parameter available in the ‘searchresults.aspx’ web page. This will allow the malicious user to enter scripts and other invalid characters which will get executed in the application page. The vulnerable URL is “http://<<hostname>>/searchresults.aspx?searchterm=<script >alert(‘TEST’)</script> ”. Cross Site Scripting could allow a malicious user to launch following type of attacks, • Session hijacking • Page defacement • Phishing attack This allows to steal sensitive information such as user credentials and affects the confidentiality, integrity and availability o the user and application.	Deloitte recommends following measures to prevent the existence of this vulnerability: • Implement a central library for input validations and ensure that all input parameters (such as HTTP headers, query strings, form fields, cookies and hidden fields) which can be controlled and tampered by the end user, are validated before being used or transmitted. • Preferably, input validation should be performed against a known whitelist of valid characters. In other words, allow only those characters that are in the whitelist and block/filter every other input. • Encode all the user supplied data which becomes part of the application output using HTML entity encoding, for e.g. • “<” to < “>” to > “(“ to (“)” to) “&” to & Further as a best practice, • Implement a perimeter based application level firewall to filter out malicious URL and to restrict malicious URL redirection • Avoid redirection to external sites and 3rd party domains. If it is necessary to do so, make sure to validate the URL to which the application is redirected to, and avoid redirections to unknown sites.	Medium	Medium	Medium

6. Application Vulnerabilities

Detailed list of vulnerabil ties dentified on the in-scope web applicat ons along w th descript on, impact, severity and recommendations.

6.1 Web Application Vulnerability List

	Application Vulnerabil ties			
IP Address / Applicat on Name	Improper input val dat on leading to SQL Injection	Improper Input/Output val dat on leading to Cross S te Scripting attack	Applicat on error page reveals technology and system details	Grand Total
Application1	**1**	**1**		**2**
Application2			**1**	**1**
Application3			**1**	**1**
Grand Total	1	1	2	4

6.2 Web Application Vulnerability Details

IP address/ Applicat on Name	Vulnerability ID	Vulnerabil ty	Vulnerability Description & Exploitation Steps (if appl cable)	Vulnerabil ty Remediation	Severity	Likelihood	Effort to Fix
Application2 Application3	V_10	Application error page reveals technology and system details	Error page of the application reveals technology and system details such as application framework, version details, web server technology and physical path of the system. Error page revealing technology and system details are present through the applications. These error pages are generated when the user tries to enter invalid characters or accesses files that are not present in the target server. The information present in the error page allows the malicious user to understand the technology that is running on the host and the directory structure. This will allow to launch targeted attacks on the application and related infrastructure.	Deloitte recommends following measures to prevent the existence of this vulnerability: • Redirect the user to a customized error page which contains generic information rather than technology and system specific details • Log the error details in the log server which will help to diagnose the problem, identify the root cause of the error and fix the issue.	Low	Low	Low

Draft - Representative Sample Only

XX.XX.26.53			1	1
Grand Total	1	1	3	5

7.2 External Network Vulnerability Details

Access Point	Vulnerabil ty ID	Vulnerability	Vulnerabil ty Description & Explo tation Steps (if appl cable)	Vulnerability Remediation	Severity	Likelihood	Effort to Fix
Name1	V_1	Improper Access Controls	FTP, Telnet are application layer protocols, that either use clear text communication channel to exchange information or weak symmetric encryption. This type of communication is susceptible to sniffing attacks and man-in-the-middle attack. Also, these protocols are inherently vulnerable to bruteforce and session hijacking attacks.	Deloitte & Touche recommends following measures to prevent the existence of this vulnerability : • Implement secure service like Secure FTP, SSH (Secure Shell) and/or TelnetS, which are ciphered and support cryptographic functions. • Implement two-factor authentication system to evade brute-force attacks.	Medium	Low	Medium
Name1	V_2	Insecure Encryption protocol in use	PHP is a scripting language for producing dynamic web based applications and sites. Nessus vulnerability scanner reported that the remote host is running a outdated and vulnerable version of PHP (<= 4.2 2). This version of PHP has a vulnerable mail() function which does not properly sanitize user input. This allows users to forge email to make it look like it is coming from a different source other than the server. Attackers can exploit this vulnerability to forge emails to any entity, even if SAFE_MODE is enabled **References**: CVE: 2002-0985 http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-0985	Deloitte & Touche recommends following measures to prevent the existence of this vulnerability : • Implement a Patch Management system, which enforces the system to apply released patches for vulnerabilities and ensure all Internet Systems are fully patched and updated till the latest version of the application, base technology and Operating System being used • Implement a perimeter based deterrent technology (i.e. firewall, IDS/IPS, etc) to restricts, blocks malicious packets from reaching the vulnerable services	Medium	Low	Medium
Name2	V_3	Insecure Configuration	IPP Facilitates printing over an IP based network and for managing print requests over the Internet, WAN, LAN and other types of IP based networks. This service allows users to print jobs by queuing several jobs simultaneously. IPP on IIS 5 0 is implemented as an extension of ISAPI filter. This service/extension has been reported by "publicly disclosed vulnerability lists" to be vulnerable to several buffer overflow attacks. It is possible to perform a Denial-of Service attack on the host(s) by sending numerous print jobs from the Internet. An attacker can also exploit this vulnerable service/extension to gain unauthorized access. **References:** CVE: 2001-0241 http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-0241	Deloitte & Touche recommends following measures to prevent the existence of this vulnerability : • Disable the Internet Printing Protocol (IPP) if there is no business requirement • Enable proper application boundary controls to allow only white listed hosts to use the service In order to disable the IPP service, Delete the Internet Print Provider Registry Key: - Go to Administrative Tools - Double-click Services - Stop the Print Spooler service - Use the Microsoft Registry Editor (Regedit exe) to delete the following key from the registry: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Print\Providers\Internet Print Provider - Restart the Print Spooler service	Low	Low	Low

Appendix - Legend

Prov des definit on of the risk ratings and descript on of the high-level categories

A.1 Vulnerability Severity & Likelihood Rating Matrix

Vulnerabil ties dentified in the target IT infrastructure are pr oritized by assigning severity to the vulnerabil ties based on factors associated w th the vulnerability (such as impact, affected users, ease of explo tation, etc.). Other factor that is used to pr oritize the vulnerabil ty is likelihood of exploiting the vulnerabil ty . The defin tion of these parameters are detailed below:

Rating	Severity	Likelihood	Estimated Effort to fix
High	Explo tation of the vulnerability will result in super user access (i.e., Administrator) or unauthorized access to the privileged information.	High probabilistic of a successful exploit w th an easily available explo t and the ability to avoid detect on.	Remediation effort requires multiple Full-Time Equivalent durat on of greater than 80 hours.
Medium	Explo tation of the vulnerability could gain access to the sensitive informat on on the host or unauthorized access to non-sens tive data.	Medium probabilist c of a successful explo t with a diff cult to obtain exploit and the abil ty to avo d detection.	Remediation effort requires multiple FTE and a durat on be hours.
Low	Explo tation of the vulnerability could result in unauthorized access to informat onal data only.	Low probabilistic of a successful exploit w th a difficult to obtain explo t and diff culty to avoid detect on.	Remediation effort requires one FTE and a durat on of less

These risk ratings are based on our experience in dentifying these issues. The decis on as to factor business risk, validate issue, determine and implement appropriate remediation is the responsibil ty of Client X

A.2 High Level Category Analysis

High Level Category Analysis

Several common themes were identified revealing the probable reasons for the vulnerabilities to exist. The analysis shows that the majority of issues fall into 3 distinct high level categories described below:

High-level Category	Description
Improper authent cation and authorizat on controls	Improper authenticat on & authorizat on controls on critical production information systems and networks may lead to unauthorized access to sensitive informat on
Missing patches	Software technologies, information systems or devices which are outdated, not updated or patched regularly with the publ cly disclosed secur ty fixes increases the risk of compromise or affect its reliabil ty.increase the threat surface.
Mis-configurations	Improperly configured services on information systems and networks including default configuration could provide unauthorized access and disclosure of sensitive informat on or configuration data.

Appendix B - Glossary and Tools

Glossary of terms and the tools used during the secur ty assessment activ ties.

B.1 Glossary of terms used in this assessment report

Term	Description
ICMP Sweep	Probe the IP address range to dentify the live hosts that are responding to ICMP request.
Delete and PUT	The PUT is HTTP method allows that the enclosed ent ty be stored to a web server and DELETE HTTP method requests that the origin server to delete the resource on web server.
Vulnerability ID	Vulnerability ID is used to map the ID (V_X) present in the "Impact vs Likelihood" graph present in the worksheet "2-High Level Executive Summary" with indiv dual vulnerabil ties.
Confirmed	"Confirmed" vulnerabil ties are those vulnerabilities wh ch the team confirmed during the course of assessment activ ties.
Probable	Probable vulnerabilities are those vulnerabilities wh ch are reported either by tool or by publ c advisories, and the team was not able confirm these vulnerabilities e ther due to the nature of testing required for confirming the vulnerabil ties or due to lack of information available for confirming the vulnerabil ties.
Risk	Risk is the probability of a loss happening by the occurrence of an event, and depends on three elements, impact, vulnerabil ty and exposure.
Risk Level	Risk level denotes the level of risk based on three factors - vulnerability severity, impact and likelihood of occurrence of the event.
SSLv3/TLSv1	Secure socket Layers /Transport Layer security provide secur ty and data integrity for commun cations over networks. TLS and SSL encrypt the segments of network connections at the Transport Layer end-to-end.
Vulnerability	A weakness in an IT system that can be exploited by an attacker.

Appendix B - Glossary and Tools

Glossary of terms and the tools used during the security assessment activities.

B.2 List of support tools used for this assessment

Tool Name	Usage
Nmap	A stealth port scanner that identifies network devices, operating systems open ports.
Solarwinds	SolarWinds is a network discovery tool used to identify network devices. It includes tools from the following nine categories: CMTS & Subscriber Modem Tools, Bandwidth and Performance Management, Network Monitoring, Network Discovery Tools, Tools for Cisco Routers, Fault Monitoring Tools, MIB Browser Tools, Ping and Diagnostic Tools, IP Address Management Tools.
Superscan	Multithreaded connect-based port scanner, hostname resolver and ping tool that uses asynchronous techniques to identify open ports of network systems.
Nessus	A vulnerability scanner that allows customization of the ports and services to be scanned to identify vulnerabilities.
Nikto	A perl script that attempts to identify well-known URLs that may indicate a security weakness.
AppScan	AppScan is a commercial web application vulnerability scanner which is used to identify security weaknesses present in web applications.
Paros	Paros is a web application proxy and a vulnerability scanner which is used to intercept the web request and response, and also to identify the security weaknesses present in web applications.
TamperIE	TamperIE acts as a plug-in of Internet Explorer web browser, which is used to tamper the web request sent from the client browser.

Attachment F-12 – Application Migration Plan

In this attachment Unisys includes a sample application migration plan.

This page intentionally left blank.

ID	Task Name	Duration	Start	Finish	Predecessors	Resource Names
1	**- Sample MOVE PACKAGE Schedule (to**	**129 days**	**Tue 7/1/14**	**Sun**		
2	Project Start Date	0 days	Tue 7/1/14	Tue 7/1/14		
3	**DCM_MP - PLAN MIGRATION**	**129 days**	**Tue 7/1/14**	**Sun 12/28/14**		
4	**Project Management Tasks**	**129 days**	**Tue 7/1/14**	**Sun 12/28/14**		
5	Goverance Plan	180 edays	Tue 7/1/14	Sun 12/28/14	2	
6	Risk Plan	180 edays	Tue 7/1/14	Sun 12/28/14	2	
7	Validate Data Gathering	180	Tue 7/1/14	Sun	2	
8	Configuration/Test Plan	180 edays	Tue 7/1/14	Sun 12/28/14	2	
9	**DCM_MP - MOVE**	**13 days**	**Tue 7/1/14**	**Thu 7/17/14**		
10	Schedule Individual Application	1 day	Tue 7/1/14	Tue 7/1/14		Customer
11	Conduct One-on-One	1 wk	Wed 7/9/14	Tue 7/15/14	10FS+1 wk	PM(s)[20%],PC(s)[2
12	Conduct Internal Planning	2 hrs	Wed	Wed	11	PM(s),PC(s),Custon
13	Identify In-Scope P2P, V2V,	4 hrs	Wed	Wed	12SS	Wintel
14	Validate Move Strategy & Initial	4 hrs	Wed	Wed	13SS	Facilities
15	Validate Out-of-Warranty	4 hrs	Wed	Wed	14	Asset Manager
16	Determine HA, backup and DR	4 hrs	Thu 7/17/14	Thu 7/17/14	15	
17	Refine MP Move Baseline (Unix	4 hrs	Thu 7/17/14	Thu 7/17/14	15	PM(s),Asset
18	**DCM_MP - CODE FREEZE**	**0.5 days**	**Thu 7/17/14**	**Thu 7/17/14**		
19	Initiate MP Server Baseline	0.5 hrs	Thu 7/17/14	Thu 7/17/14	17	Asset
20	Initiate MP Code Freeze for all	0.5 hrs	Thu 7/17/14	Thu 7/17/14	19SS	Customer App
21	Remove any remaining hard	4 hrs	Thu 7/17/14	Thu 7/17/14	20SS	Customer App
22	COMPLETED: DCM_MP -	0 days	Thu 7/17/14	Thu 7/17/14	19,21	PM(s)
23	COMPLETED: DCM_MP - MOVE	0 days	Thu 7/17/14	Thu 7/17/14	17,22	PM(s)
24	**DCM_MP - MOVE STRATEGY**	**1.5 days**	**Fri 7/18/14**	**Mon**		
25	Review Move Package Contents	1 day	Fri 7/18/14	Fri 7/18/14	23	PM(s),PC(s),Custon
26	Provide Move Package Contents	2 hrs	Mon	Mon	25	PM(s)[50%],PC(s)[5
27	Receive Move Package Content	2 hrs	Mon	Mon	26	PM(s),PC(s),Custon
28	COMPLETED: MP - MOVE	0 days	Mon	Mon	27	PM(s)
29	**DCM_MP - DUE DILIGENCE**	**1.63 days**	**Mon**	**Wed**		
30	Schedule, Prepare, Perform MP	1 hr	Mon	Mon	28	PM(s),PC(s),Custon
31	Establish Weekly Meetings with	1.5 days	Mon	Wed	30	Unix Team,Wintel
32	Schedule WAN Analysis	0.06 days	Mon	Mon	30	PM(s)
33	Check if WAN Analysis is	0.5 days	Mon	Tue 7/22/14	32	PC(s)[50%],PM(s)[5
34	COMPLETED: DCM_MP - DUE	0 days	Wed	Wed	31,32,33	Core Networks

ID	Task Name	Duration	Start	Finish	Predecessors	Resource Names
35	**DCM_MP - CREATE WORKBOOK**	**18 days**	**Mon 7/21/14**	**Thu 8/14/14**		
36	Initiate Workbook for Move	1 wk	Mon 7/21/14	Mon 7/28/14	28	PM(s)[50%]
37	Assess MP in-flight projects,	1 day	Mon	Tue 7/29/14	36	PM(s)[25%]
38	**DCM_MP - DEVELOP RISK**	**4 days**	**Mon**	**Fri 8/1/14**		
39	**MP_RISK - RISK MITIGATION**	**1 day**	**Mon 7/28/14**	**Tue 7/29/14**		
40	Review Standard Move	0.5 days	Mon	Mon	36	PM(s)[25%],PC(s)[2
41	Document Move Package	0.5 days	Tue 7/29/14	Tue 7/29/14	40	PM(s)[25%],PC(s)[2
42	**MP_RISK - CONTINGENCY**	**4 days**	**Mon**	**Fri 8/1/14**		
43	Identify / Review	1 day	Mon	Tue 7/29/14	40SS	PM(s)[25%],PC(s)[2
44	Review Options for	1 day	Tue 7/29/14	Wed	43	PM(s)[25%],PC(s)[2
45	Review Options with to	1 day	Wed	Thu 7/31/14	44	PM(s)[25%],PC(s)[2
46	Finalize Contingency Plan	1 day	Thu 7/31/14	Fri 8/1/14	45	PM(s)[25%],PC(s)[2
47	COMPLETED: MP_RISK -	0 days	Fri 8/1/14	Fri 8/1/14	46	PM(s)
48	COMPLETED: DCM_MP_PM -	0 days	Fri 8/1/14	Fri 8/1/14	41,47	PC(s)
49	**MP_APPS - DEVELOP TEST**	**13 days**	**Mon**	**Thu 8/14/14**		
50	Review Initial Test Plan	4 hrs	Mon	Mon	36,64	PM(s)[25%],PC(s)[2
51	Identify Applications to be	16 hrs	Tue 7/29/14	Wed	50	PM(s)[25%]
52	Identify Application Testers	16 hrs	Thu 7/31/14	Fri 8/1/14	51	PM(s)[50%]
53	Commit to Re-IP Planned	8 hrs	Mon 8/4/14	Mon 8/4/14	52	Service Delivery
54	Work with Application Test	8 hrs	Tue 7/29/14	Tue 7/29/14	50	Service Delivery
55	Develop the High Level Test	16 hrs	Wed	Thu 7/31/14	54	Customer App
56	Create Test Cases / Scripts	5 days	Mon 8/4/14	Fri 8/8/14	52,55	PM(s)[60%]
57	Finalize Test Plan	8 hrs	Mon	Mon	56	Customer App
58	Execute Dry Run of Test Cases	8 hrs	Tue 8/12/14	Tue 8/12/14	57	Service Delivery
59	Establish Success Criteria	4 hrs	Wed	Wed	58	PM(s)[50%],Custor
60	Receive Written Approval of	1 day	Wed	Thu 8/14/14	57,58,59	Customer App
61	COMPLETED: MP_APPS -	0 days	Thu 8/14/14	Thu 8/14/14	53,60	Customer App
62	**DCM_MP - SITE PREPARATION**	**12.13**	**Wed**	**Fri 8/8/14**		
63	**DCM_MP_SP - SERVER IP**	**7.25 days**	**Wed**	**Fri 8/1/14**		
64	Gather MP IP requirements	1 day	Wed	Thu 7/24/14	34	Customer App
65	Prepare and Submit MP IP	4 hrs	Thu 7/24/14	Thu 7/24/14	64	PM(s)[20%],Custor
66	Receive MP IP Addresses	2 hrs	Mon	Mon	65FS+2 days	PM(s)[20%],Core
67	Identify MP DNS Entries	12 hrs	Mon	Wed	66	Customer App
68	Acquire any required	2 days	Wed	Fri 8/1/14	67	DBA[50%],Unix

ID	Task Name	Duration	Start	Finish	Predecessors	Resource Names
69	Plan MP Resolution for	4 hrs	Mon	Tue 7/29/14	66	Firewall Engineer
70	Receive MP Status Update	8 hrs	Tue 7/29/14	Wed	69	Storage Team
71	MP Hardcoded IP Address	16 hrs	Wed	Fri 8/1/14	70	Unix Team
72	COMPLETED: DCM_MP_SP	0 days	Fri 8/1/14	Fri 8/1/14	67,68,71	Wintel Team
73	**DCM_MP_SP - FIREWALL**	**10 days**	**Wed**	**Wed 8/6/14**		
74	Determine MP Firewall	1 day	Wed	Thu 7/24/14	64SS	Customer App
75	Identify MP Domain	4 hrs	Wed	Wed	74SS	DBA[50%],Unix
76	Conduct MP Peer Review of	4 hrs	Thu 7/24/14	Thu 7/24/14	74,75	Firewall
77	Submit MP Load Balancer	4 hrs	Thu 7/24/14	Fri 7/25/14	76	Unix
78	Fill MP Load Balancer RM	3 days	Fri 8/1/14	Wed 8/6/14	77FS+5 days	Customer App
79	COMPLETED: DCM_MP_SP	0 days	Wed 8/6/14	Wed 8/6/14	76,78	DBA[50%],Unix
80	**DCM_MP_SP - WINTEL**	**4.38 days**	**Mon**	**Mon 8/4/14**		
81	Validate/Update MP	4 hrs	Mon	Tue 7/29/14	66	Firewall Engineer
82	Validate MP Intel server	2 hrs	Tue 7/29/14	Tue 7/29/14	81	Storage
83	Determine MP Intel Backup	4 hrs	Tue 7/29/14	Tue 7/29/14	81	Storage SME
84	Prepare and Submit MP	8 hrs	Tue 7/29/14	Wed	83SS	Storage SME
85	MP Intel Grid Space	3 hrs	Thu 7/31/14	Thu 7/31/14	84FS+1 day	PM(s)
86	Submit MP RM for Intel	4 hrs	Thu 7/31/14	Fri 8/1/14	85	Customer App
87	Create MP Rack Diagrams	12 hrs	Thu 7/31/14	Mon 8/4/14	85	Customer App
88	Submit MP RM to get PTC	4 hrs	Thu 7/31/14	Fri 8/1/14	85	Customer App
89	Determine MP Phone line	4 hrs	Fri 8/1/14	Fri 8/1/14	88	Customer App
90	Submit MP Intel SAN/NAS	4 hrs	Fri 8/1/14	Fri 8/1/14	88	Firewall Engineer
91	Submit MP Power	4 hrs	Fri 8/1/14	Fri 8/1/14	86,88	Core Networks
92	COMPLETED: DCM_MP_SP	0 days	Mon 8/4/14	Mon 8/4/14	82,85,87,89,90,	Core
93	**DCM_MP_SP - UNIX SERVICE**	**3.75 days**	**Mon**	**Fri 8/1/14**		
94	Validate/Update MP	1 hr	Mon	Mon	66	Firewall Engineer
95	Validate MP Unix server	0.67 hrs	Tue 7/29/14	Tue 7/29/14	94	Firewall
96	Determine MP Unix Backup	2 hrs	Tue 7/29/14	Tue 7/29/14	95SS	Core
97	Prepare and Submit MP	6 hrs	Tue 7/29/14	Tue 7/29/14	96SS	Core Networks
98	MP Unix Grid Space	3 hrs	Wed	Thu 7/31/14	97FS+1 day	Firewall Engineer
99	Submit MP RM for Unix	2 hrs	Thu 7/31/14	Thu 7/31/14	98	Core Networks
100	Submit MP RM to get	2 hrs	Thu 7/31/14	Thu 7/31/14	99SS	Wintel Team
101	Create MP Visio Rack	4 hrs	Thu 7/31/14	Thu 7/31/14	100SS	Wintel Team
102	Submit MP RM to get Unix	1 hr	Thu 7/31/14	Thu 7/31/14	101SS	Intel Team

Commonwealth Computing Procedures Manual (CCPM)

Contents

1 PURPOSE 3
1.1 Organizational Overview 3
1.2 Transition and Support Activities and Responsibilities 4
1.3 IT Service Management Procedures 5
1.4 Financial Management Procedures 12
1.5 Contract Management Procedures 14
1.6 Relationship Management Procedures 16
1.7 Offeror Operational Procedures 17
1.8 The Commonwealth Customer Operations Manuals 18

Content	Description
1 PURPOSE	The Offeror should describe the purpose of the Commonwealth Computing Procedures Manual. This section should address who should use the Manual, how the Manual is organized, how the initial version and updates will be distributed, version control procedures for the Manual, when updates will occur, and procedures for authorizing and implementing updates. It is intended that the structure of the Manual will require that the individual compliance requirements and business rules of each participating Commonwealth Customer are separately identified where applicable for each section or component part of the Manual.
1.1 Organizational Overview	
1. Offeror Governance Organization	Include organization charts, description of functions performed, contact information.
2. Offeror Management and Delivery Organization	Include organization charts, description of functions performed, contact information.
3. Key Contacts - Offeror	A list of contacts that are key users of the Services and/or perform a liaison function in regard to the Services (by Commonwealth and Commonwealth Agencies, by location).

Content	Description
4. Key Contacts – Third Parties	A list of key Third Parties (maintenance providers, software providers, telecom carriers, etc).
1.2 Transition and Support Activities and Responsibilities	
1. Overall Management and Reporting Process	A description of Offeror management structure, reporting, and review process associated with Transition Services and Transformation Services.
2. Critical Deliverables and Milestones	A list of Critical Deliverables, milestones and timeline for the Transition Services and Transformation Services periods.
3. Interim Performance Management Procedures	A description of interim procedures to monitor and coordinate Service delivery, including Problem Management, Change Management, Service Level monitoring and reporting, physical and Logical Security, project management, work authorization, etc. A description of the responsibilities of both Parties.

Content	Description
4. Interim Financial Management Procedures	A description of interim procedures for invoicing, invoice verification, charge back to the Commonwealth Customers, determining Resource Unit volume by Service Component, asset management, asset transfers, forecasting, Commonwealth Customer support, etc. A description of the responsibilities of both Parties.
5. Interim Contract Management Procedures	A description of interim procedures for managing and administering the Agreement including proposed changes to the Agreement, interpretation procedures, issue-escalation process, and disputes. A description of the responsibilities of both Parties.
6. Other Transition and Support Procedures and Responsibilities	Any other pertinent procedures and responsibilities.
1.3 IT Service Management Procedures	
1. Service Desk	The facilities, associated technologies, and fully trained staff who respond to Calls, coordinate all Incident Management, Problem Management and Request Management activities, and act as a single point of contact for Authorized Users in regard to the Services.

Content	Description
2. Incident Management	The use of people, processes and technology with the primary goal to restore normal Service operations as quickly as possible and minimize the adverse impact on business operations, thus ensuring that the best achievable levels of service quality and availability are maintained.
3. Problem Management	The process, software, techniques and procedures that aid in identification, tracking, communication, and resolution of Problems arising in Customer's IT Environment, and resolving those Problems arising from or related to the Services. The goal of Problem Management is to minimize the adverse impact of Incidents and Problems on the business that are caused by errors within the IT infrastructure, and to prevent recurrence of Incidents related to these errors. In order to achieve this goal, Problem Management seeks to get to the root cause of Incidents and then initiate actions to improve or correct the situation.
4. Change Management	The processes relating to planning and performing all changes in IT environment pertaining to the Services, including changes to individual components and coordination of changes across all components. The Change Management processes will support and include checkpoints to determine any potential or required Change Control Procedures and includes a process of controlling changes to the infrastructure or any aspect of Services, in a controlled manner, enabling approved changes with minimum disruption.

<table>
<tr><th>Content</th><th>Description</th></tr>
<tr><td>5. Configuration Management</td><td>The process of identifying and defining CIs in a system, recording and reporting the status of CIs and RFCs, and verifying the completeness and correctness of the CIs.

The following data fields are required as a minimum for Asset/Configuration Management (any number of these may require that auditing be enabled.):
<table>
<tr><th>Physical Attributes</th><th>Logical Attributes</th></tr>
<tr><td>CI Name</td><td>System Role</td></tr>
<tr><td>Serial Number</td><td>Primary Capability</td></tr>
<tr><td>Commonwealth Asset Tag</td><td>Capability</td></tr>
<tr><td>Owner</td><td>Complexity</td></tr>
<tr><td>Ownership Type</td><td>Priority</td></tr>
<tr><td>Funding Source</td><td>Storage (currently TPC tool)</td></tr>
<tr><td>Purchase Date</td><td>24 x 7 Access</td></tr>
</table></td></tr>
</table>

		Installation date **Related CIs**

Content	Description
6. Release Management	The process responsible for planning, scheduling and controlling the movement of Releases to Test and Live Environments. The primary objective of Release Management is to ensure that the integrity of the Live Environment is protected and that the correct Components are released. Release Management works closely with Configuration Management and Change Management.
7. Request Management and Fulfillment	The process responsible for managing the lifecycle of all Service Requests.
8. Availability Management	The process responsible for defining, analyzing, Planning, measuring and improving all aspects of the Availability of IT services. Availability Management is responsible for ensuring that all IT Infrastructure, Processes, tools, roles etc. are appropriate for the agreed Service Level targets for Availability.
9. Capacity Management	The process responsible for ensuring that the Capacity of IT Services and the IT Infrastructure are able to deliver agreed Service Level targets in a cost effective and timely manner. Capacity Management considers all Resources required to deliver the IT Service, and plans for short, medium and long term business requirements.

Content	Description
10. Service Level Management (SLM)	The process responsible for negotiating SLAs, and ensuring that these are met. SLM is responsible for ensuring that all IT Service Management Processes, OLAs, and Underpinning Contracts, are appropriate for the agreed Service Level targets. SLM monitors and reports on Service Levels, facilitates Service Delivery Failure actions with the appropriate Governance Committee and holds regular Commonwealth Customer reviews.
11. IT Service Continuity Management (ITSCM)	The process responsible for managing risks that could seriously impact IT Services. ITSCM ensures that the IT Offeror can Always provide minimum agreed Service Levels, by reducing the risk to an acceptable level and Planning for the recovery of IT Services. ITSCM should be designed to support Business Continuity Management.
12. IT Financial Management	The process responsible for managing the Budgeting, Accounting, Invoicing and Chargeback requirements).
13. Information Security Management	The process that ensures the confidentiality, integrity and Availability of an organization's Assets, information, data and IT Services. Information Security Management usually has a wider scope than the Offeror. It normally includes handling of paper, building access, phone calls etc., for the entire organization.

Content	Description
14. Project Management and Support	Project Management and Support will align projects to Commonwealth requirements and deliver projects from request through end-to-end solutioning including turnover to the Commonwealth Customers and validation that project requirements were met in terms of timing, quality, and cost.
15. Service Catalog	A database or structured Document with information about select Services, including those available for Deployment. The Service Catalog is the only part of the Service portfolio published to Commonwealth Customers, and is used to support the request and delivery of select Services. The Service Catalog may include information about Deliverables, prices, contact points, ordering and request processes.
1.4 Financial Management Procedures	
1. Invoicing	The Offeror should describe procedures for invoicing. The content should include procedures for calculating Resource Unit volumes for pricing (per Service Component, as applicable), invoicing of Projects, etc. The content should include procedures regarding disputed invoice amounts.

Content	Description
2. Chargeback	The Offeror should describe procedures for charge back of costs related to the Services and the overall Agreement to the Commonwealth Customers (to include responsibilities and support by both the Offeror and the Commonwealth).
3. Budgeting	The Offeror should describe how it would assist the Commonwealth with the annual budgeting cycle. Process should include estimation of Resource Unit volumes (by Service Component and Commonwealth Customer as appropriate), potential Projects, review cycle, etc. The content should include the responsibilities of Offeror, the Commonwealth, and Commonwealth Agencies.
4. Forecasting	The Offeror should describe procedures for forecasting cost versus budget.
5. Procurement	The Offeror should describe procedures for procurement Services (where Offeror performs procurement on behalf of the Commonwealth, as applicable). The content should include responsibilities and process for both the Commonwealth staff and Offeror.

Content	Description
6. Service Level Credits and Earnback	The Offeror should describe procedures for calculating Service Level Credits on invoices and Earnback calculations.
1.5 Contract Management Procedures	
1. Contract Change Control	The Offeror should describe procedures regarding changes to the Agreement, including changes to any Exhibit or Attachment. Content should include procedures to classify services as a New Service, and resulting process to change the Agreement (including pricing). Content should include notification period and process, authority levels, and escalation procedures for changes to the Agreement.
2. Reporting	The Offeror should describe procedures and activities regarding key standard Reports and requests for ad hoc reports from the Commonwealth and The Commonwealth Agencies.
3. New Service Levels	The Offeror should describe procedures for determining new Service Levels (based on continuous improvement and/or Commonwealth request).

Content	Description
4. Benchmarking	The Offeror should describe procedures for Benchmarking exercises, including determination and agreement of benchmark firm, sample peer group and process used for benchmark, payment for benchmark, review of results, and potential outcome. Content should include dispute resolution process.
5. Auditing	The Offeror should describe procedures for operational and/or financial audits (as required by the Commonwealth auditing and/or regulatory agencies). The Offeror should describe notification process and procedures to resolve audit findings.
6. Offeror Key Personnel and Subcontractors	The Offeror should describe procedures for Commonwealth approval regarding replacement or removal of Offeror Key Personnel and major Subcontractors to Offeror.
7. Dispute Resolution	The Offeror should describe procedures regarding formal dispute resolution process.

Content	Description
1.6 Relationship Management Procedures	
1. Customer Satisfaction Surveys	The Offeror should describe the process to be used for conducting customer satisfaction surveys. Content should include procedures regarding action items and attempts to resolve customer issues.
2. Commonwealth Agencies	The Offeror should describe procedures and responsibilities regarding the relationship between the Commonwealth, the Commonwealth Agencies and the Offeror. Content should include procedures regarding communication and coordination regarding work requests, Service delivery issues, budgeting and financial issues, etc.
3. Authorized Users	The Offeror should describe procedures and responsibilities regarding responding to Authorized Users (including listing of Authorized Users) problems, requests, and questions.

Content	Description
4. Third Party Vendors	Offeror to describe procedures for relationship regarding Third Party Vendors which may provide services, Equipment, and/or Software that are ancillary to (or support) the overall delivery of Services. Procedures and coordination with key Third Party Vendors should be documented.
5. Other Third Parties	The Offeror should describe procedures for any other contact or requests from other Third Parties in regard to the Agreement.
1.7 Offeror Operational Procedures	
1. Operating Level Agreements (OLA)	OLAs are internal "back-to-back" agreements that define how two different Service Component Providers will work together to support the delivery of defined IT Services to the Commonwealth and Commonwealth agencies. The OLAs will define how Service Component Providers will work together to meet the Service Requirements documented in SOWs and Service Level Requirements documented in formal SLAs for the DCS initiative. The OLAs are a set of operational processes that supplements the IT Service Management section of the Commonwealth Computing Procedures Manual providing the second level detail required for individual Service Components to interoperate. Simply stated, the OLA "bolts" multiple Service Components together operationally.

Content	Description
2. Operational Procedures (by Service Component, as applicable)	The Offeror should describe the activities that the Offeror proposes to undertake in order to provide the Services, including those directions, supervision, monitoring, staffing, reporting, Planning and oversight activities normally undertaken by the Offeror which shall be consistent with those Offeror activities used to provide services similar to the Services.
3. Service Responsibility Matrix (SRM)	A map of the Functional Service Areas which potentially overlap Offeror responsibility and Commonwealth responsibility required to deliver business solutions to the business units. A Service Responsibility Matrix will be developed for each such area to delineate which party is responsible for performing select service elements and/or providing assistance or input.
1.8 The Commonwealth Customer Operations Manuals	

Content	Description
1. Individual Commonwealth Customer Operations Manual	The Commonwealth Computing Procedures Manual will also contain specific sections dedicated to operational procedures for Services provided to individual The Commonwealth Customers (each a "**The Commonwealth Customer Operations Manual**"). Each The Commonwealth Customer Operations Manual will address unique operational requirements of the respective The Commonwealth Customer, including operational areas such as the following: • Runbooks • Data safeguarding, use and release restrictions • Data security policies • Disaster Recovery requirements • Notification levels and procedures (e.g. problems and initial Severity Level procedures)

Content	Description
Purpose	The Offeror should describe the purpose of the Commonwealth Computing Procedures Manual. This section should address who should use the Manual, how the Manual is organized, how the initial version and updates will be distributed, version control procedures for the Manual, when updates will occur, and procedures for authorizing and implementing updates. It is intended that the structure of the Manual will require that the individual compliance requirements and business rules of each participating Commonwealth Customer are separately identified where applicable for each section or component part of the Manual.
3.5.2.1 Organizational Overview	
2. Offeror Governance Organization	Include organization charts, description of functions performed, contact information.
3. Offeror Management and Delivery Organization	Include organization charts, description of functions performed, contact information.
4. Key Contacts – Offeror	A list of contacts that are key users of the Services and/or perform a liaison function in regard to the Services (by Commonwealth and Commonwealth Agencies, by location).

Content	Description
5. Key Contacts – Third Parties	A list of key Third Parties (maintenance providers, software providers, telecom carriers, etc).
3.5.2.2 Transition and Support Activities and Responsibilities	
6. Overall Management and Reporting Process	A description of Offeror management structure, reporting, and review process associated with Transition Services and Transformation Services.
7. Critical Deliverables and Milestones	A list of Critical Deliverables, milestones and timeline for the Transition Services and Transformation Services periods.
8. Interim Performance Management Procedures	A description of interim procedures to monitor and coordinate Service delivery, including Problem Management, Change Management, Service Level monitoring and reporting, physical and Logical Security, project management, work authorization, etc. A description of the responsibilities of both Parties.

Content	Description
9. Interim Financial Management Procedures	A description of interim procedures for invoicing, invoice verification, charge back to the Commonwealth Customers, determining Resource Unit volume by Service Component, asset management, asset transfers, forecasting, Commonwealth Customer support, etc. A description of the responsibilities of both Parties.
10. Interim Contract Management Procedures	A description of interim procedures for managing and administering the Agreement including proposed changes to the Agreement, interpretation procedures, issue-escalation process, and disputes. A description of the responsibilities of both Parties.
11. Other Transition and Support Procedures and Responsibilities	Any other pertinent procedures and responsibilities.
3.5.2.3 IT Service Management Procedures	
12. Service Desk	The facilities, associated technologies, and fully trained staff who respond to Calls, coordinate all Incident Management, Problem Management and Request Management activities, and act as a single point of contact for Authorized Users in regard to the Services.

Content	Description
13. Incident Management	The use of people, processes and technology with the primary goal to restore normal Service operations as quickly as possible and minimize the adverse impact on business operations, thus ensuring that the best achievable levels of service quality and availability are maintained.
14. Problem Management	The process, software, techniques and procedures that aid in identification, tracking, communication, and resolution of Problems arising in Customer's IT Environment, and resolving those Problems arising from or related to the Services. The goal of Problem Management is to minimize the adverse impact of Incidents and Problems on the business that are caused by errors within the IT infrastructure, and to prevent recurrence of Incidents related to these errors. In order to achieve this goal, Problem Management seeks to get to the root cause of Incidents and then initiate actions to improve or correct the situation.
15. Change Management	The processes relating to planning and performing all changes in IT environment pertaining to the Services, including changes to individual components and coordination of changes across all components. The Change Management processes will support and include checkpoints to determine any potential or required Change Control Procedures and includes a process of controlling changes to the infrastructure or any aspect of Services, in a controlled manner, enabling approved changes with minimum disruption.

Content	Description
20. Capacity Management	The process responsible for ensuring that the Capacity of IT Services and the IT Infrastructure are able to deliver agreed Service Level targets in a cost effective and timely manner. Capacity Management considers all Resources required to deliver the IT Service, and plans for short-, medium-, and long-term business requirements.
21. Service Level Management (SLM)	The process responsible for negotiating SLAs, and ensuring that these are met. SLM is responsible for ensuring that all IT Service Management Processes, OLAs, and Underpinning Contracts, are appropriate for the agreed Service Level targets. SLM monitors and reports on Service Levels, facilitates Service Delivery Failure actions with the appropriate Governance Committee and holds regular Commonwealth Customer reviews.
22. IT Service Continuity Management (ITSCM)	The process responsible for managing risks that could seriously impact IT Services. ITSCM ensures that the IT Offeror can Always provide minimum agreed Service Levels, by reducing the risk to an acceptable level and Planning for the recovery of IT Services. ITSCM should be designed to support Business Continuity Management.

Content	Description
23. IT Financial Management	The process responsible for managing the Budgeting, Accounting, Invoicing and Chargeback requirements).
24. Information Security Management	The process that ensures the confidentiality, integrity and Availability of an organization's Assets, information, data and IT Services. Information Security Management usually has a wider scope than the Offeror. It normally includes handling of paper, building access, phone calls etc., for the entire organization.
25. Project Management and Support	Project Management and Support will align projects to Commonwealth requirements and deliver projects from request through end-to-end solutioning including turnover to the Commonwealth Customers and validation that project requirements were met in terms of timing, quality, and cost.
26. Service Catalog	A database or structured Document with information about select Services, including those available for Deployment. The Service Catalog is the only part of the Service portfolio published to Commonwealth Customers, and is used to support the request and delivery of select Services. The Service Catalog may include information about Deliverables, prices, contact points, ordering and request processes.

Content	Description
3.5.2.4 Financial Management Procedures	
27. Invoicing	The Offeror should describe procedures for invoicing. The content should include procedures for calculating Resource Unit volumes for pricing (per Service Component, as applicable), invoicing of Projects, etc. The content should include procedures regarding disputed invoice amounts.
28. Chargeback	The Offeror should describe procedures for charge back of costs related to the Services and the overall Agreement to the Commonwealth Customers (to include responsibilities and support by both the Offeror and the Commonwealth).
29. Budgeting	The Offeror should describe how it would assist the Commonwealth with the annual budgeting cycle. Process should include estimation of Resource Unit volumes (by Service Component and Commonwealth Customer as appropriate), potential Projects, review cycle, etc. The content should include the responsibilities of Offeror, the Commonwealth, and Commonwealth Agencies.

Content	Description
30. Forecasting	The Offeror should describe procedures for forecasting cost versus budget.
31. Procurement	The Offeror should describe procedures for procurement Services (where Offeror performs procurement on behalf of the Commonwealth, as applicable). The content should include responsibilities and process for both the Commonwealth staff and Offeror.
32. Service Level Credits and Earnback	The Offeror should describe procedures for calculating Service Level Credits on invoices and Earnback calculations.
3.5.2.5 Contract Management Procedures	
33. Contract Change Control	The Offeror should describe procedures regarding changes to the Agreement, including changes to any Exhibit or Attachment. Content should include procedures to classify services as a New Service, and resulting process to change the Agreement (including pricing). Content should include notification period and process, authority levels, and escalation procedures for changes to the Agreement.

Content	Description
34. Reporting	The Offeror should describe procedures and activities regarding key standard Reports and requests for ad hoc reports from the Commonwealth and The Commonwealth Agencies.
35. New Service Levels	The Offeror should describe procedures for determining new Service Levels (based on continuous improvement and/or Commonwealth request).
36. Benchmarking	The Offeror should describe procedures for Benchmarking exercises, including determination and agreement of benchmark firm, sample peer group and process used for benchmark, payment for benchmark, review of results, and potential outcome. Content should include dispute resolution process.
37. Auditing	The Offeror should describe procedures for operational and/or financial audits (as required by the Commonwealth auditing and/or regulatory agencies). The Offeror should describe notification process and procedures to resolve audit findings.
38. Offeror Key Personnel and Subcontractors	The Offeror should describe procedures for Commonwealth approval regarding replacement or removal of Offeror Key Personnel and major Subcontractors to Offeror.

Content	Description
39. Dispute Resolution	The Offeror should describe procedures regarding formal dispute resolution process.
3.5.2.6 Relationship Management Procedures	
40. Customer Satisfaction Surveys	The Offeror should describe the process to be used for conducting customer satisfaction surveys. Content should include procedures regarding action items and attempts to resolve customer issues.
41. Commonwealth Agencies	The Offeror should describe procedures and responsibilities regarding the relationship between the Commonwealth, the Commonwealth Agencies and the Offeror. Content should include procedures regarding communication and coordination regarding work requests, Service delivery issues, budgeting and financial issues, etc.
42. Authorized Users	The Offeror should describe procedures and responsibilities regarding responding to Authorized Users (including listing of Authorized Users) problems, requests, and questions.

Content	Description
43. Third Party Vendors	Offeror to describe procedures for relationship regarding Third Party Vendors which may provide services, Equipment, and/or Software that are ancillary to (or support) the overall delivery of Services. Procedures and coordination with key Third Party Vendors should be documented.
44. Other Third Parties	The Offeror should describe procedures for any other contact or requests from other Third Parties in regard to the Agreement.
3.5.2.7 Offeror Operational Procedures	
45. Operating Level Agreements (OLA)	OLAs are internal "back-to-back" agreements that define how two different Service Component Providers will work together to support the delivery of defined IT Services to the Commonwealth and Commonwealth agencies. The OLAs will define how Service Component Providers will work together to meet the Service Requirements documented in SOWs and Service Level Requirements documented in formal SLAs for the DCS initiative. The OLAs are a set of operational processes that supplements the IT Service Management section of the Commonwealth Computing Procedures Manual providing the second level detail required for individual Service Components to interoperate. Simply stated, the OLA "bolts" multiple Service Components together operationally.

Content	Description
46. Operational Procedures (by Service Component, as applicable)	The Offeror should describe the activities that the Offeror proposes to undertake in order to provide the Services, including those directions, supervision, monitoring, staffing, reporting, Planning and oversight activities normally undertaken by the Offeror, which shall be consistent with those Offeror activities used to provide services similar to the Services.
47. Service Responsibility Matrix (SRM)	A map of the Functional Service Areas which potentially overlap Offeror responsibility and Commonwealth responsibility required to deliver business solutions to the business units. A Service Responsibility Matrix will be developed for each such area to delineate which party is responsible for performing select service elements and/or providing assistance or input.
3.5.2.8 The Commonwealth Customer Operations Manuals	

Content	Description
48. Individual Commonwealth Customer Operations Manual	The Commonwealth Computing Procedures Manual will also contain specific sections dedicated to operational procedures for Services provided to individual The Commonwealth Customers (each a "**The Commonwealth Customer Operations Manual**"). Each The Commonwealth Customer Operations Manual will address unique operational requirements of the respective The Commonwealth Customer, including operational areas such as the following: • Runbooks • Data safeguarding, use and release restrictions • Data security policies • Disaster Recovery requirements • Notification levels and procedures (e.g. problems and initial Severity Level procedures)

UNISYS RESPONSE:

The Offeror should describe the purpose of the Commonwealth Computing Procedures Manual. This section should address who should use the Manual, how the Manual is organized, how the initial version and updates will be distributed, version control procedures for the Manual, when updates will occur, and procedures for authorizing and implementing updates. It is intended that the structure of the Manual will require that the individual compliance requirements and business rules of each participating Commonwealth Customer are separately identified where applicable for each section or component part of the Manual.

Purpose of the Manual. The Commonwealth Computing Procedures Manual (CCPM) is an enterprise document that reflects the procedures for the Outsourcing Program between Unisys and the Commonwealth. It also provides input from subcontracting units. This manual provides process descriptions that meet contract requirements; represents best practices; includes the key elements of a quality enterprise service delivery process; and is easy to find, read, and understand.

The CCPM provides the best possible guidance for supporting infrastructure and technology for the Commonwealth and your participating agencies during the outsourcing term with Unisys.

CCPM Organization. This manual will be organized according to the outline provided below, which matches the requirements on **Schedule H.** The manual's structure will provide the opportunity for the individual compliance requirements and business rules of each participating Commonwealth customer to be separately identified when applicable for each section or component part of the manual.

Users of the CCPM. This manual should be used by each Commonwealth agency using Data Center Computing Services, all key personnel supporting the operations of the Data Center Computing Services, all Technical Support Services teams for all platforms, the subcontractors and Small Diverse Business Partners, and the Bureau of Enterprise Services (BES).

Document Development Timeline and Distribution. The initial version and updates of the CCPM are a key deliverable that will be developed within the timelines listed in **Schedule D — Transition Milestones Document.** The CCPM will be distributed for contributions and an internal review of the Data Center Computing Service key staff. This manual will then be submitted in accordance with **Schedule** D for the Commonwealth's review and preparation of a draft CCPM. On completion, the CCPM will be posted to the Knowledge Management Portal, where it can be accessed by the Commonwealth Office of Administration and the agencies.

Document Location. The Knowledge Management Portal will provide a central repository, security, and version control for all documents in the interim and through final development. An electronic copy is also located on the Unisys SharePoint portal for Data Centers and the Unisys Project Management Office. The Commonwealth will approve this manual before release.

Document Version Management. Version Control for each portion of the manual will contain a Document Tracking and Document Change History section for version control.

Recurring Document Updates. The Data Center Computing Service Offeror proposes to update this document annually or at the Commonwealth's request to reflect any changes in the operations (customer or Offeror) or procedures to be described therein. When updates to the CCPM are made, the revision will be updated and approved, and submitted to the Commonwealth according to **Schedule H.**

The procedures for authorizing and implementing updates is as follows.

1. Unisys and the Commonwealth will work jointly to create a timeline before any updates are authorized to be started.
2. After the Commonwealth approves the timeline, Unisys and our subcontracts will review and update the manual. The Process Manager will review documents with changes.
3. When all updates are completed, Unisys will send the sections of the manual with changes to subcontractors for review. Any disagreements on the documentation will be discussed between subcontractors and Unisys, and a decision will be made on whether to make the change.
4. The sections of the manual with changes will be sent to the Commonwealth for review.
5. The Commonwealth will submit changes back to Unisys in accordance with the timeline, and Unisys will implement the changes. If there are any disagreements, Unisys and the Commonwealth will meet to discuss them.
6. The manual will be sent with the final changes to the Commonwealth for a final review.
7. The Commonwealth will approve the manual, and Unisys will publish it.
8. The approved manual will be uploaded to the Knowledge Management Portal.
9. A letter of acknowledgement will be sent to the Commonwealth and be signed by the Commonwealth designee and returned to Unisys.

10. A signature acknowledgement letter will be sent to the Commonwealth designee which recognizes the joint and individual contributions to the CCPM by the Commonwealth of Pennsylvania and the Unisys Team. This letter will be signed by all third parties and returned to Unisys.

Document Protections. The security classification (Confidential) and the handling of this document will comply with the Commonwealth and vendor requirements. Controlled accessed to the Knowledge Management Portal will be maintained, and paper copies will be discouraged. The paper copies that exist will be kept in a locked cabinet or office and be shredded when obsolete.

Document Organization. The manual's structure will require each participating Commonwealth customer's compliance requirements and business rules to be separately identified when applicable for each section or component part of the manual. Operation Manuals for each Commonwealth agency will be developed where applicable and maintained by Unisys. These manuals will be located in the Data Center in hardcopy and also on our secure SharePoint site in electronic form.

The CCPM will contain the following information:

Organizational Overview document, which will contain the following documents:

- Offeror Governance Organization
  - Organizational charts
  - Brief description of functions performed
  - Contact information
- Offeror Management and Delivery Organization
  - Organizational charts
  - Brief description of functions performed
  - Contact information
- Key Contacts – Offeror
  - List of contacts that are key users of the services, perform a liaison function for the services, or both (by the Commonwealth and your agencies, by location)

- Key Contacts – third parties
  - List of Third Parties (such as maintenance providers, software providers, and telecommunications carriers).

Transition and Support Activities and Responsibilities document, which will contain the following information:

- Overall Management and Reporting Process
  - Description of management structure
  - Reporting process
  - Review processes for Transition and Transformation Services.
- **Critical Deliverables and Milestones** document will contain the following information:
  - List of Critical Deliverables
  - Milestones
  - Timeline for the transition and transformation services periods.
- **Interim Performance Management Procedures** document, which will contain the following information:
  - Interim procedures to monitor and coordinate Service Delivery noting responsibilities of both parties, including:
    - Problem Management
    - Change Management
    - Service Level Monitoring
    - Reporting
    - Physical and logical security
    - Project management
    - Work authorization.
- **Interim Financial Management Procedures** document, which will contain the following information:
  - Description of interim procedures and responsibilities of both parties for:

- Invoicing
- Invoice verification
- Chargeback to the Commonwealth customers
- Determining Resource unity volume by Service Component
- Asset Management
- Asset Transfers
- Forecasting
- Commonwealth Customer Support
- Responsibilities of both parties.

- **Interim Contract Management Procedures** document, which will contain the following information noting the responsibilities of both parties:
  - Description of interim procedures for managing and administering the Master Services Agreement, including:
    - Proposed changes to the agreement
    - Interpretation procedures
    - Issue-escalation process
    - Disputes.
- **Other Transition and Support Procedures and Responsibilities** document, which will contain the following information:
  - Pertinent procedures and responsibilities.

IT Service Management Procedures

- The **Service Desk** document will contain the following information:
  - Facilities details
  - Associated technologies

- A description of training and staffing procedures
- Coordination of all Incident Management and Request Management activities
- Single point of contact for authorized users in regard to the services.

- The **Incident Management** document will contain the following information:
  - People, processes, and technology used to restore normal service operations as quickly as possible and minimize adverse impact on business operations.
- The **Problem Management Incident Management** document will contain the following information:
  - Process, software, techniques, and procedures that aid in:
    - Identification
    - Tracking
    - Communication and resolution of problems arising in the Commonwealth's IT environment
    - Resolving problems arising from or related to the services
  - Root cause analysis procedures.
- The **Change Management** document will contain the following information:
  - Processes for planning and performing all changes in the IT environment pertaining to the services, including changes to individual components and coordination of changes across all components
  - Change Management Checkpoints.
- The **Configuration Management** document will contain procedures for the following activities:
  - Identifying CIs
  - Recording CIs
  - Reporting the status of CIs
  - Verifying completeness and correctness of each CI
  - Required data fields.

- The **Release Management** document will contain the following information:
  - Process planning and scheduling
  - Controlling movement of releases to Test and Live environments
- The **Request Management and Fulfillment Management** document will contain the following information:
  - Process for managing the life cycle of all Service Requests
- The **Availability Management** document will contain the following information:
  - Process responsible for defining, analyzing, planning, measuring, and improving all aspects of the availability of IT services
- The **Capacity Management** document will contain the following information:
  - Process for verifying that the capacity of IT Services and IT Infrastructure can deliver agreed Service Level Targets in a cost-effective and timely way
  - Plans for short-, medium-, and long-term business requirements.
- The **Service Level Management (SLM)** document will contain the following information:
  - Process responsible for negotiating SLAs
  - Monitoring and reporting on Service Levels
  - Commonwealth customer reviews
- The **IT Service Continuity Management (ITSCM)** document will contain the following information:
  - Process for managing risks that could seriously affect IT services
- The **IT Financial Management** document will contain the following information:
  - Process for managing budgeting, accounting, invoicing, and chargeback requirements
- The **Information Security Management** document will contain the following information:
  - Process for maintaining confidentiality, integrity, availability of organizations' assets, information, data, and IT services. Includes the following:
    - Building access

- Handling of paper
- Telephone calls.

- The **Project Management and Support** document will contain the following information:
  - Aligning projects with Commonwealth requirements
  - Delivering projects from request through end-to-end solutioning, including turnover
  - Validating that project requirements for timing, quality, and cost are met.
- The **Service Catalog** document will contain the following information:
  - A document with information about select services, including those available for deployment
  - The Service Catalog may include the following:
    - Deliverables
    - Prices
    - Contact Points
    - Ordering
    - Request Process.

The **Financial Management Procedures** document will contain the following information:

- Invoicing
  - Procedures for invoicing
  - Procedures for calculation of Resource Unit volumes for pricing
  - Invoicing of projects
  - Handling disputed invoice amounts
- Chargeback
  - Procedures for chargeback of costs related to the services and the overall Master Services Agreement to the Commonwealth customers

- Budgeting
  - Process describing how the Offeror will assist the Commonwealth with the annual budgeting cycle
    - Estimation of Resource Unit volumes (by Service Component and Commonwealth customer)
    - Potential projects
    - Review cycle
    - Responsibilities of Unisys, the Commonwealth, and Commonwealth agencies
- Forecasting
  - Procedure for forecasting cost versus budget
- Procurement
  - Procedure for Procurement Services (when Offeror performs them on the Commonwealth's behalf)
- The **Service Level Credits and Earnback** document will contain the following information:
  - Procedures for calculating and Service Level Credits on invoices.

The **Contract Management Procedures** document will contain the following information:

- Contract Change Control
  - Procedures for changes to the agreement, including changes to any exhibit or attachment
  - Procedures to classify services as a New Service
  - Process to change the agreement (including pricing)
  - Notification periods and process
  - Authority levels
  - Escalation procedures for changes to the agreement
- Reporting
  - Procedures and activities for key standard reports

- Procedures for ad hoc reports from the Commonwealth and your agencies

- New Service Levels
  - Procedures for determining new Service Levels (based on continuous improvement, Commonwealth request, or both)
- Benchmarking
  - Procedures for benchmarking exercises, including:
    - Benchmark firm
    - Sample peer group
    - Payment for benchmark
    - Review of results
    - Potential outcome
- Auditing
  - Procedures for performing operational audits, financial audits, or both (as required by the Commonwealth auditing agencies, regulatory agencies, or both)
  - Notification process and procedures to resolve audit findings
- Offeror Key Personnel and Subcontractors
  - Procedures for obtaining the Commonwealth's approval for the replacement or removal of Offeror Key Personnel and major Subcontractors to the Offeror
- Dispute Resolution
  - Procedures for the formal Dispute Resolution process.

The **Relationship Management Procedures Earnback** document will contain the following information:

- Customer Satisfaction Surveys
  - Process for conducting Customer Service Surveys

- Procedures to include for action items and attempts to resolve customer issues

- Commonwealth Agencies
  - Procedures and responsibilities for the relationship between the Commonwealth, the Commonwealth agencies, and the Offeror
  - Communication and coordination of work requests
  - Service Delivery issues
  - Budgeting
  - Financial issues
- Authorized Users
  - Procedures for responding to authorized users' problems, requests, and questions
  - List of authorized users
- Third-party Vendors
  - Procedures for maintaining relationship with third-party vendors, which may provide services, equipment, and software that are ancillary to (or support) the overall delivery of Services
- Other Third Parties
  - Procedures for any other contact or requests from other third parties in regard to the agreement.

The **Offeror Operational Procedures** document will contain the following information:

- Operating Level Agreements (OLAs)
  - Operational procedures that supplement the IT Service Management section of the Commonwealth Computing Procedures Manual, providing second-level detail required for individual Service Component to interoperate.
- Operational Procedures (by Service Component, as applicable)
  - Activities that the Offeror proposes to undertake to provide the Services, including:
    - Directions

- Supervision
- Monitoring
- Staffing
- Reporting
- Planning and oversight of normal activities

- Service Responsibility Matrix (SRM)
  - Map of Functional Service Areas that potentially overlap Offeror responsibility and Commonwealth responsibility required to deliver a business solution to the business units.
- Service Responsibility Matrix for each area to delineate which party performs select service elements, provides assistance or input, or does both.

The **Commonwealth Customer Operations Manuals** will include the following information:

- Individual **Commonwealth Customer Operations Manual**
  - Overview of the Commonwealth Customer Operations Manual to address unique operational requirements of the respective Commonwealth customer, including:
    - Runbooks
    - Data safeguarding, use, and release restrictions
    - Data security policies
    - Disaster Recovery requirements
    - Notification levels and procedures (for example, problems and initial Severity Level).

Request for Proposal

RFP # 6100022698

Commonwealth of Pennsylvania

Office of Administration

Office for Information Technology

Data Center Computing Services

SCHEDULE M

DETAILED TRANSITION PLAN

(Offeror to provide Offeror's Detailed Transition Plan within the Schedule)

UNISYS RESPONSE:

The Commonwealth Data Center Computing Services contract requires extensive transition, but after evaluating the Unisys Transition Plan, you will quickly see that our team offers what no other vendor can offer: rapid startup of the transition. We deliver continuity of service during transition, strong institutional depth of knowledge to mitigate risks before they become problems, and minimal business impact from our transition approach.

By retaining the Unisys Team, the Commonwealth will continue to benefit from our experience across the broad array of data center expertise. Employing this team will stabilize key data center working relationships instantly, mitigate risky transition processes, and protect the larger flow of Commonwealth projects for Pennsylvania's critical initiatives such as transformation and enterprise architecture upgrades and implementations scheduled for the next 10 to 12 years. Simply put, continuing with Unisys provides solid contract transition and continued service delivery reliability.

Our commitment to service permeates everything we deliver. Transitioning large, complex efforts from an incumbent vendor to a new vendor can be very complicated and risky. When it comes to the enterprise data centers supported for the Commonwealth, consistent operation becomes a critical service—Pennsylvania citizens rely on those systems to be reliable, stable, and available for their needs. Even the most diligent transition plan from other vendors cannot capture the knowledge and experience lost in the departure of current system support staff, especially when many of those team members bring years of experience and history with the Commonwealth and your critical enterprise applications.

The team's productivity is an important consideration for the transition period. With a new vendor, the Commonwealth will incur significant unproductive transition costs funded by taxpayer dollars, and ongoing training of new vendor staff to learn the wide range of Commonwealth systems and priorities.

Furthermore, the Commonwealth has several initiatives identified as priorities in progress; these efforts will likely stretch into and throughout the entire transition period. If the transition is unsuccessful, all of these projects will be at risk. It is clear that additional pressures on funding and requirements from the Commonwealth and federal governments—such as the impact of healthcare reform—make it imperative that the Commonwealth engage a team that can accomplish the transition with no delays and deliver reliable operational support to the full range of agencies affected by the Data Center consolidation.

On top of all that, administration changes across the contract's life may bring new priorities to the Commonwealth, driving adaptation of the delivered architecture, system requirements, and costing. No one is in a better position to provide continuity

and continued productivity throughout the transition and for the contract's duration than the Unisys Team.

As the selected contractor, we will complete the transition to the new contract within 28 months, bringing the data centers to full operations capability within the timeline set forth in the contract. We have a solid plan, schedule, team, and solution architecture.

A new vendor will remain almost solely focused on transition during this period, and likely require extensive additional knowledge transfer and training much beyond our team's level. We know the systems, the operations, and your people. We know what is required for an effective transition. Instead of asking questions during the contract's first few weeks, we will be presenting answers and moving forward to be sure we complete the work on time. No other vendor can do this except for the Unisys Team.

We recognize that you are embarking on a procurement that is different from the current contract and how things are operating today. There are some similarities to our current contract structure, but you clearly specify a number of guiding principles and objectives that are new to you. With our proposal to continue as your Data Center provider of choice, we will help you better achieve your objectives by reducing the risk of a broad transition from a new, untested, untrained team.

Sections 3.1 and 3.2 provide a glimpse into some of the details and the timeline of our transition. A detailed project plan is provided at the end of this section.

Transition Approach

The Unisys approach for the Commonwealth's Transition program includes two major categories of effort.

The first is the Transition of Services, which will concentrate on transferring operational responsibility from the current service provider to the Unisys Team. For services where the Unisys Team is the current provider, the Commonwealth benefits from less risk and faster steady state. This area's key transition events will be the gathering, analysis, and documentation of current state information. The knowledge transfer activities will take the documented information and train the steady state team so its members are aware of all aspects of the environment. Transformation activities will also use this information and with the implementation of the Unisys Team's best practices, processes, and tools to provide excellent service.

The second category is Data Center Migration, which will concentrate on using the knowledge gained during the transition activities, along with stakeholder input and Unisys processes to plan and execute the data center migrations. These activities include a joint team of Commonwealth experts working alongside the Unisys Team to plan and execute the migration activities to minimize risk to the end users of the applications.

The Unisys transition method framework defines the comprehensive projects, processes, and deliverables necessary to effectively and efficiently transition services. This framework combines best practices, industry standards, and open communication to help promote a successful transition. The framework is continuously evolving by incorporating the experiences gained by Unisys through all the transitions undertaken. Our framework promptly predicts and mitigates risk, maintains timescales and minimizes disruption to the Commonwealth's business operations.

The Commonwealth is continuously looking for ways to cut costs, improve efficiency, optimize the use of existing assets, improve service levels, and meet stricter security and compliance requirements. Evaluation, consolidation, standardization, and virtualization of data centers are some of the effective ways to meet these growing needs. In particular, we find that consolidation and optimization of data centers reduce complexity, deliver greater cost savings, and enable effective use of technology and the underlying resources.

Unisys accomplished some very large federal transitions that include the Department of Homeland Security, Department of Agriculture, Transportation Security Administration, and General Services Administration. We developed processes and gleaned from lessons learned to guide our transition leaders while consolidating and transitioning multiple data centers to a few data centers. Unisys recognizes that any large data center undergoes a level of organic growth and a natural evolution over time. The challenge for any IT organization is to take its current, organically grown and matured data center and be able to reconstruct it with minimal user impact, low risk, and low

costs, and in an efficient way. This challenge is further complicated with the absolute requirement to support and maintain the current course while provisioning for the planned future during the transition process.

The Unisys Transition Leadership model is a holistic approach that guides our transition directors and managers through the day-to-day activities. The approach involves four steps:

1. Discover
2. Plan
3. Implement
4. Course Correct.

Discover: Conduct a full inventory all the data centers, applications and agency requirements; identify every component (hardware, software, interface, document) and determine the disposition for each component in each data center (move, decommission, leave in place, and so forth); monitor changes to data centers and maintain the discovery documents, using the inventories; and initiate modeling of the transition activities.

Plan: Gather the findings of the discovery task; analyze them to build a cohesive transition plan; validate the estimates, dependencies, and status for each data center component. Identify other agency activities, plans, and projects that will intersect with transition activities. Resolve the collision between the projects. Conceptualize the overall plan, staff the plan, and cost the plan. Assess the risk of the schedule, staffing, milestones, deliverables, and all aspects of the transition. Identify and implement mitigations. Document the Transition Plan for coordination, review, and approval by the Commonwealth.

Implement: Use the plan and schedule to drive the transition. Manage the resources to execute the schedule. Measure progress with metrics and quality assessments; control the assigned staff to enable them to move as a unit, always working toward common goals.

Course Correct: Conduct governance meetings staffed by senior Commonwealth stakeholders and senior Unisys stakeholders. Discuss issues; work the issues closely to closure. Conduct risk assessments as part of the summit meeting. Identify risks, define mitigation for the risks, and contain each risk. When needed, adjust the schedule (not the milestones), adding staff, adjusting methods, and improving performance, to meet the milestones. Oversee the implementation of mitigation and make risk contingency plans available as a backup if mitigation fails.

Unisys garnered these four steps from years of transition support and refined them during post-transition meetings, reviewing the progression of events, approaches that worked, and others that required extensive attention to confirm they worked as

planned. The Transition and Migration lessons learned table (**Table M-1**) displays the key lessons learned that are applicable to the Commonwealth's transition.

Table M-1. Transition and Migration Lessons Learned

Topic	Finding	Value to Commonwealth
Inventory	Use heterogeneous and comprehensive tools to discover, identify, and document current architecture, systems, applications, and hardware components.	Generates significant savings in time during discovery and eliminates unknowns during implementation.
Control	Define roles and responsibilities of all parties involved, especially when multiple providers are involved in a solution.	Provides a clear line of communications among vendors and reduces project delays.
Budget	Identify funding constraints at the project's beginning.	Understanding funding availability (how much and when) will drive certain technical solutions and avoid major delays on the project.
Modeling	Perform technical reviews of transition solutions for each individual system, application, and hardware component.	The Unisys methodology and toolset allows for very sophisticated modeling capability throughout all phases of the project, which will provide the Commonwealth with the needed agility, accountability, and decision-making capability.
Communication	Workgroup and status meetings that include all technical team members are a key to a complete end-to-end solution.	This provides a forum to discuss plans with key stakeholders, creating a complete solution that avoids re-planning during implementation.
Problem Solving	A tiger team comprised of a member from each responsible area resolves technical issues as they arise during the migration of major systems. For example, a tiger team might include a network engineer, firewall engineer, and systems and application engineer	This provides quick resolution when problems arise during implementation, reducing user downtime and other operational impacts.
Schedule Updates	Identify required schedule adjustments and obtain approvals in advance to avoid delays. Approvals may be required from multiple change management boards if more than one provider is involved in the total management of the data center infrastructure.	Eliminates implementation delays due to lack of coordinated change board approvals that take into account all the elements affected by schedule adjustments.
System Access	Identify and define required user access firewall rules well ahead of the implementation. Test and implement the firewall rules before the cutover to the new systems.	Enables all users requiring access to specific resources to have the necessary system access, reducing user downtime and operational fixes.
Security Planning	Involve the IT security group during planning and obtain tentative approvals for the migration solution.	Involving security professionals during planning enables the solution to be complete and approved by change boards in a timely way.

Building on the Unisys Transition Leadership model and our transition lessons learned, our transition approach implements the new services while maintaining business as usual minimizing impact on end users. No major improvement or transformational

activities should be undertaken during the transition. The transaction's major activities include:

- Establish the Governance Board and the Communication Plan to enable the transition to occur smoothly and be in place to quickly resolve inter-organizational issues
- Plan any knowledge transfer required for the future delivery of the transitioned services
- Perform gap analysis between the SOW and the current operational environment and develop the necessary adjustments to meet all the Commonwealth's requirements and expectations
- Establish the specifications for system, processes, and tools required for delivery of services in the future state environment
- Develop and produce the Commonwealth Computing Procedures Manual
- Establish future organizational structures and the implementation of organizational changes
- Prepare the Transition Project Plan, which after review and approval by the Commonwealth, will be the roadmap to orient all transitional activities until the transition of services is achieved. When the Commonwealth decides to transition services first then transform the infrastructure, transition of services will end when Unisys takes full control at the transition's end. After a stabilization period, the transformation can begin.
- Migrate and consolidate existing data centers such as the DPH and the agency data centers to the Unisys Managed Data Centers.

Transition Plan

Transition Governance

Transition leadership will organize the transition team into projects. Each project will be driven by a project charter and schedule. Project managers will make project-level decisions and conduct project activities at the lowest possible level in the project's structure. Issues, regardless of where they come from or how they surface, will be reported to the appropriate transition manager to be logged and managed. Issues can be acted on (including closure) by any transition leader, including the Transition Executive.

Risks affecting the project can be suggested and reported by anyone but will require approval from the Transition Executive to officially open a project-level risk.

When appropriate, these items will be escalated to the Steering Committee, the Program Manager and/or the Executive Sponsor for action, depending on their severity, and time sensitivity.

Issue, risk, and change management will follow the standard process described in this section.

Transition Focus

The Unisys transition will address Commonwealth and federal laws and regulations intended to support internal controls and provide governance over operational data centers—primarily to reduce costs and waste, manage risk, and promote the public welfare. Unisys will demonstrate compliance with these various regulatory controls and strategic goals. Our program and solution governance brings compliance with security considerations, staffing considerations, milestone requirements, and transfer of control. The overall transition solution will enhance the Commonwealth's presence across Pennsylvania. Activities affected by the transition are:

- Facilities
- Staff Training
- Data Center Consolidation
- Data Center Architecture
- Service Portfolio
- Enterprise Services Catalog
- Service Level Agreements
- Configuration Management
- System and Services Acquisition
- Physical and Environmental Protections
- Identification and Authentication

- Access Control
- System and Information Integrity
- Audit and Accountability
- Contingency Planning
- Data Recovery.

Transition Plan Components

The Unisys Transition Plan will contain a transition description, transition scope statement, and list of transition deliverables. The Transition Plan also will contain the components in **Figure M-2**. A detailed description of each Transition Plan component is provided in the following pages.

Figure M-2. Principal Unisys Transition Plan Components

Unisys Transition Plan Component	High Level Description
Transition Methodology	The Transition method is accomplished in five phases: Planning, Assessment, Design Validation, Deployment, and Handover.
Transition Staffing	The Transition team consists of a Transition Executive, Deputy Transition Executives, Project Managers, and various specialized team members. They work together to accomplish the goals and objectives expressed in the Transition Schedule.
Roles and Responsibilities	Each member of the Transition team has a clearly defined role and specific responsibilities. Their assigned tasks are specified in the Transition Schedule. Each assigned task is allocated to a specific milestone and deliverable. Status meetings confirm all are working on the assigned tasks in the schedule.
Communications Plan	• Team Meetings • Status Reporting • Summit Meetings
Transition Deliverables	Complete list of Transition Deliverables is developed during the planning process along with those in Schedule K.
Transition Schedule	List of tasks organized into activities grouped to meet milestones and deliverables. Structured in a work breakdowns format; presented in Microsoft Project; and provides the task's description, duration, start date, end date, dependencies (on other tasks, deliverables, and milestones), and assigned resources.
Transition Controls	• Transition Metrics Collection • Schedule Management • Risk Management • Issues Management • Change Management
Transition Quality Management	• Quality Audits • Quality Reviews

The plan component discussions that follow are briefly presented to deliver a concise understanding of the Unisys process for developing the final Transition Plan delivered to the Commonwealth.

Transition Methodology

The Unisys Transition methodology combines Gartner best practices, and industry standards with open communication to promote collaboration among Unisys, the Commonwealth, and business partners to make the transition a success.

Unisys follows a phased methodology using our Service and Solutions Delivery Framework (SDF). The Unisys SDF methodology prescribes that the transition be divided into the five phases in **Figure M-1.**

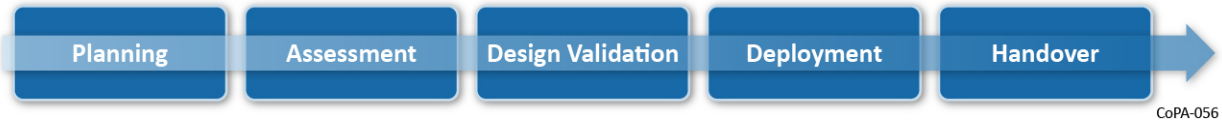

Figure M-1. Service and Solution Delivery Phased Methodology

The Transition methodology used by Unisys is a pragmatic phase-by-phase approach for each deliverable, which provides milestones that the Commonwealth can use to provide input and monitor progress. The Unisys Transition team will not exit a phase until the Commonwealth has had the opportunity to evaluate and approve the transition activities for the current phase. The objective of this approach is to provide the structure for managing the transition with the lowest risk while providing the Commonwealth with visibility and management control throughout the transition. Unisys keeps this methodology in constant evolution by incorporating the experiences we gained from many previous transitions.

The following narrative addresses the five phases of the Unisys Transition methodology in detail.

Planning Phase

During this phase, the Commonwealth and the Unisys Team will work to build the work plan to define the transition tasks and outlined resources required.

The Unisys Transition Executive will structure work packages by the respective project teams and continuously monitor completion of tasks and deliverables. Transition progress will be formally updated and analyzed weekly in the Project Plan. Corrections to the Project Plan will be made when necessary and agreed to in the mutually agreed change control procedures outlined as part of the Transition Governance Plan.

This phase will provide:

- An updated and agreed Transition Project Management Plan
- A detailed plan of activities required to achieve the transition (the Transition Schedule)
- The acceptance criteria for the services provided through transition
- Transition interfaces and dependencies

- Risk management and mitigation plans
- The Unisys and Commonwealth combined resource plans
- Communication plans
- The Unisys governance framework

Detailed planning will be the responsibility of Unisys, with assistance and input from the Commonwealth as reasonably required and will be signed off and agreed on by Unisys and the Commonwealth.

Assessment Phase

Assessment is the second phase of work following completion and approval of the Planning phase. Unisys will commence the knowledge gathering exercise to capture and document operational information that will be required to design and validate the solution to be delivered. This operational information includes details of current performance reporting processes, organization, business context, and users. An in-depth assessment of the Commonwealth's environment and the current procedures is critical to enabling a successful implementation of the solution. This data is used throughout the transition to validate that the solution design is implemented to meet the Commonwealth's business needs and verify that gaps between the current mode of operation and the future mode of operation are identified and remediated.

Representatives from each service stream and the Knowledge Management team will work with the Commonwealth to perform a detailed analysis at all levels of the operations to verify that all aspects are correctly evaluated and understood. The Subject Matter Experts (SMEs) and Knowledge Managers will meet with designated representatives of the Commonwealth and the incumbent agency providers to assess all needed processes and gather historical and current data to validate and finalize our proposed solution. To support these activities, Unisys developed tools, templates, and checklists that cover the various aspects of the business for the service streams. To enable a smooth transition, Unisys will define how the knowledge that is currently with the Commonwealth or the third party, and incumbent agency providers will be captured with the Commonwealth's support.

During the Assessment phase, Unisys will also review support category types of incidents and determine which types of incidents can be performed by the Service Desk to provide resolution as soon as possible. Unisys also will assess server and storage infrastructure and outline any areas of opportunity for cost reduction where the Commonwealth could look to migrate to a cloud-based infrastructure solution. The goal for doing this will be to reduce the manual effort of notifying third parties and provide the Commonwealth with a single view of the enterprise support using the Unisys ITSM solution.

On completion of the Assessment phase, the findings will be reviewed internally at Unisys and then jointly between Unisys and the Commonwealth. The assessment findings document will outline all gaps discovered and remediation plans for those

gaps. Unisys will request formal approval from the Commonwealth on the assessment data so we have a proper baseline from which to start. This approval from the Commonwealth will also signify the completion and acceptance that the Assessment phase is completed.

The Assessment phase will deal with the following actions and deliverables:

- Gather Commonwealth, incumbent agency provider, and third-party performance data Gather Commonwealth, incumbent agency provider, and third-party performance reporting processes and examples
- Gather the Commonwealth IT Services retained organizational model (current and near-term)
- Review staff position responsibilities
- Gather Commonwealth, incumbent agency provider, and third-party interviews
- Conduct workshops with the Commonwealth, incumbent agency provider, and third-party current operational management teams
- Capture documentation on current operational processes
- Capture list and deployment timelines for current and near-term IT projects
- Capture documentation on current operational issues
- Conduct a risk assessment.

Design Phase

The Design phase focuses on finalizing the strategy for developing processes, as well as implementing and deploying a governance structure to manage the current mode of operations. Unisys will design the reporting information consolidation (where possible), organization, and management structure required for managing the current services. The Commonwealth will review and approve the technical designs, plans, processes, and interfaces to confirm that they align with the Commonwealth's requirements. Unisys will conduct go/no-go reviews with the Commonwealth before discontinuing any services from the current systems to the new proposed systems. On successful cutover, Unisys will work with the Commonwealth to conduct post-implementation reviews as well as capture lessons learned and communicate them to all the stakeholders.

This phase will deal with the following actions and deliverables:

- Analyze documentation on the Commonwealth's current mode of operations
- Review the Commonwealth's requirements and expectations
- Review assessment analysis
- Update the risk assessment
- Develop end-to-end process flows for reporting on performance
- Develop the organizational structure for oversight by Unisys operations
- Design the billing process and reports
- Develop billing testing parameters
- Develop testing parameters for consolidated performance reporting

- Review and mutually agree on the feasibility and an approach to implementation of any immediate service improvements
- Agree with the Commonwealth on all the changes to be integrated into the Transition solution design for the current mode of operations.

Deployment Phase

The Deployment phase's activities will be based on the analysis and reviews performed in the previous phases of transition. In this phase, the Transition teams will deploy the resources, processes, tools, and operational solutions, as outlined and agreed by the Commonwealth in the Design phase. The Deployment phase consists of the following steps:

- **Implementation of Tools, Processes and Procedures –** The Transition teams will use the documents and standards from the design phase to implement processes and procedures for supporting the new environment.
- **Data Center Migrations –** The Data Center migrations will occur in accordance with the mutually agreed schedule established in the Planning phase.

Handover Phase

In the Handover phase, the Transition team will finalize all necessary documentation; verify that all processes, procedures, and tools are functioning according to the approved plan and design; review the implementation strategy; review and approve the plan; and hand the ownership of each in-scope service work stream over to the Unisys Agency Account Manager and Steady State team.

As a final activity, lessons learned are conducted and reported back to the Transition Management teams for inclusion in subsequent service deployments. Lessons learned will be solicited from members of the Commonwealth as well as from the Transition and Account teams.

Transition Staffing

Our transition staffing includes the Transition Executive, Deputy Transition Executives, Project Managers, the management team, project steering committees, and the individual transition experts we organized into a cohesive team.

Transition Executive

Unisys appointed a Transition Executive, [redacted] who is responsible for all aspects of delivering the transition, including milestones, meeting of key deliverables, communications, and the identification and assignment of transition resources. The Unisys Transition Executive will represent Unisys as the single point of contact (SPOC) during the transition, provide oversight and direction, and monitor the transition's overall status. The Unisys Transition Executive's role includes:

- Managing all aspects of the Transition program, including planning, staffing, finance, and implementation of transition deliverables
- Maintaining overall business relationship with Unisys, the Commonwealth, and business partners
- Overseeing that all communication is made according to the Communication Plan
- Confirming that resources participating in the transition program have a common understanding of needs of both businesses and the program's deliverables
- Agreeing on the scope, timelines, costs, and delivery timetables for each tower, confirming they are consistent and complementary with the Transition program's objectives
- Establishing effective controls and procedures for the Transition program
- Monitoring progress with all areas contributing to the program
- Reporting the transition's status to all program stakeholders
- Managing professional team performance to meet all transition objectives on time and within budget and quality
- Identifying and resolving conflicting transition priorities
- Managing internal and external relationships and expectations for a successful transition
- Conducting project and program implementation reviews to measure the transition's actual performance against the goals.

Unisys expects that the Commonwealth will also appoint a Transition Executive who shall have the following roles and responsibilities:

- Supporting Unisys tracking and reporting of the transition's progress
- Supporting Unisys management of the transition's key risks and issues
- Informing the Commonwealth's business areas of the transition activities relevant to them and that Unisys is managing the process
- Understanding and agreeing to follow the Unisys Transition Methodology Framework described in this proposal section
- Serving as the SPOC to all matters related to the transition on the Commonwealth stakeholders' behalf
- Assigning the necessary quantity and quality of resources to complete all activities under the Commonwealth's responsibility as planned
- Negotiating and agreeing to changes to the Transition Plan when circumstances caused by new findings justify those changes
- Contributing relevant information for inclusion in the Transition Plan and other transition documentation
- Facilitating the generation, ownership, and implementation of the Commonwealth's plans for management and transition in individual service streams
- Attending and chairing (as agreed and appropriate) designated transition review and progress meetings
- Liaising with any existing suppliers and third-party contributors to the transition, as appropriate.

Transition Team

The Unisys Transition program is organized into major activity-focused teams reporting to a senior member of the Transition Program Management Office.

Figure **M-4** shows the structure of the Unisys Transition Team.

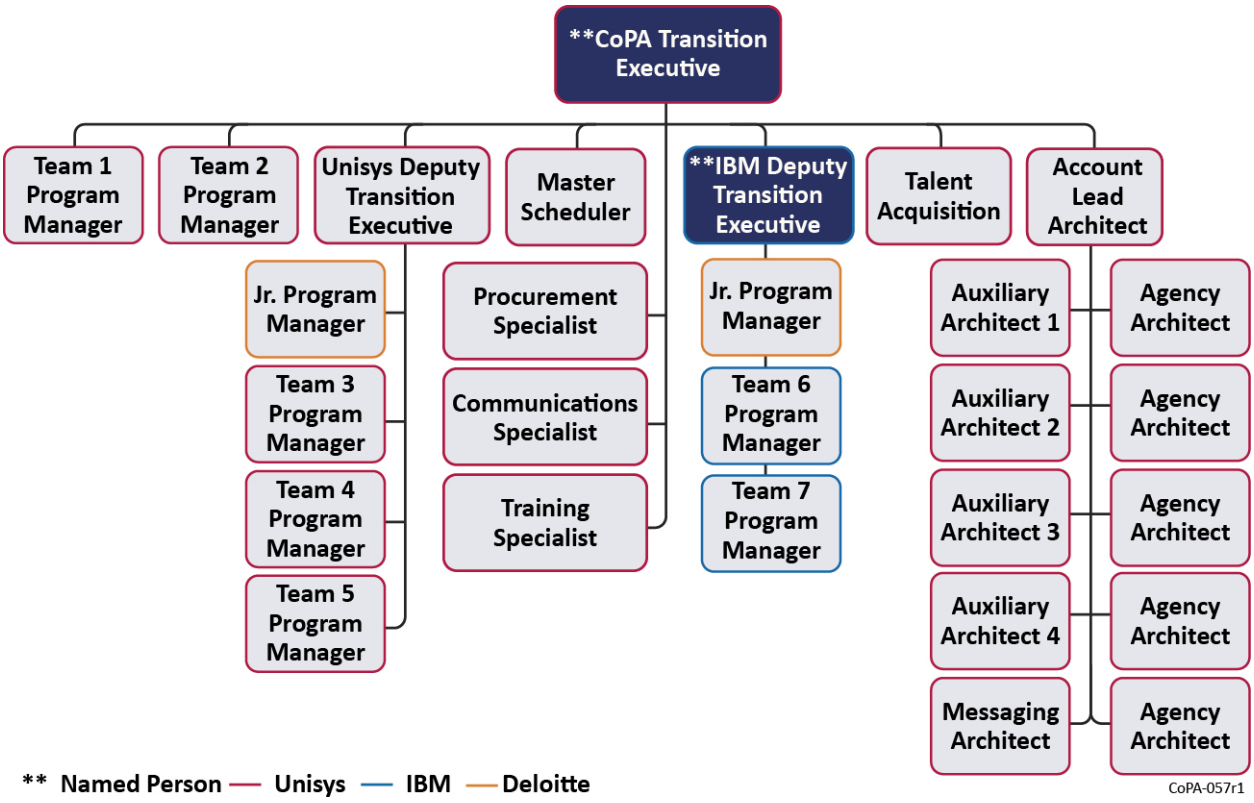

Figure M-4. Transition Program Management Office Structure

Each team has a distinctive purpose and membership. The teams are working teams whose members are actively engaged in the transition. Collectively, their tasks are defined on the Transition Schedule. They are organized to implement the Transition methodology under the watchful eye of the Transition Program Management Office.

During the planning sessions, transition staff will be organized into Teams. Unisys will identify a powerful group of experts to support each team. Each team will have a role in the Unisys Transition program, and each expert will have responsibilities individually assigned. At the transition kickoff meeting, the roles and responsibilities will be briefed to the entire team so each team member knows what he or she is responsible for and how his or her actions affect the larger group. **Figure M-5** provides a high level overview of the roles and responsibilities for each member of the Transition team.

Team Member Role	Team Member Responsibilities
Transition Executive	Responsible for the overall success of the program's goals and objectives
Deputy Transition Executives	Each will oversee a subset of the planning, design, and implementation of the data center migration projects.
Project Managers	Develop project plans and cause the project plans to be executed. They will work with individual agency leads and applications owners to communicate with stakeholders.
Project Coordinator/Jr. PM	Supports Deputy Transition Executives and Project Managers by taking meeting minutes and coordinating meetings.
Technical Implementation Engineers	Responsible for various technical disciplines including Mainframe, AIX, x86 (Windows and Linux), Network, Security, ITSM, Storage, Backup, and Monitoring. Will include technical knowledge of subject matter and tools for implementation and processes.
Master Scheduler	Establishes Microsoft Project standards, consolidation of working project schedules, and reporting.
Procurement Specialist	Verifies that all team members know and understand the procurement process. Assists TIEs with securing BOMs; PO approval; and the tracking, expediting, and receiving of orders. Also notifies appropriate team members when orders are received.
Talent Acquisition Specialist	Confirms that all team members know and understand the staffing process, assists team members with tracking, expediting, and receiving staffing requisitions.
Training Specialist	Coordinates all training needs for the Account PMO and Transition PMO teams, including use of facilities for training, coordination of third-party training required for the transition, and possibly support for the development of account-specific training needs.
Communications Specialist	Confirms that all communications to the Commonwealth and Commonwealth stakeholders are timely, accurate, and professional.
Account Lead Architect	Confirms that overall Commonwealth Supported Architecture meets or exceeds requirements, is documented, and is implemented within quality standards.
Agency and Auxiliary Architects	Responsible for agency- and tower-specific architectures as determined by the Agency Infrastructure Architect.

Figure M-5. Transition Roles and Responsibilities

Approach to the Transition Communications Plan

Communication is the cornerstone of the Unisys Service Transition Methodology (see **Figure M-6**). Our transition organization's structure enables rapid communication of issues, thereby preventing issues from affecting quality, project timelines, and end users' experience. The Unisys Service Transition Methodology will include the Commonwealth every step of the way to enable us to understand your steady state and evolving needs so key personnel are retained or added quickly and mission performance, SLA attainment, and customer satisfaction are not compromised during the transition.

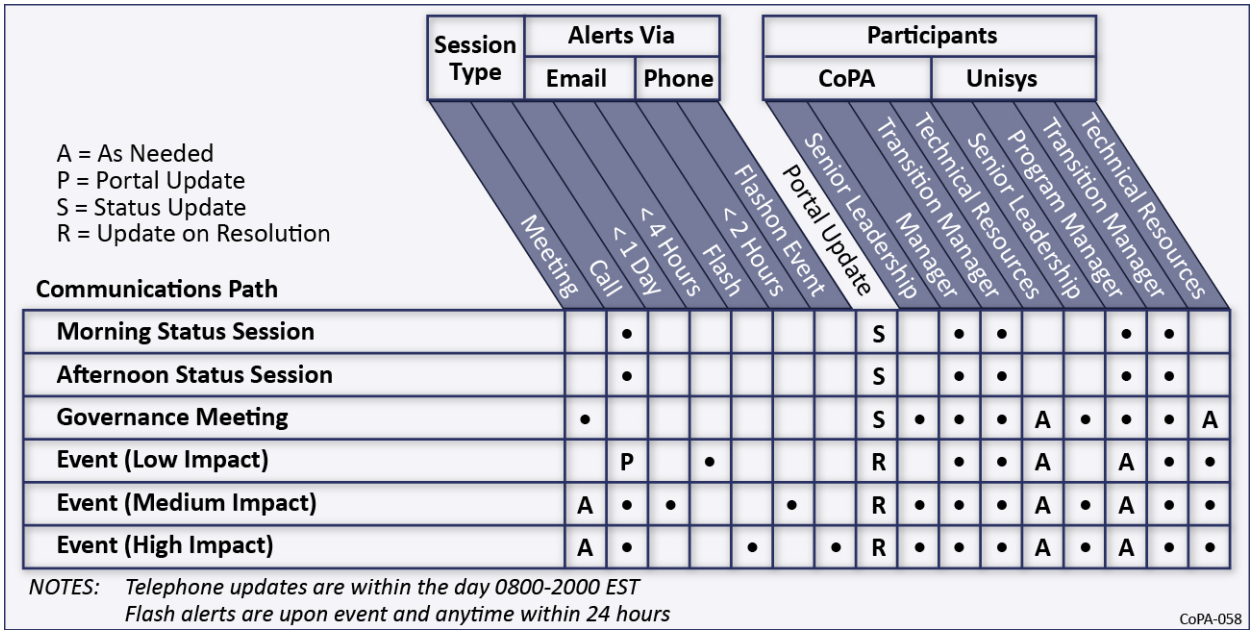

Figure M-6. Unisys Communication Management Approach

Throughout the process, Unisys will enable the Commonwealth's agency project contacts to be fully engaged through an aggressive, three-touch communications strategy. Using this strategy, we will contact agency designated contacts at least three times by using various techniques and media appropriate to your environment before any change affecting them occurs. This process is critical to help overcome resistance to change and minimize confusion. **Figure M-6** depicts our communication management approach for the transition project's delivery.

Transition Status Reporting Approach

The Unisys Service Transition Methodology defines the process steps for managing transition performance and progress reporting, which involves a standard set of reports developed to keep program stakeholders updated on the different aspects of transition work. In addition to the standard reports, Unisys and the Commonwealth can agree on different types of reports to keep the project sponsors and key stakeholders informed of the program's performance and progress.

The standard set of reports is designed to disseminate information on the following aspects of the program:

- **Status and Progress Reports –** Focus on the results achieved in comparison with the plan. Monitor performance (whether the responsibility of Unisys, the Commonwealth, or any third party) against the Transition Plan, documenting significant issues and related information about the actions underway, and informing constituents of upcoming activities.

- **Meeting minutes and ad hoc reports –** Document meetings, discussions, and decisions on several levels of the program, such as the Transition Steering Group, Program Steering Group, any other relevant meetings, and where decisions about the transition are made.

Each week during the transition, unless otherwise requested by the Commonwealth, Unisys will provide the Commonwealth a detailed progress report that describes the following:

- Summary reports including completion statistics, issues encountered, failures, and problems
- An executive-level summary of the transition's progress to date, including an updated summary project schedule and project highlights
- An updated Gantt chart detailing the status of all transition activities (including slippages, changes from the previous plan, and so forth in line with project management best practices)
- A list of all transition milestones, including estimated time to completion, days overdue, contract completion date, actual completion date, comments, and a RAG (Red, Amber, Green) report
- A list of all unresolved issues with the execution of the Transition Plan, including those for which the Commonwealth has primary responsibility, along with due date, priority, responsible party, and an assessment of the potential and actual business impact on the Transition Plan.

Requirements for quality reports will be defined in the detailed transition program planning process. **Figure M-7** shows the structure of transition status governance.

Structure	Timing	Participants	Goals/Agenda
Program Steering Committee	Weekly	• Commonwealth Program Sponsor (Chair) • Commonwealth Transition Executive • Commonwealth Program Steering Committee (3 or 4 representatives of key agencies) • Unisys Engagement Executive • Unisys Enterprise Architect • Unisys Service Delivery Executive • Unisys Transition Executive • IBM Deputy Transition Executive	• Review the transition program's status • Review the transition program's risks and mitigation plans • Discuss and resolve any open issues with the transition program • Discuss and resolve any contractual items related to the transition program or the services
Transition of Services Project Management	Weekly	• Transition of Services Project Manager • ITSM Project Manager • Commonwealth Transition Sponsor	• Review the status of each transition project, including progress against Transition Plan milestones and the status of milestones and

Structure	Timing	Participants	Goals/Agenda
		• Commonwealth Project Steering Committee (3 or 4 representatives of key agencies in the EDC) • Unisys Service Delivery Executive • Unisys Transition Executive • IBM Deputy Transition Executive	deliverables • Review open actions and information requests • Discuss and resolve any issues identified by the transition work streams • Discuss and action any planned changes • Identify any issues or contractual items that require escalation to the Program Steering Committee
Agency Data Center Migration (DCM) Project Work Streams	Weekly	• Agency Data Center Migration Project Sponsor • Agency DCM Director • Application Owners • Unisys Agency DCM Project Manager • Unisys Agency/Service Architect • Unisys Agency Account Manager • Unisys Service Delivery Manager • IBM or Unisys Deputy Transition Executive	• Report progress against DCM Plan milestones • Review open actions and information requests • Discuss and resolve any issues identified by the work stream • Discuss and action any planned changes
Data PowerHouse Data Center Migration (DCM) Project Work Streams	Weekly	• DPH Data Center Migration Project Sponsor • DPH DCM Director • Application Owners • Unisys Agency DCM Project Manager • Unisys Agency/Service Architect • Unisys Account Manager • Unisys and IBM Deputy Transition Executives	• Report progress against DCM Plan milestones • Review open actions and information requests • Discuss and resolve any issues identified by the work stream • Discuss and action any planned changes

Figure M-7. Transition Status Governance Structure

Approach to Transition Team Meetings

Before the first meeting, Unisys will develop meeting agendas, including a dashboard status report for each meeting that the leader will distribute before the meeting. **Figure M-8** lists the types of meetings, their purpose, attendees, and standard frequency.

Meeting	Purpose	Attendees	Frequency
Daily Transition Standup (Unisys Internal)	Results from the previous day and today's plans	Transition Tower Leads, SMEs, and Transition Manager	Daily
Daily Transition Meeting with the Commonwealth Transition Manager	Review of the transition's activities and status	Commonwealth and Unisys Transition Managers and Transition Tower Leads	Daily
Program Management Review	Status of the transition and the implementation	Commonwealth Senior Managers, Unisys Account Executive, and Transition Managers	Twice a week
Change Advisory Board	Review and approval of change requests	Change Control Board members	Weekly
Risk Management Review	Review of risks and issues	Transition Managers and Transition Tower Leads	Twice a week
Ad Hoc Meetings	Discussion of one or more transition-specific topics	T.B.D.	As needed

Figure M-8. Types of Meetings

Transition Deliverables

Unisys does not promise instant gratification with a one-time, "big bang only" approach to deliverable production. Credible transitions take careful planning. We work with Commonwealth stakeholders to establish goals, develop strategic plans, and deliver products and documents that maximize productivity during transition. Each subsequent task in our transitions builds upon the success of the previous one—introducing efficiencies that traverse the overall timeline.

The Unisys approach to data center transition planning drives our top-down approach. With decades of experience in transitioning mission-critical data center environments, Unisys Team is considered expert in business and IT Services—delivering on the needs for a service-structured enterprise. The key transition deliverables in **Schedule K** and other deliverables identified during the Planning phase will be included in scope of the Transition Plan.

Transition Schedule

Data center transition is not a destination; it is a journey that requires thoughtful planning. Unisys views transition as the process through which the Commonwealth Data Centers are prepared for the next generation. The transition does not happen overnight. However, Unisys experience with data center transformation enables us to use best practices and proven tools that accelerate the process and convert time to value. Our Transition Schedule is displayed in **Figure M-9.**

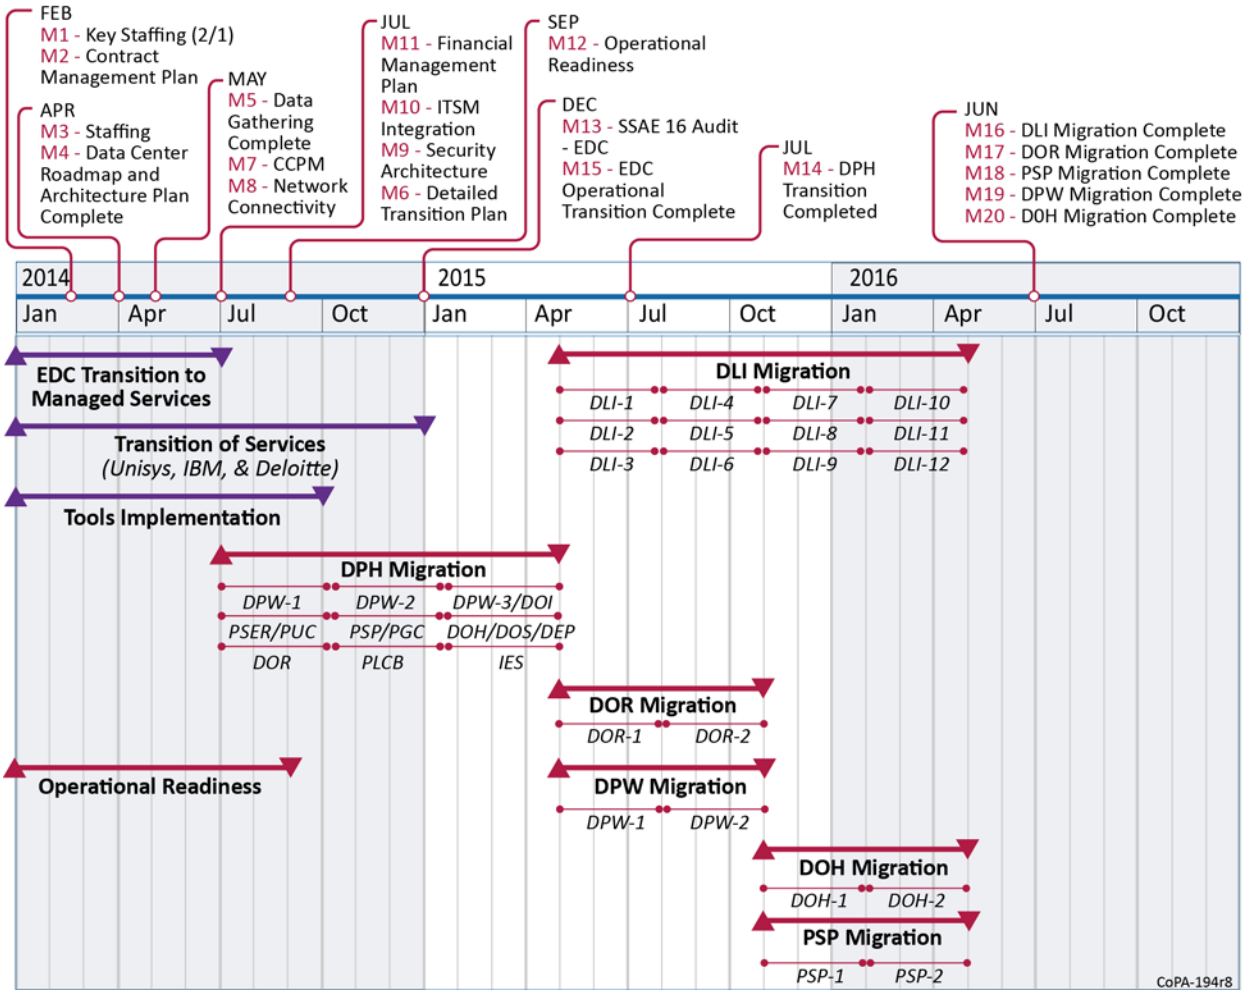

Figure M-9. Transition Schedule

Transition Controls

The Commonwealth Data Center Transition Program will implement three types of project controls to oversee the various projects and activities: Risk Management, Issue Management, and Change Management.

Transition Risk Management

Each Transition team member will document risks, as soon as they are identified, on the Transition Program Risks Log, along with an assessment of the severity, potential impact, and mitigation approach. The Transition Program Risks Log is a dynamic document, which will be reviewed weekly during the progress review meetings. Actions to address, eliminate, or mitigate the risks shall be included in the Transition Program Project Plan, and the Transition Program Issues and Risk Regiser shall be

cleared, as appropriate. Issues and risks that cannot be addressed by the Transition Managers will be escalated to the Program Steering Committee for resolution. The Transition Risks Management Process will follow five basic steps.

Step 1 – Risk Identification

Risk identification is an ongoing process, which is performed, monitored, and updated regularly. Unisys, the Commonwealth, and third parties can all raise concerns about new findings, which can represent issues or risks that can adversely affect the development of activities, the quality of services, or both.

All issues and risks are documented in a specifically defined, tangible item, which can be fully understood, and specific actions can be devised to mitigate or eliminate the problem. Once identified and clearly defined, the risk is documented on the Risk Register for review.

Step 2 – Risk Analysis

Once identified, the risk is will be analyzed to evaluate the events that can trigger the risk, probability of occurrence, and impact on the transition or business. These measures are relevant to determine risk response and priority to be adopted on a scale from lower impact/lower probability to high impact/high probability.

If the risk is determined to adversely affect the transition, the Transition and Project Managers will assign an owner to collect further information and derive options that can be used to mitigate or eliminate the risk.

Step 3 – Risk Mitigation Strategy Definition

This step will (1) analyze the options to mitigate or eliminate the risk and (2) define the risk response if the risk does occur. Basically, this is accomplished by outlining actions and activities to either prevent a risk from occurring or reduce the impact or consequences of its occurrence (or do both) as well as establishing in advance the contingency plan to be activated in case the efforts to prevent the risk fail. An important part of the risk mitigation strategy will be the definition of the level of control that shall be performed during the timeframe for the risk life cycle.

Step 4 – Risk Monitoring

Risks included on the Risk Register will be monitored systematically to understand whether the new events increase or decrease the probability and impact of occurrence in accordance with the level of control defined in the previous step. If changes in the risk parameters happen, the mitigation plan will be reviewed and the Risk Register updated, as appropriate.

Step 5 – Risk Closure

If during the monitoring process, the change to the risk parameters are related to a situation in which the event that triggers the risk, the probability of occurrence, or the impact on the business are no longer valid; the risk will be closed and the Risk Register updated accordingly.

Transition Issue Management

An issue is any item that is perceived as a problem, which is still not formally addressed for resolution. Similar to risk treatment, each team member will document issues, as soon as they are identified, on the Transition Issues and Actions Log. The Transition Issues and Actions Log will be a dynamic document, which contains both a description of the issue and the actions needed to address the issue, including the owners and deadlines for the planned actions.

The Transition Issues and Actions Log shall be reviewed weekly during the progress review meetings. Once the activities to address an issue are identified and agreed, these activities will be included on the Transition Schedule, and the Transition Issues and Actions Log shall be cleared, as appropriate. Issues that cannot be addressed by the Transition Managers will be escalated to the Program Managers for resolution.

The Issues Management process can be described in four basic steps.

Step 1 – Issue Identification

Issue identification is an ongoing process, which will be performed, monitored, and updated regularly. Unisys, the Commonwealth, and third parties can all raise concerns about new findings, which can represent issues that if not addressed promptly, can adversely affect the development of activities, the quality of the transition services, or both. All issues are to be documented on the Issues and Actions Log for review.

Step 2 – Issue Validation

The issue will be analyzed to determine its impact and priority. The issue will be assigned to the appropriate team or individual to identify the best alternative and the set of tasks needed for resolution, including accountability, ownership, and timeframe.

Step 3 – Issue Resolution

Once all the tasks including accountability, ownership, and timeframe, are identified and agreed for resolution, the tasks will be added to the Transition Schedule. From this point forward, the issue will be viewed as a normal requirement of the transition program, which has the tasks associated with its resolution and a standard process for monitoring progress.

Step 4 – Issue Closure

Once the tasks for resolution of the issue are added to the Transition Schedule, the issue will be closed, and the Issues and Actions Log will be updated accordingly. Also, Root Cause Analysis will be performed on common and problematic issues to identify trends and implement corrective actions, as appropriate.

Transition Change Management

Changes in the market, laws, regulations, and technology happen and affect the core business of all organizations. Consequently, changes affect projects and must be managed in an orderly way. Proper change control is essential to effectively manage

the transition program. The Change Management process is an integral part of the Unisys Service Transition Methods Framework. The Change Management process will follow five basic steps.

Step 1 – Establish the Need for a Change Request

Unisys, the Commonwealth, and third parties can all submit change requests. The change control process is essential to maintain the integrity of the project baseline and to manage the delivery schedules and corresponding acceptance criteria. The process is initiated by the submission of a Change Request Form. Some key tasks to create sound change requests are:

- Determine the impact of change on the transition schedule, budget, or both
- Determine the impact of change on the business processes
- Determine the impact of change on the contracted Service Level Agreement
- Determine the impact of change on the resources assigned to do the work
- Determine the impact of change on the associated costs and budget
- Determine the impact of change on any other activity and deliverable
- Assess the risks associated with the changes.

Step 2 – Evaluate the Change Requests

As a change request is received, it will be evaluated to determine if it should be approved. The Unisys Transition Manager will evaluate each request to determine the impact on the transition program. Key team members will be asked to participate in the change impact review, as appropriate. If the change request creates new risks, the risks will be added to the risk plan and factored into the impacts. Once the impacts are known, the values can be added to the Change Request Form. A Change Control Checklist will be used to help in these evaluations.

Change requests may also affect third parties. If third parties are affected, the Unisys Transition Manager will involve each vendor affected by the change to determine the impacts. These impacts will be included in the response given to the Commonwealth Transition Manager.

The Unisys Transition Manager, together with the Commonwealth Transition Manager, will have the ability to reject a change request if they believe the change is not in the transition program's best interests. Some change requests may be deferred instead of rejected if they are not critical to the program's success, and will be reviewed later when circumstances are best fit for discussing the subject.

Once the impacts are known, the Transition Managers will complete the change request with all pertinent information to submit for approval. Some key tasks during the evaluation step are:

- Review the urgency of the change, understand the impact of no action, and act accordingly, as appropriate

- Evaluate the ramification of all impacts and risks associated with the change and decide the next step to be followed: (1) approve changes with minimum impact; (2) reject changes that add no value to services; (3) request for additional or new information, as appropriate; (4) defer opportunity to review; or, (5) submit for analysis and decision of the Transition Steering Committee.

Step 3 – Obtain Change Request Approval

Once the change request is deemed necessary, the Transition Managers will determine if the change will be done by a change order or a contract amendment, depending on whether the nature of changes affects requirements that were originally in scope or the changes bring new requirements that did not belong to the original scope. Some key tasks in this step are:

- Complete the documents, including all information and evidence to support the decision
- Associate the urgency and priority with the change request
- Schedule the meeting for change request approval, including taking the necessary actions to expedite the process, as appropriate.

Step 4 – Submit the Change Order to the Transition Steering Committee

The Unisys Transition Manager will review with the Commonwealth Transition Manager all details of the change request for further approval or rejection. A deadline should be negotiated to approve or reject the request with a default position, with clear impact for no action until the deadline. The change request will then be submitted to the Program Governance Board for approval. The necessary tasks to execute the changes will be incorporated into the Transition Plan for further implementation.

Step 5 – Implement the Changes

Once the change request is formally approved, the following steps will complete the cycle:

- The necessary tasks to execute changes will be incorporated into the Transition Project Plan for implementation
- The Transition Program Change Management Log will be updated
- The executed documents will be sent to the appropriate Commercial Manager to be incorporated into the agreement's scope.

The results of the process will be communicated to the change initiator and all stakeholders affected by the change.

Transition Quality Assurance Plan Approach

Quality Management is to be conducted in accordance with the Commonwealth and Unisys Quality Management methods. The Unisys approach to Quality Management incorporates a set of standards by which Quality Management, Change Management,

Risk Management, and Reporting can be established and maintained. Establishing these standards will enable the project to be controlled and monitored so that deviations from the plan can be detected and addressed.

All deliverable work products are to be reviewed before submission to the Commonwealth. A combination of formal and informal, independent and joint (the Commonwealth and Unisys) reviews will be used. This will enable (1) requirements to be well understood and responded to, (2) issues and errors to be identified and promptly resolved, (3) rework to be minimized, and (4) formal acceptance processes that are trouble free.

During the Design phase, Unisys will review technical designs and plans. We will also conduct go/no-go reviews before cutting any services over from the current system to the new proposed system and require the Commonwealth's acceptance at the end of the cutover before the event is deemed successful. After each cutover, Unisys will conduct post-implementation reviews to capture lessons learned.

Unisys understands that testing is an integral part of a successful transition. Our methodology recommends testing of our solutions and reviewing test results before transitioning any services. Our approach also includes pilot testing, when possible, before full cutover of any services. This approach will help detect issues and limit the impact to only pilot test group users. Another feature of our Quality Management Plan is audits by the Unisys Project Quality Office (PQO). Unisys Quality Assurance staff may audit parts or all of the transition project's management and delivery. We will perform these audits by prior arrangement with the Unisys Engagement Executive.

Detailed Transition Plan

On the following pages, Unisys includes our Detailed Transition Plan for Commonwealth review.

Introduction –Program Deliverables

This Schedule sets forth certain obligations of Offeror regarding Program Deliverables. The Offeror must deliver to the Commonwealth any Key Program Deliverables as described below, in format and content acceptable to the Commonwealth.

As specified below, Offeror shall provide each Key Program Deliverable on or before the date specified in this Schedule. The Key Program Deliverable Acceptance Criteria and the Commonwealth Sign-off Matrix will be developed prior to the Effective Date and will be in the format referenced below in this document.

Key Program Deliverables

D-01 Datacenter Architecture Plan and Roadmap

The Datacenter Architecture Plan and Roadmap will include the Offeror's proposed Datacenter Architecture that will be utilized to support the Project. The Datacenter Architecture Plan and Roadmap should include at minimum sections that support the following:

- 2+ Datacenter Architecture (with EDC) - describes the overall Datacenter Architecture used in the delivery of the Offeror's Enterprise Datacenter Services. This should include details on datacenter specifications, location, physical security, and capacity. The architecture will show how the Commonwealth's Enterprise Data Center (EDC) will be incorporated into the Offeror's overall datacenter capacity.

- Datacenter Network Architecture - describes the required network connectivity between each of the datacenters. Included are connection requirements to the Commonwealth's network COPANET. The Offeror will also describe its Internet connection to the proposed Datacenter(s).

- Datacenter Security Architecture - describes the security architecture used to ensure the confidentiality, integrity and availability of Commonwealth information and infrastructure systems. The Security Architecture will describe the security technology components such as firewalls, intrusion detection devices, virus detection, etc. that will be utilized in the Offerors solution. Datacenter Security implementation activities must be conducted in accordance with, but not limited to, leading industry and Commonwealth standards such as ISO 27001:2005 and ISO 27002:2005.

- Datacenter Technology Environment - describes the Datacenter technology used in the delivery of the Offeror's Enterprise Datacenter Services. A summary of the planned allocation of platforms within each of the proposed datacenters should be included. Note: more detailed technology specifications shall be provided in the *D-03 Technology Architecture and Refresh Approach* deliverable.

- Datacenter Implementation Roadmap – presents the detailed implementation plan for the enablement of the overall Datacenter Architecture. The Datacenter Implementation Roadmap shall Reference roles and responsibilities, as well as critical dates and timelines.

EDC Assessment

D-01.01	Effective Date + 45 days	Offeror must assess the EDC facilities and provide a report to the Commonwealth as it pertains to: • Required security upgrades • Required HVAC and power upgrades • Required physical access to the EDC facility • Monitoring, maintain and reporting on EDC SLAs • Monitoring, maintaining and operating the installed infrastructure
Multi Datacenter Environment (2+ Architecture)		
D-01.02	Effective Date + 60 days – with quarterly updates	*Datacenter Architecture Plan and Roadmap* Datacenter Architecture Plan and Roadmap includes: • 2+ datacenter architecture (with/plus EDC) • Datacenter Network Architecture • Datacenter Security Architecture • Datacenter Technology Environment • Datacenter Implementation Roadmap Offeror must publish quarterly updates to the Datacenter Architecture Plan and Roadmap to include proposed updates to the technical architecture and implementation plan
Network and Security Architecture		
D-01.03	Effective Date + 60 days – with quarterly updates	*Datacenter Architecture Plan and Roadmap – Network and Security Architecture* The Network and Security Architecture - describes the network and security architecture to support the 2+ datacenter architecture.
Datacenter Architecture and Technology		
D-01.04	Effective Date +60 days– with quarterly updates	*Datacenter Architecture Plan and Roadmap* – Datacenter Technology The Datacenter Technology describes the technology used in the delivery of the Offeror's Enterprise Datacenter Services.
D-01.05	Effective Date +90 days – with quarterly updates	*Datacenter Architecture Plan and Roadmap* – Datacenter Technology Roadmap The Datacenter Technology Roadmap will identify specific, short-term steps and schedules for project of changes with estimated timings and cost impact to Commonwealth datacenter customers.
D-01.06	Effective Date + 180 days	*Datacenter Architecture Plan and Roadmap – Configuration Item Reconciliation* *The Configuration Item Reconciliation is the validation and update of the CMDB of record with the Offeror's configuration information including the EDC assets and CI's.*

Limited-Use Colocation Services		
D-01.07	Effective Date + 30 days	*Datacenter Architecture Plan and Roadmap*

D-02 Commonwealth Computing Procedures Manual (CCPM)

Offeror will develop documentation in accordance with the requirements in **Schedule H - Commonwealth Computing Procedures Manual (CCPM)**. This comprehensive services management manual will include, but not be limited to, the following sections as described in **Schedule H**:

- Organizational Overview
- Transition and Support Activities and Responsibilities
- IT Service Management Procedures
- Financial Management Procedures
- Contract Management Procedures
- Relationship Management Procedures
- Offeror Operational Procedures
- Commonwealth Customer Operations Manuals

Additional Planning Services		
D-02.01	Effective Date + 14 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide the initial version of the Commonwealth Computing Procedures Manual (CCPM) (see Schedule H CCPM Commonwealth Computing Procedures Manual) that includes Offeror's overall program and service management processes and procedures. The comprehensive manual includes the following sections: • Organizational Overview • Transition and Support Activities and Responsibilities • IT Service Management Procedures • Financial Management Procedures • Contract Management Procedures • Relationship Management Procedures • Offeror Operational Procedures • The Commonwealth Customer Operations Manuals PMO & Contract Management will focus on the bolded sections of the CCPM.
D-02.02	As needed during transition	After review and approval from the Commonwealth, Offeror must provide ongoing updates to the CCPM during the startup and transition phase
D-02.03	Yearly or as required	Offeror must provide CCPM updates as required as new services are added and yearly after the transition phase.

Availability/SLA Management		
D-02.04	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must document the Availability and SLA Management approach and providing updates to the CCPM.
D-02.05	Effective Date +45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must review the Availability and SLA Management approach and project plan with Commonwealth stakeholders.
D-02.06	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* SLA Achievement Report, detailing system availability, SLA attainment, and reason for outages.
D-02.07	As Needed	*Commonwealth Computing Procedures Manual (CCPM)* Root Cause Analysis (RCA) report for all major outages within SLA (e.g. hours/days of outage).
D-02.08	As requested	*Commonwealth Computing Procedures Manual (CCPM)* Ad hoc – Availability and SLA Reports
Change & Release Management		
D-02.09	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must document the Change and Release Management approach and project plan updating appropriate sections to the CCPM.
D-02.10	Effective Date +45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must review the Change and Release Management approach and project plan with Commonwealth stakeholders.
D-02.11	Weekly	*Commonwealth Computing Procedures Manual (CCPM)* Weekly Change Management Meeting with the Change Advisory Board
D-02.12	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Monthly Change & Release Management summary report containing the number of changes, by platform, by Commonwealth organization, and status.
D-02.13	Yearly	*Commonwealth Computing Procedures Manual (CCPM)* On a yearly basis, randomly select completed Changes & Releases for detail auditing to determine compliance to policies. Create a summary report of the finding and make recommendations for improvements where appropriate.

D-02.14	Per Change Event	*Commonwealth Computing Procedures Manual (CCPM)* Complete Change Control & Release Management process for each change event adhering to the letter and spirit of the policy and process. Maintain a complete copy of the change / release for possible future audit.
Service Desk		
D-02.15	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must document the Service Desk approach, organization, schedule and project plan.
D-02.16	Effective Date +45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must review the Service Desk approach and project plan with Commonwealth stakeholders
D-02.17	Effective Date + 60 days	*Knowledge Management Portal (KMP)* Offeror must provide a Knowledge/Service Management portal that describes the Offeror's contract information, pricing schedules, service offerings and operating procedures (operational, service delivery processes, SLAs, service ordering, etc.)
D-02.18	Effective Date +60 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide Commonwealth Computing Procedures Manual (CCPM) including but not limited to the following: Datacenter Operations, Change Management, Service Desk Operations, Security Management, Backup Management, Disaster Recovery, Performance Management, Asset Management, Service Level Management and Configuration Management. The Offeror must make the CCPM available on the Offeror's Knowledge/Service portal. See Schedule H Commonwealth Computing Procedures Manual (CCPM) for additional detail.
D-02.19	Effective Date +180 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must describe the process to keep separate and current specific sections of the CCPM dedicated to the operations of individual Commonwealth customers.
D-02.20	Effective Date +90 days	Knowledge Management Portal Offeror must provide Knowledge/Service portal training to authorized Commonwealth stakeholders
D-02.21	Weekly	*Commonwealth Computing Procedures Manual (CCPM)* Weekly summary report containing the type of incidents and problems being reported to the Service Desk. Identify measures being taken to reduce or eliminate stated incidents and problems.

D-02.22	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Monthly summary report containing the type of incidents and problems being reported to the Service Desk. Identify measures being taken to reduce or eliminate stated incidents and problems.
Account Management		
D-02.23	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must document their Account Management approach and project plan.
D-02.24	Effective Date +45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must review the Account Management approach and project plan with Commonwealth stakeholders
D-02.25	Monthly	Monthly summary report containing the operational availability report on all systems in service, events and issues that occurred during the month. Report shall contain operational metrics by service platform, highlights and exceptions, and project status updates.
Configuration Management		
D-02.26	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must document their Configuration Management approach, tool(s) and project plan.
D-02.27	Effective Date +45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must review the Configuration Management approach, tool(s) and project plan with Commonwealth stakeholders
D-02.28	As Requested	Offeror must provide Agency / Commonwealth level Configuration Management Reports
3rd Party License Management		
D-02.29	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must document their 3rd Party License Management approach, tool(s) and project plan.
D-02.30	Effective Date +45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must review the 3rd Party License Management approach, tool(s) and project plan with Commonwealth stakeholders
D-02.31	Per request	Offeror must provide Software License Reports

Capacity Management		
D-02.32	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must document their Capacity Management approach, tool(s) and project plan.
D-02.33	Effective Date +45 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must review the Capacity Management approach, tool(s) and project plan with Commonwealth stakeholders
D-02.34	Effective Date + 240 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must present the baseline Capacity Management Plan
D-02.35	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must issue periodic reports showing usage, trends, capacity forecasts, and recommendations for upgrades.
D-02.36	Annual	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide technology usage report (i.e. MIPS, vcpu, storage, etc.) by stakeholder and overall usage by the Commonwealth. The report must show monthly technology growth patterns by stakeholder.
Windows Support		
D-02.37	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must present their roadmap and project plan to address the Windows Operations and Management including but not limited to the following; windows servers, backups, network connectivity, technical support, staffing, etc.
D-02.38	Effective Date + 45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must present plan to address the assessment recommendations identified in the Windows Operations and Management project plan.
D-02.39	Effective Date +60 days	*Commonwealth Computing Procedures Manual (CCPM)* Present a report describing the methodology the Offeror will follow to perform a Windows backups audit finding and recommendation to the Commonwealth Stakeholders, the audit report will include findings, recommendations, project plan and cost estimates.
D-02.40	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide SLA report(s). Provide a report detailing system availability, SLA attainment, reason for outages, and recommendations for improvements.

D-02.41	Quarterly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide Continuous Improvement Report. Provide a report detailing system availability and SLA attainment. Recommend system and cost improvements as appropriate.
Storage Management		
D-02.42	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must present their roadmap and project plan to address Storage Management including but not limited to the following; data storage, backups, network connectivity, technical support, staffing, etc.
D-02.43	Effective Date + 45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must present plan to address the assessment recommendations identified in the Storage Management project plan.
D-02.44	Effective Date +60 days	*Commonwealth Computing Procedures Manual (CCPM)* Present a report describing the methodology the Offeror will follow to perform a system backups audit finding and recommendation to the Commonwealth Stakeholders, the audit report will include findings, recommendations, project plan and cost estimates.
D-02.45	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide SLA report(s). Provide a report detailing system availability, SLA attainment, reason for outages, and recommendations for improvements.
D-02.46	Quarterly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide Continuous Improvement report(s). Provide a report detailing system availability and SLA attainment. Recommend system and cost improvements as appropriate.
ERP Hosting – SAP / Oracle		
D-02.47	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must present their roadmap and project plan to address ERP Hosting including but not limited to the following; data storage, backups, network connectivity, technical support, staffing, etc.
D-02.48	Effective Date + 45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must present plan to address the assessment recommendations identified in the ERP Hosting project plan.

D-02.49	Effective Date +60 days	*Commonwealth Computing Procedures Manual (CCPM)* Present a report describing the methodology the Offeror will follow to perform a system backup audit finding and recommendation to the Commonwealth Stakeholders, the audit report will include findings, recommendations, project plan and cost estimates.
D-02.50	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide SLA report(s). Provide a report detailing system availability, SLA attainment, reason for outages, and recommendations for improvements.
D-02.51	Quarterly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide Continuous Improvement report(s). Provide a report detailing system availability and SLA attainment. Recommend system and cost improvements as appropriate.
UNIX Support – AIX / Linux		
D-02.52	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must present their roadmap and project plan to address UNIX Support including but not limited to the following; data storage, backups, network connectivity, technical support, staffing, etc.
D-02.53	Effective Date + 45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must present plan to address the assessment recommendations identified in the UNIX Support project plan.
D-02.54	Effective Date +60 days	*Commonwealth Computing Procedures Manual (CCPM)* Present UNIX audit finding and recommendation to the Commonwealth Stakeholders, the report will include findings, recommendations, project plan and cost estimates.
D-02.55	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide SLA report(s). Provide a report detailing system availability, SLA attainment, reason for outages, and recommendations for improvements.
D-02.56	Quarterly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide Continuous Improvement report(s). Provide a report detailing system availability and SLA attainment. Recommend system and cost improvements as appropriate.

Mainframe Services		
D-02.57	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must present their roadmap and project plan to address Mainframe Support (IBM & Unisys) including but not limited to the following; data storage, backups, network connectivity, technical support, staffing, etc.
D-02.58	Effective Date + 45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must present project plan to address the assessment recommendations identified in the Mainframe Support (IBM & Unisys) plan.
D-02.59	Effective Date +60 days	*Commonwealth Computing Procedures Manual (CCPM)* Present mainframe audit finding and recommendation to the Commonwealth Stakeholders, the report will include findings, recommendations, project plan and cost estimates.
D-02.60	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide SLA report(s). Provide a report detailing system availability, SLA attainment, reason for outages, and recommendations for improvements.
D-02.61	Quarterly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide Continuous Improvement report(s). Provide a report detailing system availability and SLA attainment. Recommend system and cost improvements as appropriate.
Database Management Services		
D-02.62	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must document their Database Management approach, tool(s) and project plan.
D-02.63	Effective Date +45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must review the Database Management approach, tool(s) and project plan with Commonwealth stakeholders
D-02.64	Effective Date +60 days	*Commonwealth Computing Procedures Manual (CCPM)* Present backup audit finding and recommendation to the Commonwealth Stakeholders, the report will include findings, recommendations, project plan and cost estimates.
D-02.65	Effective Date	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide Database Management Service Architecture document (Oracle, Sybase, and MS SQL).

D-02.66	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide Database Management Service Usage Reports
Server Capacity on Demand		
D-02.67	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must document their Server Capacity on Demand approach, tool(s) and project plan.
D-02.68	Effective Date +45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must review the Server Capacity on Demand approach, tool(s) and project plan with Commonwealth stakeholders
D-02.69	Quarterly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must host a quarterly meeting with the Commonwealth to review current server utilization on all managed server platforms and locations, and forecast future quarter's server processing requirements. Recommendations to increase capacities will be made, when approved by the Commonwealth; the additional equipment will be scheduled for deployment.
Storage Capacity on Demand		
D-02.70	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must document their Storage Capacity on Demand approach, tool(s) and project plan.
D-02.71	Effective Date +45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must review the Storage Capacity on Demand approach, tool(s) and project plan with Commonwealth stakeholders
D-02.72	Quarterly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must host a quarterly meeting with the Commonwealth to review current SAN storage utilization on all managed SAN platforms and locations, and forecast future quarter's SAN storage requirements. Recommendations to increase capacities will be made, when approved by the Commonwealth; the additional equipment will be scheduled for deployment.
DR Infrastructure on Demand		
D-02.73	Quarterly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must host a quarterly meeting with the Commonwealth to review current disaster recovery service and capabilities, and forecast future quarter's disaster recovery requirements. Recommendations to increase capacities will be made, when approved by the Commonwealth, the additional equipment and services will be scheduled for deployment.

Additional Technical Services		
D-02.74	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide a monthly report on technical support services usage by Commonwealth datacenter customer.
Limited-Use Colocation Services		
D-02.75	Effective Date + 30 days	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must document their approach, tool(s) and project plan for supporting Limited-Use Colocation Services.
D-02.76	Effective Date +45 days	*Commonwealth Computing Procedures Manual (CCPM)* After review and approval from the Commonwealth, Offeror must review the Limited-Use Colocation Services approach, tool(s) and project plan with Commonwealth stakeholders
D-02.77	Effective Date +60 days	*Commonwealth Computing Procedures Manual (CCPM)* Present backup audit finding and recommendation to the Commonwealth Stakeholders, the report will include findings, recommendations, project plan and cost estimates.
D-02.78	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide Limited-Use Colocation Services Usage Reports
Performance Monitoring & Management		
D-02.79	Monthly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide monthly summary report containing the performance level achieved for each system being monitored. This report will be reviewed with the Commonwealth and plans will be made to address system utilization as appropriate.
D-02.80	Daily	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide daily reports containing the performance level achieved for each system being monitored. Daily reports summarizing incidents for the past 24-hours and immediate reports of incidents and routine status reports of incidents in progress for resolution such as a network or server outage that impacts a facility and our business. These reports will be reviewed with the Commonwealth and plans will be made to address system utilization as appropriate.

Transition Program Management		
D-02.81	Effective Date + 60 days	*Commonwealth Computing Procedures Manual (CCPM)* Establish Interim Contract Management Procedures during the transition of datacenter services. Offeror must describe an interim procedure to monitor and manage service delivery including but not limited to the following; Problem Management, Change Management, Service Level monitoring and reporting, physical and logical security, project management, etc. while the service is transitioned from the Commonwealth to the Offeror.
D-02.82	Weekly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide Transition Status reports, including any schedule variance that cannot be remediated will trigger the escalation procedures outlined in the Transition Plan/Agreement, which will be developed during Transition.
Security & Firewall		
D-02.83	Quarterly	*Commonwealth Computing Procedures Manual (CCPM)* Offeror must provide Continuous Improvement report. Provide a report detailing system availability and SLA attainment. Recommend system and cost improvements as appropriate.

D-03 Technology Architecture and Refresh Approach

The Technology Architecture and Refresh Approach will include the Offeror's proposed the Technology that will be utilized to support the architecture and delivery of services across all platform and services. The Technology Architecture and Refresh Approach should include at minimum sections that support the following:

- Datacenter Technology - describes the technology used in the delivery of the Offeror's Enterprise Datacenter Services. The technology descriptions should include hardware, software that will be included in the overall solution delivery. The technology should also include a complete list of those Service Level measurement and monitoring tools that will be used to measure and report Offeror's performance of the Services at a level of detail sufficient, as determined by the Commonwealth, to verify Offeror's compliance with those Service Levels described in **Schedule J.1 Datacenter Service Level Management** as of the Effective Date.

- Datacenter Technology Roadmap - will identify specific, short and long term steps and schedules for planned and proposed future changes with estimated timings and cost impact to Commonwealth datacenter customers. This should be the basis for generation of technology roadmaps which will include schedules, dependencies and requirements for introduction of new technology changes as well as acquisition, support, and retirement of current software/hardware.

- Configuration Item Reconciliation - is the validation and update of the CMDB of record with the Offerors configuration information including the EDC assets and Configuration Items (CI's).

Technology Refresh		
D-03.01	Effective Date + 30 days	*Technology Architecture and Refresh Approach* Offeror must document the following Technical Architecture approach and project plan including; Service Catalog, IT Architecture, and Technical support
D-03.02	Effective Date +45 days	*Technology Architecture and Refresh Approach* After review and approval from the Commonwealth, Offeror must review the Technical Architecture approach and project plan with Commonwealth stakeholders
D-03.03	Effective Date + 60 days	Offeror must identify the technical architecture organization and staff.
Infrastructure Architecture		
D-03.04	Effective Date + 45 days	*Technology Architecture and Refresh Approach* Offeror must document the approach and project plan for the computing infrastructure architecture and review with Commonwealth Stakeholders
D-03.05	Effective Date + 45 days	*Technology Architecture and Refresh Approach* After review and approval from the Commonwealth, Offeror must document the approach and project plan for the network architecture to connect Offeror's datacenter(s), review with Commonwealth Stakeholders
D-03.06	As requested by Commonwealth Stakeholders	*Technology Architecture and Refresh Approach* Offeror must describe the process to request a review new technologies evaluations by Commonwealth datacenter customers.
D-03.07	Per request – prior to a new application infrastructure service	*Technology Architecture and Refresh Approach* Offeror must provide Infrastructure Architecture Design Reports
Performance Monitoring & Management		
D-03.08	Effective Date + 30 days	*Technology Architecture and Refresh Approach* Offeror must document their Performance Monitoring and Management approach, tool(s) and project plan.
D-03.09	Effective Date +45 days	*Technology Architecture and Refresh Approach* After review and approval from the Commonwealth, Offeror must review the Performance Monitoring and Management approach, tool(s) and project plan with Commonwealth stakeholders

D-04 IT Service Continuity Architecture and Plan

The IT Service Continuity Architecture and Plan will include the Offeror's proposed Disaster Recovery (DR) solution architecture. The DR solution architecture will describe how the Offeror will deliver multiple tiers of disaster recovery services. The IT Service Continuity Architecture and Plan will also describe the Offeror's approach to reviewing the Commonwealth's current DR Plans and the updating of those plans in coordination with the Commonwealth.

IT Service Continuity Architecture		
D-04.01	Effective Date + 30 days	*IT Service Continuity Architecture and Plan* Offeror must describe their methodology for reviewing and refreshing technology on a scheduled basis.
D-04.02	Effective Date + 30 days	*IT Service Continuity Architecture and Plan* Offeror must provide an IT Service Continuity Architecture and Plan to Implement DR solution
D-04.03	30 days prior to transition of each critical application	*IT Service Continuity Architecture and Plan* Offeror must describe their approach to providing Develop/Update Agency Application DR and Business Recovery Plan(s)
D-04.04	Depending on DR Tier Solution • Current DR • Tier 0 • Tier 1 • Tier 2 • Tier 3 • Tier 4	*IT Service Continuity Architecture and Plan* Offeror must develop a plan to transition agencies to Tiered DR Solution • Currently have DR (DPH) – at time of transition • Tier 0 – Transition + 90 days • Tier 1 – Transition + 60 days • Tier 2 – Transition + 30 days • Tier 3 – at time of transition • Tier 4 – at time of transition
DR Planning & Testing		
D-04.05	Effective Date + 30 days	*IT Service Continuity Architecture and Plan* Offeror must document their Tiered Disaster Recovery approach, tool(s) and project plan.
D-04.06	Effective Date +45 days	*IT Service Continuity Architecture and Plan* After review and approval from the Commonwealth, Offeror must review their Tiered Disaster Recovery approach, tool(s) and project plan with Commonwealth stakeholders

D-04.07	Monthly	*IT Service Continuity Architecture and Plan* Offeror must provide report(s) describing schedule of stakeholder participation in DR solution

D-05 Transition Management Plan

The Transition Management Plan will provide a detailed overview of the Offeror's transition management approach, process and procedures. The Transition Management Plan will describe the enablement of the Transition Project Management Office (TPMO) and also provide a detailed implementation schedule of transition activities and milestones. The Transition Management Plan should include at minimum sections that support the following:

- Transition Management Approach
- Transition Project Management Office (TPMO) Organization and Responsibilities
- Transition Management Communications Plan
- Transition Schedule

Transition Management (New Customer and/or Services)		
D-05.01	Effective Date + 60 days	*Transition Management Plan* Offeror must create a Transition Roadmap with major milestones and present it to the Commonwealth for review
D-05.02	Effective Date + 90 days	*Transition Management Plan* After review and approval from the Commonwealth, Offeror must create a Detailed Transition Project Plan with major milestones and present it to the Commonwealth for review
D-05.03	Weekly	*Transition Management Plan* Offeror must create a report for the Commonwealth detailing the transition projects on the plan, status, schedule, risks, and the forecasted transition date.
Transition Program Management		
D-05.04	Effective Date + 60 days	*Transition Management Plan* Offeror must present their approach to transition Commonwealth computing assets. The approach must include a roadmap and project plan to successfully transition Commonwealth computing assets using the schedule identified in the RFP
D-05.05	Effective Date + 90 days	*Transition Management Plan* Present and review the transition roadmap and plan to Commonwealth stakeholders.

D-05.06	Effective Date + 60 days	*Transition Management Plan* Establish Interim Contract Management Procedures during the transition of datacenter services. Offeror must describe an interim procedure to monitor and manage service delivery including but not limited to the following; Problem Management, Change Management, Service Level monitoring and reporting, physical and logical security, project management, etc. while the service is transitioned from the Commonwealth to the Offeror.
D-05.07	Effective Date + 60 days	*Transition Management Plan* EDC / Legacy Datacenter Infrastructure Maintenance Strategy – Offeror must document their strategy as it related to providing a solution to the infrastructure maintenance expiration issue at the EDC and any other datacenter that has the same or similar issue.
D-05.08	Effective Date + 60 days	*Transition Management Plan* Offeror must provide the procedure to standup their Transition Management Office
D-05.09	Weekly during transition	*Transition Management Plan* Offeror must provide Transition Status reports, including any schedule variance that cannot be remediated will trigger the escalation procedures outlined in the Transition Plan/Agreement, which will be developed during Transition.
Security Transition Activities		
D-05.10	Effective Date + 60 days	*Transition Management Plan* Offeror must provide their Security Transition Plan
D-05.11	Weekly updates during transition	*Transition Management Plan* Offeror must provide their Security Transition Status Report(s)

D-06 Agency Level DR Plan(s)

The Offeror is required to assist the Commonwealth Agencies with updates to or development of their current DR Plans (DRPs). These Agency Level DR Plans will reflect the Offeror's DR approach and solution for DR testing. The following describes the Offeror's responsibilities regarding the updating of Agency Level DRPs:

- Within six (6) months after the Effective Date, Offeror shall complete the update all existing Agency-specific Disaster Recovery Plans and technical recovery guides to reflect all changes implemented to the Services infrastructure prior to or during the performance of Transition Services.
- For Applications lacking tested Disaster Recovery Plans, Offeror shall work with Commonwealth Agencies to complete a gap analysis of the current Disaster Recovery

Plans and technical recovery guides compared to the requested recovery time objective, as specified in **Schedule J.1 Datacenter Service Level Management**, and update the Disaster Recovery Plans with the results within forty-eight (48) months after the Effective Date.

- For Agencies without a Disaster Recovery Plan, the Offeror shall work with Agencies to develop a basic Disaster Recovery Plan and technical recovery guides within eighteen (18) months after the Effective Date.

DR Planning & Testing		
D-06.01	Monthly	*Agency Level DR Plan* Offeror must provide report(s) describing the schedule of DR test being performed by stakeholders
D-06.02	Monthly	*Agency Level DR Plan* Offeror must provide report(s) describing the results of stakeholder DR test
D-06.03	As requested– Per Agency Critical Application	*Agency Level DR Plan* Offeror must provide DR Test Plans as required

D-07 Security Management Plan

The Security Management Plan will address the overall security management for the planned facility security implementation for the EDC, the Offeror Facilities, software and equipment deployment specifically for data and online security, annual security assessments and other standard security concepts for ensuring the safety, security and confidentiality of Commonwealth Data.

The Security Management Plan shall include a complete description of the personnel security management program. It shall comply with background check requirements specified in the Terms and Conditions and shall provide a methodology for ongoing evaluation and reporting of any change in status of Offeror personnel that would negatively impact their ability to continue to meet Commonwealth or Agency security requirements.

Security Management		
D-07.01	Effective Date + 30 days	*Security Management Plan* Offeror must document their Security Management approach, tool(s) and project plan.
D-07.02	Effective Date +45 days	*Security Management Plan* After review and approval from the Commonwealth, Offeror must review their Security Management approach, tool(s) and project plan with Commonwealth stakeholders.

D-07.03	Quarterly	*Security Management Plan* Offeror must provide the Commonwealth with a report containing the detailed results of the Vulnerability Analyses testing. Include any remediation activities that are required.
D-07.04	Monthly	*Security Management Plan* Offeror must provide the Commonwealth with the detailed monthly Security Log Analysis report. Include any remediation activities that are required.
D-07.05	Ongoing	*Security Management Plan* Offeror must maintain a hardcopy file of all security access changes. The copy will contain the date, time, file changes, access rights applied and the name of the security officer completing the access request.
Security & Firewall		
D-07.06	Effective Date + 30 days	*Security Management Plan* Offeror must document their Security and Firewall approach, tool(s) and project plan.
D-07.07	Effective Date +45 days	*Security Management Plan* After review and approval from the Commonwealth, Offeror must review the Security and Firewall approach, tool(s) and project plan with Commonwealth stakeholders
D-07.08	Monthly	*Security Management Plan* Threat Assessment and Analysis Report. Provide a monthly report detailing the threat assessments, volume and major types of malware detected, volume of SPAM rejected, corrective actions, and recommendations that would improvement security of Commonwealth systems.
D-07.09	Monthly	*Security Management Plan* Offeror must provide SLA reports. Provide a report detailing system availability, SLA attainment, reason for outages, and recommendations for improvements, security incident notification, and security change request intervals and results.
D-07.10	Monthly	*Security Training and On-boarding Status Report* Offeror must provide a monthly Security Training and On-boarding Status Report detailing security training, changes to project personnel, and background check status and results.

D-08 Facilities Management Plan

The Facilities Management Plan will address management for both the EDC facility and the proposed Offeror's facility(s). The Facilities Management Plan should describe the Offeror's plan for providing and managing the physical environment. For example; power and power distribution, cooling and ventilation, fire detection and suppression, building security and access control, and environmental monitoring. Provide an approach for yearly review and self-verification that the datacenters will be managed, maintained and operated at the equivalent of Uptime Institute of Tier 3 rating. The plan should also address how the Offeror will support SSAE-16 compliance audits.

Facilities Architecture / Maintenance		
D-08.01	Effective Date + 60 days	*Facilities Management Plan* Offeror must present their assessment of the EDC and any required facility changes/modification required to upgrade the facility to meet service level objectives. The assessment must include a roadmap and project plan to make any required facility modifications.
D-08.02	Effective Date + 365 days	*Facilities Management Plan* Present results of the SSAE 16 audit of the EDC and all other datacenters used by the Offeror to provide computing services to Commonwealth shareholders.
D-08.03	Monthly	*Facilities Management Plan* Offeror must provide monthly Facilities SLA Report, detailing environmental equipment availability, SLA attainment, and reason for outages.
D-08.04	Quarterly	*Facilities Management Plan* Offeror must provide quarterly Facility service improvement report. Report changes and improvements to the facility or the maintenance of the facilities.
D-08.05	Annual	*Facilities Management Plan* Offeror must provide annual SSAE 16 audit reports for each datacenter facility being used to support the Commonwealth.
Site Operations		
D-08.06	Effective Date + 60 days	*Facilities Management Plan* Offeror must present their assessment of the EDC monitoring and staffing changes/modification required to upgrade the facility to meet Commonwealth service level objectives. The assessment must include a roadmap and project plan to make any required monitoring and staffing modifications.

D-08.07	Effective Date + 90 days	*Facilities Management Plan* Present plan to address the assessment recommendations identified in the EDC monitoring, project plan and staffing report.
D-08.08	Daily, Monthly	*Facilities Management Plan* Offeror must provide daily and monthly SLA report(s), detailing environmental equipment availability, SLA attainment, and reason for outages.
D-08.09	Quarterly	*Facilities Management Plan* Offeror must provide quarterly site operations improvement report. Identify changes or improvements to the site operations that would assist the Offeror in meeting the agreed facility SLAs.

D-09 Security Risk and Vulnerability Assessment Report

The Offeror will execute a Baseline Security Risk and Vulnerability Assessment. The assessment report must include a roadmap and project plan to make any required security modifications prior to final transition of services.

Security Transition Activities		
D-09.01	Effective Date + 60 days	*Security Risk and Vulnerability Assessment Report* Offeror must execute a Baseline Security Risk and Vulnerability Assessment. The assessment must include a roadmap and project plan to make any required security modifications.
D-09.02	Effective Date + 90 days	*Security Risk and Vulnerability Assessment Report* Present results of the Security Risk and Vulnerability assessment along with a Roadmap and Project Plan to address the recommendation identified in the assessment.

D-10 Gap Analysis Report

The Offeror will execute a Data Center Gap Analysis. The analysis report must identify gaps in the current data centers and the Offeror's recommendations and corrective approach.

Gap Analysis Activities		
D-10.01	Effective Date + 120 days	*Gap Analysis Report* Offeror must execute a Data Center Gap Analysis. The analysis must include gaps identified and a roadmap and project plan to institute any recommendations and corrective actions.

D-10.02	Effective Date + 150 days	*Gap Analysis Report* Present results of the Data Center Gap Analysis along with a Roadmap and Project Plan to address the recommendations identified in the analysis.

D-11 Contract Management Plan

The Contract Management Plan will address management for the overall contract. The Contract Management Plan should describe the Offeror's plan to ensure it is adhering to the terms and conditions of the contract and providing the services/products that meet the requirements of the project. The Contract Management Plan must identify the activities to be performed or initiated to manage, track, amend, and close the contract. The Contract Management Plan must include but is not limited to: participants roles and responsibilities, task accomplishment plan, status reports, deliverable management, contact performance management, risk management, and contract closeout.

Contract Management Plan		
D-11.01	Effective Date + 45 days	*Contract Management Plan* Offeror must document its Contract Management approach, tool(s) and project plan.
D-11.02	Effective Date + 60 days	*Contract Management Plan* After review and approval from the Commonwealth, Offeror must review its Contract Management approach, tool(s) and project plan with Commonwealth stakeholders.

Deliverable Acceptance Criteria Matrix

This section is provided for the Offeror to understand the process the Commonwealth will use for acceptance of Deliverables/Milestones that are committed to in the RFP. The Matrix provided below is an example of the template that will be used to capture Deliverables/Milestones and other information related to the acceptance process.

It is critical to the success of the Data Center Computing Services project that the deliverable acceptance process is thorough and that any deficiencies are addressed as early as possible to minimize impacts to the Services. Designated Commonwealth working teams will be reviewing the Deliverables/Milestones throughout the phases of development. The Offeror will solicit input from the Commonwealth team members as the items are developed with the goal of understanding expectations in advance so as to obtain acceptance upon delivery. Feedback and suggestions received from the Commonwealth must be incorporated into the Deliverables/Milestones. The Commonwealth will identify the individuals authorized to provide formal Acceptance Approval / Nonconformance notification to the Offeror for the Deliverables/Milestones. The deliverable acceptance process will comply with the following guidelines and be formally documented in the Commonwealth Computing Procedures Manual (CCPM).

1. The Offeror will give written notice to the Commonwealth that a Deliverable / Milestone is complete.
2. A walk-through review of the Deliverable and/or Milestone will be scheduled by the Offeror seven (7) days following the issuance of the written notice to the Commonwealth. The purpose of the walk-through is to provide a forum for discussion and review of the Transition Deliverable / Milestone with the approver/s. If additional review, physical inspection, on-line access or backup information is required, the Commonwealth will notify the Offeror at this time.
3. The Commonwealth will provide the Offeror with notice that the Deliverable / Milestone is Accepted or notice of Noncompliance no later than seven (7) days after the walk-through, fourteen (14) days after notice of completion.
4. If the Commonwealth does not provide notice to the Offeror of their Acceptance or Nonconformance within fourteen (14) days of notice of completion, the Offeror will give the Commonwealth written notice that the request was not received and the Acceptance Review Period will be extended an additional seven (7) days.
5. The Enterprise Datacenter Services Transition Management Committee will review all Deliverable / Milestones which have not received written notice of Acceptance or Noncompliance within fourteen (14) days after notice of completion. The Enterprise Datacenter Services Transition Management Committee's goal is to determine and document the Commonwealth and Offeror actions necessary to complete the review minimizing any potential delays to the project and addressing any substantive issues.
6. For any Deliverables / Milestones which are found to be Noncompliant, the Offeror will address the nonconformity (and any other problems of which it has knowledge) and redeliver the item to the Commonwealth using the process outlined above.

The status of each Deliverable and any associated issues will be managed through a monthly deliverables review meeting between the Commonwealth and the Offeror. The objective of the meeting is to review the status of all deliverables, communicate deliverable owners and

deliverable recipients for upcoming deliverables, review rejected deliverables and remediation plans for those deliverables.

Example - Deliverable Acceptance Matrix

Reference #	Deliverable / Milestone Name	Due Date	Acceptance Criteria	Monthly Credit

D-10	Gap Analysis Report		➢	
D-11	Contract Management Plan		➢	

UNISYS RESPONSE:

The Commonwealth identified 11 Key Program Deliverables specified within Schedule K with prescriptive Program Deliverables detailing specific timeframes, milestones within the deliverable and criteria to be met for each deliverable to be considered acceptable. This section discusses the approach we will take to comply with the deliverables set forth in Schedule K. The Unisys Team understands that Key Program Deliverables will be subject to deliverable acceptance criteria and Commonwealth approval documented on the Commonwealth Sign-off Matrix. This matrix will be developed prior to the effective date of the contract in the format referenced in Schedule K.

Considering the aggressive timelines associated with key program deliverables, it is important that clarity on acceptance criteria be established early to ensure that completed deliverables meet the needs of the Commonwealth without requiring rework. It is our responsibility to define and agree upon the expectations in advance to provide deliverables that are compliant with Commonwealth anticipated finished products. We will do this through collaboration with the designated Commonwealth working teams to review deliverables and milestones throughout the phases of development.

The Key Program Deliverables provide a strong foundation upon which the Data Center Services Computing Program will be established. These deliverables are critical to the success of our transition and future programs, so tasks associated with their completion have been highlighted in our transition plan. In **Schedule M: Transition Plan**, the Unisys Team provides tasks and milestones that mirror the Commonwealth's Key Program Deliverables within our Transition of Services (ToS) projects. The Transition Plan can be found in **Attachment 9 of Section 3.0 – Schedule M: Transition Plan** of this proposal.

During the ToS project, Unisys, IBM, and Deloitte subject matter experts (SMEs) will work with the Commonwealth to identify the appropriate format, content, and timing as well as deliver the first occurrence of each report or plan as appropriate. During transition, the TPMO will oversee the production of the deliverables. For deliverables intended to be produced periodically throughout the agreement's duration, the Transition SME will review them with the appropriate Commonwealth stakeholder for approval and then with the appropriate steady state resources to provide knowledge transfer of the process, source of data, required timing, and stakeholders. After turnover, the PMO will oversee the production of the deliverables.

The Unisys Team and the Commonwealth will meet on a monthly basis to review the status of each deliverable and any associated issues. In addition to providing status, this meeting will provide the opportunity for direct communication

between deliverable owners and deliverable recipients for upcoming deliverables, and a review of rejected deliverables and remediation plans for those deliverables.

Unisys will work with the Commonwealth to formalize the deliverable acceptance criteria and process. The Commonwealth will identify the individuals authorized to provide formal acceptance approval or nonconformance notification to Unisys following receipt of the deliverable. The deliverable acceptance process will be defined and subsequently documented in the Commonwealth Computing Procedures Manual (CCPM). Minimally, this process will comply with the following Commonwealth guidelines:

- Unisys will give written notice to the Commonwealth that a deliverable or its milestone is complete.
- Unisys will schedule a walk-through review of the deliverables and/or milestones seven days following the issuance of the written notice to the Commonwealth.
- The Commonwealth will provide Unisys with notice that the deliverable and/or milestone has been accepted or does not comply within seven days after the walk-through, 14 days after the Unisys notice of completion.
- If the Commonwealth does not provide notice to Unisys of their acceptance or nonconformance within 14 days of notice of completion, Unisys will provide written notice to the Commonwealth that the request was not received and the acceptance review period will be extended an additional seven days.
- The Enterprise Data Center Services Transition Management Committee will review deliverable/milestones which have not received written notice of acceptance or noncompliance within 14 days after notice of completion. This committee's goal is to determine and document the Commonwealth and Unisys actions necessary to complete the review minimizing any potential delays of the project and addressing any substantial issues.
- For any deliverables/milestones which are found to be noncompliant, Unisys will address the nonconformity and redeliver the item to the Commonwealth using this process.

D-01 – Data Center Architecture Plan and Roadmap

The Data Center Architecture Plan and Roadmap will be developed during the early stages of the Data Center Migration project's planning. This deliverable consists of seven major milestones that are due within the first 30 to 180 days of contract effective date. Specific data centers will be chosen for each application, and detailed plans will be developed to provide for the workloads targeted for each center.

Key to the Data Center Plan will be the use of the Enterprise Data Center (EDC), which will be evaluated for deficiencies that need to be remediated to provide the level of services required by the Commonwealth. The plan's other components will include technical specifications of the target data centers and tools that will be used to support the service levels required.

D-02 – Commonwealth Computing Procedures Manual (CCPM)

The Commonwealth Computing Procedures Manual (CCPM) deliverable consists of 83 milestones to be delivered from 30 to 180 days of contract start, and on a regular basis throughout steady state of the contract. The CCPM will be developed during the Transition of Services project and maintained throughout the agreement's duration as a tool for communicating how the Commonwealth and Unisys Team should interact in specific situations and how Unisys will support your technologies. This document is to be used by each Commonwealth Agency using Data Center Computing Services, all key personnel supporting the operations of the Data Center Computing Services, all Technical Support Services Teams for all platforms, the subcontractors and Small Diverse Business partners and the Bureau of Enterprise Services (BES). For additional details, please refer to **Attachment 7 to Section 3.0 – Schedule H: Commonwealth Computing Procedures Manual (CCPM).**

D-03 – Technology Architecture and Refresh Approach

The Technology Architecture and Refresh Approach is a key program deliverable with nine specific milestones that are due from 30 to 60 days from the start of the contract. This deliverable will enable the Commonwealth to meet the technical requirements of the business and application. This approach will include an ongoing review of the currently implemented technologies and assets to identify and validate when the Commonwealth's Capacity on Demand, Fully Managed, and Managed-Only Services or equipment should be replaced to support new business needs or maintain hardware and software currency and defined service levels. The Senior Enterprise Infrastructure Architect and the Agency Infrastructure Architects will manage the Technology Architecture and Refresh Approach, with recurring scheduled reviews and discussions with the Commonwealth and participating agencies.

The Data Center Technology Roadmap will begin with defining and understanding key Commonwealth business plans and needs. Using the Commonwealth's business plans and needs to define the technical requirements will enable the roadmap to align the technology recommendations, schedules, and retirement with the changes in the Commonwealth's business environment. The roadmap will also include technical recommendations identified in the Continuous Improvement process.

D-04 – IT Service Continuity Architecture and Plan

The IT Service Continuity Architecture and Plan key program deliverable consists of seven major milestones that are due from 30 to 45 days from the effective date of the contract, with a monthly reoccurring requirement. The Unisys Team will design, build, and test a tiered DR solution for the Commonwealth. The architecture for the DR solution will be documented, reviewed with the Commonwealth, and updated based on reviews and DR testing results.

A Unisys IT Risk Manager will coordinate the overall IT Service Continuity across all agencies. This experienced resource will have the responsibility to develop and execute the project plan to test DR plans prior to workload migrations in cases where DR Service is already established. In addition, the scope of the DR plan will include transition of agencies to the requested Tiered DR solution.

To support a cross-agency IT Service Continuity architecture and plan, Unisys provisioned a common Online Disaster Recovery Planning tool that will help agencies identify gaps in IT Service Continuity. We also provisioned an Emergency Notification system that can be tuned to each agency's roster of agency staff that require notifications.

D-05 – Transition Management Plan

The Transition Management Plan key program deliverable consists of 11 major milestones that are due from the initial startup through the first 90 days with reoccurring requirements thereafter. The Commonwealth's Transition Program Management Plan will focus on two primary functions: Transition of Services and Data Center Migrations. Transition of Services activities will concentrate on the implementation and transformation of processes, tools, technology, and people providing support services to the Commonwealth and data centers. Much of this effort will center on the implementation of an ITILV3-based framework that will facilitate continuous improvement in the delivery of services. The Data Center Migration (DCM) activities will center on the design and build out of the technical infrastructure required to provide a secure, highly reliable, and cost-effective environment for the Commonwealth's applications to execute as well as the organization and coordination necessary to migrate the Commonwealth's applications to this new environment. The plan's actual content will follow the Commonwealth's ITIL V3 guidelines for Management Plans, including an explanation of the methodology, staffing, schedule, and specific tasks required to accomplish the transition. Transition deliverables will be documented in the plan as part of Key Deliverable D-05.

D-06 – Agency Level DR Plan(s)

The Agency Level DR Plan key program deliverable consists of three major milestones with monthly recurring requirements. We also understand the importance of protection of critical agency applications from disaster. Unisys will provide assistance to Commonwealth agencies with updating or developing their current disaster recovery plans. Agency

level DR plans will reflect the Unisys DR approach and solution for testing and be modified to include the new technology solution utilized for their application infrastructure in the new data center. We will also work with agencies that do not have disaster recovery plans, but desire protection to develop plans to protect their most critical applications.

D-07 – Security Management Plan

The Security Management Plan key program deliverable consists of 10 major milestones that are due within the first 45 days of the contract. The Security Management Plan will be developed during the Transition of Services project and include a provision for annual security assessments and definition of security controls to address the confidentiality, integrity, and availability of Commonwealth data. It will address procedures for personnel security, including background check requirements as well as a procedure for ongoing personnel status changes that may negatively affect their ability to continue meeting security requirements.

D-08 – Facilities Management Plan

The Facilities Management Plan key program deliverable consists of nine key program deliverables effective within the first year of the contract. The Offeror Facility Management Plan will provide a proven framework for all facility-related environmental systems, including power, cooling, fire detection and suppression, building access control, and environmental monitoring as well as how future project work is to be performed at the EDC facility and the Unisys Team facilities. All facility management work detailed will be subject to the Change Management process.

D-09 – Security Risk and Vulnerability Assessment Report

The initial Security Risk and Vulnerability Report due within the first 90 days of the contract will be developed during the Transition of Services project and will leverage Deloitte's leading practices for assessing security risk and conducting vulnerability assessments to help achieve the Commonwealth's IT security and overriding business objectives in a timely and cost-effective way.

Deloitte's approach is based on deep experience in serving multiple agencies of the Commonwealth and other public sector clients using Deloitte's demonstrated methodology and framework. Deloitte's security vulnerability assessment process is comprised of five phases: Scope and Plan; Conduct vulnerability assessment; Perform penetration testing; Perform security risk assessment and architecture review; and Perform security configuration risk review.

D-10 – Gap Analysis Report

The Gap Analysis Report key program deliverable consists of two major milestones that are due between 120 and 150 days from contract start. Unisys will conduct a data center analysis, and create a report that identifies gaps in the current data centers including Unisys corrective action and approach recommendations.

D-11 – Contract Management Plan

The Contract Management Plan key program deliverable consists of two major milestones due within 60 days of the contract effective date. The Contract Management Plan will be developed to address management procedures for the overall contract. It will describe our plan to remain compliant with the terms and conditions of the contract and provide services and products that meet the requirements of the project. This plan will identify activities to be performed or initiated to track, manage, amend, and close the contract. This plan will include interim contract procedures.

4. ADDITIONAL DEFINITIONS....103

1. Offeror Guidelines

This Schedule contains specific service level requirements that the Offeror must meet in order to perform the requested Services. The Offeror must respond to the requirements contained in this Schedule according to the instructions provided below.

1.1. Offeror Instructions

- The Offeror's response to the RFP should reflect and comply with the information contained in this Schedule.
- The Offeror will complete the following sections in each of the Critical Measurements and Key Measurements:
  - Collection Process – identify how the measurement data will be collected
  - Reporting Tools – identify any tools, automated or manual, that will be used
  - Raw Data Storage (Archives) – identify where data will be stored and accessible by the Commonwealth for further analysis
  - Reporting Format/s – identify the proposed reporting format

1.2. Service Level Class Definitions

There are two classes of Service Level performance metrics used, Critical Measurements (CMs) and Key Measurements (KMs).

- **Critical Measurements (CMs)** are performance measurements defined for the most important service areas. CMs will have associated fees, e.g. Performance Credits, payable by the Offeror to Commonwealth for missed CMs according to the terms of the negotiated contract.

- **Key Measurements (KMs)** are performance target measurements for non-critical service areas. KMs are not eligible for Performance Credits. Key Measures cover less critical service deliverables, sub processes or interim activities that are related to CM performance, and are reflective of overall effective and efficient service performance management. Based on periodic contractual SLA reviews, adjustments may be negotiable and KMs may be promoted to CMs.

Service Level measurement and reporting normally begins immediately following the Service Commencement Date. However, to allow for stabilization where appropriate, application of Performance Credits may be reduced or waived for some period of time (to be negotiated) after the Service Commencement Date.

2. Service Level Details

The following pages describe each Service Level, its calculation, and other details relevant to the Service Level.

SL01 Application Infrastructure Availability – Platinum

Service Level Reference	Description
Application Infrastructure Availability– Platinum	
Service Category	Availability
Metric Description	This Service Level measures the percentage of time the Applications are Available during the applicable Measurement Window. This measurement is by application, not by server instance. Availability is defined by whether the application residing on any of the associated server instances is available to users. Targeted Applications will be determined by the Commonwealth based on the critical nature of the Agency Application.
Metric Inclusions	Server Instances and related CIs supporting Targeted Applications are identified in the CMDB. Scheduled hours of operations and maintenance windows for each infrastructure element related to the Targeted Applications will be maintained in the Commonwealth Computing Procedures Manual.
Metric Exclusions	• All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** The Service Level calculation for "Targeted Applications Infrastructure Availability" is the sum of Actual Uptime for the individual Applications divided by the sum of expected, scheduled Uptime for the Applications, with the result expressed as a percentage. • = 1 – ((Sum of Minutes the Application is not Available) / ((1440 Minutes Per Day) X (Calendar Days In Month))) expressed as a percentage
Collection Process	Unisys will work with the Commonwealth to establish the processes for collecting appropriate data for infrastructure availability measurements for the required Commonwealth Application(s). These metrics will be established when the Commonwealth selects the Unisys proposed Enterprise Services Catalog for mapping Configuration Items (CI's) for each Commonwealth Application. As part of this service, Unisys can show the relevant metrics that can be collected by the BMC Service Level Management (SLM) Application. This data is used to setup service targets against incident tickets affecting availability for each mapped Commonwealth Application CI. The SLM Application will compute the availability for supporting mapped CI's, as outlined above, for the Commonwealth Application(s). Inputs: • CMDB (mapped CI's to application)

	• Incident Tickets
Reporting Tools / Data Source(s)	The SL01 compliance will be recorded in the BMC ITSM Service Level Management Application and displayed on the real-time dashboard for all stakeholders to view and access. Data Sources: • BMC ITSM Incident Tickets • BMC ITSM Configuration Management Database Reporting Tools: • BMC Service Level Management Module • Real-time Dashboard • BMC Analytics Reporting Outputs: • Notifications through email generated from BMC ITSM SLM module for SL01 violations • SLA compliance will be displayed on Real-time Dashboard • BMC Analytics SLA Monthly Report
Data Storage (Archives)	13 months – Online Tape Backup – Life of Contract
Reporting Format/s	The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-1** provides a dashboard example:

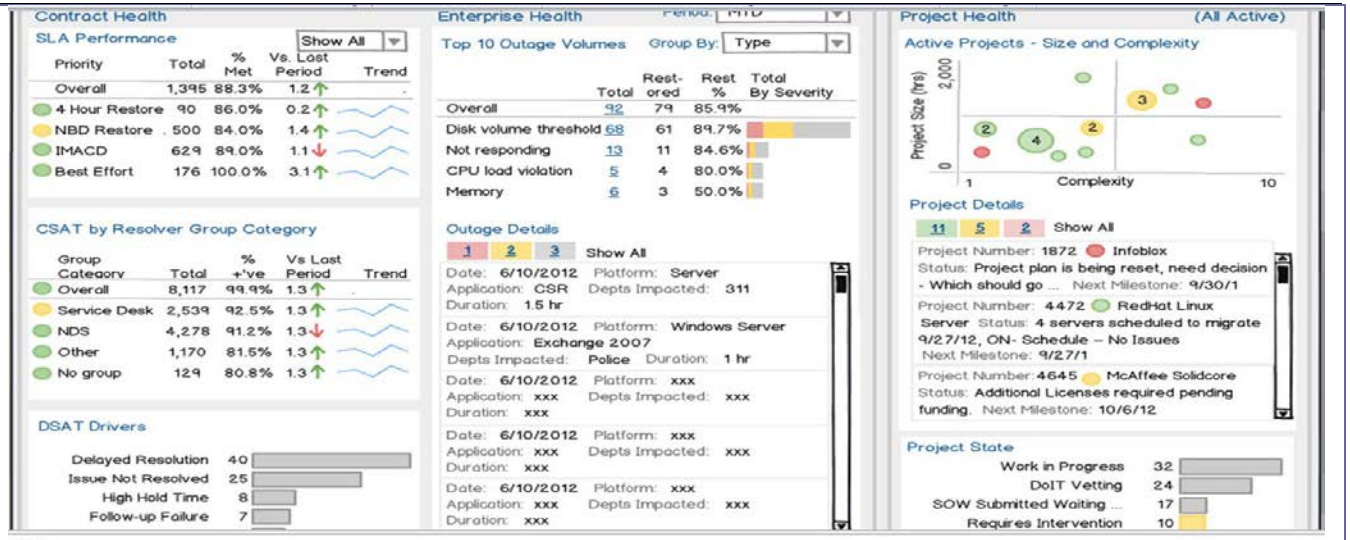

Figure J-1. SL01 Real-time Dashboard

The SLA Reporting format will be determined during transition for reporting using BMC Analytics Reporting. **Figure J-2** is an example of reports [redacted] This format will continue to be used until a new format is deployed:

Metric Inclusions	Server Instances and related CIs supporting Targeted Applications are identified in the CMDB. Scheduled hours of operations and maintenance windows for each infrastructure element related to the Targeted Applications will be maintained in the Commonwealth Computing Procedures Manual.
Metric Exclusions	• All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** The Service Level calculation for "Targeted Applications Infrastructure Availability" is the sum of Actual Uptime for the individual Applications divided by the sum of expected, scheduled Uptime for the Applications, with the result expressed as a percentage. • = 1 – ((Sum of Minutes the Application is not Available) / ((1440 Minutes Per Day) X (Calendar Days In Month))) expressed as a percentage
Collection Process	The Unisys Team will work with the Commonwealth to establish the processes for collecting appropriate data for infrastructure availability measurements for the required Commonwealth Application(s). These metrics will be established when the Commonwealth selects the Unisys proposed Enterprise Services Catalog for mapping Configuration Items (CIs) for each Commonwealth Application. As part of this service, Unisys can show the relevant metrics that can be collected by the BMC Service Level Management (SLM) Application. This data will be used to setup service targets against incident tickets affecting availability for each mapped Commonwealth Application CI. The SLM Application will compute the availability for supporting mapped CIs, as outlined above, for the Commonwealth Application(s). Inputs: • CMDB (mapped CIs to application)

	• Incident Tickets
Reporting Tools / Data Source(s)	The SL03 compliance will be recorded in the BMC ITSM Service Level Management Application and displayed on the Real-time Dashboard for all stakeholders to view and access. Data Sources: • BMC ITSM Incident Tickets • BMC ITSM Configuration Management Database Reporting Tools: • BMC Service Level Management Module • Real-time Dashboard • BMC Analytics Reporting Outputs: • Notifications through email generated from BMC ITSM SLM module for SL03 violations • SLA compliance will be displayed on Real-time Dashboard • BMC Analytics SLA Monthly Report
Data Storage (Archives)	13 months – Online Tape Backup – Life of Contract
Reporting Format/s	The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-5** provides a dashboard example:

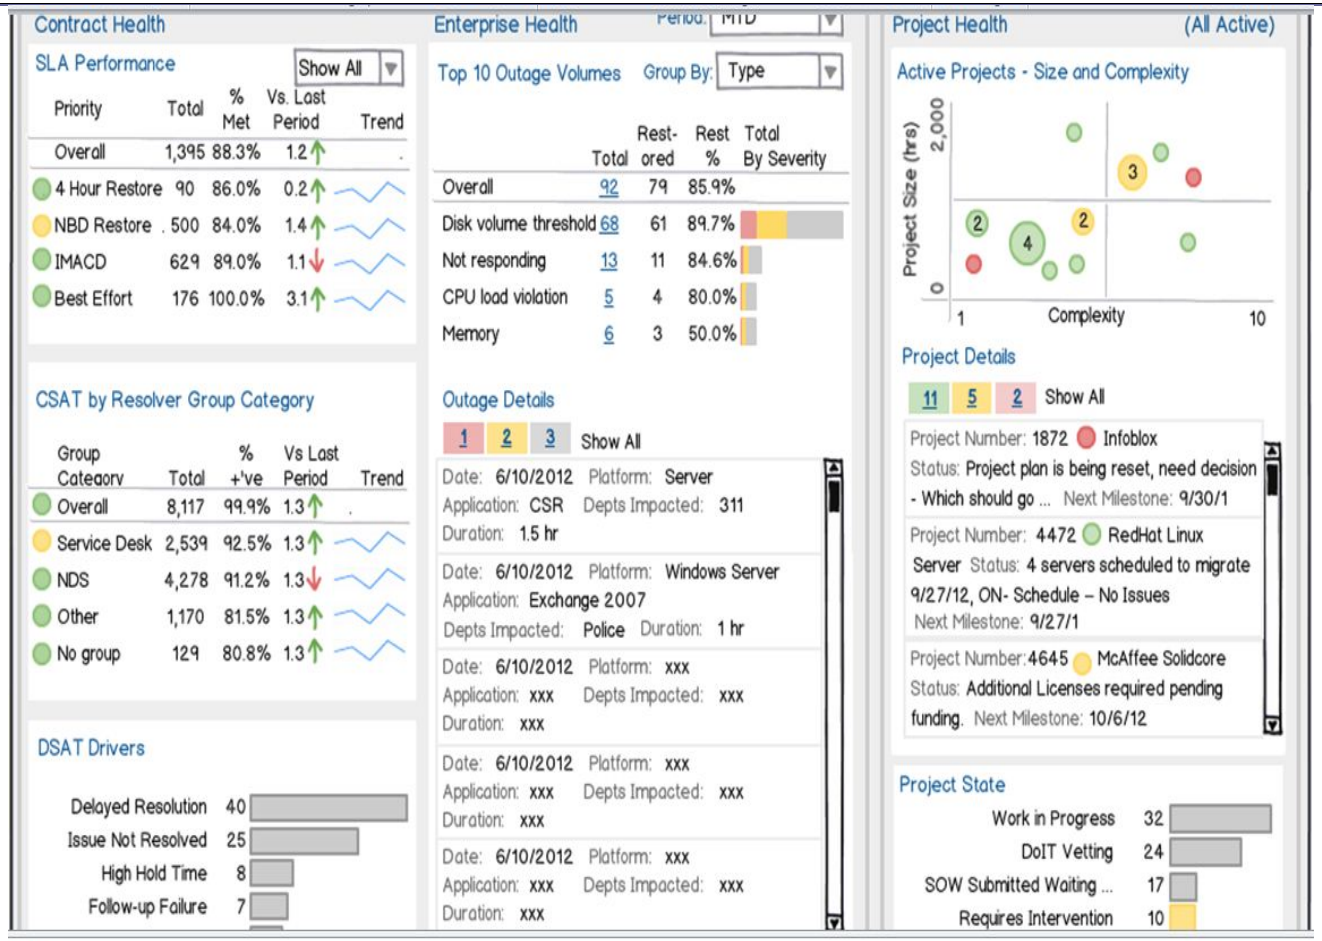

Figure J-5. SL03 Real-time Dashboard

The SLA Reporting format will be determined during transition for reporting using BMC Analytics Reporting. **Figure J-6** is an example of reports [redacted] This format will continue to be used until a new format is deployed

SL04 Application Infrastructure Availability – Bronze

Service Level Reference	Description
Application Infrastructure Availability– Bronze	
Service Category	Availability
Metric Description	This Service Level measures the percentage of time the Applications are Available during the applicable Measurement Window. This measurement is by application, not by server instance. Availability is defined by whether the application residing on any of the associated server instances is available to users. Targeted Applications will be determined by the Commonwealth based on the critical nature of the Agency Application.
Metric Inclusions	Server Instances and related CIs supporting Targeted Applications are identified in the CMDB. Scheduled hours of operations and maintenance windows for each infrastructure element related to the Targeted Applications will be maintained in the Commonwealth Computing Procedures Manual.
Metric Exclusions	• All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** The Service Level calculation for "Targeted Applications Infrastructure Availability" is the sum of Actual Uptime for the individual Applications divided by the sum of expected, scheduled Uptime for the Applications, with the result expressed as a percentage. • = 1 – ((Sum of Minutes the Application is not Available) / ((1440 Minutes Per Day) X (Calendar Days In Month))) expressed as a percentage
Collection Process	Unisys will work with the Commonwealth to establish the processes for collecting appropriate data for infrastructure availability measurements for the required Commonwealth Application(s). These metrics will be established when the Commonwealth selects the Unisys proposed Enterprise Services Catalog for mapping Configuration Items (CIs) for each Commonwealth Application. As part of this service, Unisys can show the relevant metrics that can be collected by the BMC Service Level Management (SLM) Application. Figure J-10. SL05 BMC Analytics Reporting

Service Level Reporting Window	Monthly

SL06 Resolution Time - Severity Level 1 Incidents

Service Level Reference	Description
Resolution Time - Severity Level 1 Incidents	
Service Category	Incident and Problem Resolution
Metric Description	This Service Level measures the percentage of time Offeror resolves Severity Level 1 events within the applicable time period. Also known as "Mean Time To Resolve" (MTTR) for Severity Level 1 Incidents.
Metric Inclusions	Includes all Applications Infrastructure components as defined by the CMDB and Severity Level 1 events that are assigned to the appropriate Service Level. The time limits for the resolution of each are as listed below. Time frame for resolution shall be based on the Tier designation for the highest mainframe, server or instance associated with the respective incident. For incidents not associated with a specific Mainframe, Server, or Instance, the resolution timeframe shall be measured as a Silver Tier. Platinum < 90 minutes Gold < 120 minutes Silver < 180 minutes Bronze < 240 Minutes
Metric Exclusions	• All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** The Service Level calculation for "Resolution Time – Severity Level 1" is the total number of Incidents that are or become Severity Level 1 that are Resolved within the relevant Resolution Time specified, divided by the total number of Incidents that are or become Severity Level 1 during the applicable Measurement Window, with the result expressed as a percentage. • = (Number of Severity Level 1 Incidents Resolved within Limit) / (Total Number of Severity Level 1 Incidents) expressed as a percentage
Collection Process	All infrastructure components with a Severity 1 incident ticket resolved during the measurement window will be included for calculation of the SL06 Resolution Time SLA. The CMDB will be used to determine the highest-level incident to be included for the calculation of the SLA. A Service Target

	in the BMC ITSM module will calculate the Mean Time to Resolve (MTTR) for each identified incident ticket using the time stamps of when the incident started and when the service was restored for the Configuration Item identified. The service target in the Service Level Management Module will calculate the compliance of the Severity 1 Incident Ticket(s) according to the SL06 definition. Inputs: • Incident Tickets (Severity 1) • CMDB (hierarchy of CIs and service level for the CI)
Reporting Tools / Data Source(s)	The SL06 compliance will be recorded in the BMC ITSM Service Level Management Application and reported on Real-time Dashboard for all stakeholders to view and access. Outputs: • SLA compliance will be displayed on Real-time Dashboard • SLA reports from BMC Analytics Data Sources: • BMC ITSM Incident Management Module • BMC ITSM Configuration Management Module • BMC ITSM Service Level Management Reporting Tools: • BMC ITSM Service Level Management • Real-time Dashboard • BMC Analytics
Data Storage (Archives)	Data storage is 13 months of history online with offline storage to tape with all supporting details.
Reporting Format/s	The SLA Incident reporting format will be determined during transition for display on the Real-time Dashboard. **Figure J-11** is a sample of an Incident SLA resolution time report. **Figure J-12** provides additional examples of BMC analytics page displaying incident time analysis. **Figure J-13** demonstrates a model we will use to display incident data on the dashboard.

SL07 Resolution Time - Severity Level 2

Service Level Reference	Description
Resolution Time - Severity Level 2	
Service Category	Incident and Problem Resolution
Metric Description	This Service Level measures the percentage of time Offeror resolves Problems within the applicable time periods. Also known as "Mean Time To Resolve" (MTTR) for Severity Level 2 Incidents.
Metric Inclusions	Includes all Mainframes, Servers, and Instances associated with Targeted Applications and other Severity Level 2 events not associated with Servers or Instances. The time limits for the resolution of each mainframe, server or instance are as listed below. Time frame for resolution shall be based on the Tier designation for the highest mainframe, server or instance associated with the respective incident. For incidents not associated with a Mainframe, Server, or Instance, resolution shall be measured as Silver Tier (< 360 minutes). Platinum < 90 minutes Gold < 180 minutes Silver < 360 minutes Bronze < 960 Minutes
Metric Exclusions	• All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** The Service Level calculation for "Resolution Time – Severity Level 2" is the total number of Incidents that are or become Severity Level 2 that are Resolved within the relevant Resolution Time specified, divided by the total number of Incidents that are or become Severity Level 2 during the applicable Measurement Window, with the result expressed as a percentage. • = (Number of Severity Level 2 Incidents Resolved within Limit) / (Total Number of Severity Level 2 Incidents) expressed as a percentage
Collection Process	All infrastructure components with a Severity 2 incident tickets resolved during the measurement window will be included for calculation of the SL07 Resolution Time SLA. The CMDB will be used to determine the highest-level incident to be included for the calculation of the SLA. A Service Target in the BMC ITSM module will calculate the Mean Time to Resolve (MTTR) for each identified incident ticket using the times stamps of when the incident started and when the service was restored

	for the Configuration Item identified. The service target in the Service Level Management Module will calculate the compliance of the Severity 2 incident ticket(s) according to the SL07 definition. Inputs: • Incident Tickets (Severity 2) • CMDB (hierarchy of CIs and service level for the CI.
Reporting Tools / Data Source(s)	The SL07 compliance will be recorded in the BMC ITSM Service Level Management Application and reported on Real-time Dashboard for all stakeholders to view and access. Outputs: • Notifications through email generated from BMC ITSM with communication status updates per time intervals defined for SL07 • SLA compliance will be displayed on Real-time Dashboard • SLA reports from BMC Analytics Data Sources: • BMC ITSM Incident Management Module • BMC ITSM Configuration Management Module • BMC ITSM Service Level Management Reporting Tools: • BMC ITSM Service Level Management • Real-time Dashboard • BMC Analytics
Data Storage (Archives)	Data storage is 13 months of history online with offline storage to tape with all supporting details.
Reporting Format/s	The SLA incident-reporting format will be determined during transition for display on the Real-time Dashboard. **Figure J-14 and J14a** are samples of an BMC Incident SLA resolution time report:

Service Category	Incident and Problem Resolution
Metric Description	This Service Level measures the percentage of time Offeror resolves Incidents within the applicable time periods. Also known as "Mean Time To Resolve" (MTTR) for Severity Level 3 and Severity Level 4 Incidents.
Metric Inclusions	Severity Level 3 - For all Severity Level 3 Incidents , the incident shall be resolved within 3,780 Business Minutes (i.e. 63 hours) Severity Level 4 - For all Severity Level 4 Incidents, the incident shall be resolved within 4,860 Business Minutes (i.e. 81 hours or 9 business days) Total Business Minutes shall be measured during only those minutes between 8:00 AM and 5:00 PM inclusive, Monday through Friday inclusive (1 Business day = 9 Business hours = 540 Business minutes); (1 Business Week = 2,700 minutes)
Metric Exclusions	• All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	8:00AM – 5:00 PM
Days of Measurement	Monday through Friday
Calculation	• **Summary:** The Service Level calculation for "Resolution Time – Severity Level 3/4" is the total number of Incidents that are or become Severity Level 3 or 4 that are Resolved within the relevant Resolution Time specified, divided by the total number of Incidents that are or become Severity Level 3 or 4 during the applicable Measurement Window, with the result expressed as a percentage. • = ((Number of Severity Level 3 Incidents Resolved within Limit) +(Number of Severity Level 4 Incidents Resolved within Limit)) / ((Total Number of Severity Level 3 Incidents) + (Total Number of Severity Level 4 Incidents)) expressed as a percentage
Collection Process	All infrastructure components with a Severity 3 and 4 incident tickets resolved during the measurement window will be included for calculation of the SL08 Resolution Time SLA. A Service Target in the BMC ITSM module will calculate the Mean Time to Resolve (MTTR) for each identified incident ticket using the times stamps of when the incident started and when the service was restored for the Configuration Item identified. The service target in the Service Level Management Module will calculate the compliance of the Severity 3 and 4 incident ticket(s) according to the SL08 definition.

	Inputs: • Incident Tickets (Severity 3 and 4)
Reporting Tools / Data Source(s)	The SL08 compliance will be recorded in the BMC ITSM Service Level Management Application and reported on Real-time Dashboard for all stakeholders to view and drill down into details. Outputs: • Notifications through email generated from BMC ITSM with communication status updates per time intervals defined for SL08 • SLA compliance will be displayed on Real-time Dashboard • SLA reports from BMC Analytics Data Sources: • BMC ITSM Incident Management Module • BMC ITSM Service Level Management Reporting Tools: • BMC ITSM Service Level Management • Real-time Dashboard • BMC Analytics
Data Storage (Archives)	Data storage is 13 months of history online with offline storage to tape with all supporting details.
Reporting Format/s	The SLA Incident Resolution Reporting format will be determined during transition. **Figure J-16** is a sample of a BMC Analytics Time Analysis sheet, **Figure J-17** is a BMC incident work sheet, and **Figure J-18** provides a sample view of the dashboard Incident SLA resolution time report:

Service Level Reporting Window	Monthly

SL09 Solution Request Fulfillment

Service Level Reference	Description
Solution Request Fulfillment	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of time Offeror successfully implements a Solution Request within the timeframe committed to the requester as measured in the applicable Measurement Window. All phases of the Solution implementation process from the Commonwealth Customer approval of the Solution Proposal through implementation and the Commonwealth Customer acceptance into production are included in this measure.
Metric Inclusions	For purposes of calculating this Service Level, only those requests which require a solution proposal that has been accepted by the State will be included in the calculation. Solution Requests without a production date established by the time the order is received will be counted as a "missed" expectation.
Metric Exclusions	None
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of projects that are successfully completed during the applicable Measurement Window on are before the due date specified in the applicable Solution Proposal and/or a subsequent project plan, divided by the total number of projects that should have been completed during the applicable Measurement Window, with the result expressed as a percentage. • = (Number of Solution Requests Completed within Limit) / (Total Number of Solution Requests) expressed as a percentage
Collection Process	To support the Commonwealth Service Level for Solution Request Fulfillment, approved solution requests requiring a project plan will be tracked. The approved project completion date following the review of the documented project plan will be used to provide the tracked due date. The due dates will be added to the service request within the service request tracking tool and added to the project status reports. The reporting and calculations for the service level will occur based upon the data recorded in within the Service Request tracking tool and validated by the Project Status Reports. Input: • Approved Solution Request requiring a project plan • Approved Project Plan with Completion Date

Reporting Tools / Data Source(s)	Data Sources: • Project Plan • Service Request Tracking Tool • ITSM Change Management Reporting Tools: • Project Management Status Reports • Service Request Tracking Reports • Real-time Dashboards
Data Storage (Archives)	Online Storage – 13 months Tape Backups – Life of the Contract
Reporting Format/s	The Project Management Status reports will be generated using MS Project and MS Excel, the exact format and content will be determined through collaborative meetings with the Commonwealth during transition. The content and format of the Service Request tracking form will be determined through collaborative meeting with the Commonwealth during the transition. The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. See **Figure J-19** for an example of the Real-time Dashboard.

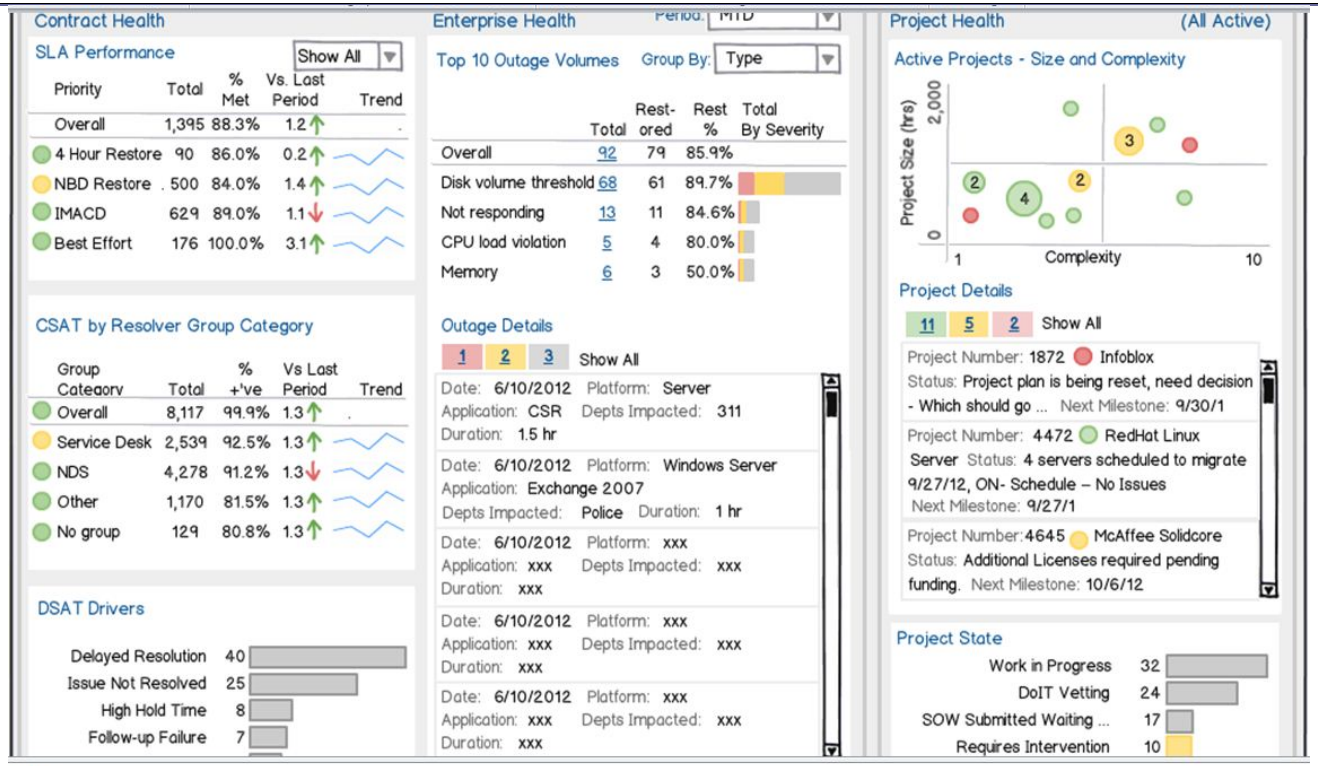

Figure J-19. SL03 Real-time Dashboard

Service Level Reporting Window	Monthly

SL10 Standard Service Request Fulfillment

Service Level Reference	Description
Standard Service Request Fulfillment	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of time Offeror successfully completes Standard Service Requests that do not require a purchase or a solution proposal to be approved by the State. Specific target timeframes are either established in the CCPM or a specific commitment date outside of the standard timeframe may be established at the State's discretion. Examples of these types of requests are provision of ID access, upgrade to a new OS version, run a special batch job, etc.
Metric Inclusions	Included as Standard Service Requests shall be an agreed upon set of service requests as specified in the Commonwealth Computing Procedures Manual.
Metric Exclusions	• Elapsed time waiting for the Commonwealth or a Commonwealth Customer's required approval or hold shall be excluded. • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of Standard Service Requests successfully completed by Offeror during the applicable Measurement Window and within the required timeframes specified in Commonwealth Compute Procedure Manual (CCPM) or other agreed to date, divided by the number of Standard Service Requests that should have been completed by Offeror during the applicable Measurement Window, with the result expressed as a percentage. • = (Number of Standard Requests Completed within Limit) / (Total Number of Standard Requests) expressed as a percentage
Collection Process	To support the Commonwealth Service Level for Standard Service Request Fulfillment, standard service requests will be entered into the service request tool with date submitted and date completed. The type of service request will be identified in the service request record. This data will be used to calculate the SL10 calculations for reporting. The Commonwealth's standard service requests will be documented within the CCPM and include a description of the service, the tasks to be performed, and the timeframe for the service request's

	implementation. The tracking for each service request will begin with the submittal of the requests within the Service Request tool and end with its completion and acceptance update within the tool. Inputs: • Standard Service Requests
Reporting Tools / Data Source(s)	Data Sources: • Standard Service Requests Reporting Tools • Service Request tool • ITSM Change Management Modules • Real-time Dashboards
Data Storage (Archives)	Online Storage – 13 Months Tape Backups – Life of Contract
Reporting Format/s	The Change Management report format and content, and the Service Request tracking form, will be determined through collaborative meetings with the Commonwealth during transition. The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. Real-time Dashboard is shown below in **Figure J-20**

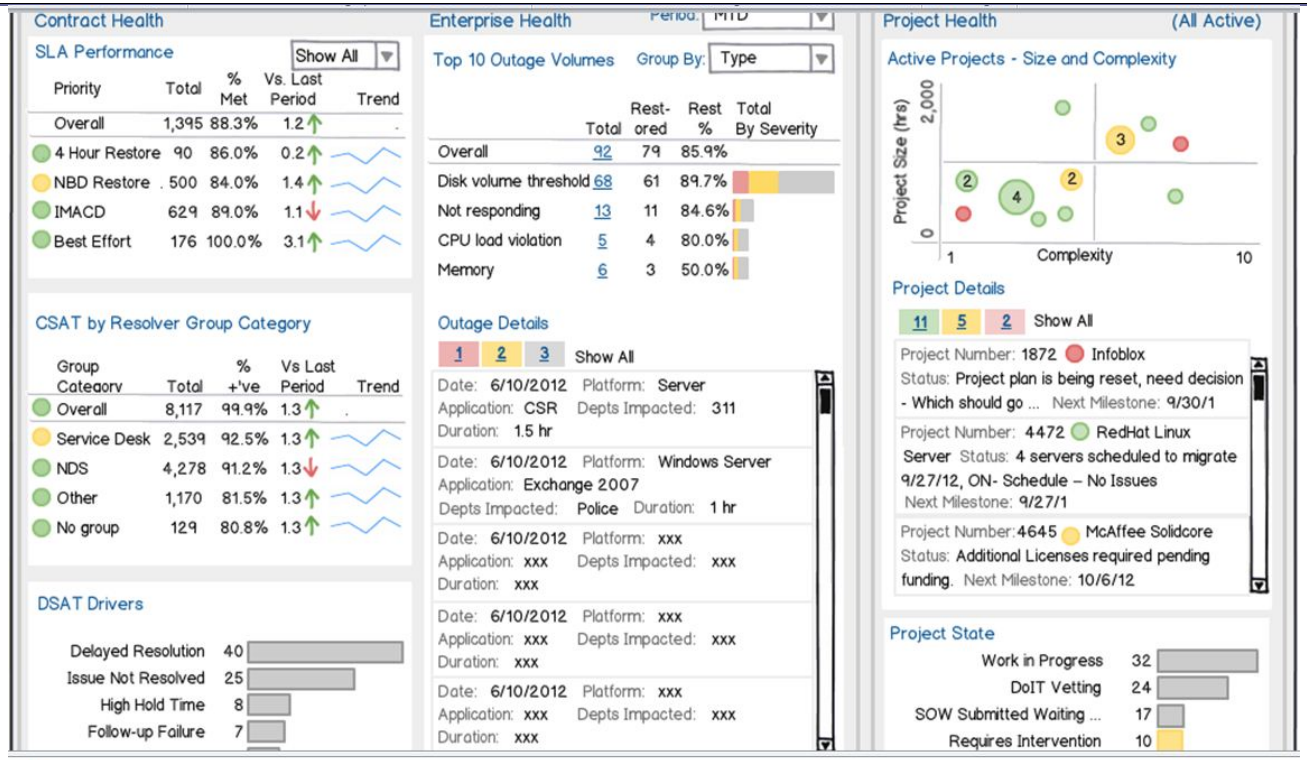

Figure J-20. SL10 Real-time Dashboard

Service Level Reporting Window	Monthly

SL11 Completion of Project/Solution Phase

Service Level Reference	Description
Completion of Project/Solution Phase	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of time Offeror successfully completes a phase (e.g. procurement, floor prep, network prep, physical install, turn-up and test, production) milestone no later than the committed timeframe. All phases of the Solution implementation process following the Commonwealth Customer approval of the Solution Proposal through implementation and the Commonwealth Customer acceptance into production are included in this measure.
Metric Inclusions	For purposes of calculating this Service Level, only those requests which require a solution proposal or project plan that has been accepted by the State and a production date established will be included in the calculation. If a milestone is missed, the rescheduled milestone will also be included in the measurement
Metric Exclusions	All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of Project or Solution Requests successfully completed by Offeror during the applicable Measurement Window and within the required timeframes specified in Commonwealth Compute Procedure Manual (CCPM) or other agreed to date, divided by the number of Project and Solution Requests that should have been completed by Offeror during the applicable Measurement Window, with the result expressed as a percentage • = (Number of Project/Solution Requests Completed within Limit) / (Total Number of Project/Solution Requests) expressed as a percentage
Collection Process	To maintain on time delivery of projects and support the Commonwealth's business operations, the Service Level for Project/Solution Phase Completion, approved solution requests requiring projects with multiple phases will be tracked. Each phase's due date, including the project's completion date, will be reviewed with the Commonwealth and, upon approval, recorded within the Service Request tool and documented in the Project Management Status Report for the individual service requests. As phases are performed and completed, the status will be recorded in the project plan, Service Request Tracking tool and the Project Status Reports. The reporting and calculations for the service level will occur based upon the data recorded within the Service Request Tracking tool and validated by the

	Project Status reports. Inputs • Approved Solution Requests requiring Project Plans with multiple Phases • Project Plan with approved dates for multiple phases.
Reporting Tools / Data Source(s)	Data Sources • Approved Project Plans with multiple phases • Approved Service Requests requiring project plans with multiple phases • Service Request Tracking Tool Reporting Tools: • Project Management Status Reports • Service Request Tracking Tool • Real-time Dashboard
Data Storage (Archives)	Online Storage – 13 months Tape Backups – Life of Contract
Reporting Format/s	The Project Management Status reports will be generated using MS Project and MS Excel, the exact format and content will be determined through collaborative meetings with the Commonwealth during transition. The content and format of the Service Request tracking form will be determined through collaborative meetings with the Commonwealth during the transition. The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-21** is an example of the CIO Dashboard for SLA's:

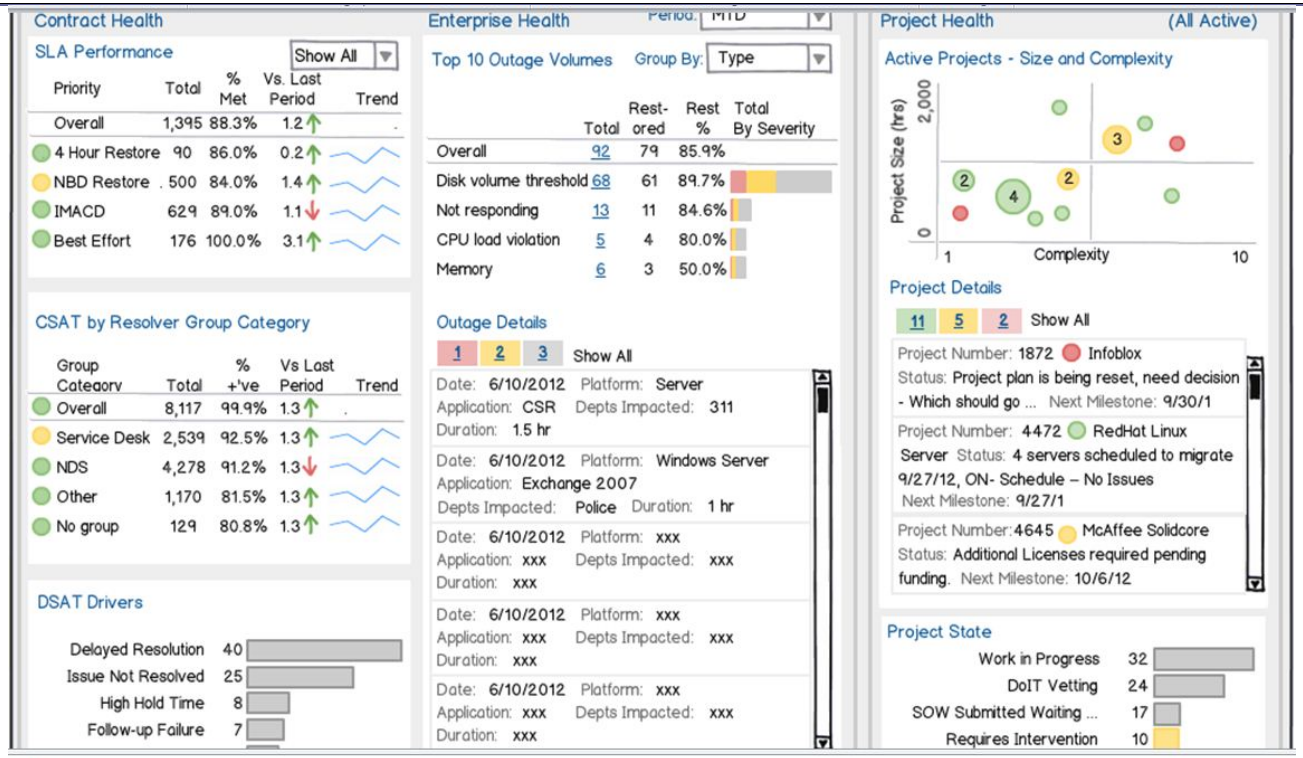

Figure J-21. SL11 Real-time Dashboard

Service Level Reporting Window	Monthly

SL12 Solution and Procurement Proposals Delivered

Service Level Reference	Description
Solution and Procurement Proposals Delivered	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of time Offeror provides a viable proposal to the State, in response to a solution or procurement request, within the timeframe established in the Commonwealth Computing Procedures Manual for commodity and standard requests or a jointly agreed to commitment date for custom requests.
Metric Inclusions	Each proposal submitted to the State will be considered a measurable event. If there are multiple proposals for one request due to requirements changes then subsequent iterations will be counted as another event. Each will count as an event and an opportunity to succeed or fail.
Metric Exclusions	• All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of viable proposals submitted to the State during the applicable Measurement Window on or before the due date determined from the Commonwealth Computing Procedures Manual for Standard and Commodity Requests or jointly agreed for custom requests, divided by the total number of proposals that should have been submitted during the applicable Measurement Window, with the result expressed as a percentage. • = (Number of Solution and Procurement Proposal Requests Completed within interval) / (Total Number of Solution and Procurement Proposal Requests) expressed as a percentage
Collection Process	As the Commonwealth's business needs continues to change, new solutions and procurement requests will be submitted to request support for the new requirements and to provide new and additional services or technology. The Service Level for the Delivery of Solution and Procurement Proposals will support multiple types of requests with several dates tracked within the Service request tool. The Commonwealth has identified several types of solution requests, which will require solutions or procurement activity and which will be tracked as part of this service level. 1) Statement of Objectives: Request covering multiple functional areas with additional procurement requirements or new services to be added to the Enterprise Services Catalog. 2) Work Order: Request covering multiple functional areas with no additional procurement

requirements and all services are within the existing Enterprise Services Catalog.

3) Service Requests: Request covering a single functional area with no additional procurement requirements and the services are within the existing Enterprise Services Catalog

4) Request for Technical Analysis: Technical Solution Research requests on possible solutions

5) Cost-Benefit Analysis: Research request to identify the cost benefit of new technologies and services

6) Conceptualization: Research request to identify possible technical options to fulfill an objective.

7) High Level Estimates: Research request to develop a rough order of magnitude cost quote

8) Technical Opinions: Research request to analyze technologies for technical merits and suitability within the Commonwealth environment

All Solution requests will be entered into the Service Request Tracking Tool and tracked until the request has been approved for implementation. The actual fulfillment of an approved solution will not be tracked by this Service Level, but will be tracked by SL09 (Solution Request Fulfillment) and SL11 (Completion of Project/Solution Phase).

To maintain the quality and timeliness of the solutions, the Service Level may include the time to collect, review and approve the requirements, but the final date for the delivery of the solution will not be established until after the requirements are agreed to with the Commonwealth. The SLA tracking will begin after the Requirements approval by the requesting Agency. If new requirements are received at any time after the requirements are approved by the Agency, the Service Level time measurement will be reset after the additional Agency review and updated date for the solution is submitted and approved.

The solution review's approval with the Commonwealth will be considered the final tracking item for this Service Level SL12. This date will be captured in the service request for custom solution requests.

Inputs

- Solution Request, including the type of service request
- Requester requirements confirmation
- Solution plan delivery date

Reporting Tools / Data Source(s)	Data Sources • Service Request Tracking Tool Reporting Tools • Real-time Dashboard • Service Request Tracking Tool
Data Storage (Archives)	Online Storage – 13 months Backups – Life of Contract Completed Solutions – Knowledge Management Database and /or SharePoint
Reporting Format/s	The content and format of the Service Request tracking form will be determined through collaborative meetings with the Commonwealth during the transition. The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-22** provides an example of the format we plan to use for SLA 12. 
	Figure J-22. SL12 Real-time Dashboard
Service Level Reporting Window	Monthly

SL13 CMDB Content Accuracy and Timeliness

Service Level Reference	Description
CMDB Content Accuracy and Timeliness	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of an audited statistically valid sample of Inventory Records (as defined below) during the Measurement Window that is determined to be Accurate (as defined below) by such audits.
Metric Inclusions	The audited sample for this Service Level must contain a number of randomly selected CMDB Inventory Records that is reasonably acceptable to the Commonwealth. The random selection shall be a statistically significant stratified random sampling representing all Commonwealth Customers each month. **Definitions for purposes of this Service Level:** "Accurate" means all Critical Inventory Attributes are correctly and completely populated in the CMDB Inventory of Record. "Critical Inventory Attributes" means those database fields in an Inventory Record that are essential for Offeror's successful delivery of Service and necessary for CoPA's successful performance of retained responsibilities, including architecture, IT planning, and reconciliation of invoices. Critical Inventory Attributes that shall be audited are set out in Commonwealth Computing Procedures Manual and may be modified over time in accordance with the Commonwealth Computing Procedures Manual. "CMDB Inventory of Record" means the inventory of CIs, including all Equipment and Software, to be created and maintained by Offeror in accordance with the CCPM. "Inventory Record" means the record for a single item of Equipment or Software in the Inventory of Record, including all of the Critical Inventory Attributes for that item.
Metric Exclusions	• All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of CMDB Inventory Records that are audited during the applicable Measurement Window and that are Accurate, divided by the total number of Inventory Records that are audited during the applicable Measurement Window, with the result expressed as a percentage.

	• = ((Number of Valid Records Found) / (Total Number of Records Audited)) expressed as a percentage
Collection Process	The Commonwealth will supply a list of Configuration Items (CIs) to be audited on the agreed monthly cycle. The CIs will be reviewed together with the Commonwealth to determine which attributes of the CIs are to be audited and the approach to auditing. The audit results will be recorded in a spreadsheet. The spreadsheet will contain the random sample CI description, location and the CMDB configuration attribute information extracted from the CMDB. The discovered or audited value for each CI and attribute will be recorded in the same spreadsheet and compared to the CMDB values. Any discrepancies will be noted and researched. The spreadsheet will calculate the SL13 compliance metrics to be reported.
Reporting Tools / Data Source(s)	The reporting tool will be Real-time Dashboard to display the SLA compliance calculation. The spreadsheet will be used to calculate the SLA compliance and to populate the SL13 Real-time dashboard. The details recorded in the spreadsheet will be used for analysis and a PowerPoint Presentation summarizing the results, analysis and recommendations for change will be created on a monthly basis.
Data Storage (Archives)	The spreadsheet and PowerPoint for summary review of results will be locked after analysis is completed and stored in the Services Portal for future access and review.
Reporting Format/s	The content and format of the SLA Compliance tracking will be determined through collaborative meetings with the Commonwealth during the transition. Formats for reporting audit results will be agreed to in transition for the PowerPoint audit results and spreadsheet detail formats. **Figure J-23** provides an example of how the SL13 results will be shown in the Real-time Dashboard.

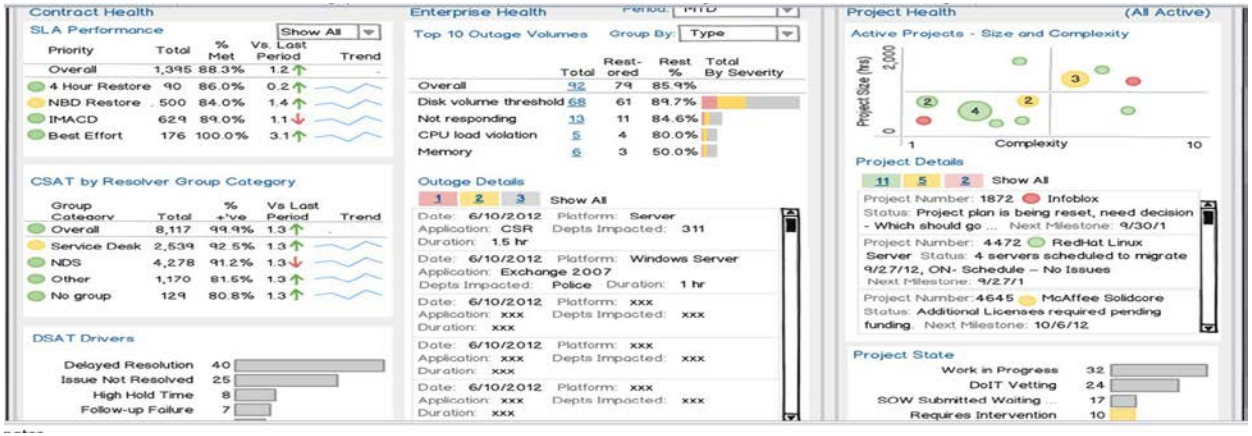

Figure J-23. SL13 Real-time Dashboard

Service Level Reporting Window	Monthly

SL14 Software License Renewal Timeliness

Service Level Reference	Description
Software License Renewal Timeliness	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the timeliness of all license and maintenance renewals for software managed by Offeror.
Metric Inclusions	This SLA includes the renewal of software licenses included in the Agreement and hardware maintenance agreements included in Hardware Service Charges (HSC) to a the Commonwealth Customer (e.g. renewal of SSL certificates, Application Utility software, custom solution hardware (covered by a maintenance agreement) charged to the Commonwealth Customer through the HSC).
Metric Exclusions	• Renewals for software or maintenance purchased outside of this contract by the Commonwealth or the Commonwealth Customers and not included in Offeror's charges to the Commonwealth are excluded. • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	This Service Level measures the timeliness of all license and maintenance renewals for software managed by Offeror.
Days of Measurement	N/A
Calculation	• **Summary:** Renewals are routinely expected to be installed ten (10) or more Business Days prior to the renewal due date for the item or service. (Renewal due date is the date when the current license or maintenance contract expires.) The Service Level calculation for "Software License Renewal Timeliness" is a percentage derived from the total number of all renewals processed divided by the total number due for the month that were renewed before the renewal expiration date without disruption in service. • = ((Successful Software Renewals implemented within Time Frame) / (Total Software License Renewals Completed)) expressed as a percentage
Collection Process	To support the Commonwealth Service Level for the timeliness of Software maintenance renewals, the hardware and software maintenance renewals for the components used to support the services provided and the maintenance renewals for software licenses from Exhibits B.4 and B.10 will be tracked. The software and hardware used by the Unisys team or hosted using our services will be tracked within the ITSM Asset Management module. As maintenance renewal cycles occur, the License

	Manager will use the data stored within the Asset Management module to identify the software and hardware to renew prior to the required renewal date. The updated expiration dates will be added to the Asset Management data. Within a set timeframe defined within the CCPM, an email will be generated by the ITSM Asset Management and Notification system and sent to authorized Commonwealth and Unisys staff to communicate when renewals are required. As additional software and hardware is added into the service, the additional maintenance renewal requirements will be added into the Asset Management module. For software which is removed from active service, the Asset Management data will be updated to reuse the software or hardware or, upon retirement, the Asset Management data will be updated to document the actual retirement. SL14 will be calculated by the Service Level Management Application utilizing maintenance renewal target date and updates for completed renewals for software and hardware maintenance contract renewal requirements compared to the SLA requirement of all renewals completed 10 days prior to expiration. Inputs: BMC Asset data for : • Software License and Hardware Maintenance contract begin and end dates • Software Licensing certificates • SSL certificate Purchase and Expiration dates
Reporting Tools / Data Source(s)	Data Sources: ITSM Remedy Asset and Service Level Management Applications Reporting Tools: • Real-time Dashboard • BMC ITSM Remedy • BMC ITSM Remedy email notification for maintenance renewals
Data Storage (Archives)	Online – 13 months Tape Backups – Life of Contract
Reporting Format/s	The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-24** provides an example of the Real-time Dashboard:

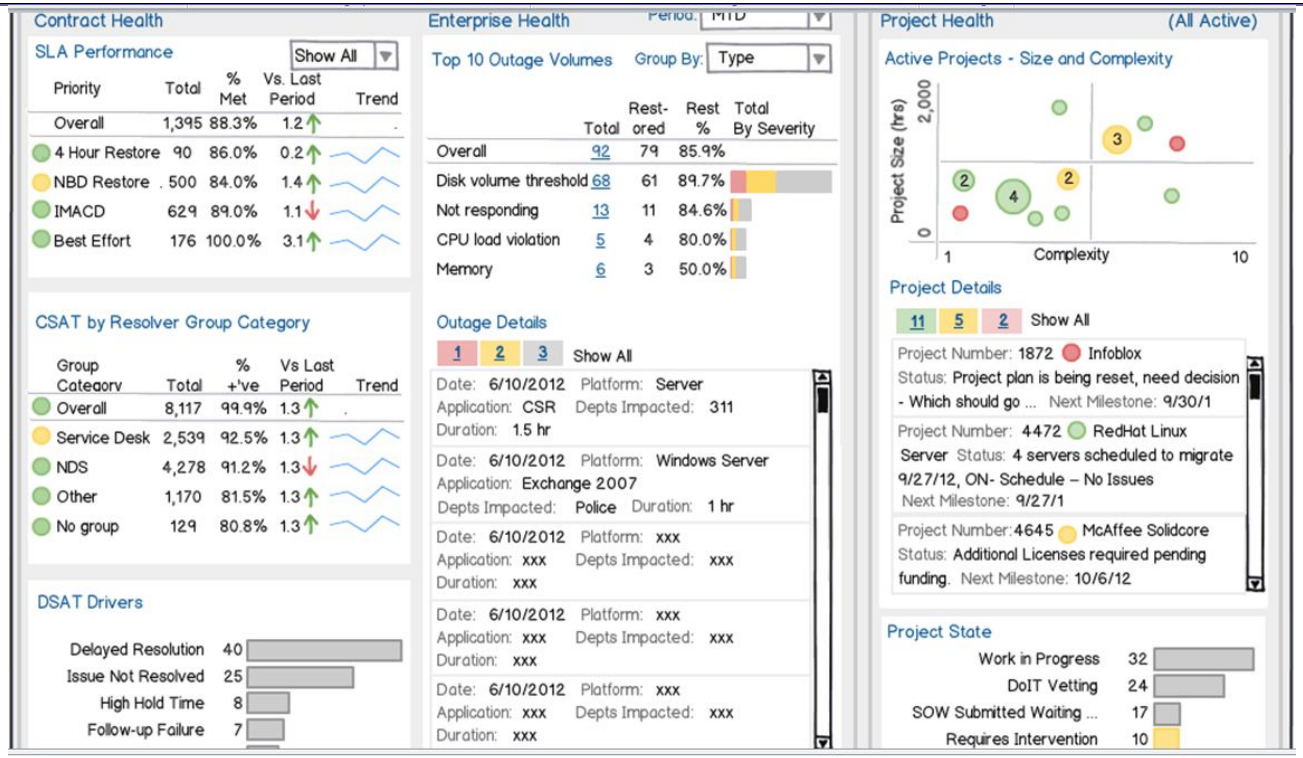

Figure J-24. SL14 Real-time Dashboard

Service Level Reporting Window	Monthly

SL15 Successful Backups

Service Level Reference	Description
Successful Backups	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of time Offeror completes backup jobs successfully during the applicable Measurement Window in accordance with the relevant criteria specified in the Commonwealth Computing Procedures Manual.
Metric Inclusions	Backup jobs include all registered backup clients (including but not limited to all file systems, databases, application files, operating systems, applications and respective data).
Metric Exclusions	• If there is an appropriate tool available and in use that captures open files, then the backup of open files are included as part of the backup. If there is not an appropriate tool available and in use for the capture of open files, then open files are skipped and not counted against this Service Level. Any batch jobs related to infrastructure backups, or other functionality exclusively for Offeror would be excluded. • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level is the sum of the number of times Offeror completes backup jobs successfully and complete on time during the applicable Measurement Window divided by the of the sum of the number of times Offeror began or should have begun backup jobs within the applicable measurement window, with the result expressed as a percentage. • = ((Number of Successful Backups) / (Total Number of Backups Attempted)) expressed as a percentage
Collection Process	Success/failure data from the CommVault tool used to backup data will be used to calculate the SLA. Backup failures will be captured in the ITSM system. Count of successful and total backups can be exported out of CommVault. The SLA will be displayed in the SLA dashboard and reported monthly as part of the BMC Analytics SLA Summary Report. Inputs: • CommVault success/failure data
Reporting Tools / Data Source(s)	The SL15 compliance will be recorded in the BMC ITSM Service Level Management Application and

	displayed on the Real-time Dashboard for all stakeholders to view and drill down into details. Data Sources: • CommVault Reporting Tools: • BMC Service Level Management Module • Real-time Dashboard • BMC Analytics Reporting Outputs: • SLA compliance will be displayed on Real-time Dashboard • BMC Analytics SLA Monthly Report
Data Storage (Archives)	Data storage is 13 months of history online with offline storage to tape with all supporting details `
Reporting Format/s	The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-25** is a dashboard (back page) example:

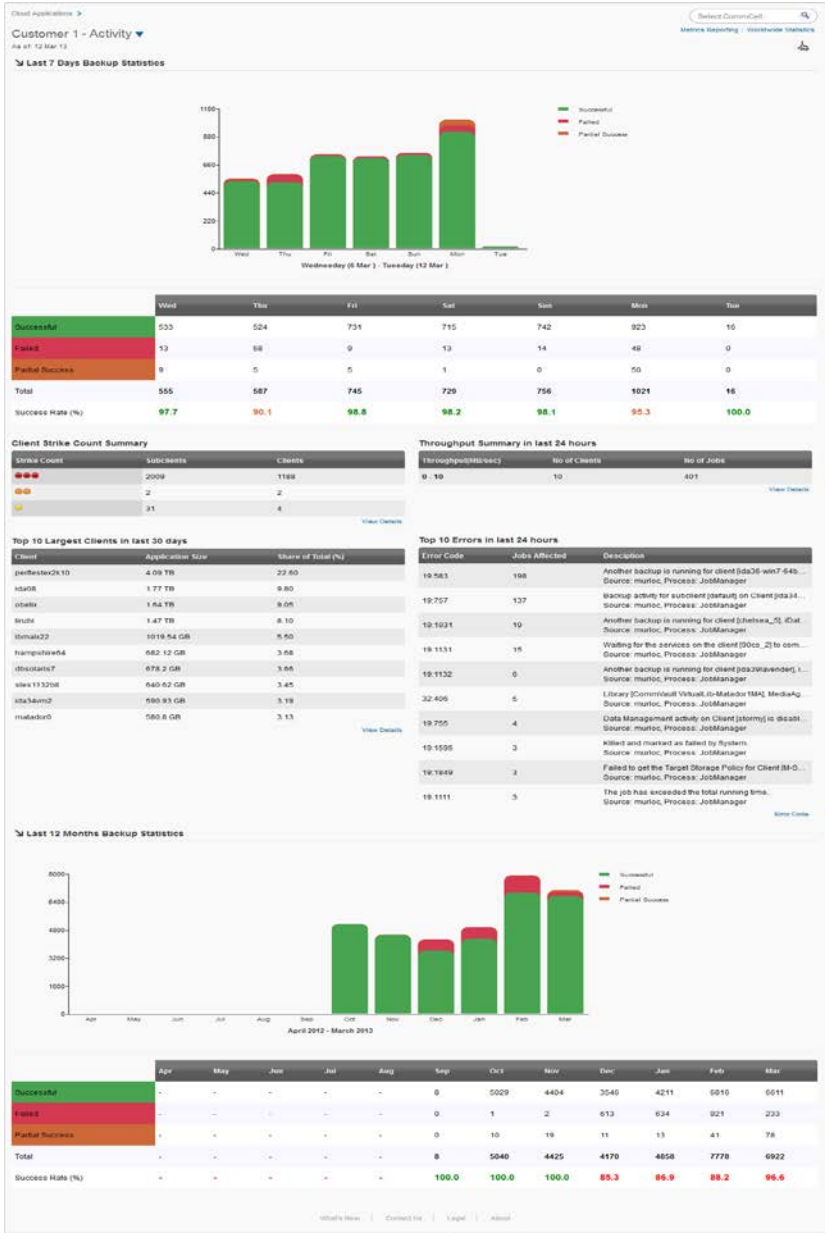

Figure J-25. SL03 Real-time Dashboard

Service Level Reporting Window	Monthly

SL16 Successful Recoveries

Service Level Reference	Description
Successful Recoveries	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of time Offeror completes data recoveries successfully and on time during the applicable Measurement Window in accordance with the relevant criteria specified in the Commonwealth Computing Procedures Manual.
Metric Inclusions	Recoveries include all registered recovery clients (including but not limited to all file systems, databases, application files, operating systems, applications and respective data).
Metric Exclusions	• Any batch jobs related to infrastructure recoveries, or other functionality exclusive for the Offeror would be excluded. • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of data recovery jobs that are completed successfully and on time in accordance with the relevant criteria set forth in the Commonwealth Computing Procedures Manual during the applicable Measurement Window, divided by the total number of data recovery jobs that were attempted or scheduled to be completed during the applicable Measurement Window, with the result expressed as a percentage. • = ((Number of Successful Recoveries) / (Total Number of Recoveries Attempted)) expressed as a percentage
Collection Process	A service request ticket for data restore jobs will be updated with success/failures outcomes according to the defined CCPM procedure for calculating SL16. The service request ticket will be updated manually with the success/failure data from the procedure and CommVault Tool used to restore data. The Service Level Management Module will be used to calculate the SLA from the service request tickets for data restores by examining the success/failure status of the tickets. The SLA will be displayed in the SLA dashboard and reported monthly as part of the BMC Analytics SLA Summary Report. Inputs: • Service Request Tickets (for data restores) • CommVault success/failure data

Reporting Tools / Data Source(s)	The BMC Service Level Management Application will be configured with service targets to calculate SL16 for data restore service requests. The SLA will be displayed on the Real-time Dashboard for all stakeholders to view and drill down into details. Outputs: • SLA compliance will be displayed on Real-time Dashboard • SLA reports from BMC Analytics Data Sources: • Service Request Tickets Reporting Tools: • Real-time Dashboard • BMC Analytics Monthly Summary SLA Report
Data Storage (Archives)	Data storage is 13 months of history online with offline storage to tape with all supporting details.
Reporting Format/s	The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-26** is an dashboard (back page) example:

Figure J-26. SL16 Real-time Dashboard

Service Level Reporting Window	Monthly

SL17 Security Incident Notification Timeliness

Service Level Reference	Description
Security Incident Notification Timeliness	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of time Offeror completes identifying and notifying CoPA of detected security incidents in accordance with ITB-SEC024.
Metric Inclusions	Time required receiving and analyzing reactive and/or proactive incidents from any and all managed sources including, but not limited to, firewalls, intrusion detection/prevention devices, VPN appliances, switches, routers, and all other equipment over which Commonwealth traffic traverses. Time required contacting CoPA and reporting the incident in accordance with ITB-SEC024.
Metric Exclusions	• All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of Security Incidents reported in accordance with ITB SEC-024 using the procedure set forth in the Commonwealth Computing Procedures Manual, divided by the total number of detected security incidents, with the result expressed as a percentage. • = [(number of incidents reported in accordance with ITB SEC-024) / number of detected incidents)] expressed as a percentage
Collection Process	All detected security incidents will be collected in the ArcSight tool from any and all managed sources including, but not limited to, firewalls, intrusion detection/prevention devices, VPN appliances, switches, routers, and all other equipment over which Commonwealth traffic traverses and will be forwarded and recorded in the BMC ITSM toolset. The ArcSight tool will set a data field on the incident record forwarded to BMC ITSM that indicates the incident is in accordance with ITB SEC-024. This flag will be used by the BMC ITSM Service Level Management (SLM) Application to calculate the SLA. The Commonwealth will be notified through email for every recorded security incident following the incident management process and in accordance with ITB SEC-024. The SLA will be calculated and recorded. Input: • Detected Security Incident

	• Recorded Incident in BMC ITSM Toolset
Reporting Tools / Data Source(s)	SL17 compliance will be recorded in the BMC ITSM Service Level Management Application and reported on Real-time Dashboard for all stakeholders to view and drill down into details. Output: • SLA compliance will be displayed on Real-time Dashboard • SLA reports from BMC Analytics Reporting Tools • Real-time Dashboard • BMC Analytics for SL17 Summary Report Data Sources • ArcSight database for security events and incidents • BMC ITSM database for security incidents and service level targets
Data Storage (Archives)	Data storage is 13 months of history online with offline storage to tape with all supporting details.
Reporting Format/s	The reporting format will be determined during transition for display on the Real-time Dashboard. **Figure J-27** is a dashboard example:  **Figure J-27. SL03 Real-time Dashboard**
Service Level Reporting Window	Monthly

SL18 Security Update Timeliness

Service Level Reference	Description
Security Update Timeliness	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of time Offeror completes Security Updates successfully and on time during the applicable Measurement Window in accordance with the relevant criteria specified in the Commonwealth Computing Procedures Manual.
Metric Inclusions	Security Updates include all updates and changes designated as a Security Update at the time or request/order. These updates includes, but are not limited to, Security Patches, Firewall configuration changes, Proxy updates and changes, and Identity Management Changes.
Metric Exclusions	• Any batch jobs related to infrastructure recoveries, or other functionality exclusive for the Offeror would be excluded. • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of Security update requests that are completed successfully and on time in accordance with the relevant criteria set forth in the Commonwealth Computing Procedures Manual during the applicable Measurement Window, divided by the total number of Security update requests that were requested to be completed during the applicable Measurement Window, with the result expressed as a percentage. • = ((Number of Security Updates) / (Total Number of Requested Security Updates)) expressed as a percentage
Collection Process	After a determination has been made by the security team that a security update is needed, a change request is created to be implemented during the appropriate security change window. Priority and schedule for the SLA will be determined based on the CCPM and recorded in the change request. The change request will include the implementation date of the security update and the SLA will be calculated. Input: • Security team determination of a security update requirement • A change request

	• Implementation date of the change
Reporting Tools / Data Source(s)	The SL 18 compliance will be recorded in the BMC ITSM Service Level Management Application and reported on Real-time Dashboard for all stakeholders to view and drill down into details. Output: • SLA compliance will be displayed on Real-time Dashboard • SLA reports from BMC Analytics Reporting Tools: • Real-time Dashboard • BMC Analytics Data Sources: • BMC ITSM data including Change tickets and SLM targets
Data Storage (Archives)	Data storage is 13 months of history online with offline storage to tape with all supporting details.
Reporting Format/s	The reporting format will be determined during transition for display on the Real-time Dashboard. **Figure J-28** is a dashboard example:  **Figure J-28. SL18 Real-time Dashboard**
Service Level Reporting Window	Monthly

SL19 Incident Management Communication – for Severity 1 Incidents

Service Level Reference	Description
Incident Management Communication – for Severity 1 Incidents	
Service Category	Incident & Problem Resolution
Metric Description	This Service Level measures the percentage of time the Offeror provides the notices to the applicable Authorized Users within the following timeframes with respect to Incidents that are or become Severity 1 Incidents and that are not Resolved in less than one (1) hour from the Start Time for such Incident. •□ First notice: Within one hour of incident ticket creation •□ Subsequent notices: every 30 minutes A "notice" is defined as : •□ Verbal communication to Authorized User, as documented in the ticket •□ Bridge call including Authorized User, as documented in the ticket •□ Email to Authorized User, as documented in the ticket Such notices shall not be deemed to have been provided unless (a) the Authorized User that reported the Incident has been contacted by the Offeror and such notice of status has been provided or (b) Offeror has left a voice mail (or if not possible because the Authorized User does not have a voice mail box, sent an email or attempted some other reasonable means of communication) for the Authorized User.
Metric Inclusions	Includes all Priority 1 Incidents
Metric Exclusions	•□ Priority 2, 3 and 4 Incidents •□ Duplicate Incident Reports for the incident •□ All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	•□ **Summary:** This Service Level calculation is the total number of Incidents that are or become Severity 1 Incidents, that have Start Times during the applicable Measurement Window, that have actual Resolution Times of greater than one (1) hour and for which Offeror provided the applicable Authorized User the required notice(s) within the required timeframe(s) as set forth in this Section, divided by the total number of Incidents that are or become Severity 1 Incidents, that have Start Times during the applicable Measurement Window and that have actual Resolution Times of

	greater than one (1) hour, with the result expressed as a percentage. •□ = ((Number of Incidents with Communications within Established Intervals) / (Total Number of Severity 1 Incidents)) expressed as a percentage
Collection Process	All communications to authorized users in the Commonwealth for Priority tickets will be recorded on the incident ticket (priority 1 only) with a time stamp until the incident ticket is resolved with a restored service. A service target in the Service Level Management Module will calculate the compliance of communication on the Priority 1 incident ticket according to the definition of SL19.
Reporting Tools / Data Source(s)	The SL19 compliance will be recorded in the BMC ITSM Service Level Management Application and reported on Real-time Dashboard for all stakeholders to view and drill down into details as configured.
Data Storage (Archives)	Data Storage is 13 months of history online with offline storage to tape with all supporting details.
Reporting Format/s	The reporting format will be determined during transition for display on the Real-time Dashboard. **Figure J-29** is an example:  **Figure J-29. SL19 Real-time Dashboard**
Service Level Reporting Window	Monthly

SL20 Root Cause Analysis Delivery

Service Level Reference	Description
Root Cause Analysis Delivery	
Service Category	Incident & Problem Resolution
Metric Description	This Service Level measures the percentage of time Offeror reports the results of a Formal Root Cause Analyses for Service Restoral Incidents within the timeframes below during the Measurement Window: • RCA's due within ten (10) Business Days from the request of the RCA.
Metric Inclusions	An Authorized User may request a Formal RCA for incidents that require more in-depth analysis than required with the "normal" Root Cause Analysis process. The Formal RCA is documented and tracked within the Problem Management process, and upon completion, is presented by the Offeror Problem Management Team to the affected the Commonwealth Customer and the Commonwealth for review and approval. Offeror shall perform a "Formal" Root Cause Analysis with respect to any Service Restoral Incident, if requested by the Commonwealth, and that has a Start Time during the applicable Measurement Window.
Metric Exclusions	• Those Service Restoral Incidents for which the Commonwealth or the Commonwealth's Customer does not request a "Formal" Root Cause Analysis. • Duplicate Requests • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of written Formal Root Cause Analyses that are delivered to the Commonwealth within the timeframes specified in this Section during the applicable Measurement Window, divided by the total number of written Formal Root Cause Analyses that should have been delivered to the Commonwealth during the applicable Measurement Window, with the result expressed as a percentage. • = ((Number of Formal Root Cause Analyses Delivered within Established Interval) / (Total Number of Formal Root Cause Analyses Due)) expressed as a percentage
Collection Process	The Commonwealth will request a formal RCA for selected problems. The request will be recorded within the problem ticket. A service target from the Service Level Management (SLM) application in

	Remedy ITSM will monitor and calculate the time it takes to issue a formal RCA that will also be recorded in the problem ticket. The SLM application will alert when there is an SLA violation in the Real-time dashboard, when the RCA report has not been completed within 10 days and report SL20 compliance in the SLA Monthly Summary Report.
Reporting Tools / Data Source(s)	The SL20 compliance will be recorded in the BMC ITSM Service Level Management Application and reported on Real-time dashboard for all stakeholders to view and drill down into details as configured. SL20 compliance will also be reported in the SLA Monthly Summary Report.
Data Storage (Archives)	Data Storage is 13 months of history online with offline storage to tape with all supporting details.
Reporting Format/s	The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-30** is a dashboard example:  **Figure J-30. SL20 Real-time Dashboard** The SLA Reporting format will be determined during transition for reporting using BMC Analytics Reporting. **Figure J-31** is an example [redacted]

Figure J-31. SL20 BMC Analytics Reporting

Service Level Reporting Window	Monthly

SL21 Chronic Problems

Service Level Reference	Description
Chronic Problems	
Service Category	Incident & Problem Resolution
Metric Description	A "Chronic Problem" means a problem which meets any of the following criteria: 1. The existence two or more incidents with the same root cause for the same software, service, process, or hardware for which Offeror, the Commonwealth, or the Commonwealth Customer, have designated as a problem requiring a Root Cause Analysis with a Corrective Action Plan. 2. The existence of three or more service failures or outages for the same software, service, process, or hardware within the same month for any two (2) months within any rolling six (6) months. 3. The existence of three (3) or more service failures or outages for the same software, service, process, or hardware within any rolling six (6) month period for which no root cause has been determined. Multiple Incidents that are opened contemporaneously for the same software, service, process, or hardware due to the same root cause shall be deemed to be a single incident for purposes of this Service Level.
Metric Inclusions	All incidents and Problem Investigation reports for all services covered by any service level metric.
Metric Exclusions	• Problems which have a published Root Cause Analysis with an associated action plan approved by the Commonwealth Customers and which has all agreed corrective actions on schedule (not exceeding their completion dates) and have had no reoccurrences of the same failure may be excluded at the Offeror's request and the Commonwealth's approval. • All items defined in Note 2 at the bottom of this Schedule J.3 • Duplicate Incident Reports for the same Incident
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** Offeror's performance shall be measured by determining the total number of Problem that are or become Chronic Problem during the applicable Measurement Window. • ((the number of Chronic Problems) / (the total number of problems)) expressed as a percentage
Collection Process	The collection process requires the Service Level Management (SLM) application in Remedy ITSM to be configured for service targets to identify, track and record Chronic Problems as defined above. The

	collection process will calculate SL21 using the number of identified Chronic Problems identified and the total number of problem records for the appropriate timeframe to report SL21.
Reporting Tools / Data Source(s)	The SLM application will alert when there is an SLA violation in the Real-time dashboard, when the Chronic Problem threshold has been exceeded and report SL21 compliance in the SLA Monthly Summary Report.
Data Storage (Archives)	Data Storage is 13 months of history online with offline storage to tape with all supporting details.
Reporting Format/s	The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-32** is an example:  **Figure J-32. SL21 Real-time Dashboard** The SLA Reporting format will be determined during transition for reporting using BMC Analytics Reporting. **Figure J-33** is an example [redacted]:

Service Level Reporting Window	Monthly

SL22 High Risk Security Patch Updates

Service Level Reference	Description
High Risk Security Patch Updates	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the timeliness in which high-risk security patches are applied. All high risk security patches must be applied within five (5) Business Days from the date the software vendor or applicable industry guiding entity provides notice to the Offeror or other date as agreed to by the Commonwealth or the Commonwealth Customer.
Metric Inclusions	Includes those security patches for which the vendor or applicable industry guiding entity indicates is "high" risk.
Metric Exclusions	• Excludes low and medium risk patches • All items defined in Note 2 at the bottom of this Schedule J.J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of high risk security patches released five (5) Business Days prior to the beginning and end of the measurement window that were installed within five (5) Business Days divided by the total number of high risk security patches released five (5) Business Days prior to the beginning and end of the measurement window, with the result expressed as a percentage. • = ((Number of High Risk Intrusion Protection Updates Installed within Established Interval) / (Total Number of High Risk Intrusion Protection Updates Installed)) expressed as a percentage
Collection Process	A change request will be opened upon notification from the Commonwealth of the need to apply high-risk security patches. The change request will include the implementation date of the high-risk security patch and the SLA will be calculated. Input: • Notification from Commonwealth of a high-risk security patch requirement • A change request • Implementation date of the change
Reporting Tools / Data Source(s)	The SL 22 compliance will be recorded in the BMC ITSM Service Level Management Application and reported on Real-time Dashboard for all stakeholders to view and drill down into details.

	Output: • SLA compliance will be displayed on Real-time Dashboard • SLA reports from BMC Analytics Reporting Tools: • Real-time Dashboard • BMC Analytics for SL22 Summary Report Data Sources • BMC ITSM Change Request Records • BMC ITSM SLM service targets
Data Storage (Archives)	Data storage is 13 months of history online with offline storage to tape with all supporting details.
Reporting Format/s	The reporting format will be determined during transition for display on the Real-time Dashboard. **Figure J-34** provides a dashboard example; **Figure J-35** provides an example of a BMC analytics summary report that could define the SL 22 Summary Report format.

Service Level Reporting Window	Monthly

SL23 Change Management Effectiveness

Service Level Reference	Description
Change Management Effectiveness	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of time Offeror successfully implements Changes to the Services.
Metric Inclusions	Changes are not successfully implemented if they: (i) do not comply with the Change Management procedures (including the Change Control Process), (ii) do not comply with the Change Management procedures detailed within the Commonwealth Computing Procedures Manual, (iii) cause Severity 1 Incidents or Severity 2 Incidents, within 168 hours of implementing the change, (iv) exceeds the reserved implementation or maintenance window as approved within the ITSM Change Request, or (v) are backed out.
Metric Exclusions	• Severity Level 1 and Severity Level 2 incidents that occur during the implementation window for the change and are resolved before the Implementation or Maintenance window ends. • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the number of changes that are successfully implemented by Offeror during the applicable Measurement Window, divided by the number of changes that should have been implemented by Offeror during the applicable Measurement Window, with the result expressed as a percentage. • = ((Number of Successful Change Management Requests) / (Total Number of Change Management Requests Scheduled during the period)) expressed as a percentage
Collection Process	All conditions that are related to an unsuccessful change below will be attached or documented in the change ticket including: (i) Changes that do not comply with the Change Management procedures (including the

	Change Control Process) (ii) Changes that do not comply with the Change Management procedures detailed within the Commonwealth Computing Procedures Manual (iii) Severity 1 Incidents or Severity 2 Incidents will be related to a change ticket. The service target within the SLM application will determine an SLA violation if a new incident occurred within 168 hours of the change being deployed (iv) Change tickets that are deployed that are not completed within the reserved maintenance window approved, or are backed out will be identified as an SLA violation The data in the change record will be used by the Service Level Management service targets setup to identify these unsuccessful changes and calculate SL23 accordingly.
Reporting Tools / Data Source(s)	SL23 results will be published in the Real-time Dashboard utilizing the service target data and calculations from the BMC ITSM Service Level Management Application. Real-time Dashboard will display the SL23 results with drill down capability to review change record details supporting the SL19 calculation.
Data Storage (Archives)	13 months online in Real-time Dashboard and ITSM SLM with a rotation to archive tape backup
Reporting Format/s	The SLA reporting format will be determined during transition for Real-time Dashboard and will resemble the format in **Figure J-36**:

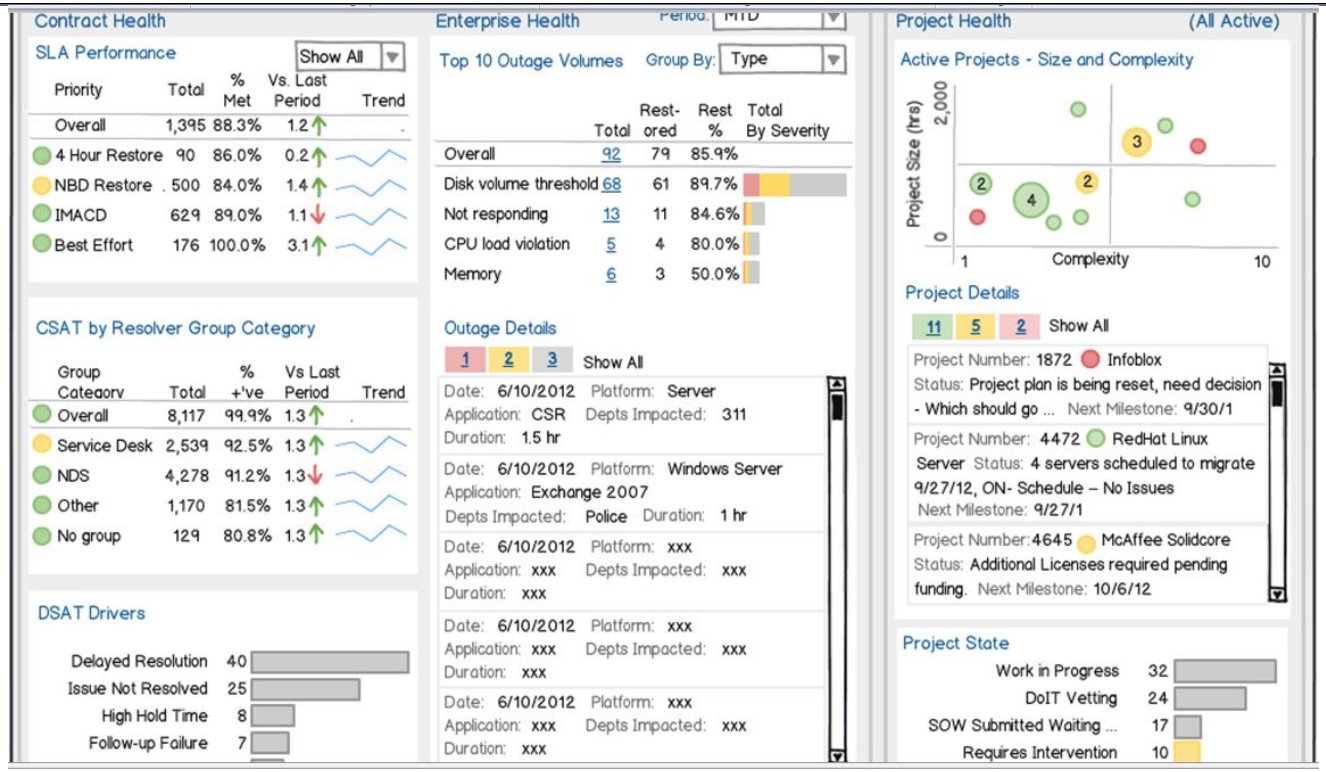

Figure J-36. SL23 Real-time Dashboard

Service Level Reporting Window	Monthly

SL24 Service Desk – Call Answer Time

Service Level Reference	Description
Service Desk – Call Answer Time	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the elapsed time an Authorized User is placed on hold after leaving the Interactive Voice Response or Automatic Call Distribution System to the time the phone call is answered by a live support technician.
Metric Inclusions	All phone calls to the Service Desk shall be included in the calculation of this Service Level with no exceptions for phone calls to the Service Desk during any period of Downtime.
Metric Exclusions	• All items defined in Note 2 at the bottom of this Schedule J.3 • Excludes the time a caller is listening to a Menu of choices before being routed to a helpdesk agent.
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of seconds, for all phone calls to the Service Desk during the applicable Measurement Window, between the time the phone caller first selects a menu option on the IVR or Automatic Call Distribution System for assistance by a live support technician to the time the phone call is verbally answered by a live support technician ready to start working on the phone call, divided by the total number of all phone calls to the Service Desk during the applicable Measurement Window. • = (Average Time a Call takes to be answered by Service Desk Agent) expressed in seconds
Collection Process	Input • Unisys ACD captures all inbound call data including arrival time, as well as agent answer time or abandon time. Process • Call is time stamped on arrival and again at agent answer in the ACD system. The Service Desk team will pull data from an ACD Call Answer report monthly for use in the SLA calculation as required. Output • SLA reports from ACD – MS Excel format

Reporting Tools / Data Source(s)	SL24 compliance will be recorded in the MS Excel spreadsheet and reported on SharePoint for all stakeholders to view and drill down into details.
Data Storage (Archives)	Avaya ACD data stored online for 13 months of history with offline storage to tape for all call history with all supporting details.
Reporting Format/s	SL24 compliance is reported in MS Excel format, the details for the format will be worked out with the Commonwealth during the transition. A two day excerpt from a sample ACD report is shown in **Figure J-37:**
Service Level Reporting Window	Monthly

Global Day	Target	3/19/2013	3/20/2013

Figure J-37. SL24 Sample ACD Report

SL25 Service Desk – Abandon Rate

Service Level Reference	Description
Service Desk – Abandon Rate	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of phone calls to the Service Desk that are abandoned by the Authorized User after the Authorized User selected a service option and prior to a live support technician answering the phone call.
Metric Inclusions	All phone calls to the Service Desk shall be included in the calculation of this Service Level with no exceptions for phone calls to the Service Desk during any period of Downtime.
Metric Exclusions	• Calls disconnected prior to an automated voice response system completing the Menu of choices for callers are not counted as abandoned. • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of phone calls to the Service Desk during the applicable Measurement Window that are abandoned by the Authorized User (prior to an automated voice response system answers), divided by the total number of phone calls to the Service Desk during the applicable Measurement Window, with the result expressed as a percentage. • = ((Number Of Abandoned Telephone Calls) / (Total Number Of Telephone Calls)) expressed as a percentage
Collection Process	Input • Unisys ACD captures all inbound call data including arrival time, as well as agent answer time or abandon time. Process • Call is time stamped on arrival and again at agent answer. All calls that are dropped by the caller after the 30-second SLA threshold will be considered Abandoned. The Service Desk team will pull an ACD Abandon report monthly for use in the SLA calculation as required. Output • SLA MS Excel report from ACD

Reporting Tools / Data Source(s)	SL25 compliance will be recorded in the MS Excel spreadsheet and reported on SharePoint for review and analysis.
Data Storage (Archives)	Avaya ACD data stored to tape on archive schedule.
Reporting Format/s	SL25 compliance is reported in MS Excel format, the details for the format will be worked out with the Commonwealth during the transition. A two day excerpt from a sample ACD report is shown in **Figure J-38**:
Service Level Reporting Window	Monthly

Figure J-38. SL25 ACD Report Excerpt

SL26 Incident Ticket Quality

Service Level Reference	Description
Incident Ticket Quality	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the quality and timeliness of the Offeror's incident management and communication of incident management activities (as defined in the Commonwealth Computing Procedures Manual Commonwealth Computing Procedures Manual). Offeror must update the incident tickets at a minimum on the following frequencies: **Service Restorals**: P1: every 15 minutes; P2: 30 minutes; P3: daily; P4: weekly **Service Requests**: P1: Daily; P2: Weekly; P3: every 2 weeks; P4: Monthly
Metric Inclusions	Includes a statistically valid random sample of Service Restorals and Service Requests closed during the Measurement Window, all priorities.
Metric Exclusions	• Excludes Change Requests (CRQ), Solution Requests (REQ), and Problem Management (PBI) • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the number of sampled tickets in the Measurement Window which meet the defined quality and communication frequency criteria divided by the total number of sampled tickets in the Measurement Window, with the result expressed as a percentage. • ((Number of service restorals and requests that met the interval) / (the total number of service restorals and requests)) expressed as a percentage
Collection Process	Input • Responsible Resolver and/or Incident Manager manually updates ticket in ITSM Process • ITSM tracks the time each ticket is updated, as well as updates to the ticket status and work log that were made by the Incident Managers.

	P1/P2 - Incident Managers interact with designated P1 / P2 Escalation Team and responsible Resolvers - manually update ticket in ITSM. P3/P4 - Incident Managers interact with responsible Resolvers to obtain incident status. Resolver must manually update ticket status in ITSM. If SLA threshold is close to being reached, an Incident Manager will contact the Resolver for status and will update the ticket status themself. Output • SLA metric reported on SLA dashboard on agreed periodic timeframe
Reporting Tools / Data Source(s)	SL26 compliance will be recorded in the MS Excel spreadsheet and reported on Real-time Dashboard for all stakeholders to view and drill down into details. The reporting format will be determined during transition for display on the Real-time Dashboard. **Figure J-39** is an example of the dashboard:  **Figure J-39. SL26 Real-time Dashboard.**
Data Storage (Archives)	13 months – Online Tape Backup – Life of Contract

Reporting Format/s	The reporting format will be determined during transition for display on the Real-time Dashboard. **Figure J-40** is an example of the dashboard:
Service Level Reporting Window	Monthly

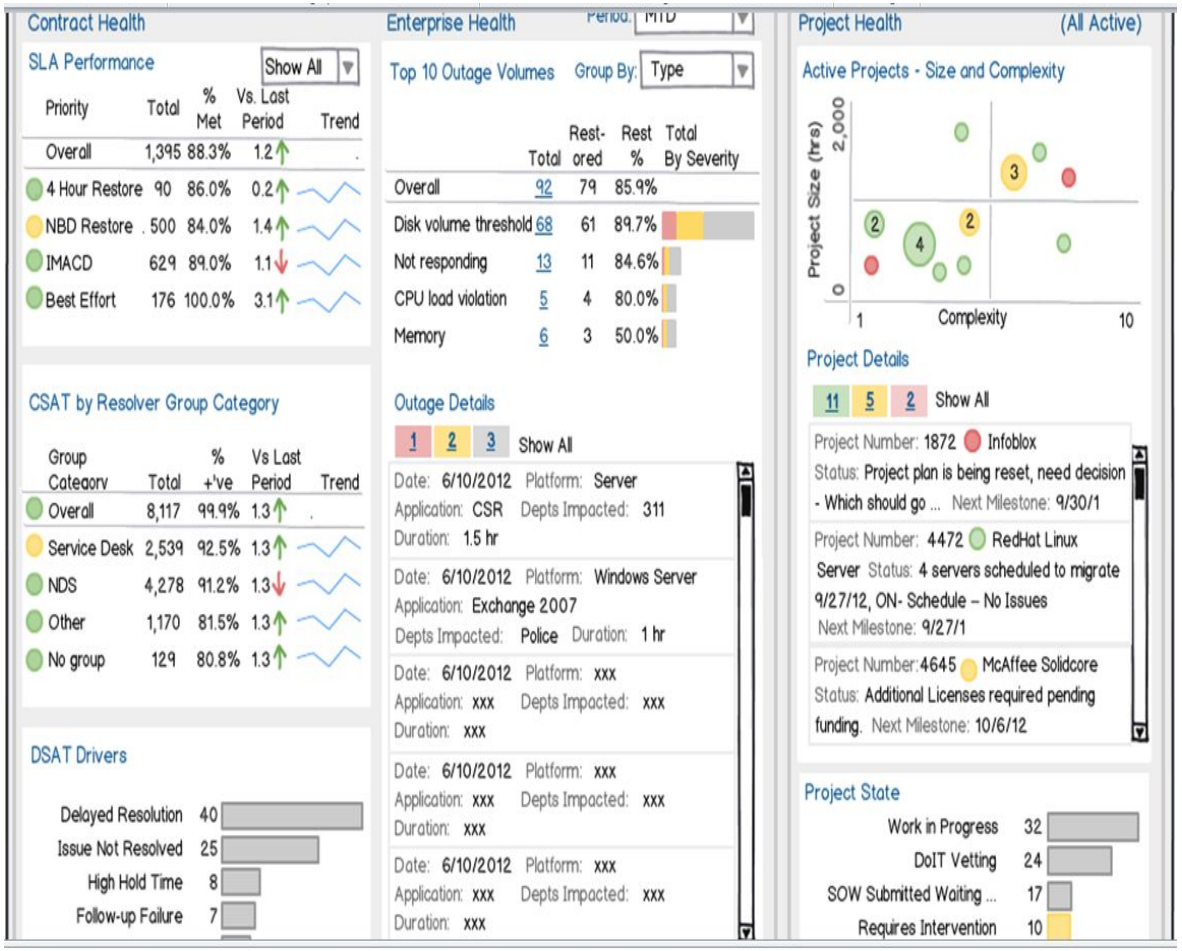

Figure J-40. SL26 Real-time Dashboard

SL27 Service Desk – Customer Satisfaction

Service Level Reference	Description
Service Desk – Customer Satisfaction	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the average scores of the customer satisfaction surveys taken on a random statistical sample of customers that had a service contact with the Offeror during the measurement period. The surveys will be conducted in accordance with the Commonwealth Computing Procedures Manual.
Metric Inclusions	Survey responses shall be on a five (5) point scale (with five (5) being the most satisfied) or shall reflect such other satisfaction criteria established pursuant to the survey design process.
Metric Exclusions	• All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** At the Commencement Date, This Service Level calculation is the sum of all scores for each response (question answered) for the Point of Service surveys that are returned during the applicable Measurement Window, divided by the total number of responses for all Point of Service surveys that are returned during the applicable Measurement Window. • = (Average Score of Surveys)
Collection Process	Input • Email-based survey responses from Service Desk users. Process • Unisys sends a request to complete a Customer Satisfaction Survey by e-mail to users who recently reported an incident to our Service Desk. The e-mail contains a hyperlink that takes a user to a Web site to enter his or her responses on an HTML form. Responses are delivered back to our Service Desk by e-mail and collected in a database. Unisys will use the information collected in our Customer Satisfaction Survey as a basis for continuous improvement of service delivery. To calculate customer satisfaction, we take the sum of all scores for all surveys performed in a month and divide it by the total number of surveys performed in that month. To conduct Customer Satisfaction Surveys, Unisys uses an automated survey system process and a set of questions that ask the end user to rate our service on a scale of 1 to 5:

	5—Very Satisfied 4—Satisfied 3—Neither Satisfied nor Dissatisfied 2—Dissatisfied 1—Very Dissatisfied. For questions the end user rates with a 1 or a 2, Unisys asks him or her to provide supporting detail; we record this detail in the survey record and escalate customer satisfaction issues that require follow-up electronically to the Unisys Service Manager or the appropriate management representative Output • Spreadsheet with survey results compared to SLA targets • SLA metric imported into SLA Real-time Dashboard on agreed periodic timeframe.
Reporting Tools / Data Source(s)	SL27 compliance will be recorded in the MS Excel spreadsheet and reported on Real-time Dashboard for all stakeholders to view and drill down into details.
Data Storage (Archives)	ITSM data stored to tape on archive schedule
Reporting Format/s	SLA Report is formatted in MS Excel. An excerpt from a sample report is shown in **Figure J-41**:

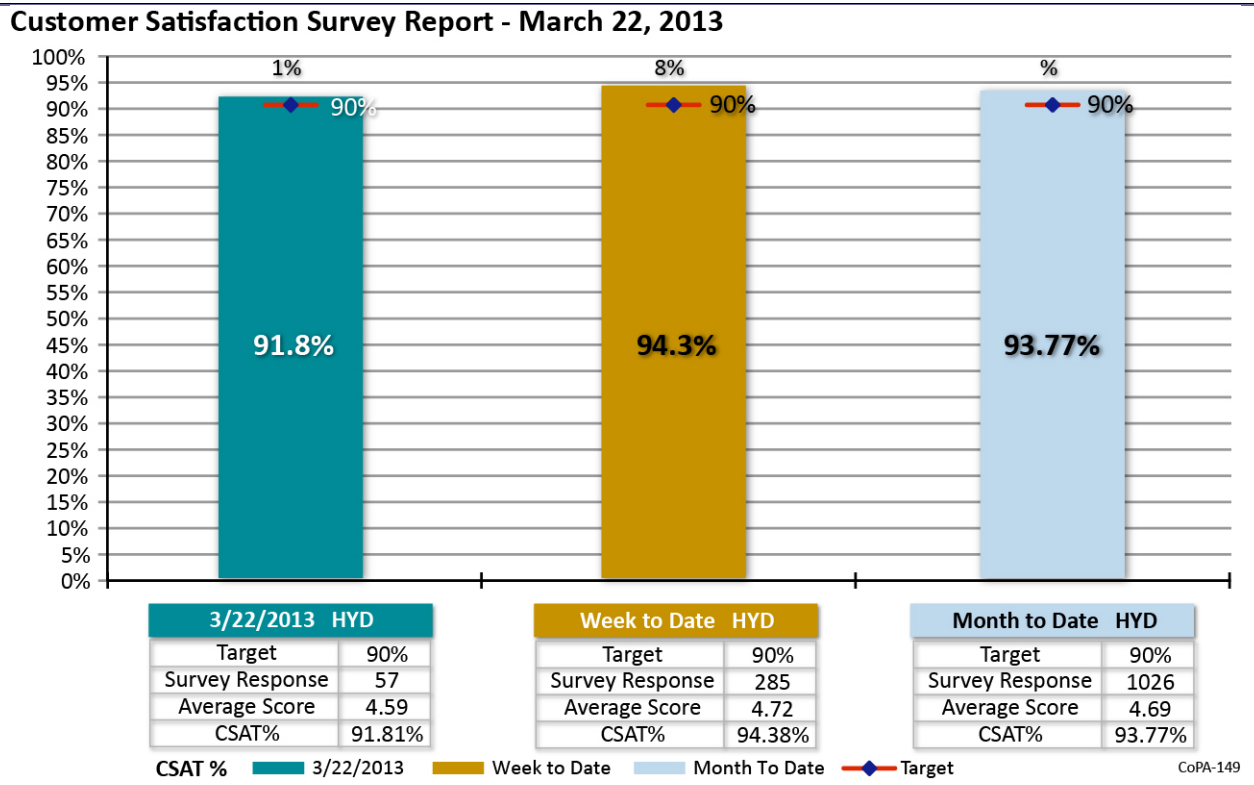

Figure J-41 – SL27 Sample SLA Report

Service Level Reporting Window	Monthly

SL28 Batch Scheduling Launched on Time

Service Level Reference	Description
Batch Scheduling Launched on Time	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of time Offeror starts the Batch job schedules defined in the standard scheduling tool or manually scheduled at the established start time associated with such schedules specified in the Commonwealth Computing Procedures Manual.
Metric Inclusions	Scheduled Batch jobs include normally scheduled and recurring production jobs, as well as production jobs that are run on an as-needed basis.
Metric Exclusions	• Any batch jobs related to infrastructure backups, or other functionality exclusive for Offeror would be excluded. • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of Batch job schedules defined in the standard scheduling tool that are started during the applicable Measurement Window at the established start time associated with such schedules as set forth in the Commonwealth Computing Procedures Manual, divided by the total number of Batch job schedules that should have been started during the applicable Measurement Window, with the result expressed as a percentage. • = (Number Of Batches Launched On Time) / (Total Number Of Batches Scheduled) expressed as a percentage
Collection Process	Input • Scheduled Jobs launched time compared to scheduled launch time in BMC Control M Process • Calculate SL28 Batch Scheduling Launched on Time SLA = = (Number Of Batches Launched On Time) / (Total Number Of Batches Scheduled) expressed as a percentage Output • SLA metric reported on SLA CIO Real-time Dashboard • BMC Control M Monthly summary report for SL28
Reporting Tools / Data Source(s)	Real-time Dashboard and BMC Control M reports.

Data Storage (Archives)	13 months – Online Tape Backup – Life of Contract
Reporting Format/s	The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. See **Figure J-42** for an example of a Real-time Dashboard snapshot.  **Figure J-42. SL28 Real-time Dashboard**
Service Level Reporting Window	Monthly

SL29 Batch Processing Completed Successfully

Service Level Reference	Description
Batch Processing Completed Successfully	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the percentage of time Offeror completes Batch jobs successfully and on time during the applicable Measurement Window in accordance with the relevant specifications located in the Commonwealth Computing Procedures Manual.
Metric Inclusions	Batch jobs include normally scheduled and recurring production jobs, as well as production jobs that are run on an as-needed basis. To be considered Successful the Batch must complete within the schedule window for that particular Batch Job.
Metric Exclusions	• Any batch jobs related to infrastructure backups, or other functionality exclusive for Offeror would be excluded. • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is the total number of Batch jobs that are completed successfully and on time in accordance with the relevant criteria set forth in the Online CCPM repository during the applicable Measurement Window, divided by the total number of Batch jobs that should have been completed during the applicable Measurement Window, with the result expressed as a percentage. • = ((Number Of Successful Batches) / (Total Number Of Batches Scheduled)) expressed as a percentage
Collection Process	Input • Batch jobs scheduled in Batch Scheduling and Management Tool BMC Control-M • Acceptable time to complete batch job (CCPM) Process • SLA 29 Batch Processing Completed Successfully = ((Number Of Successful Batches) / (Total Number Of Batches Scheduled)) expressed as a percentage Output

	• SLA 29 Batch Processing Completed Successfully reported in Real-time Dashboard • Monthly SL 29 Summary Report of batches completed and batches not completed on time
Reporting Tools / Data Source(s)	Real-time Dashboard and BMC Control M
Data Storage (Archives)	13 months – Online Tape Backup – Life of Contract
Reporting Format/s	The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-43** is an example:  **Figure J-43. SL29 Real-time Dashboard**
Service Level Reporting Window	Monthly

SL30 Reports Delivered On Time

Service Level Reference	Description
Reports Delivered On Time	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level for Reports delivered on time as outlined in Schedule K - Reports measures the percentage of time Offeror delivers the Reports on time in accordance with the requirements. Each Report provided with respect to a Critical Service Level or Key Measurement shall be deemed an individual Report for the purposes of calculating this Service Level.
Metric Inclusions	Schedules as set forth in the Commonwealth Computing Procedures Manual.
Metric Exclusions	• Any reports identified as Critical Monthly Reports in the Commonwealth Computing Procedures Manual and measured in Critical Service Levels. • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	24x7
Days of Measurement	365
Calculation	• **Summary:** This Service Level calculation is a count of the total number of Reports that were not successfully delivered (i.e. on time and in compliance with content and format requirements) during the applicable Measurement Window. • = ((Number Of Reports Delivered On Time) / (Total Number Of Reports Scheduled To Be Delivered)) expressed as a percentage
Collection Process	Input: • Collection inputs will be the scheduled ITSM reports outlined in Schedule K by Commonwealth Agency and time period Process • Process will be to setup a SLA service target for collecting the ITSM reports delivered to the appropriate output medium (Real-time Dashboard) on time at agreed interval to agreed medium. Output • SLA 30 Report Delivered on Time Metric in SLA Dashboard • SLA 30 Report of Reports Delivered on Time and Reports not Delivered on Time
Reporting Tools / Data Source(s)	Remedy Report (Analytics)

	Real-time Dashboard
Data Storage (Archives)	13 months – Online Tape Backup – Life of Contract
Reporting Format/s	The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-44** is an example: **Figure J-44 SL30 Real-time Dashboard**
Service Level Reporting Window	Monthly

SL31 Off-Site Media Management

Service Level Reference	Description
Off-Site Media Management	
Service Category	Other Service Management and Delivery
Metric Description	This Service Level measures the accuracy of the Offeror's management of off-site media, specifically the physical location and electronic tracking accuracy of off-site media. The measure is intended to sample one-twelfth of the universe of off-site media such that each the Commonwealth Customer's complete environment is sampled at least once per year.
Metric Inclusions	All media for which Offeror receives an off-site storage resource unit charge.
Metric Exclusions	• Virtual tapes and tapes retained in the Consolidated Data Centers or Non-Consolidated Service Locations. • All items defined in Note 2 at the bottom of this Schedule J.3
Hours of Measurement	N/A
Days of Measurement	N/A
Calculation	• **Summary:** This Service Level calculation is based on a statistically valid random sample representing one-twelfth of the universe of off-site media and is the sum of the number of times a tape is either physically in the correct location or electronically listed in the correct location divided by the total number of tapes in the random sample, with the result expressed as a percentage. • = ((Number Of Correct Audits) / (Total Number Of Audits))expressed as a percentage
Collection Process	Tape media personnel will conduct monthly audits of 1/12th of the off-site media against the record locations stored in media management tools (e.g., CommVault). The results will be recorded in a spreadsheet for SLA calculation and reporting. Inputs: • Audit results • CommVault data records
Reporting Tools / Data Source(s)	The MS Excel spreadsheet will be used for comparing audit results to media tools location records, and for calculating the off-site media accuracy SL31. The MS Excel spreadsheet will also contain the details to be used for reporting. Outputs: • MS Excel Spreadsheet with off-site media audit results and details

	Data Sources: • CommVault • Mainframe media management tools Reporting Tools: • Real-time Dashboard • MS Excel Summary SL31 Report
Data Storage (Archives)	13 months – Online Tape Backup – Life of Contract
Reporting Format/s	The Off-site Media SLA Report will be developed during the transition period, we will engage in discussions with the Commonwealth to define the exact content of the report. The SLA dashboard format will be determined during transition for display on the Real-time Dashboard. **Figure J-45** is an example:  **Figure J-45. SL31 Real-time Dashboard**

3. Notes

Note 1: Offeror's failure to achieve any Service Level will not constitute a Service Level Default or accrue toward a Service Level Termination Event to the extent such failure is directly attributable to any Force Majeure events as (as defined in Paragraph 65 of the Contract.

Note 2: Offeror's failure to achieve any Service Level will not constitute a Service Level Default or accrue toward a Service Level Termination Event to the extent such failure is directly attributable to any of the following:

(i) the failure or unavailability of equipment or other resources for which the Commonwealth is operationally and managerially responsible pursuant to the Contract,

(ii) changes made to the environment by the Commonwealth that were not communicated in accordance with the Change Control Procedure or other method agreed upon by the Parties, and

(iii) scheduled and approved maintenance windows.

4. Additional Definitions

1. "Accurate" means all Inventory Attributes are correctly and completely populated in the CMDB Inventory of Record.
2. "Bronze" is defined as a level of service that has a specific Availability value or Response time interval requirement.
3. "CMDB Inventory of Record" means the inventory of CIs, including all Equipment and Software, to be created and maintained by Offeror in accordance with the CCPM.
4. "Commonwealth Computing Procedures Manual" means the established procedural manual related to services offered within this procurement.
5. "Configuration Management Database" (CMDB) is defined as the complete database of all Hardware and software items that make up a service.
6. "Customer Request Date" means the customer requested due date (CRDD) in the Offeror's service management platform (SMP).
7. "Emergency Downtime" means downtime agreed by the Parties to enable maintenance and break fix
   i. necessary to address Service issues stemming from Force Majeure causes or
   ii. Otherwise agreed by the Commonwealth pursuant to the Emergency provisions of the Change Control Procedures.
8. "Gold" is defined as a level of service that has a specific Availability value or Response time interval requirement.
9. "Hold Time" or "Customer Time" is defined as a period of time when Offeror is prevented from progressing the investigation or repair of an incident (outage or degradation) due to Commonwealth required decisions or actions. Examples of this include, but are not limited to:

i. Not providing physical access to a facility pursuant to the Contract so that equipment can be tested or replaced

ii. Not releasing a Application or Server for testing

iii. Not providing accurate or complete information when opening an incident resulting in a Offeror inability to progress the resolution of the logged incident

iv. Not responding with necessary additional information upon request to enable the effective investigation or repair of a logged Service ID

v. related incident

vi. Commonwealth requested delays in the installation of required patches and/or upgrades

vii. Failure of user authentication services, unique end-user VPN client software issues, or other components managed by the Commonwealth. In every case in which Offeror intends to place an incident or ticket on Hold Time or Customer Time, Offeror will make the appropriate prior notification to the Commonwealth. Valid Hold Time and Customer Time is excluded as outage time in calculations of Service Level Availability and Time to Restore.

10. "Inventory Attributes" means those database fields in an Inventory Record that are essential for Offeror's successful delivery of Service and necessary for The Commonwealth's successful performance of retained responsibilities, including architecture, IT planning, and reconciliation of invoices. Inventory Attributes that shall be audited are set out in Commonwealth Computing Procedures Manual and may be modified over time in accordance with the Commonwealth Computing Procedures Manual.

11. "Inventory Record" means the record for a single item of Equipment or Software in the Inventory of Record, including all of the Inventory Attributes for that item.

12. "Major Degradation of Service" means a Service that tests as fully operational but is degraded below user expectations across a significant segment of the user population as determined by the Commonwealth.

13. "Non-Excluded Outage Minutes" is defined as a Minutes that are not considered Customer Time, Hold Time, Scheduled Downtime as defined within this Schedule J.3

14. "Resolution" is defined as removing a fault or degradation from the Commonwealth operational environment. Resolution is followed by notification to the Commonwealth and either performing further joint testing or receiving an approval to place the affected Service or Service ID back in operation.

15. "Response" or "Respond" is defined as Offeror taking and logging meaningful action to progress the testing and restoration of any Service ID, or, as the case may be, Security Services, that has an active Incident ticket opened in the Incident Management System as defined by the Incident and Problem Management Process which is part of the Process and Procedures Manual.

Examples of meaningful response actions include the following, all pursuant to the Policies and Procedures Manual:

- Calling the Commonwealth to obtain additional information to help progress the testing and restoration of the logged incident
- Requesting access to a facility
- Requesting release of a Service ID for testing

- Requesting contact information required to progress the incident management process
- Escalating the incident to technical support for additional testing and analysis

16. "Scheduled Availability" means 24/7/365, unless otherwise specified in a Service Level, minus Scheduled Downtime, Customer Time, Hold Time, and Emergency Downtime.

17. "Scheduled Downtime" means downtime expected and agreed by the Parties, expressed monthly, for which the underlying systems were taken off- line for routine or scheduled maintenance during the Measurement Window.

18. "Service ID" means the unique identifier assigned to a service by Offeror.

19. "Service Level Availability" shall mean the actual availability of access and all functionality of the Services described in a Service Level expressed as percentage of the Scheduled Availability for such Services.

20. "Severity Level" means a priority setting assigned to an incident or change that represents the impact the event has on service for the customer. This level is set by the person reporting the incident or requesting the change and may be adjusted by authorized personnel at the Commonwealth.

21. "Silver" is defined as a level of service that has a specific Availability value or Response time interval requirement.

22. "Standard Service Interval" means the corresponding period of time in the Standard Service Intervals in the Policy and Procedures Manual, including procedures regarding accuracy, completeness and changes to previously accepted orders. As of the Execution Date, the Standard Service Intervals are set forth in the document provided by the Offeror to the Commonwealth labeled [***to be completed by Offeror***].

23. For purposes of This Service Level Matrix, a "day" means a 24 hours period from the trigger for the measurement. For example, if a ticket is logged at 9:15am on Tuesday the 14th, a "day" ends at 9:15am on Wednesday day the 15th.

Commonwealth of Pennsylvania Data Center Computing Service Proposed Work Plan

ID	Task Name	Start	Finish	Duration

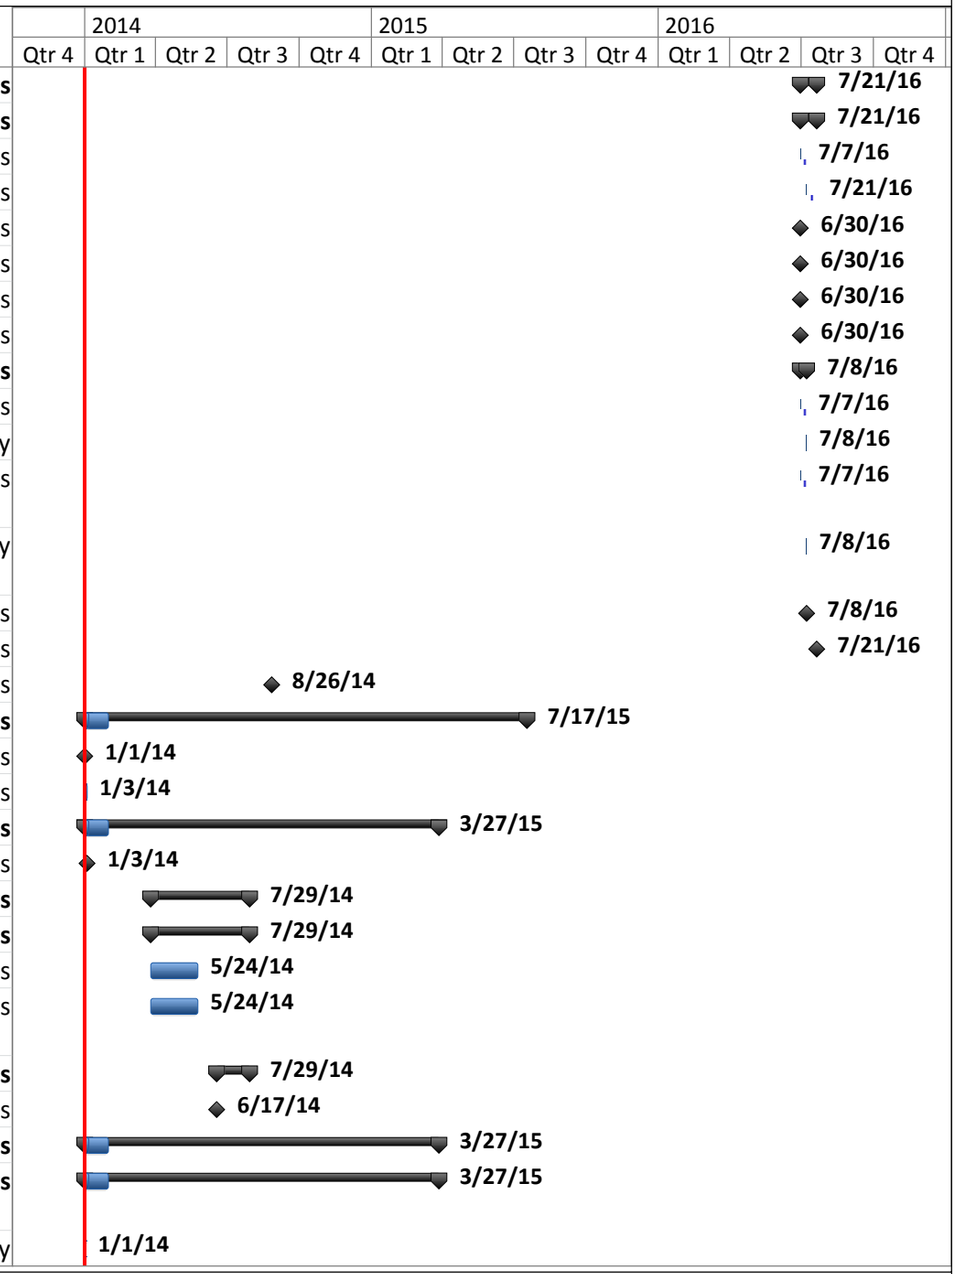
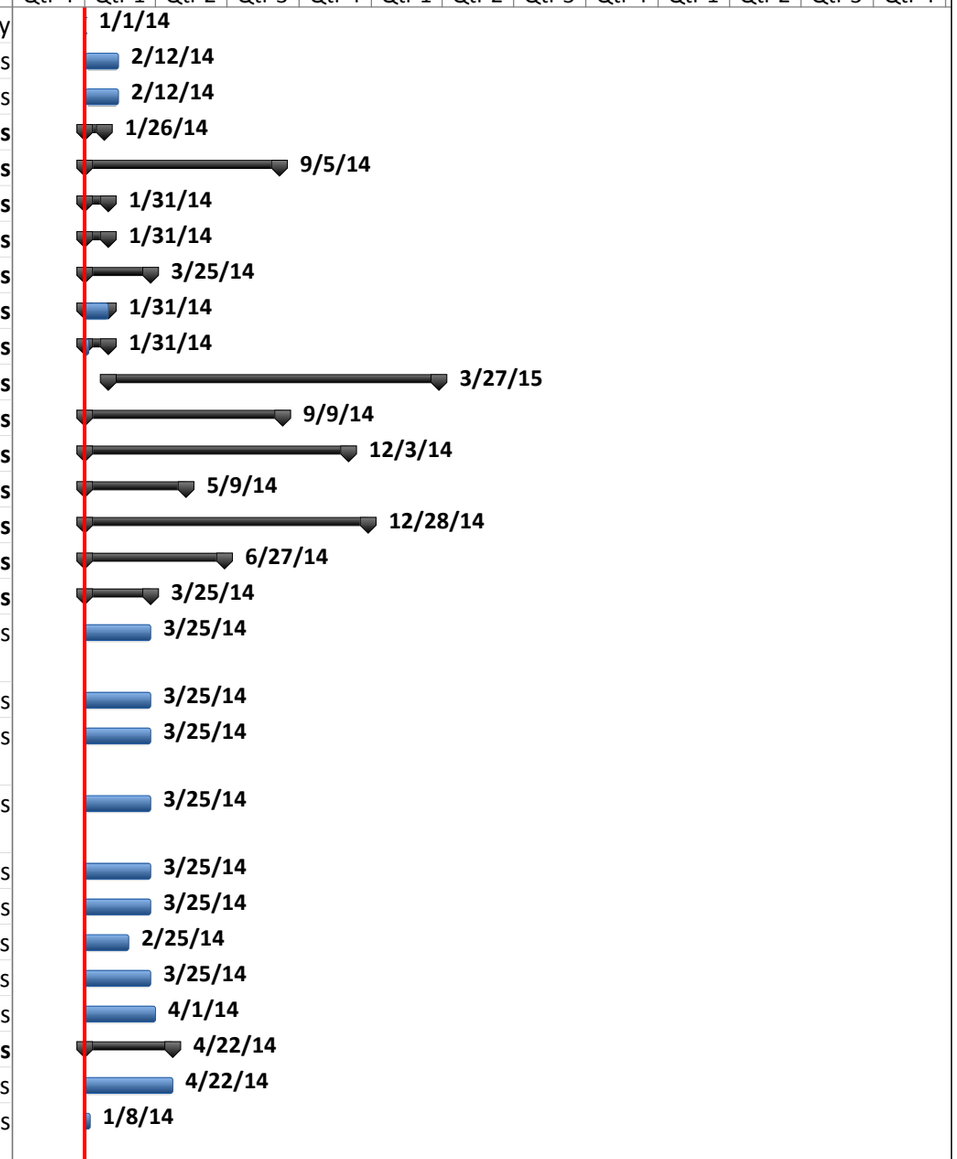
103	**3.3.2 Assess CoPA Current Environments**	**3/25/14**	**7/29/14**	**90 days**
104	**3.3.2.1 Knowledge Transfer activities**	**3/25/14**	**7/29/14**	**90 days**
105	3.3.2.1.1 Review ADDM Results EDC and DPH	3/25/14	5/24/14	60 edays
106	3.3.2.1.2 Review ADDM results DOR, DLI, DPW, DOH, PSP	3/25/14	5/24/14	60 edays
107	**3.3.2.1.3 D-10 - Gap Analysis Report**	**6/17/14**	**7/29/14**	**30 days**
110	3.3.2.2 PMS-5 - Data Gathering	6/17/14	6/17/14	0 days
111	**3.3.3 Setup the Account Team**	**1/1/14**	**3/27/15**	**323 days**
112	**3.3.3.1 Organizational Change Control Components - Program and Services Management**	**1/1/14**	**3/27/15**	**323 days**
113	3.3.3.1.1 Townhall to announce Agreement	1/1/14	1/1/14	1 day

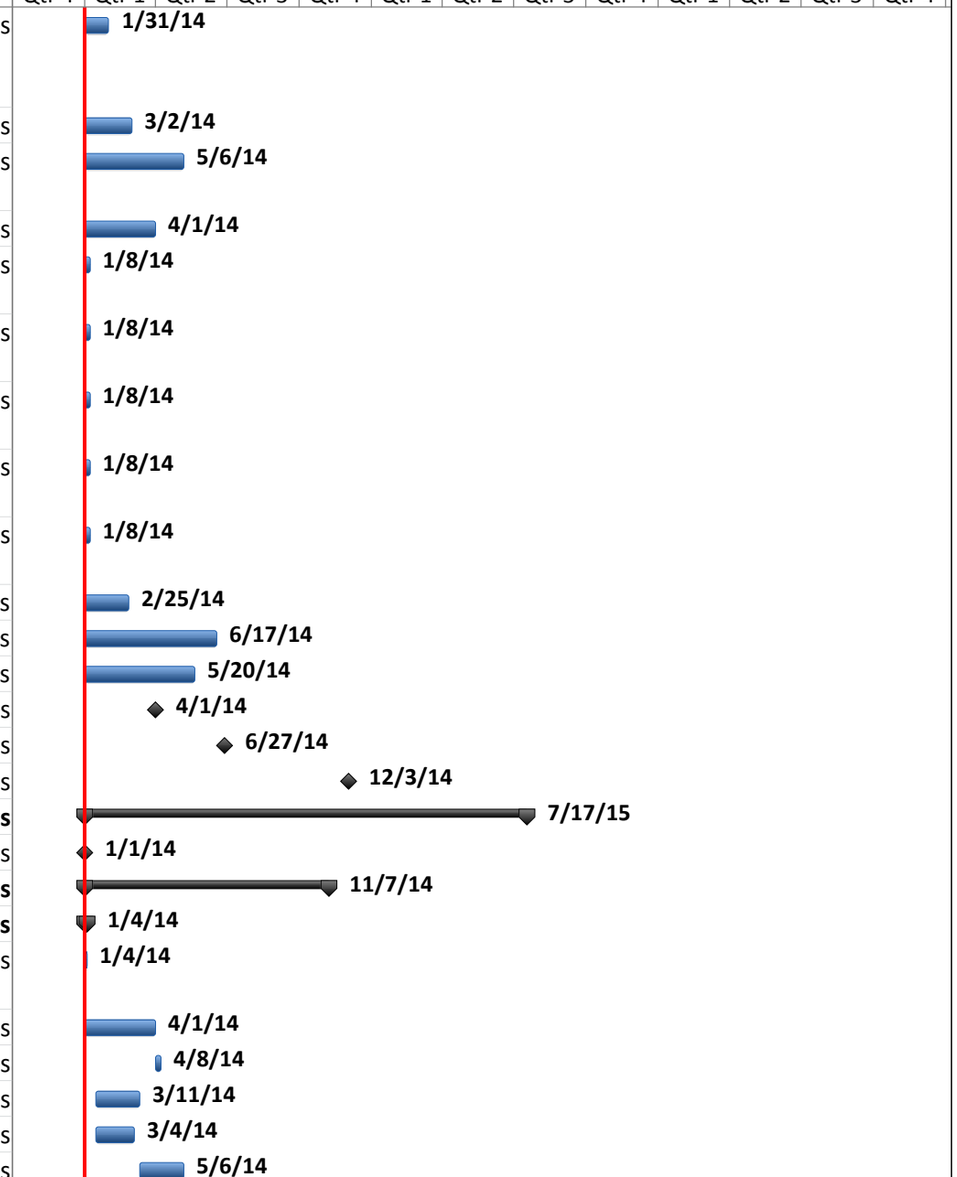


Commonwealth of Pennsylvania Data Center Computing Service Proposed Work Plan

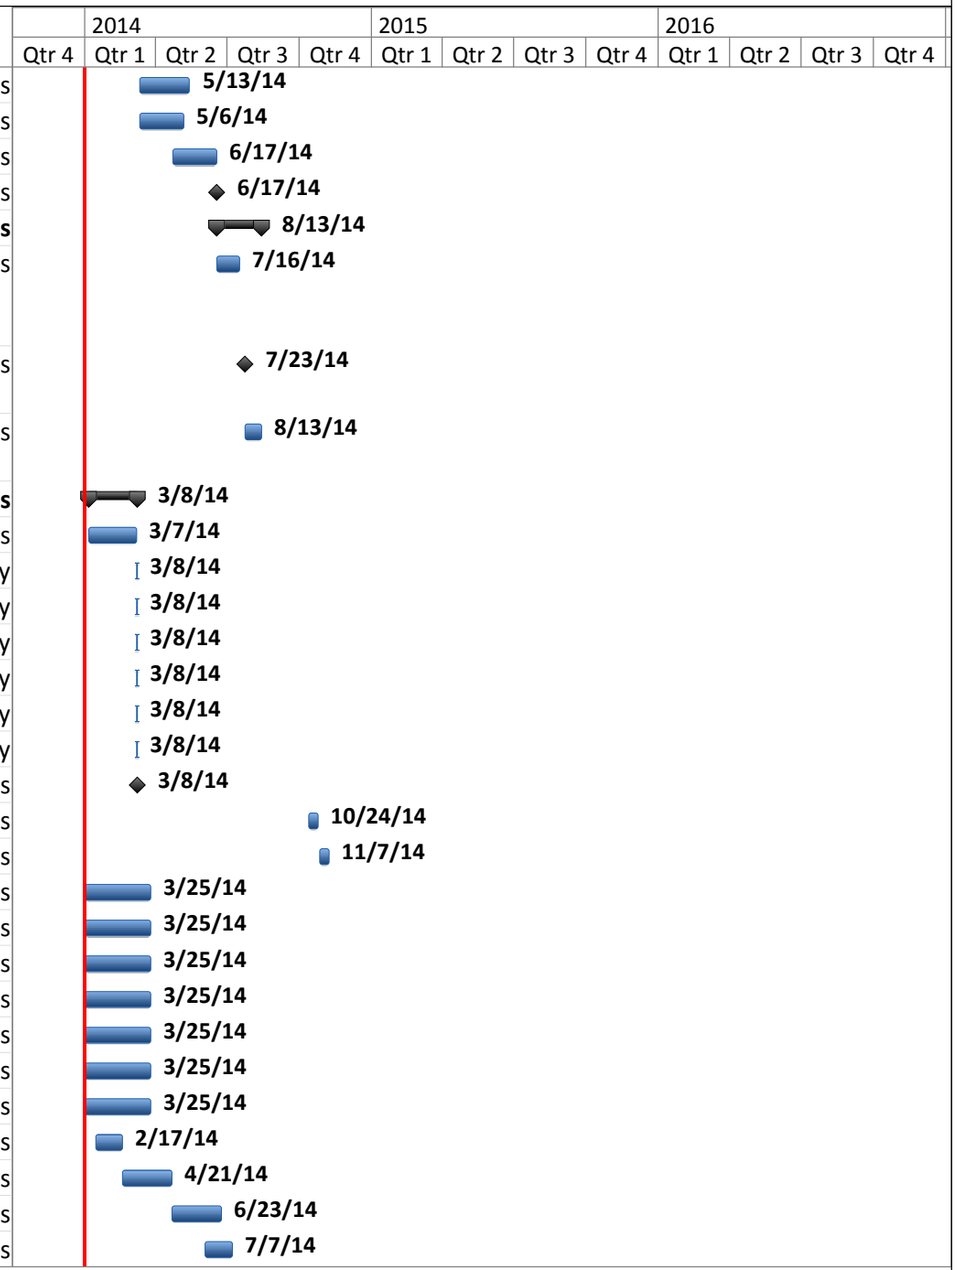
ID	Task Name	Start	Finish	Duration
114	3.3.3.1.2 Team Meetings to discuss what this "means to me"	1/1/14	1/1/14	1 day
115	3.3.3.1.3 Re-Organize Account Staff to new model	1/2/14	2/12/14	30 days
116	3.3.3.1.4 Establish PMO Guidelines and Processes	1/2/14	2/12/14	30 days
117	**3.3.3.1.5 Establish Vendor and Subcontractor Management**	**1/1/14**	**1/26/14**	**18 days**
121	**3.3.3.1.6 Staff Account**	**1/1/14**	**9/5/14**	**178 days**
143	**3.3.3.1.7 Establish PMO Leadership Team**	**1/1/14**	**1/31/14**	**22 days**
146	**3.3.3.1.8 Establish Project Management Team - TPMO and Steady State**	**1/1/14**	**1/31/14**	**22 days**
148	**3.3.3.1.9 Establish Contract Management Team**	**1/1/14**	**3/25/14**	**60 days**
157	**3.3.3.1.10 Establish Agency Account Management Team**	**1/1/14**	**1/31/14**	**22 days**
160	**3.3.3.1.11 Establish Enterprise Architecture Team**	**1/1/14**	**1/31/14**	**22 days**
163	**3.3.3.1.12 Establish Service Excellence Office (SEO)**	**1/31/14**	**3/27/15**	**301 days**
264	**3.3.3.1.13 Establish Financial Management Team Processes**	**1/1/14**	**9/9/14**	**180 days**
272	**3.3.3.1.14 Establish Service Delivery Teams - Processes and Procedures**	**1/1/14**	**12/3/14**	**240 days**
381	**3.3.3.1.15 Training**	**1/1/14**	**5/9/14**	**93 days**
398	**3.3.3.1.16 Relocate Account Team**	**1/1/14**	**12/28/14**	**258 days**
405	**3.4 Enterprise Data Center to Managed Services Model**	**1/1/14**	**6/27/14**	**128 days**
406	**3.4.1 Perform EDC Assessment**	**1/1/14**	**3/25/14**	**60 days**
407	3.4.1.1 Identify Required Security Updates/Upgrades	1/1/14	3/25/14	60 days
408	3.4.1.2 Identify HVAC and power upgrades	1/1/14	3/25/14	60 days
409	3.4.1.3 Identify physical access required for facility	1/1/14	3/25/14	60 days
410	3.4.1.4 Review BMS System quality and information	1/1/14	3/25/14	60 days
411	3.4.2 Integrate Building Management System to BMC BEM	1/1/14	3/25/14	60 days
412	3.4.3 Integrate DCIMI to BMC BEM	1/1/14	3/25/14	60 days
413	3.4.4 Implement Rackwise	1/1/14	2/25/14	2 mons
414	3.4.5 Install Electrical SubMetering	1/1/14	3/25/14	3 mons
415	3.4.6 SSAE 16 Audit of EDC	1/1/14	4/1/14	90 edays
416	**3.4.7 Knowledge Transfer activities**	**1/1/14**	**4/22/14**	**80 days**
417	3.4.7.1 Create/update Runbooks	1/1/14	4/22/14	4 mons
418	3.4.7.2 Verify CMDB contains EDC assets and Cis	1/1/14	1/8/14	7 edays



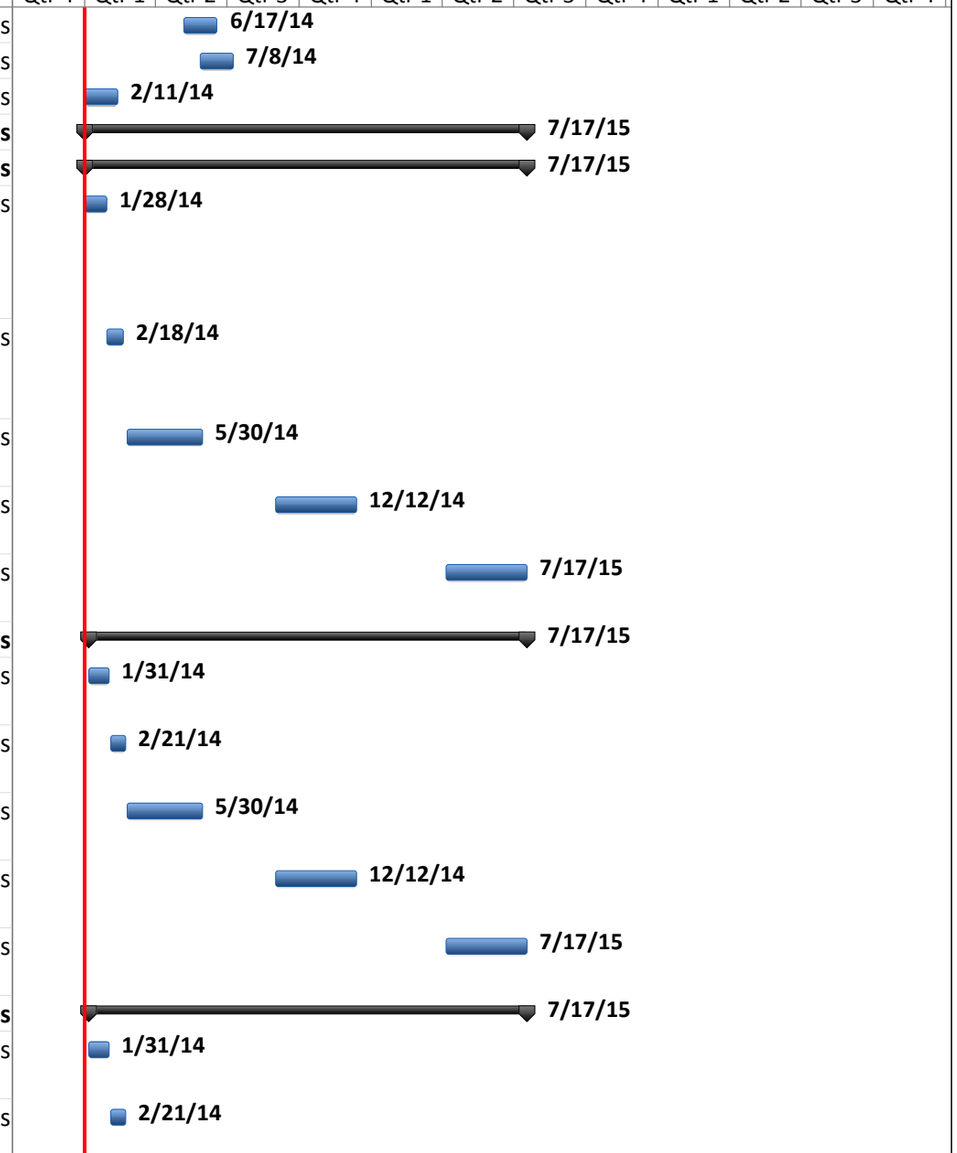
ID	Task Name	Start	Finish	Duration
419	3.4.7.3 Document current Service Catalogs, processes and procedures are transitioned	1/1/14	1/31/14	30 edays
420	3.4.8 Multi-environments/instances are available for identified systems	1/1/14	3/2/14	60 edays
421	3.4.9 Verify High Availability, backup and DR are operational for identified system	1/1/14	5/6/14	90 days
422	3.4.10 Verify specific details for CCPM are in KMP	1/1/14	4/1/14	90 edays
423	3.4.11 Verify Operational dashboards are in place to report on status and alerts	1/1/14	1/8/14	7 edays
424	3.4.12 Verify Service Level agreements have been identified and supporting metrics are in place	1/1/14	1/8/14	7 edays
425	3.4.13 Verify system is Operational for scheduling and tracking of ticket-based tasks and incidents (ITSM/Remedy)	1/1/14	1/8/14	7 edays
426	3.4.14 Verify system is is operational to begin data collection in order to produce Configuration, monitoring and management status reports	1/1/14	1/8/14	7 edays
427	3.4.15 Verify all Transition Orders are completed and accepted by the Commonwealth	1/1/14	1/8/14	7 edays
428	3.4.16 Implement ITIL Processes	1/1/14	2/25/14	2 mons
429	3.4.17 Complete Staffing	1/1/14	6/17/14	6 mons
430	3.4.18 Implement Tools	1/1/14	5/20/14	5 mons
431	3.4.19 PMS-13 - SSAE 16 Audit of EDC Completed	4/1/14	4/1/14	0 days
432	3.4.20 PMS-15 - EDC Transition Completed	6/27/14	6/27/14	0 days
433	3.5 MS-ToS Complete	12/3/14	12/3/14	0 days
434	**3.6 Tools Implementation Project**	**1/1/14**	**7/17/15**	**403 days**
435	3.6.1 MS - Tools Implementation Project Start	1/1/14	1/1/14	0 days
436	**3.6.2 Install BMC ITSM**	**1/1/14**	**11/7/14**	**223 days**
437	**3.6.2.1 Prepare Foundation Data**	**1/1/14**	**1/4/14**	**3 days**
438	3.6.2.1.1 Host Workshops for ITSM / SEO Process Development - Data Gathering	1/1/14	1/4/14	3 edays
439	3.6.2.2 Gather ITSM Data from Commonwealth	1/1/14	4/1/14	90 edays
440	3.6.2.3 Gain approval from Commonwealth on B2B interface	4/1/14	4/8/14	7 edays
441	3.6.2.4 Configure Incident Management	1/15/14	3/11/14	40 days
442	3.6.2.5 Configure Problem Management	1/15/14	3/4/14	35 days
443	3.6.2.6 Configure Change Management	3/12/14	5/6/14	40 days



ID	Task Name	Start	Finish	Duration
444	3.6.2.7 Configure CFG Management	3/12/14	5/13/14	45 days
445	3.6.2.8 Configure Release Management	3/12/14	5/6/14	40 days
446	3.6.2.9 Configure Service Level Management	4/23/14	6/17/14	40 days
447	3.6.2.10 MS - ITSM Configured and Tested	6/17/14	6/17/14	0 days
448	**3.6.2.11 CCPM Approach & Reviews with COPA**	**6/18/14**	**8/13/14**	**41 days**
449	3.6.2.11.1 Prep SD,SLM,CHG&Release, Performance & Capacity Mgt, Configuration Mgt + Software License MgtApproach CCPM	6/18/14	7/16/14	21 days
450	3.6.2.11.2 Review SD,SLM,CHG & Release, Performance & Capacity Mgt, Configuration Mgt + Software License MgtApproach CCPM	7/23/14	7/23/14	0 days
451	3.6.2.11.3 Change and Asset Mgt Procedures Delivered to CCPM KM	7/24/14	8/13/14	15 days
452	**3.6.2.12 DSO - Remedy Sync**	**1/6/14**	**3/8/14**	**45 days**
453	3.6.2.12.1 Configure DSO - Remedy Sync	1/6/14	3/7/14	45 days
454	3.6.2.12.2 Test Incident Connectivity	3/7/14	3/8/14	1 eday
455	3.6.2.12.3 Problem Connectivity	3/7/14	3/8/14	1 eday
456	3.6.2.12.4 Change Request Connectivity	3/7/14	3/8/14	1 eday
457	3.6.2.12.5 Configuration items reconciliation	3/7/14	3/8/14	1 eday
458	3.6.2.12.6 Invoices processed through ITSM to Commonwealth AP	3/7/14	3/8/14	1 eday
459	3.6.2.12.7 Reporting from Unisys ITSM is available in Commonwealth's ITSM	3/7/14	3/8/14	1 eday
460	3.6.2.13 PMS-9 - ITSM Systems Integration Completed	3/8/14	3/8/14	0 days
461	3.6.2.14 Install and Configure Knowledge Management	10/13/14	10/24/14	10 days
462	3.6.2.15 Load KM ITSM Procedures, SC, Contract Pricing	10/27/14	11/7/14	10 days
463	3.6.2.16 Install & Configure EDC & DPH ADDM Discovery	1/1/14	3/25/14	60 days
464	3.6.2.17 Install & Configure DOR ADDM Discovery	1/1/14	3/25/14	60 days
465	3.6.2.18 Install & Configure DLI ADDM Discovery	1/1/14	3/25/14	60 days
466	3.6.2.19 Install & Configure DOH ADDM Discovery	1/1/14	3/25/14	60 days
467	3.6.2.20 Install & Configure DPW ADDM Discovery	1/1/14	3/25/14	60 days
468	3.6.2.21 Install & Configure PSP ADDM Discovery	1/1/14	3/25/14	60 days
469	3.6.2.22 Install BPPM/BEM/SIM Monitoring & Integration	1/1/14	3/25/14	60 days
470	3.6.2.23 Configure Availability Management	1/15/14	2/17/14	24 days
471	3.6.2.24 Configure Capacity Management	2/18/14	4/21/14	45 days
472	3.6.2.25 Install and Configure BladeLogic for Servers (EDC)	4/22/14	6/23/14	45 days
473	3.6.2.26 Install and Configure BladeLogic for Network	6/3/14	7/7/14	25 days



ID	Task Name	Start	Finish	Duration
474	3.6.2.27 Configure Standard Reporting BMC	5/7/14	6/17/14	30 days
475	3.6.2.28 Configure Pureshare Dashboards	5/28/14	7/8/14	30 days
476	3.6.2.29 Configure PMG - Service Catalog	1/1/14	2/11/14	30 days
477	**3.6.3 Security Tools**	**1/1/14**	**7/17/15**	**403 days**
478	**3.6.3.1 Data Loss Prevention**	**1/1/14**	**7/17/15**	**403 days**
479	3.6.3.1.1 Perform requirements gathering and design the data center DLP solution to monitor the datacenter egress points	1/1/14	1/28/14	20 days
480	3.6.3.1.2 Implement pilot solution and configure DLP policy on one egress point	1/29/14	2/18/14	15 days
481	3.6.3.1.3 Implement DLP solution for DCM Phase 1	2/24/14	5/30/14	70 days
482	3.6.3.1.4 Implement DLP solution for DCM Phase 2	9/1/14	12/12/14	75 days
483	3.6.3.1.5 Implement DLP solution for DCM Phase 3	4/6/15	7/17/15	75 days
484	**3.6.3.2 Database Firewall (DBFW)**	**1/6/14**	**7/17/15**	**400 days**
485	3.6.3.2.1 Perform requirements gathering and design the data center DBFW	1/6/14	1/31/14	20 days
486	3.6.3.2.2 Implement pilot solution and configure DBFW	2/3/14	2/21/14	15 days
487	3.6.3.2.3 Implement DBFW solution for DCM Phase 1	2/24/14	5/30/14	70 days
488	3.6.3.2.4 Implement DBFW solution for DCM Phase 2	9/1/14	12/12/14	75 days
489	3.6.3.2.5 Implement DBFW solution for DCM Phase 3	4/6/15	7/17/15	75 days
490	**3.6.3.3 Web Application Firewall (WAF)**	**1/6/14**	**7/17/15**	**400 days**
491	3.6.3.3.1 Perform requirements gathering and design the data center WAF	1/6/14	1/31/14	20 days
492	3.6.3.3.2 Implement pilot solution and configure WAF	2/3/14	2/21/14	15 days



Commonwealth of Pennsylvania Data Center Computing Service Proposed Work Plan

ID	Task Name	Start	Finish	Duration
493	3.6.3.3.3 Implement DBFW solution for WAF Phase 1	2/24/14	5/30/14	70 days
494	3.6.3.3.4 Implement DBFW solution for WAF Phase 2	9/1/14	12/12/14	75 days
495	3.6.3.3.5 Implement DBFW solution for WAF Phase 3	4/6/15	7/17/15	75 days
496	3.6.4 MS - Tools Implementation Project Complete	7/17/15	7/17/15	0 days
497	3.6.5 MS - CoPA Transition of Services Complete	7/17/15	7/17/15	0 days
498	**4 CoPA Application Workload Migration**	**1/1/14**	**6/30/16**	**651 days**
499	4.1 MS - CoPA Datacenter Migration Start	1/1/14	1/1/14	0 days
500	**4.2 Infrastructure Readiness Project**	**1/1/14**	**2/13/15**	**293 days**
501	**4.2.1 Project Management Tasks**	**1/1/14**	**6/30/14**	**128 days**
502	4.2.1.1 Refine Governance Plan	1/1/14	6/30/14	180 edays
503	4.2.1.2 Develop and maintain Risk Plan (RAID)	1/1/14	6/30/14	180 edays
504	4.2.1.3 Validate Data Gathering Timeline	1/1/14	6/30/14	180 edays
