# TRANSMITTAL LETTER

## PUBLICATION:

222 - August 2015 Edition

## DATE:

10/07/15

### SUBJECT:

Revisions to Publication 222 "Geotechnical Investigation Manual"

### INFORMATION AND SPECIAL INSTRUCTIONS

This issuance is effective immediately for all projects not yet in the preliminary design phase. To promote time-neutrality and cost-neutrality of this issuance, any Department project that is currently at or beyond the geotechnical development phase (i.e., bidding and contracting of geotechnical drilling) may be completed under the May 2014 Edition of the Publication 222 specifications. The content of Publication 222 has been revised and updated throughout, and a list of substantive changes is attached.

The August 2015 Edition of Publication 222 is currently in electronic form (pdf format), and is available through the Department's website:

[http://www.dot.state.pa.us/public/pdf/bocm\\_mtd\\_lab/publications/pub\\_222/publication%20222.pdf](http://www.dot.state.pa.us/public/pdf/bocm_mtd_lab/publications/pub_222/publication%20222.pdf)

### CANCEL AND DESTROY THE FOLLOWING:

SOL 481-14-05

Publication 222, May 2014 Edition

### ADDITIONAL COPIES ARE AVAILABLE FROM:

**D** PennDOT SALES STORE  
(717) 787-6746

### APPROVED FOR ISSUANCE BY:

Robert Horwhat, P.E., Acting Chief  
Bureau of Project Delivery  
Innovation and Support Services Division

By: Kerr W. Petrasic, P.E. Chief  
Geotechnical Engineer  
Innovation and Support Services Division

## Summary of Substantive Changes included in Publication 222 August 2015 Edition

The following is a summary of the more substantial changes. This is not a complete listing of all of the changes in the updated publication, but only a summary of those of greater impact and significance. There are many changes in the new publication that are not covered in the list, below.

### **General:**

- 1) A Table of Contents, List of Tables, and List of Figures have been revised.
- 2) Drilling Inspector Guidance Documents (Appendices) have been revised as valuable tools to be used during inspection.
- 3) Rescind Strike-Off Letter 481-14-05, Publication 222, Geotechnical Investigation Manual – 2014 Initial Edition.

### **Chapter 1:**

- 1) Section 1.2, Criteria for Prequalification of Drilling Contractors – The prequalification minimum requirements have been revised including new minimum requirements for Class S indicated in Criteria Notes (4) and (8).
- 2) Drilling Contractor Prequalification Request Form – Form has been revised.
- 3) Drilling Contractor Prequalification Request Form – Submission Checklist has been added.
- 4) Section 1.3, List of Prequalified Drilling Contractors – Prequalified Drillers are required to respond within thirty days from the verification email date.

### **Chapter 3:**

- 1) Section 3.1, Minimum Requirements for Drilling Inspection Exam – Inspection minimum qualifications for drilling inspectors has been clarified, including acceptable footage in surrounding states for Non-Department Boring Inspection.
- 2) Section 3.2, Certification Policies and Procedures – Application submission requirements have been revised.
- 3) Section 3.3.2 – Rock and Soil Sample Identification Examination (Part-3) was revised to include two additional rock samples.
- 4) Section 3.3.3 – A small piece of plate glass is now a required material for drill inspection. The Department recommends plate glass that is 1/4” thick.
- 5) Section 3.3.8 – Certified Drilling Inspectors are required to respond within thirty days from the verification email date.
- 6) Section 3.6.6 – Direction has been provided to access the PennDOT gINT Webpage. An electronic version of the Inspector’s Field Log is now available for use in gINT.
- 7) Section 3.8, Packaging and Labeling of Samples – Figure 19 and 20 have been revised.

### **Chapter 4:**

- 1) Section 4.4(a) – Clarification is provided for pre-bid meeting minute questions and answers, including time restrictions.

- 2) Section 4.4(g) – DGE’s are required to send a completed copy of the “Form of Proposal” to the CGE.

### **Chapter 5/Subchapter 5E:**

#### **Section 100:**

- 1) Section 103.02, Contract Time Adjustment – Section has been rewritten.
- 2) Section 103.04, Liquidated Damages – Section has been rewritten.
- 3) Section 104.03, Work Plan Schedule – Revised to state the contractor must notify the PGM and Inspector if not working on a planned day.

#### **Section 200:**

- 1) Section 212, Standby for Borings – The Description was revised.
- 2) Section 215, Packaging, Protecting, and Shipping Samples – Figure 30 was acclimated to a word document and revised.

#### **Appendices:**

- 1) Appendix H, Photos of Commonly Encountered Rock Types in Pennsylvania – Appendix was revised to provide clarification between Quartzite and Sandstone.
- 2) Appendix K, Field Sheet Summaries of Soil and Rock Descriptors – Appendix K was originally Appendix J but was revised. It provides clarification for inspectors according to the soil and rock description sequence.
- 3) Appendix J, Delineation Maps for Acceptable Non-Departmental Boring Inspection – Appendix was included to provide clarification on acceptable footage in surrounding states for Non-Department boring inspection.

## PURPOSE & SCOPE OF PUBLICATION

A geotechnical subsurface investigation serves to identify and delineate subsurface materials and conditions relative to the design of proposed highway facilities. The purpose of this publication is to present the criterion that pertains to the Drilling Contractors working for the Department or the Department's consultant; and to present criteria defining the requirements and responsibilities of the geotechnical inspection forces.

This publication provides the specifications, forms, and instructions relative to the following subsurface investigation topics:

- 1) Drilling Contractor prequalification
- 2) Drilling Contractor performance evaluation
- 3) Drilling Inspector requirements (certification and responsibilities)
- 4) SBST Contract administration
- 5) SBST Contract standard specifications
- 6) Drilling Inspector Guidance Documents (Appendices)

Complete administration of the geotechnical subsurface investigation (boring, sampling and testing) portion of a project is obtained by combining the text in **Publication 222**, "*Geotechnical Investigation Manual*" and [Publication 293](#), "*Geotechnical Engineering Manual*". These publications cover the administration requirements, policies, and procedures of the planning and execution of subsurface explorations.

Maintenance and updating of this Manual is the responsibility of the Innovation & Support Services Division. Users may suggest modifications or additions to the current edition of the manual in writing to the following:

Chief Geotechnical Engineer  
PennDOT Materials Testing Laboratory  
81 Lab Lane  
Harrisburg PA 17110-2543

BLANK PAGE

## Chapter 1 - DRILLING CONTRACTOR PREQUALIFICATION

### 1.1 PREQUALIFICATION PROCEDURE

The objective of the prequalification process is to provide a mechanism to identify the pool of qualified drilling contractors meeting the minimum requirements to bid on subsurface investigation contracts under this publication. Prequalification promotes timely project development and a quality end product. The following procedure, in conjunction with [Figure 1](#), will be used in prequalifying drilling contractors for PennDOT projects:

- (1) The prequalification criteria are outlined in [Chapter 1.2](#), the "Criteria for Selection of Drilling Contractors."
- (2) The prospective drilling contractor shall complete the application package and submit to:

Chief Geotechnical Engineer  
PennDOT Materials Testing Laboratory  
81 Lab Lane  
Harrisburg PA 17110-2543

The application package shall include the completed [Drilling Contractor Prequalification Request Form](#), Drilling Contractor Prequalification Checklist, and a copy of valid documentation that verifies the current name and ownership of your company. The documentation should include the name of the owner(s), partner(s), managing member(s) or equivalent of the organization. Examples of acceptable documents may include:

- Article of Incorporation
- Business certificate or license
- Certificate of Formation
- Charter document
- Doing-Business-As document
- Legislation excerpt showing the establishment/creation of your organization

Any parent company or wholly-owned subsidiary arrangements must be fully disclosed to the Department as part of the application package.

- (3) The Central Office Geotechnical Section will review the application, render a decision, and inform the applicant when the determination has been made to prequalify the drilling contractor.
- (4) The applicant may appeal the decision made by the Central Office Geotechnical Section. Appeals must be made in writing to the CGE. The appeal must clearly provide the basis for the appeal and include any supporting information and documentation. The appeal must be submitted within 30 days of the original notification of application status.

## 1.2 CRITERIA FOR PREQUALIFICATION OF DRILLING CONTRACTORS

The minimum requirements necessary to be considered for prequalification in the various drilling classifications is indicated in [Table 1](#).

CRITERIA ITEM (1)	CLASS B (2)	CLASS A (3)	CLASS S (4)	CLASS E1 (11)	CLASS E2 (11)
	General BST	General BST	Specialized BST	Environmental BST	Environmental BST
a. Number of years in business (5)	3	5	5	3 (12), 1 (13)	3 (12), 1 (14)
b. Number of Projects last 5-years (5)	10	20	20	10 (12), 1 (13)	10 (12), 1 (14)
c. LF of drilling past 2-years (5)	14,000	21,000	(8)	14,000 (12), 1,400 (13)	14,000 (12), 1,400 (13), 1,000 (14)
d. Number/LF of SPT soil samples during past 2-years (5)	2,400/ 3,600	3,600/ 5,400	(8)	2,400/ 3,600 (12), 240/360 (13)	2,400/ 3,600 (12), 240/360 (13), 80/120 (14)
e. LF of rock coring during past 2-years (5)	2,000	3,000	2000	2,000 (12)	2,000 (12)
f. Number of full-time operational drill rigs owned by drilling contractor (6)	2	3	2	2	2
g. Number of employees and their qualifications (7)	3	7	5	3 (15), 2 (16)	3 (15), 2 (16)
h. Specialized drilling or field testing experience required	No	No	Yes (8)	No	No
i. Full-time office manager	No	Yes	Yes	Yes	Yes
j. Project completion record of previous 1-year (9)(10)	100%	100%	100%	100%	100%
k. Number of GMWs installed (17)	0	0	0	5 (13)	2 (14)
Abbreviations: BST = Boring Sampling and Testing LF = Linear Feet GMW = Groundwater Monitoring Well					

Table 1 – Criteria for Drilling Contractor Prequalification  
Numbers in ( ) refer to notes on the following pages

Criteria Notes for **Table 1** (Page 1 of 2)

- (1) Table presents minimum requirements: any exceptions must be approved by the Department in writing.
- (2) Class B - Capable of providing typical boring, sampling and testing, including Standard Penetration Testing (SPT), disturbed and undisturbed soil sampling, auger sampling, rock coring, and installation of piezometers and slope inclinometers. No full-time office manager required.
- (3) Class A - Same capabilities as Class B, but requires a greater level of experience and a full-time office manager.
- (4) Class S - Special Class capable of specialized drilling, testing or sampling generally not available from Class A or Class B drilling contractors; however, any entity applying for Class S must be prequalified as a Class A or B Driller, or have the ability to meet Class A or B requirements. See Note (8) for specialized drilling requirements.
- (5) Experience of employees may be substituted for required minimum criteria within reason for Items (a.), (b.), (c.), (d.), and (e.) provided a detailed resume of related experience is submitted to the Department for approval. If employee experience is accepted, the drilling contractor will be temporarily classified for a probationary period of two (2) years prior to being placed on the permanent list.
- (6) Supply detailed list of equipment and accessories.
- (7) Provide resumes for drillers and full-time office manager, each indicating number of years of relevant experience in the drilling industry.
- (8) Specialized drilling or field testing experience includes work such as Horizontal Drilling (HZD), Inclined Drilling (IND), Air-Rotary Drilling (ARD), Off-Shore Drilling requiring a barge (OSD), Cone Penetration Testing (CPT), Dilatometer Testing (DMT), Pressure Meter Testing (PMT), Vane Shear Testing (VST), Borehole Geophysical Testing (BGT), or other testing. Special class qualification can be obtained for limited areas of testing and experience. Approval will be limited to the specific area(s) of expertise for which the drilling contractor can demonstrate satisfactory experience. Meet the following Class S Minimum requirements in which you are applying:

<b>Class S Minimum Requirements</b>		
<b>SPECIALIZED BST</b>	<b>NUMBER OF TESTS OR LINEAR FEET OF DRILLING</b>	<b>NUMBER OF PROJECTS</b>
Horizontal Drilling (HZD)	1500 LF	3
Inclined Drilling (IND)	1500 LF	3
Air-Rotary Drilling (ARD)	3000 LF	3
Off-Shore Drilling (OSD)	1000 LF	3
Cone Penetration Testing (CPT)	750 LF	3
Dilatometer Testing (DMT)	10 Tests	2
Pressure Meter Testing (PMT)	10 Tests	2
Vane Shear Testing (VST)	10 Tests	2
Borehole Geophysical Testing (BGT)	Inquire	Inquire

Criteria Notes for **Table 1** (Page 2 of 2)

- (9) Completion is defined as completing a project in a timely manner to the satisfaction of the owner: must provide letters of reference. Completion history includes both Environmental and General drilling projects.
- (10) Provide a minimum of two letters of reference from other state agencies or private firms that indicate satisfactory performance.
- (11) Class E1 and E2 - Experience must include drilling under Health and Safety Plans (HASP) prepared as required in [29 CFR 1910.120 \(OSHA\) Hazardous Waste Operations and Emergency Response](#). Class E1 must include experience drilling under personnel protection Levels D and C. Class E2 must include experience drilling under personal protection Levels D, C, and B.
- (12) May be tabulated from any projects completed by the firm during this period.
- (13) Must include only projects completed under a HASP.
- (14) Must include only projects completed under a HASP using Level B with positive pressure, full-face piece self-contained breathing apparatus (SCBA) or positive pressure supplied air respirator with escape SCBA personnel protection, approved by the National Institute for Occupational Safety and Health (NIOSH).
- (15) Total employees with or without OSHA health and safety training.
- (16) Individuals must possess mandatory 40-hour OSHA training in health and safety for hazardous waste operations and emergency response with current certificate. This must include enrollment in a medical surveillance program as per [29 CFR 1910.120 \(OSHA\) Hazardous Waste Operations and Emergency Response](#).
- (17) Groundwater monitoring wells (GMWs) are to collect geological data, groundwater data, chemical data on soil and water, and provide for long-term monitoring capabilities.

### 1.3 LIST OF PREQUALIFIED DRILLING CONTRACTORS

A current listing of prequalified drilling contractors is maintained by the Central Office Geotechnical Section, and can be accessed at:

[Prequalified Geotechnical Drilling Contractors](#)

It is the responsibility of each prequalified drilling contractor to ensure their contact information is kept up-to-date with the Department. The required contact information includes:

- Company name
- Mailing address
- Phone number
- Fax number
- Name of primary contact
- Email address of primary contact

Contact information updates should be sent to the Central Office Geotechnical Section at the address shown in [Chapter 1.1](#). The Department will make periodic (bi-annual) notifications via email to all certified drillers. Prequalified drillers are required to respond within thirty days from the email date. For any contractor not responding to the email solicitation, a follow-up phone call may be attempted by the Department. Any contractor that cannot be contacted will be removed from the prequalification list.

BLANK PAGE

## Chapter 2 - DRILLING CONTRACTOR PERFORMANCE EVALUATION

### 2.1 INSTRUCTIONS TO COMPLETE PERFORMANCE EVALUATION

The procedural flowchart for Drilling Contractor Performance Evaluation is presented in [Figure 2](#).

#### 2.1.1 Consultant Contracts

- (1) The Project Geotechnical Manager (PGM) and project Inspector(s) will be responsible for preparing the [Drilling Contractor Performance Evaluation](#).
- (2) The project PGM/PGE will discuss the Drilling Contractor's work performance with the DGE prior to completing the Performance Evaluation.
- (3) The Consultant will send copies of the evaluation to the Drilling Contractor and the DGE for their review.
- (4) If the evaluation results in a satisfactory rating, copies of the evaluation must be submitted to both the DGE and CGE. If the evaluation results in an unsatisfactory rating and the DGE rejects the rating due to insufficient documentation, the Consultant will be notified of the deficiencies and must provide the required documentation and resubmit. If the DGE concurs with the unsatisfactory rating, it will be submitted to the CGE for review.
- (5) If the CGE rejects the rating, it will be returned to the DGE and Consultant with the deficiencies identified. Deficiencies must be addressed and the evaluation resubmitted. If the CGE approves the rating it will be returned to the DGE and Consultant with the necessary action defined.
- (6) Information for the CGE will be sent to the following address:

Chief Geotechnical Engineer  
PennDOT Materials Testing Laboratory  
81 Lab Lane  
Harrisburg PA 17110-2543

#### 2.1.2 Department Contracts

- (1) The DGE and project inspector(s) will complete the [Drilling Contractor Performance Evaluation](#).
- (2) The DGE will send a copy of the evaluation to the Drilling Contractor for their review.
- (3) If the evaluation results in a satisfactory rating, copies of the evaluation must be submitted to the CGE. If the evaluation results in an unsatisfactory rating, it will be submitted to the CGE for review. If the CGE rejects the rating, it will be returned to the DGE with the deficiencies identified. Deficiencies must be addressed and the

evaluation resubmitted. If the CGE approves the rating it will be returned to the DGE with the necessary action defined.

(4) Information for the CGE will be sent to the following address:

Chief Geotechnical Engineer  
 PennDOT Materials Testing Laboratory  
 81 Lab Lane  
 Harrisburg PA 17110-2543

### 2.1.3 Rating Procedure

- Record the exact company name of the Drilling Contractor and Inspector's organization.
- Describe the drilling project as specifically as possible
- If multiple drill crews are assigned to a project and the crew performance is notably different, each unit (drill crew) is to be rated separately.
- Assign a point value to all rating factors according to [Table 2](#).
- Equipment, Safety, Procedure and Management Units: Calculate the 'Applicable Points', 'Earned Points' and 'Rating' for each unit using formulas shown on the evaluation form.
- For contracts extending one year or more, rate the Drilling Contractor at least once per year.
- In some cases, rating a Drilling Contractor prior to the completion of the contract would be appropriate. (e.g., a lengthy contract in which the Contractor is performing poorly) In such cases, mark the report at the top as "Interim Evaluation."

<b>Bonus points</b>	+1, +2	Drilling Contractor performs this operation consistently throughout the project at all times.
-	0	Drilling Contractor performs this operation correctly for the remainder of the project after verbal directive to correct a deficiency.
<b>Penalty points</b>	-1, -2, -3	Drilling Contractor continues to perform this operation incorrectly after verbally directed to correct a deficiency.
-	N/A	This factor not applicable to the project.

Table 2 - Key to Rating System Point Values

**IMPORTANT:**  
 Inspectors must provide daily documentation of drilling operations using the  
*Drilling Inspector's Daily Report*

Drilling Contractor Performance Evaluation  
(Page 2 of 5)

**KEY TO RATING SYSTEM:**

RATING	DESCRIPTION
<b>Bonus points</b>	+1, +2 Drilling Contractor performs this operation consistently throughout the project at all times.
-	0 Drilling Contractor performs this operation correctly for the remainder of the project after verbal directive to correct a deficiency.
<b>Penalty points</b>	-1, -2, -3 Drilling Contractor continues to perform this operation incorrectly after verbally directed to correct a deficiency.
-	N/A This factor not applicable to the project.

**DEFINITIONS:**

Sufficient Quantity: Enough to perform the work as indicated by the contract quantities.

Sufficient Quality: Able to perform the indicated work with the equipment in an efficient manner.

**CONTRACTOR SAFETY RATING:**

CODE	SAFETY RATING FACTOR	REFERENCE SECTION(S)	POSSIBLE RATINGS
S-1	All equipment was maintained to safe standards and operated in a safe manner complying with regulations and standards.	103.09(a); 103.09(b); 204.02	+1 0 -3 N/A
S-2	All safety clothing was available and used when necessary, including: - Hard hats - Safety vests - Work boots All safety devices necessitated by HASP available and used when necessary.	103.09(c); 103.09(d); 103.09(e); 103.13; 104.11	+1 0 -3 N/A
S-3	A safe work site was maintained such that no operation was conducted in a manner that could result in danger to the public, environment, inspection staff, or the driller.	103.10; 104.01; 104.10; 104.11; 211.02	+1 0 -3 N/A
S-4	All traffic control set-ups were in conformance to the traffic control plan. All traffic control devices were provided and conformed to specifications. All traffic control devices were maintained as required or directed.	<a href="#">Pub.213:</a> 216.02; 216.03	+1 0 -3 N/A
<b>APPLICABLE POINTS = 4 - (Sum of Bonus Points for any N/A Items) =</b>			
<b>EARNED POINTS = (Bonus Points Earned) + (Penalty Points Earned) =</b>			

Drilling Contractor Performance Evaluation

(Page 3 of 5)

**CONTRACTOR EQUIPMENT RATING:**

CODE	EQUIPMENT RATING FACTOR	REFERENCE SECTION(S)	POSSIBLE RATINGS
E-1	The specified number of drill rigs was provided.	Ch. 5A., Sec. C-2	+1 0 -3 N/A
E-2	The drill rigs were fully equipped and manned.	Ch. 5A., Sec. C-2	+1 0 -3 N/A
E-3	The necessary equipment for water borings was provided.	201.01	+1 0 -3 N/A
E-4	For test pits, a properly manned backhoe of the required size was provided	201.01; 211.02	+1 0 -3 N/A
E-5	All drilling equipment was properly maintained and promptly repaired during the project	202.02; 202.03(b); 204.02(b)(1); 212.02	+1 0 -2 N/A
E-6	A sufficient quantity and quality of drilling steel was provided during the project including: - Drill casing - Hollow-stem augers - Sample retaining devices - A minimum of two (2) split-barrel sampling devices for each rig - Any additional required drilling tools - Core barrel and diamond bits of proper quality and construction	Ch. 5A., Sec. C-2; 202.02; 202.03(b)(1); 202.03(c); 204.02(b)(2); 204.02(b)(3); 205.02(b)	+1 0 -2 N/A
E-7	A hammer of the proper weight and construction was provided	202.03(b)(2)	+1 0 -3 N/A
E-8	Undisturbed sample tubes of necessary quantity and quality were provided	203.02	+1 0 -3 N/A
E-9	Proper equipment for advancing borings in soil was used.	202.02(b)	+1 0 -2 N/A
E-10	Sufficient quantity and quality of equipment for monitoring devices, instrumentation, special installations and field testing were provided including: - Standpipe piezometers - Inclinometers	206.02(e); 207.02; Attachment II	+1 0 -3 N/A
E-11	Sample boxes and jars of the required size and composition were provided. Stenciled core boxes and sample jar labels were provided.	215.02	+1 0 -3 N/A
<b>APPLICABLE POINTS = 11 - (Sum of Bonus Points for any N/A Items) =</b>			
<b>EARNED POINTS = (Bonus Points Earned) + (Penalty Points Earned) =</b>			

Drilling Contractor Performance Evaluation

(Page 4 of 5)

**CONTRACTOR PROCEDURE RATING:**

CODE	PROCEDURE RATING FACTOR	REFERENCE SECTION(S)	POSSIBLE RATINGS
P-1	All physical damage to property was promptly repaired. Site clean-up and restoration was completed.	103.14; 104.08; 104.09; 104.10; 104.11; 104.12	+2 0 -3 N/A
P-2	Standard penetration tests were performed as specified. The hammer was permitted to free fall from a height of 30-inches. Blows were recorded per 0.5 ft. of penetration.	202.02; 202.03	+2 0 -3 N/A
P-3	Undisturbed soil samples were obtained as specified. Undisturbed samples were advanced using rig hydraulics. Undisturbed sample and tubes remained in place for 15 minutes.	203.03	+2 0 -3 N/A
P-4	Rock coring was performed as specified. Rock coring was performed in a manner that no grinding of cores occurred. Core runs were limited to five feet. Initial core runs were limited as required. Notes were made of significant actions of the drilling equipment. In soft or broken rock adjustments were made to maximize core recovery.	204.02(a); 204.02(b); 204.02(c)	+2 0 -3 N/A
P-5	A written work plan and schedule was submitted prior to start of work. A written list of supervisor(s), foreman(s), and driller(s) was provided at the start of work.	104.01; 104.03	+1 0 -2 N/A
P-6	Holes have been temporarily plugged and properly grouted. Test pits have been properly backfilled.	210.02; 211.02	+1 0 -2 N/A
P-7	Handwritten driller's boring logs were properly completed, submitted and maintained. Groundwater levels were measured. Boring information was properly documented.	Ch. 5A., Sec. C-3; 204.02(c); 209.02; 214.02; 214.03; 214.04	+1 0 -3 N/A
P-8	Proper installation of standpipe piezometers and slope inclinometers were completed. Piezometers and slope inclinometers were properly back-filled. Installation of slope inclinometers meet the requirements of <a href="#">Figure 27</a> , <a href="#">Figure 28</a> , and <a href="#">Figure 29</a> , and as specified. Special installations and field testing were completed in accordance with Attachment II specifications.	206.02; 207.02; Attachment II	+2 0 -3 N/A
P-9	Proper procedure was followed when encountering potentially contaminated materials not previously suspected.	103.09(e)	+1 0 -3 N/A
P-10	Sample boxes and jars were properly handled, packaged, protected, shipped, and stored.	215.02; 215.03; Articles G & H	+2 0 -3 N/A
<b>APPLICABLE POINTS = 16 - (Sum of Bonus Points for any N/A Items) =</b>			
<b>EARNED POINTS = (Bonus Points Earned) + (Penalty Points Earned) =</b>			

Drilling Contractor Performance Evaluation  
(Page 5 of 5)

**CONTRACTOR MANAGEMENT RATING:**

CODE	MANAGEMENT RATING FACTOR	REFERENCE SECTION(S)	POSSIBLE RATINGS
M-1	All work was completed within the time specified.	5D(3); 103.01	+2 0 -3 N/A
M-2	All work within Railroad Right-of-Way was completed within the time specified.	Attachment III; 103.12	+1 0 -1 N/A
M-3	All required permits and insurances were obtained prior to start of work.	103.07; 201.01	+2 0 -3 N/A
M-4	All of the underground structures and utilities were located prior to start of work.	103.10; 104.03; 218.02	+2 0 -3 N/A
M-5	The driller made specific arrangements for access onto private property.	103.11	+1 0 -2 N/A
M-6	The full-time office staff (for Class A, S, E1, or E2 drillers only) was available to make and receive calls, make PA One-calls, and make and submit invoices during regular office hours Monday through Friday, OR an alternate contact was available to provide adequate response time (Class B drillers).	103.05	+2 0 -3 N/A
<b>APPLICABLE POINTS = 10 - (Sum of Bonus Points for any N/A Items) =</b>			
<b>EARNED POINTS = (Bonus Points Earned) + (Penalty Points Earned) =</b>			

**IMPORTANT:**

To justify any ratings of zero or less, the *Drilling Inspector's Daily Report* must be completed by the inspector during the project. No action will be taken by the DGE or CGE on any rating forms submitted without complete and thorough documentation.

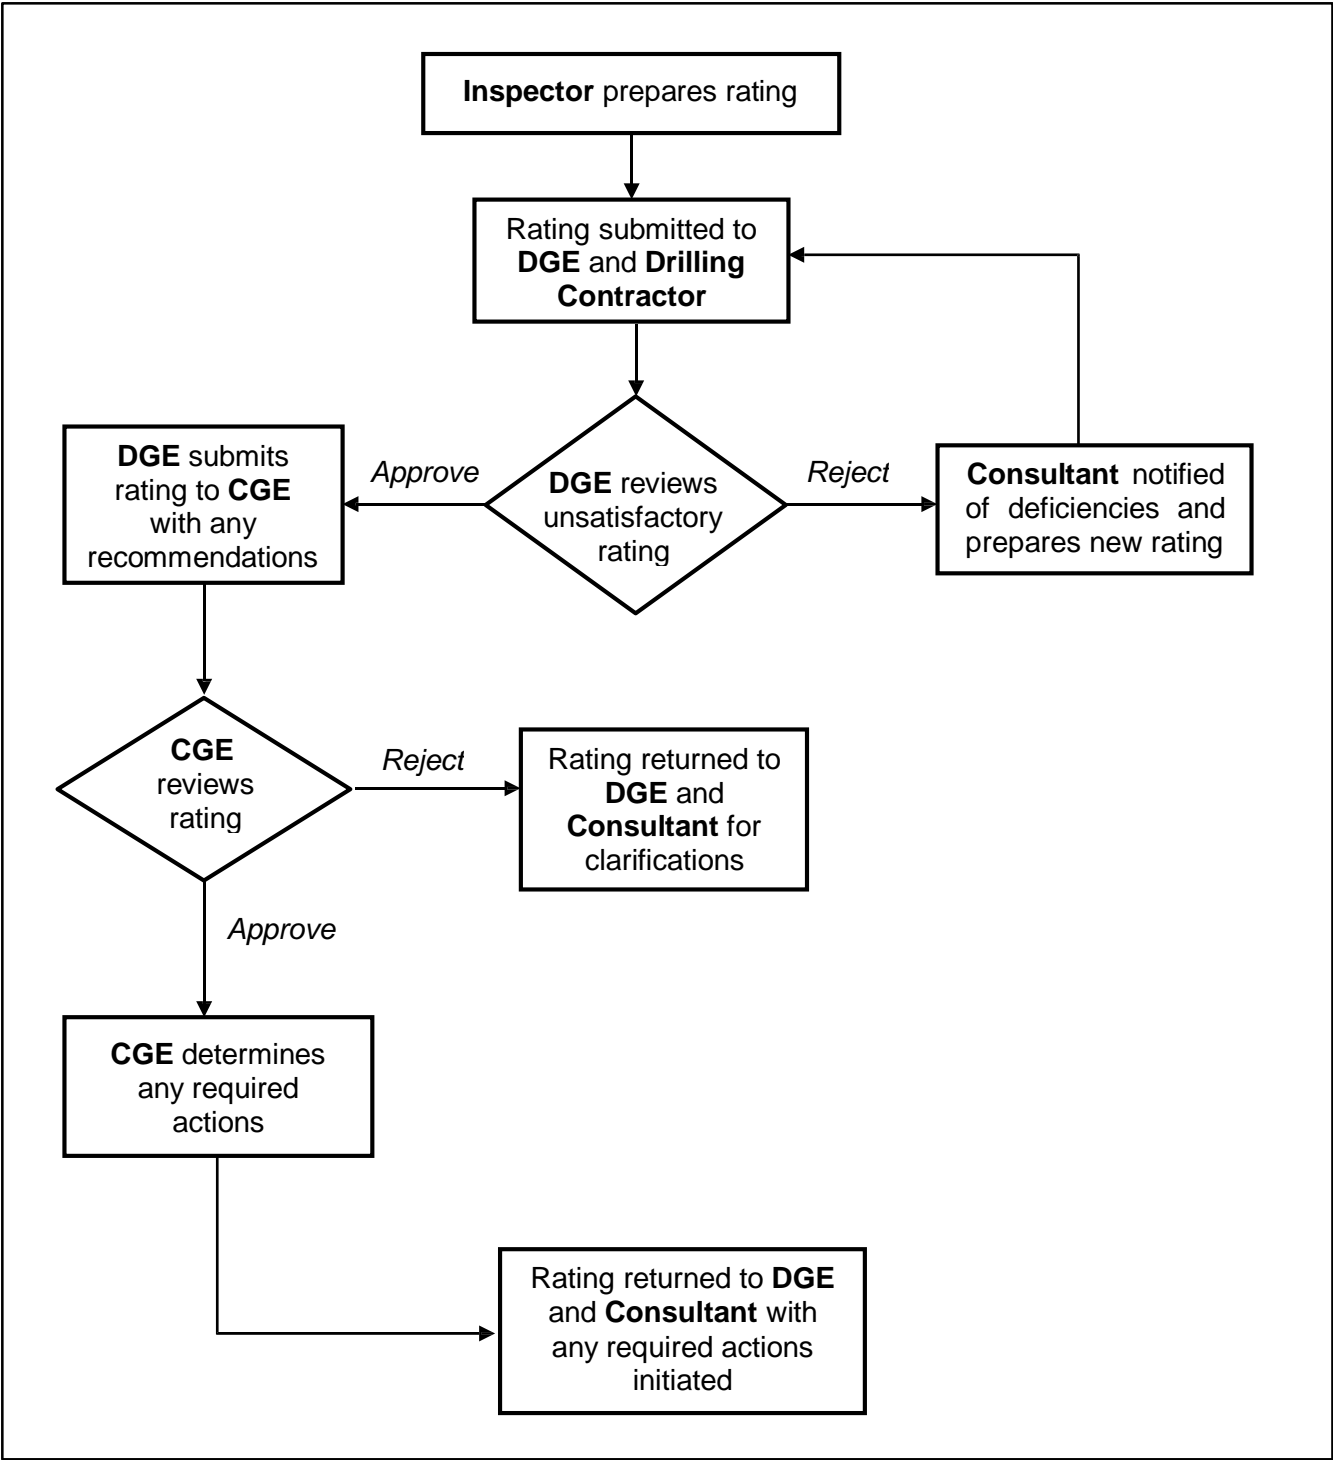

Figure 2 - Drilling Contractor Evaluation Procedural Flowchart

## 2.2 REMOVAL OF DRILLING CONTRACTOR FROM PREQUALIFIED LIST

- The Department will maintain a performance evaluation record for each contractor based on the information received from the District and Consultant offices.
- Any unsatisfactory rating received on any of the four contractor rating factors (Equipment, Procedure, Safety or Management) will be reviewed by the CGE.
- During the review process, the Drilling Contractor shall provide an explanation to the CGE as to the reason for the unsatisfactory rating and shall demonstrate a plan for upgrading the rating to a satisfactory level.
- Upon review, the CGE will decide if the Drilling Contractor is to be placed on “Notice” status.
- A “Notice” status is to be a minimum duration of one year. During this period, the Drilling Contractor is permitted to bid on Department work.
- To be removed from “Notice” status, the Drilling Contractor must successfully work at least one Department project while on “Notice”. This work must demonstrate that the contractor has corrected any previous deficiencies related to the “Unsatisfactory” performance rating. This work shall earn a “Satisfactory” performance rating and include a minimum of 50 ft. of SPT soil sampling and 50 ft. of rock coring.
- If a Drilling Contractor receives an unsatisfactory rating while on “Notice”, the CGE shall review the rating to decide if the Drilling Contractor should be removed from the prequalified list.
- In the event a Drilling Contractor is removed from the prequalified list, the company will not be permitted to apply for prequalification for a time period deemed appropriate by the CGE, but not exceeding three years.

BLANK PAGE

## Chapter 3 - DRILLING INSPECTION REQUIREMENTS

### 3.1 MINIMUM REQUIREMENTS FOR DRILLING INSPECTION

All inspection will be the responsibility of the Project Geotechnical Manager (P.E. or P.G.).

One full-time, certified Inspector shall be assigned to each operating drill rig. It is not reasonable to expect an Inspector to visually monitor and accurately log the operation of two or more drilling rigs that are operating simultaneously.

Projects drilled under Department contracts will be inspected by District personnel or the District's representative. District drilling Inspectors must be certified drilling Inspectors. District employees needing to become certified must be tested and certified by the CGE, or through other arrangements (such as testing by a neighboring District) as approved by the CGE.

Projects drilled under Consultant design contracts will normally be inspected by Consultant personnel. Consultant projects can be inspected by Department forces provided the Department Inspector is certified and the DGE is a licensed P.E. or P.G. in the Commonwealth. In addition, the DGE must review the core boxes and check and initial the *Final Engineer's Log*.

For projects where the geotechnical Consultant (or a subsidiary company thereof) is also a Drilling Contractor, the Consultant may be permitted to provide the project drilling services and to inspect the work performed by their own Driller. See [Chapter 4.5](#) for more clarification on the requirements for this case.

The following minimum qualifications must be met by all drilling Inspectors:

- Speaks, writes, reads and understands the English language fluently.
- Has prior drilling inspection experience on a minimum of three (3) drilling projects (Department or private) in Pennsylvania and surrounding states (refer to [Appendix J](#) for acceptable project locations) in the past two years, with minimum logging experience of 200 ft. of Standard Penetration Testing and 100 ft. of rock coring meeting Department requirements. Inspection credit is not given for auger advance footage during non-continuous sampling, such as augering through a soil zone for accessing top-of-rock, or auger advances for 3-ft or 5-ft interval SPT sampling. Minor amounts of augering can be counted when it is part of continuous sampling, such as when an obstruction or a 50/xx zone is encountered.
- Is knowledgeable of general drilling practices and the following references:
  - [Publication 213](#) (Temporary Traffic Control Guidelines)
  - **Publication 222** (Geotechnical Investigation Manual)
  - [Publication 293](#) (Geotechnical Engineering Manual)
  - A copy of the boring contract for the project
  - A rock identification text (e.g., the *Audubon Society Field Guide to North American Rocks and Minerals*, the *Smithsonian Handbook of Rocks and Minerals*, other reference suitable for identification of PA rocks)

- Be able to: traverse rough, steep terrain; cope with inclement weather conditions; deal with potential natural hazards such as snakes, ticks, bees and poison ivy; work safely in the vicinity of live traffic and open bodies of water.
- Understands the general geotechnical design principles involved in the anticipated construction, and the anticipated laboratory testing.
- Successfully passed all parts of the Department's Drilling Inspector Examination and possess a valid drilling inspector certification issued by the Department.

**Any inspector who does not demonstrate adequate proficiency or dependability at the project site, or engages in activities contrary to the best interest of the Department, as determined by the DGE, will be subject to immediate removal from the project.** A qualified replacement will be required before work will be permitted to resume. The DGE must complete a [\*Drilling Inspector Performance Evaluation\*](#) and submit copies to the removed inspector and the CGE within three working days of the dismissal.

## 3.2 CERTIFICATION POLICIES AND PROCEDURES

The purpose of this process is to provide a mechanism to certify drilling inspectors. The goal of this process is to provide qualified, knowledgeable inspectors for overseeing drilling operations on PennDOT projects. **Having a Department certified inspector performing the required inspection duties does not release the consultant from the responsibility of providing accurate subsurface interpretations.** A certification procedural flowchart is presented in [Figure 3](#). Submit the [Drilling Inspector Examination Application](#) to apply.

- All Consultant drilling inspection forces shall be certified by meeting the requirements of this Publication and passing the Standardized Drilling Inspector Examination.
- For minimum drilling inspector qualifications, see [Chapter 3.1](#) of this Publication.
- Certified inspectors are subject to an orientation session prior to the start of drilling operations on any project at the discretion of the DGE. Inspectors are also subject to a quality-assurance performance review during drilling operations.
- Applications for project-specific drilling inspection certification must be submitted to the District where the project is located.
- Applications not related to a specific project (general state-wide certification) will be scheduled (time and date) at the convenience of the DGE at any one of the eleven Districts.
- Follow the Procedural Flowchart, [Figure 3](#), to apply for the examination.
- Provide application to the DGE at least thirty (30) days prior to start of drilling operations.
- The application submission must include the following:
  - Application ([Drilling Inspector Examination Application](#))
  - Resume
  - Project Listing. Provide list of at least three projects inspected as an apprentice (project name and location is fine), with a tabulation of SPT footage (200-ft min), auger footage, and rock coring (100-ft min) that you inspected.
  - Boring Logs. Provide copies of Inspector's Field Logs and Final Engineer's Logs used to tabulate the SPT, auger, and rock coring footage from each project listed above that were inspected by the candidate.

### 3.3 CERTIFICATION EXAM REQUIREMENTS AND GUIDELINES

#### 3.3.1 Written Examination (Part-1 and Part-2)

- The written examination is open-book and divided into two subject areas, Drilling Operations, Duties and Technical Knowledge (Part-1) and Traffic Control (Part-2).
- There is a 105-minute time limit for the written test.
- Part-1 consists of 35 questions and covers all required duties and knowledge including geology, soil and rock identification, drilling operations, logging of borings, inspection duties, and PennDOT guidelines/requirements.
- Part-2 consists of 6 questions and covers temporary traffic control procedures and requirements.

#### 3.3.2 Rock & Soil Sample Identification Examination (Part-3)

- Open Book
- 18 to 22 soil/rock identifications (minimum of 6 soil IDs and 12 rock IDs)
- There is a 70-minute time limit for the standard 18 sample test, with 5 additional minutes allotted for any additional sample
- Physical descriptions based on **Publication 222** requirements
- All candidates must be able to perform the following:
  - Use **Publication 222**
  - Use the AASHTO and Unified (USCS) soil classification systems, and cross reference as necessary
  - Identify different rock and soil types found in Pennsylvania
  - Distinguish between siltstone, claystone, and shale
  - Distinguish between carbonate and non-carbonate rocks
  - Distinguish between sedimentary, igneous, and metamorphic rocks
  - Distinguish between clay, silt, sand, and gravel

#### 3.3.3 Required References, Identification and Tools

- Technical references (see [Chapter 3.1](#), 3rd bullet), and other pertinent geologic references.
- Driver's license
- Black pen, pencil, eraser, calculator
- 10% HCl acid solution, pocket knife, hand lens, common hardwood dowel (not oak), copper pipe or penny, common steel nail, steel file, plate glass (recommend ¼" thick)

**Note:** None of the above materials will be supplied by the Department to take the exam. Failure to bring any of the above materials will result in failure of the exam, and will require the candidate to follow re-examination procedures.

### 3.3.4 Examination Rules

- Communication with any other applicant or source (including cell phone or texting) during the examination is prohibited, except with the DGE or their designate. Prohibited communications will result in immediate failure of the exam.
- Required examination references, publications or other required items will not be supplied at the test site. Failure to bring required examination materials will result in their forfeit of the exam. These candidates must reapply to take the exam.
- Sharing of examination items or references between applicants is not permitted.
- Examination materials or answers may not be removed from the test site in any form.

### 3.3.5 Pass/Fail Requirements

- A procedural flowchart for Pass/Fail requirements is presented in [Figure 3](#).
- To be placed on the statewide approved drilling inspectors list, candidates must demonstrate overall aptitude by meeting minimum scoring requirements for both the Written and Sample Identification portions of the examination
- For Part-1 of the exam, a minimum score of **75%** is required to pass.
- For Part-2 of the exam, a minimum **5** correct responses out of a total of **6** are required. If less than five of the questions are completed successfully, the candidate fails the entire exam, regardless of the overall exam score.
- For Part-3 of the exam, a minimum score of 75% is required to pass. At the discretion of the CGE or DGE, partial credit can be given for any sample identification description.
- If a passing score is not achieved in any one part of the exam, the candidate must retake the entire exam (Part-1, Part-2, and Part-3).

### 3.3.6 Failure of Examinations

The following requirements must be completed prior to re-application for drill inspector.

- Work on three documented drilling inspection projects. At least one of the three projects must be on a Department project as an apprentice. Apprenticeship is at no additional cost to the Department. Total footage requirements are as defined in [Chapter 3.1](#).

### 3.3.7 Examination Results

- The DGE shall inform both the candidate and the CGE of examination results in writing (email is acceptable) within three working days of the exam.
- The [Drilling Inspector Post-Examination Checklist](#) shall be completed to indicate any areas of weakness exhibited on the exam. The list shall be completed by the DGE whether the candidate passes or fails. This list should be reviewed by the candidate in preparation for inspection duties or reapplication, if necessary.

The CGE will mail a certificate to a candidate that successfully passes the certification exam. The certification number and contact information of the newly-certified inspector

will be included on the current listing of all PennDOT certified drilling inspectors maintained by the CGE's office.

### 3.3.8 List of PennDOT-Certified Drilling Inspectors

A current listing of all PennDOT Certified Drilling Inspectors is maintained by the CGE's office and is accessible on-line at:

[\*Certified Drilling Inspectors\*](#)

Once certified, the drilling inspector is responsible to promptly notify the CGE's office of any needed update of their personal contact information. See the on-line certified inspectors list for contact information in order to report personal contact information changes. The Department will make periodic (bi-annual) notifications via email to all certified inspectors. Certified inspectors are required to respond within thirty days from the email date. Any inspector that cannot be contacted will be removed from the certification list and placed on the probationary list for a period of one year before being decertified. Only those inspectors that are listed on the on-line certification list are considered to hold a current and valid certification.

# DRILLING INSPECTOR POST-EXAMINATION CHECKLIST

PennDOT Innovation & Support Services Division – Geotechnical Section

Exam Applicant Name: .....

Based on your exam results, the following subject area(s) may require your additional review:

### WRITTEN EXAMINATIONS (PART-1 and PART-2):

- Colluvial, Alluvial, and Residual soils
- Purpose of a 24-hr. water reading
- Dealing with suspicious or hazardous material; bag samples, test pits
- Sedimentary, Igneous, and Metamorphic rocks
- Standard Penetration Testing (SPT); split-barrel sampling
- Publication 213*, temporary traffic control guidelines
- Publication 222**, drilling specifications and guidelines
- Plasticity test, Torvane test, Pocket Penetrometer test, acid test
- Rock coring
- Site restoration and clean-up
- Piezometer, Inclinometer, grouting of boreholes
- DGE final authority concerning drilling decisions
- Undisturbed soil sampling (Thin-walled tube)
- Inspector's duties
- Driller's duties
- Required on-site traffic-control reference items
- Required safety attire and equipment
- Required distance of drill rig from overhead lines
- Measurement and calculation of recovery
- Measurement and calculation of RQD
- Other .....
- Other .....

### SAMPLE IDENTIFICATION EXAMINATION (PART-3):

- Identifying basic rock types
- Identifying rock descriptors (carbonate, slickenside, fissility, etc.)
- Soil description and identification
- Other .....
- Other .....

ADDITIONAL COMMENTS OR NOTES: .....

.....  
.....  
.....

### 3.4 DUTIES OF INSPECTION FORCES

The general duties of a drilling inspector include:

- Verify the testing and sampling procedures are performed correctly.
- Ensure the depth of each sample is known and recorded correctly.
- Describe soil and rock samples correctly.

#### 3.4.1 Prior To the Start of Drilling Operations

The PGM is responsible to notify the DGE of the planned start-date of drilling and to forward to the DGE a copy of the Drilling Contractor's submission providing applicable information required by [Sections 104.01, 104.03, 104.08, and 104.09](#).

The inspector is responsible to:

- Have a copy of the "Intent to Enter" letter available at the site and confirm that arrangements for property access were made. Document all information that was discussed between the property owner(s) and the driller. Be prepared to provide the Department with written documentation of this contact.
- Determine the apparent adequacy of the Drilling Contractor's drilling equipment. If any equipment appears faulty or questionable, the inspector should discuss this with the driller and the PGM/PGE, if warranted.
- Determine the adequacy of the Drilling Contractor's equipment for temporary maintenance and protection of traffic.
- Determine if the Drilling Contractor has contacted all utilities and that all utilities are clearly marked in the field.
- Visually confirm all plan locations of borings, test pits and instruments are clearly staked according to plans or instructions given by PGE. Notify the PGE if any discrepancies are found or suspected. Note if any locations appear to be within 100 ft. of any domestic water supply wells or spring boxes and if so, confirm that the contractor has the proper provisions as specified in [Section 219](#).
- Conduct field view of the site and understand what work is to be done. Note any environmental sensitive areas and if any temporary traffic control will be needed.
- Study all documents, reports, and any other previous borings that were done at the site or nearby sites.
- Have a list of emergency phone numbers, hospitals, and maps available at the site.
- Study the drilling contract and all attachments, as applicable.
- Be familiar with the subsurface investigation plan.
- Understand the information to be gathered, its purpose in design and use for lab testing.

#### 3.4.2 During Drilling Operations

The PGM/PGE is responsible to keep the DGE promptly informed of any issues or problems.

The inspector's responsibilities include:

- Complete the [Drilling Inspector's Daily Report](#).
- Keep daily drilling quantity records/summaries, and review quantities with the driller each day work is completed.

- Label all samples and core boxes and log all test borings and test pits in accordance with [Chapter 3.6](#).
- Ensure that the operations are performed according to the terms of the work and all relevant publications and guidelines. Promptly report and document in detail any unexpected findings or problems to the PGM/PGE.
- Be attentive and follow safe work practices at all times. During field work, wear appropriate safety apparel at all times including; hard hat, high-visibility safety vest or shirt, and leather work boots.
- Document instrument installations, including, but not limited to, types, locations, installation procedures and any problems encountered during installation.
- Record any instructions given to the contractor including date, time, to whom, and the driller's response and whether or not actual work was performed as per the instructions.
- Maintain any records required by this publication or the DGE.
- Record in detail any events or situations that may later result in litigation or a claim against the Department.
- Confirm and have the contractor make necessary field adjustments of the work zone traffic control set-up using PennDOT [Publication 213](#), Temporary Traffic Control Guidelines.
- Act as a responsible representative of the Department at all times.
- Document and assist to resolve any issues with the driller, motorists, and/or property owners during field operations. Communicate clearly. Be professional and courteous.
- Have the following available at the jobsite:
  - All required technical references ([Chapter 3.1](#), 3<sup>rd</sup> bullet) and other pertinent geologic references
  - Driver's license
  - Black pen, pencil, eraser, calculator
  - 10% HCl acid solution
  - Pocket knife, hand lens, common hardwood dowel (not oak), copper pipe or penny, common steel nail, steel file,
  - PennDOT Drilling Inspector Certification Number

### 3.4.3 Drilling Inspector's Daily Report

Complete the [Drilling Inspector's Daily Report](#). The inspector will maintain and update daily a record for each drill rig, of the work completed including footage of drilling in soil and rock. The record will document the quantity of each pay item listed in the Form of Proposal completed during the day. The record will also indicate, for each day, the driller's name, the helper's name and the hours worked. The record must document any verbal directives and the resulting corrective action performed by the driller. The record must note in detail any unusual events or conditions (e.g., petroleum odors or saturation thereof, damaging underground utilities, any situations that may later result in litigation or a claim against the Department) and their resolution and/or action taken. Failure to supply proper documentation may result in the Department taking necessary corrective actions upon the Inspector, including De-Certification. The Inspector and the Driller shall review and sign the record daily to indicate agreement of the documentation and to indicate agreement with the quantities listed as complete. Also, note any disagreement with either the documentation or the listed quantities. One copy of the record will be made available to the PGM/PGE at the end of each work day, or weekly if agreed to by the PGM/PGE.

## 3.5 EVALUATION OF DRILLING INSPECTORS

### 3.5.1 Evaluation Procedure

All drilling inspectors should be formally evaluated by the DGE (or a qualified representative of the DGE staff) on every project for performance of inspection duties using the *Drilling Inspector Performance Evaluation*. Evaluations can be based on delivered product. For better quality assurance, evaluations should be based on an actual site visit during the drilling operations, if possible. If an Inspector is removed during operations due to unacceptable performance, an Inspector evaluation form must be completed by the DGE as indicated in *Chapter 3.1*. A copy of all completed performance evaluation forms shall be forwarded to the CGE.

### 3.5.2 Recommended Actions by the DGE

Item number six of the Inspector evaluation form requires the DGE to recommend one of the following based on the inspector's performance.

- **Certification** - Inspector performance is 'Satisfactory' to 'Excellent' and individual should remain a statewide certified inspector.
- **Probationary Certification** - An overall performance of 'Unsatisfactory' can result in a certified inspector to be placed on probationary certification status. An Inspector placed on probationary certification remains on the statewide approved list; however, an additional documented 'Unsatisfactory' or 'Unacceptable' performance during probation may result in de-certification. The minimum duration of probationary certification is one year. In addition, the Inspector must inspect at least one project and receive a 'Satisfactory' or better performance rating to be removed from probationary status.
- **De-Certification** - The CGE may revoke an Inspector's certification if blatantly uncooperative, unsafe, or incompetent performance is thoroughly documented and receives an 'Unacceptable' rating. De-certification may also occur if the Inspector receives an 'Unsatisfactory' or 'Unacceptable' rating while on probationary status. The individual may apply for re-certification after a one year waiting period and the performance issue(s) prompting the de-certification have been resolved to the satisfaction of the CGE.

The CGE may take independent actions if the situation warrants. Prior to a CGE making a final determination of 'Probationary Certification' or 'De-Certification,' the Inspector shall be provided with written notice of the CGE's intent to make such a determination and be provided with an opportunity to meet with the CGE and present any mitigating evidence or facts relevant to the CGE's determination. The CGE's written determination shall be considered the Department's final determination and shall be appealable to the Secretary, in accordance with the Administrative Agency Law, 2 Pa. C.S. § 101 seq.

The CGE will promptly notify all DGE's of any Inspector who has been placed on probationary status, or who has been de-certified.

# DRILLING INSPECTOR PERFORMANCE EVALUATION

Inspector Name: ..... Certification No.: .....

PGE Name: ..... Company Name: .....

District: ..... SR: ..... Sec: ..... County: .....

1) Have all daily Inspector reports been properly completed, signed and submitted?  Yes  No

If No, describe deficiency: .....

.....

2) Are logs properly prepared and complete?  Yes  No

If No, briefly describe deficiency: .....

.....

3) Do the daily inspection reports support the driller performance evaluation?  Yes  No

If No, briefly describe deficiency: .....

.....

4) Has the Inspector satisfactorily completed inspection duties?  Yes  No

If No, briefly describe deficiency: .....

.....

5) How would you rate the overall performance of the Inspector (check the most appropriate box)?

At a minimum, consider if the Inspector demonstrated these qualities: • cooperative, conscientious • technically competent • well organized • anticipates project needs • understands purpose of work performed	Excellent		Very Good		Satisfactory		Unsatisfactory		Unacceptable	
	10	9	8	7	6	5	4	3	2	1

6) Recommended Action:  Certification  Probationary Certification  De-Certification

### 3.6 FIELD LOGS & FINAL ENGINEER’S LOGS

The Inspector is required to log all borings in the field, observing and recording information as the boring is being completed. The Inspector’s Field Logs are to be submitted daily or weekly as required by the PGM/PGE or DGE. Log a boring by recording the field observations needed to complete the standard format “*Final Engineer’s Log*”, including information identified in [Chapter 3.6.1](#) and [Chapter 3.6.2](#). Log a test pit by recording the information required on the final standard format “*Engineer’s Test Pit Log*” including the applicable information identified in [Chapter 3.6.1](#) and [Chapter 3.6.2](#). Describe soil samples and rock core samples in conformance with the requirements of this publication, and record on standard hand-written field logs or PDA-generated field logs.

#### 3.6.1 Information required on the Inspector’s Field Log

- Project identification, including ECMS#, state route or local designation, section, district, and county
- Identification number for the test boring or test pit. Use the following acceptable naming conventions:

Type of Boring	Abbreviation
Roadway/Other Boring	R
Structure Boring	S
Sign Structure	SS
Noise Wall	NW
Retaining Wall/MSE Boring	W
Test Pit	TP

Table 3 - Boring Naming Convention

Note: For multiple borings of a structure or wall, include collated numbering following each abbreviation (i.e., S1-01, S1-02, S1-03, S2-01, W1-01, W1-02, W1-03, W2-01).

- Original ground elevation at the top of the test boring to the nearest 0.1 foot
- Date and time at which the boring was started and completed as well as the date and time the boring was grouted
- Name of the drilling company, drill operator, and type of drill rig used
- Drilling Inspector name and PennDOT certification number (for District and Consultant inspection)
- Location of test boring relative to project reference line (e.g., segment/offset, station/offset from centerline) or other suitable references given by the PGE. Include the geodetic coordinates or state plane coordinates, whichever is known
- Drilling method used to advance the boring in soil. Use the following hole types:

Hole Type	
Auger with Shelby Tube	Interval SPT - Rock Core
Continuous SPT	Auger
Continuous SPT - Rock Core	Auger - Undisturbed Sample
Interval SPT	Auger - Rock Core

Table 4 - Type of hole to Advance the Boring in Soil

- SPT hammer type (automatic, safety, or donut). Record the measured hammer efficiency rating (ER) and calibration date, if known
- Casing type, diameter, and depth (if used)
- Size of hammer and free fall used to advance casing (if used)
- Rock coring method used to advance the boring in rock. Include type and size of core barrel. Include the condition of the core bit, if known. Use the following rock coring methods:

Rock Coring Method	
Dble. Tube Wire Ln - HQ	Dble. Tube Split Inner Brl - HQ
Dble. Tube Wire Ln - HX	Dble. Tube Split Inner Brl - HX
Dble. Tube Wire Ln - NQ	Dble. Tube Split Inner Brl - NQ
Dble. Tube Wire Ln - NX	Dble. Tube Split Inner Brl - NX

Table 5 - Type of Rock Coring Method

**Note:** Refer to [Section 204](#) for approval for alternate rock coring methods.

- Change in drilling method and reasons for such changes
- Depth, type, number, relative moisture content and recovery of each soil sample
- Hammer blows to advance split-barrel sampler 6 inches. If sampler advances less than 6 inches after 50 blows, record the depth of penetration for 50 blows (e.g., 50 / 0.2 ft.)
- Unconfined compressive strength of fine-grained cohesive soils based on Pocket Penetrometer and/or Torvane tests
- Depth, type, number, total recovery length of core recovered, and Rock Quality Designation (RQD) recovery length for each run of rock core
- Description and identification of each soil and rock stratum as indicated in [Chapter 3.6.3](#), [Chapter 3.6.4](#), and [Chapter 3.6.5](#)
- Depth to top and bottom of profile for each distinctive interval, layer or horizon in soil, rock, and anomalous zones
- Depth to groundwater level, measured immediately after completion of drilling (0-hour), and 24-hours after completion of drilling. Determine using an electronic water level meter.
- Depths at which field tests are made and results of the tests (if available)
- Difficulties in drilling such as obstructions, caving, boulders, rising of sand into bottom of boring, etc. If there are potential or likely causes for unexpected drilling results (e.g., lower than anticipated recovery, tool advancement problems, no recovery), indicate any potential causes that exist and may result in the observed conditions
- Depth of loss and return of circulating water. Also note any increase in usage of drilling water

### 3.6.2 Information required on the Final Engineer's Log

The Final Engineer's Log must be in the appropriate format (see [Final Engineer's Log](#)). The final log is comprised mostly of the information taken from the Inspector's log, but

may also contain appropriate information from the laboratory testing results and the Driller's log as determined by the PGM or PGE of record.

All Engineers' Logs must be sealed by a Professional Engineer (P.E.) or Professional Geologist (P.G.) currently licensed in the Commonwealth of Pennsylvania. The log must be sealed by the individual checking and approving the log. The purpose of the seal is to attest to the accuracy of information provided on the log as can be verified by inspection of core boxes and review of information provided by the drilling inspector. Since much of the information is collected through visual observation and field diagnostic procedures, it is not intended to imply sealing of the log assures 100 percent accuracy of the information presented. Rather, the seal attests the information on the log is consistent with materials and information contained in the core boxes representing the specific bore hole, and the reasonable accuracy of material (soil and rock) descriptions and identifications. The term reasonable accuracy reflects the realities of the variable nature of subsurface materials, the range of characteristics within specific soil and rock material types, the limitations of field identifications/classifications, and the inherent subjectivity in documenting field observations.

In addition to the information recorded on the Inspector's Field Log, the Final Engineer's Log is to include the following:

- Depth and Elevation at top of rock to the nearest 0.1 ft., if applicable
- Coordinates of the boring: The Inspector is to record the horizontal coordinate of each boring. This information will be provided by the project designer and will be in both of the following formats:

State Plane Coordinates:    \_\_\_\_\_ . \_\_\_ N            \_\_\_\_\_ . \_\_\_ E

Geodetic Coordinates:    N \_\_° \_\_' \_\_. \_\_"    W \_\_° \_\_' \_\_. \_\_"

Because this information is commonly provided as Geodetic Coordinates (latitude and longitude), the links below will aid in the conversion of the Geodetic Coordinates into State Plane Coordinates (northing and easting). Coordinates of all borings are to be provided by the project designer and must be recorded on the final boring logs. This is required to enable standardized electronic data entry and also to facilitate the long-term retracement of boring locations.

[NOAA State Plane Coordinate Utilities Online](#)

[NOAA Geodetic Software](#)

[US Army Corps of Engineers Corpscon Software](#)

- Graphic column that gives a visual depiction of different soil and rock types encountered in the boring. This shall use the patterns shown in [\*Figure 15\*](#), [\*Figure 16\*](#), [\*Figure 17\*](#), and also accent shading shown in [\*Table 34\*](#) to assist in the clarity of the graphics.
- A graphical depiction of sample RQD percentage, SPT (N) value, soil recovery (percent), and rock recovery (percent) versus depth of boring
- Indicate when laboratory testing has been performed by using capital letters to designate the laboratory AASHTO/USCS soil classification. The laboratory classification must be applied to all adjacent materials (directly above and below the laboratory sample depth) that are equivalent (visually, textually, and behaviorally the same). For example, lab classified material from 12.0 – 13.5 ft. must be applied to entire soil strata, 10.5 – 15 ft. if the adjacent materials are equivalent. Any other soil

strata in the boring that are not adjacent, but are equivalent (visually, textually, and behaviorally the same) to the laboratory classified soil strata, must be revised to the appropriate visual classification. A sample boring of a field and laboratory classification is provided in [Figure 4](#). The field classification of the soil stratum from 6.0 – 9.0 ft. is visually identical to the soil stratum from 10.5 – 15.0 ft. The laboratory sample was collected from 12.0 - 13.5 ft. and classified as A-4. The original field classification of the soil stratum from 6.0 – 9.0 ft. must be revised to the appropriate visual classification (in this case, a-4).

Figure 4 - Field Classification Corrections based on Laboratory Testing Results

- **SPT Hammer Efficiency.** SPT Hammer energy efficiency can be measured as specified in [ASTM D4633, Standard Test Method for Energy Measurement for Dynamic Penetrometers](#). The Department requires the drilling contractor to provide measured hammer efficiency ( $ER_m$ ) values for Donut hammers. The Department is currently not requiring measured  $ER_m$  values for Automatic hammers or Safety hammers; however, this information is to be recorded on the log if available from the driller. If actual calibration data is not available, an assumed hammer efficiency value ( $ER_a$ ) will be recorded on the Final Engineer's Log and noted as such. The corrected N-value will be calculated and recorded on the Final Engineer's Log using the following equation:

$$N_{60} = \frac{ER * N_{unc}}{0.60}$$

Where:  $N_{60}$  = corrected N-value (rounded down to the nearest whole number)  
 $ER$  = hammer efficiency (measured or assumed – see [Table 6](#) for assumed values)  
 $N_{unc}$  = uncorrected N-value, number of hammer blows on the bottom 12 inches of penetration

Assumed hammer efficiency values ( $ER_a$ ) based on hammer type will be according to [Table 6](#). Note that for an assumed Safety hammer efficiency, no correction is necessary since the correction equation yields a value of 1.0.

Hammer Type	Assumed Efficiency (ER <sub>a</sub> )
Automatic	0.80
Safety	0.60
Donut	0.45

Table 6 - Assumed Hammer Efficiency Based on Hammer Type  
Reference: CALTRANS 59-910683 Drill Rig Hammer Evaluation

### 3.6.3 Standard Descriptors for Soil Samples

Soil is defined as unconsolidated material derived from physical, chemical and biological degradation of rock that can normally be excavated by manual methods alone and that can be satisfactorily penetrated and sampled by standard soil boring and sampling techniques. The Inspector shall describe the applicable characteristics of texture, state, moisture, structure, gradation, particle shape, plasticity, color, and depositional environment for each soil stratum encountered using the identification procedure described in this section. This procedure is adapted from the Burmister Soil Description System, and shall be used to develop the written descriptions on the log, as well as aid in estimating the USCS (Unified) and AASHTO visual classifications recorded on the log. The field description and classifications are meant to supplement the more formal laboratory AASHTO soil classification tests that are typically directed by the PGM/PGE at a later time. Field estimations of USCS and AASHTO classifications are to be recorded in lower-case lettering (e.g., sm, a-2-4), while laboratory classifications are to be recorded in capital lettering (e.g., SM, A-2-4). A complete full-word description is to be written in the description column. In cases where space is limited in the field, the abbreviations shown in this section may be useful to record the soil descriptions. Care must be taken that all abbreviated descriptions remain clear and easily understood. Use descriptive abbreviations only when necessary. Guidelines for the determination and formatting of soil descriptions are as follows:

**Sequence of Description:** Record the following description sequence on the Field and Final Engineer's Log to describe soil stratification:

- (a) Soil Constituents and Fractions ([Table 7 and Table 8](#))
- (b) Soil Composition Modifier (if applicable) ([Table 10](#))
- (c) Soil State: Consistency or Relative Density
  1. Consistency (fine-grained soils) ([Table 11](#))
  2. Relative Density (coarse-grained/granular soils) ([Table 12](#))
- (d) Soil Moisture Range ([Table 13](#))
- (e) Soil Structure (if applicable) ([Table 14](#))
- (f) Soil Gradation Description ([Table 15](#))
- (g) Soil Particle Shape (coarse-grained/granular soils) ([Table 16](#))
- (h) Soil Plasticity (fine-grained soils) ([Table 9](#))
- (i) Soil Color Range (modifier and hue as applicable) ([Table 17, Table 18, and Table 19](#))
- (j) Depositional Environment (if applicable) ([Table 20](#))
- (k) Visual Classification (AASHTO and USCS) ([Appendix D](#))
- (l) General Boring Remarks
- (m) General Soil Descriptions

Each primary descriptor is defined in detail in the following sub-sections. The sequence is followed as shown in the [examples](#) at the end of this section, however depending upon the specific material and type, some description elements may have multiple parts (e.g., soil constituents) and some elements may only apply to certain material types (e.g., plasticity).

(a) **Soil Constituents and Fractions:** List the primary constituent(s) name, then any secondary constituent(s) in order of decreasing relative amount using fraction descriptor. Constituents are visually identified following [Table 7](#). Please note that this is a soil [description](#), not a soil [classification](#). Particle size breakdown follows AASHTO classification system. When descriptions are written, capitalize the entire primary constituent for coarse-grained soil (see [Table 7](#)), and for fine-grained soil (see [Table 9](#)). Capitalize the first letter of secondary constituents. Do not capitalize any other standard descriptors. Place any supplemental descriptor(s) within parentheses, and locate in the description sequence where most appropriate, usually following the standard descriptors.

1. **Coarse-grained Constituents:** Sand-size and larger particles are primarily identified according to [Table 7](#). Additional information for fine-grained constituents can be found in [Table 9](#). To visually assess grain size, refer to [Figure 5](#).

Constituent	Primary Descriptor	Grain Sizes	
		inches	sieve
Coarse-Grained	Boulders	≥ 12	-
	Cobbles	≤ 12 to > 3	-
	Coarse Gravel	≤ 3 to > 1	≤ 3 to > 1 inches
	Medium Gravel	≤ 1 to > 3/8	≤ 1 to > 3/8 inches
	Fine Gravel	≤ 3/8 to > 5/64	≤ 3/8 inch to > #10
	Coarse Sand	-	≤ #10 to > #40
	Fine Sand	-	≤ #40 to > #200
Fine-Grained	Silt	-	≤ #200
	Clay	-	≤ #200

Table 7 - Descriptors for Grain Material based on Grain Size

2. **Fine-grained Constituents:** Identify the fine-grained constituents by observing their behavior, since particle sizes are too small to observe with the unaided eye. Silt particles are sized between 0.075 mm and 0.002 mm. Clay particles are sized below 0.002 mm. Use [Table 9](#) to aid in identifying and estimating the relative amounts of fine-grained constituents. Materials that exhibit more plastic behavior contain high proportions of clay, while lower plastic materials would have more silt. Fine-grained materials that behave as exhibited and have the characteristics of perfectly, non-plastic soil are identified as silts, while very high plastic materials that have a slick or smooth texture are identified as clays. Fine-grained materials that feel both gritty and slippery, or feel gritty but exhibit plastic behavior (e.g., are highly moldable, sticky, can be rolled into a thin ribbon) are a combination of silt and clay. The relative amount of silt and clay is estimated based upon an assessment of the various physical characteristics indicated in [Table 9](#). Diagnostic methods for fine-grained soils are described in [Appendix K-3](#).

3. **Other Constituents:** It is appropriate to describe some materials more accurately by a specific name, such as “PEAT,” “TOPSOIL,” “ORGANICS,” “SHELL

FRAGMENTS,” “SLAG,” etc. When these materials are encountered, address them in the *General Soil Description* Section. Additionally, the soil type “MECHANICALLY BROKEN ROCK” (BR) may be encountered which shall describe rock broken up by the impact from SPT sampling or other mechanical means. When mechanically broken rock is designated as a soil type, no other primary or secondary constituents should be included, regardless of particle size. It is intended that mechanically broken rock describe a condition when SPT is conducted in zones transitioning into bedrock where lower quality rock is encountered. It is not desired to describe this material in the condition it is retrieved in the split-barrel sampler, but rather to represent the source of the material so that misleading representations and conclusions as to the nature of the material do not result.

Figure 5 - Visual Estimation of Grain Sizes

**4. Relative Amounts of Each Constituent:** After identifying the various soil constituents in the sample, the relative amount of each constituent must be estimated. This is determined visually (in conjunction with the simple field tests). Use *Figure 6* to assist in the visual determination of the amount of secondary constituents (to the nearest 5%) then select the appropriate “relative amount” descriptor to describe and record, as shown in *Table 8*. Please note that the main constituents may only be joined by “and”. Additional fractional amounts will be included by adding “trace”, “little”, and “some” in front of the soil fraction depending on their relative amounts.

Figure 6 - Visual Estimation of Coarse Fragments  
(modified from Terry and Chilingar, 1955)

Descriptor (Abbrev.)	Relative Amount (based on total sample volume)
Trace (Tr)	Content < 10%
Little (Lt)	Content $\geq 10$ to < 20%
Some (Sm)	Content $\geq 20$ to < 35%
And (An)	Content $\geq 35\%$

Table 8 - Soil Fraction Descriptors

Because visual observation and field diagnostic procedures limit the accuracy to which relative amounts of fine grained soil constituents are present in a sample (silt versus clay fractions), certain field visual descriptions of soil are not acceptable. For example, a soil description of “Silt, some Sand, trace Clay” is not a reasonable or acceptable description. This description indicates the material contains less than 10 percent clay, but greater than 35 percent silt. It is not possible to visually discern clay versus silt particles in such a wide variant, and field diagnostic procedures do not permit a refined assessment of clay and silt content. Therefore, it is neither practical nor possible to define such large differences (less than 10 percent to greater than 35 percent) in relative amounts of silt and clay content in a soil sample. Some additional incorrect examples include: “Clay, little silt, trace sand;” “Silt, little clay, trace sand;” “Sand and Silt, trace clay;” or any description where the relative amounts of silt and clay are substantial (more than one fraction descriptor range apart).

To further clarify, estimated relative amounts of silt and clay (if present) should still be provided, but must be described in relative amounts that are viable based on the limits of visual, textual, and field diagnostic procedures. Descriptions such as, but

not limited to, "Silt and Clay, little sand," "Clay, some silt, little sand," "Sand, some silt, little clay," "Sand, little silt, trace clay," are all potential examples of descriptions based on limitations of field diagnostic procedures. Descriptions of simply "Silt" or "Clay," exclusive of the other, and with or without coarse grain constituents, are also acceptable for visual description if the fine grained portion of the sample exhibits extreme non-plastic (silt) or extreme plastic (clay) behavior.

A jar test (which is a semi-quantitative and inexact procedure) can be used to help quantify relative amounts of coarse and fine grained materials. Conduct the test by filling a standard glass sample jar 1/3 full of a representative sample of soil. Fill the jar with water until it 2/3 full. Seal the jar and shake vigorously until the sediments break apart and are separated into individual particles. Place the jar on a flat surface and leave undisturbed to allow the sediments to settle naturally. Coarse-grain sediments will fall out of suspension first, followed by fine sands, silts, and clay sized particles. This method can further enhance estimation of relative amounts of soil particle size constituents; however, caution should be used because of the following limitations:

- Finer constituents would be deposited in a more flocculent consistency thereby making it appear that they constitute a greater percentage of the sample than they actually do.
- This method will not permit a highly accurate estimation of relative amounts of fine silts and clays given that the upper zone (where the fine silts and clays settle) of the settled sample does not permit visual discerning between the two materials. The same can be said for very fine sands and coarser silts.

Again, noting the limitations indicated above, caution must be observed in using this method to estimate grain size distribution. Also note that it is not practical to conduct a jar test on every sample due to either restriction in time or the need for a representative sample to conduct laboratory testing.

Fine-Grained Constituent	Plasticity Description/ Abbreviation	Estimated Plasticity Index (PI)	Smallest Thread Diameter	Physical Behavior							
				Thread Characteristics	Workability to reach Plastic Limit	Moldability	Dilatancy	Adhesion	Appearance and or Texture	Drying Time	Dry Residue
Predominately Silt ↑ More Silt	Non-plastic (Np)	0% - 2%	Ball cracks	Dries rapidly when rolling; a 1/8-inch thread cannot be rolled at any water content	Not applicable, thread cannot be rolled	Does not mold well	Moist soil ball sheds water when shaken giving a glossy appearance	Non-sticky	Rough or gritty texture, dull smear btw. thumb and forefinger	Rapid	Very powdery residue when dry
	Low Plastic Fines (Lp)	3% - 10%	1/4 to 1/8 -inch	Feels powdery when drying out during rolling; The thread can barely be rolled; the thread is weak and soft	Thread can barely be rolled	Moldable under small range of water content	Moist soil ball retains water or sheds water slowly when shaken	Slightly sticky	Rough to smooth texture, dull smear btw. thumb and forefinger	Moderate	Powdery residue when dry
Predominately Clay ↓ More Clay	Medium Plastic Fines (Mp)	>10% - 20%	1/16 - inch	The thread cannot be rerolled after reaching plastic limit; the thread has medium stiffness	Short working time to reach plastic limit	Very moldable		Moist soil ball retains water when shaken	Moderately sticky	Smooth texture, dull to shiny smear btw. thumb and forefinger	Slow
	High Plastic Fines (Hp)	>20%	1/32 - inch	The thread can be rerolled after reaching the plastic limit; the thread has very high stiffness	Very long working time to reach plastic limit	Very moldable over a wide range of water content	Very sticky		Slick texture, very shiny or waxy appearance	Very slow	Very little powdery residue when dry

Table 9 - Descriptors for Fine-Grained Materials Based on Behavior  
(modified from D.M. Burmister, Suggested Methods for Identification of Soils, 1970)  
(modified from Soils and Foundations Reference Manual –Volume I, FHWA-NHI-06-088, 2006)

- (b) **Soil Composition Modifier:** Special modifiers are used for some soils in which particular combinations of texture and mineralogy require distinct emphasis. If applicable, describe the soil composition according to [Table 10](#).

Descriptor	Abbreviation
Contains ash and cinders	Ash
Contains bituminous concrete fragments	Bcf
Contains brick fragments	Cbf
Contains cement concrete fragments	Ccf
Contains organics	Org
Contains rock fragments	Rfg
Contains slag	Slg
Micaceous	Mic

Table 10 - Composition Modifiers

- (c) **Soil State: Consistency or Relative Density:** The description of the relative density or soil consistency is based largely on the penetration resistance properties, as follows:

1. **Consistency:** Describe the consistency of cohesive, fine-grained soils according to the [Table 11](#) based on SPT N-values, or estimated unconfined compressive strength from either pocket penetrometer tests or torvane tests. On the Final Engineer's Log, the descriptor for consistency must be based upon pocket penetrometer or torvane tests when available, or the corrected ( $N_{60}$ ) N-value when pocket penetrometer or torvane tests are unavailable. Refer to [Appendix I](#) for corrected ( $N_{60}$ ) N-values for various hammer types at assumed efficiencies.

The **pocket penetrometer** test is conducted to estimate the unconfined compressive strength of a cohesive soil. Conduct the test on the sample within the split-barrel and according to the pocket penetrometer manufacturer's directions.

The test is conducted using the following general instructions:

- i. To begin the test, remove protective cap and push the indicator ring so that it reads zero (0).
- ii. Slowly insert piston at a constant rate until engraved mark on the side of the piston (approximately  $\frac{1}{4}$  inch travel) is level with soil.
- iii. Observe and record the reading (typically in tsf). If the specific device used registers in different units, the observed reading must be converted to tsf for the Final Engineer's Log. Repeat.
- iv. For weak soils, use 1 inch adaptor foot, multiply reading by 0.0625.

The **torvane** test is conducted to estimate the undrained shear strength of a cohesive soil. Conduct the test according to the torvane manufacturer's directions.

The test is conducted using the following general instructions:

- i. To begin the test, push the indicator to the zero stop.
- ii. Select a reasonably flat surface, extending well beyond the vane size used. It is important that the area tested is not a locally raised area. The test location must be well supported by the surrounding soil. The soil surrounding the test area must be of the same general condition and consistency of the test area.
- iii. Use a larger torvane for weaker soils and a smaller vane size as the soil stiffens. Multiple vane sizes should be used to compare results.
- iv. Press pocket vane shear tester into soil to depth of blade; maintain constant vertical pressure while turning knob clockwise at a rate to develop failure within 5 to 10 seconds.

- v. After failure develops, release remaining spring tension slowly. Pointer will indicate maximum shear value until manually reset.

Since the undrained shear strength of a cohesive soil ( $c_u$ ) is related to the unconfined compressive strength of a cohesive soil ( $q_u$ ),  $c_u = 0.5 q_u$ , either test can be used to help validate estimates of unconfined compressive strength to SPT N-values.

Descriptor	Abbreviation	Typical Consistency	Est. Unconfined Compressive Strength		SPT-N <sub>60</sub> * (blows per ft.)
			Tons/Sq. Ft.	(MPa)	
Very Soft	Vsf	Extruded between your fingers when squeezed	≤ 0.25	(≤ 0.025)	≤2
Soft	Sf	Molded by light finger pressure	≥ 0.25 - 0.5	(0.025 - 0.05)	3-4
Medium	Md	Molded by strong finger pressure	> 0.5 – 1.0	(0.05 – 0.1)	5-8
Stiff	St	Readily indented by thumbs but penetrated with great effort	> 1.0 - 2.0	(0.1 – 0.2)	9-15
Very Stiff	Vst	Readily indented by thumbnail	> 2.0 – 4.0	(0.2 – 0.4)	16-30
Hard	Hd	Indented with difficulty by thumbnail	> 4.0	(> 0.4)	≥31

\* **Important Note:** SPT values alone are not a reliable means for estimating Unconfined Compressive Strengths of cohesive soils. Pocket penetrometer or Torvane tests should be performed in the field to assist the Engineer in assessing the strength of cohesive soil deposits.

Table 11 - Consistency of Cohesive Fine-grained Soils  
Reference: Adapted from Soil Mechanics NAVFAC DM-7.1, Page 7.1-17, 1982

- Relative Density:** Describe the relative density of granular soils based on standard penetration resistance from Standard Penetration Tests (SPT), according to [Table 12](#). On the Final Engineer’s Log, the descriptor for relative density must be based upon corrected ( $N_{60}$ ) N-values. Refer to [Appendix I](#) for corrected ( $N_{60}$ ) N-values for various hammer types at assumed efficiencies.

Descriptor	Abbreviation	SPT-N <sub>60</sub> (blows per ft.)
Very Loose	Vls	≤4
Loose	Ls	5-10
Medium Dense	Md	11-30
Dense	Dn	31-50
Very Dense	Vdn	≥50

Table 12 - Relative Density of Granular Coarse-grained Soils  
Reference: Adapted from Penetration Tests and Bearing Capacity of Piles, Meyerhof, 1956

- Soil Moisture Range:** Describe the amount of moisture present in each soil sample using the descriptors and corresponding defined appearance in [Table 13](#). The amount of moisture within a given soil can have a dramatic effect on its engineering properties. Knowing how the moisture content of the soil column varies with depth can be very valuable to site assessment.

Descriptor	Abbreviation	Appearance
Dry	Dr	Absence of moisture, dusty, completely dry to the touch
Damp	Dp	Slight moisture perceptible by touch, fine-grained soils are usually firm, granular soils usually have very little apparent cohesive binding
Moist	Ms	Sample visibly wet but no visible free water, sample cool to the touch, at or above optimum moisture, granular soil may exhibit slight apparent cohesive binding
Wet	Wt	Visible free water throughout sample, usually soil is below water table, contains significantly more moisture than moist soil, fine-grained soils usually soft or very soft, granular soils exhibit no apparent cohesive binding

Table 13 - Standard Moisture Descriptors

- (e) **Soil Structure:** Inspect the soil samples to determine if any of the textural-structural features listed in [Table 14](#) are evident. Record structure descriptors on the logs as applicable.

Descriptor	Abbreviation	Description
Blocky	Bl	Cohesive soil that can be broken down into small angular blocks which resist further breakdown
Fissured	Fi	Soil tends to break along definite planes of fracture with little resistance to fracturing
Heterogeneous	He	Composed of dissimilar parts throughout
Homogeneous	Ho	Similar color and texture throughout
Laminated	La	Alternating very thin layers of varying material or colors with the layers less than ¼" thick
Lensed	Le	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay
Saprolitic	Sa	Soil composed of completely weathered rock that retains the fabric and appearance of the original rock but with only a trace of the original bond strength
Slickensided	Sl	Contains shear planes that appear striated, polished and/or glossy
Stratified	St	Alternating thin layers of varying material or color with layers at least or greater than ¼" thick
Varved	Va	Layered soil having a repetitive structure of contrasting color (often alternating between fine sand and silt or clay), resulting from variations in annual seasonal deposition

Table 14 - Soil Structure Descriptors

Reference: Adapted from [Description and Identification of Soils, ASTM D-2488, and D-653](#)

- (f) **Soil Gradation Description:** Inspect the soil samples to determine the character of the gradation and record descriptor on the log as required. Gradation describes the distribution of different size groups within a soil sample. Refer to [Figure 7](#) for a distribution photograph and [Table 15](#) for a detailed description of soil gradation. **Well graded** sand has all sizes of material present from the No. 10 sieve to the No. 200 sieve. **Poorly graded** sand may be **uniformly graded** or **gap graded**. If soil is uniformly-graded, most of its particles are about the same size. An example of this is a sieve analysis for sand in which the No. 20 sieve size is almost exclusively present. If a soil is gap-graded, at least one particle size is missing. An example of gap-graded sand is one in which a sieve analysis reveals that No. 40 size material is missing while all other sand sizes are present.

Descriptor	Abbreviation	Description
Well Graded	Wg	Having a good distribution of particles sizes
Poorly Graded	Pg	Lacking good representation of particle sizes within the maximum to minimum particle size range of the material. Use this term when the gradation is not well distributed, but sufficiently different from a uniform or gap graded material.
Uniformly Graded	Ug	Particles are nearly all the same size (or fall within a tight range of sizes)
Gap Graded	Gg	Gradation is missing a band or range of particle sizes

Table 15 - Soil Gradation Descriptors

Figure 7 - Soil Gradation Distribution

- (g) **Soil Particle Shape:** Inspect the soil samples to determine the shape of the gravel and coarse sand particles. The description of the particle shape is based largely on the close examination of the individual grains and is only appropriate for coarse-grained soil or more accurately the coarse fraction of a soil. The grain shape affects the stability of the soil because of the increased resistance to displacement that is found in the more irregular particles. According to [Figure 8](#) or based upon the criteria presented in [Figure 9](#), record the descriptor on the log as required using [Table 16](#).

Descriptor	Abbreviation	Description
Angular	An	Particles have irregular shape with crisp angular edges
Sub Angular	Sa	Particles have irregular shape with weathered or rounded angular edges
Sub Rounded	Sr	Particles have an irregular shape with well rounded edges
Rounded	Ro	Particle has a generally smooth rounded shape
Elongated	El	Particle length is more than three times particle width
Flat	Fl	Particle thickness is less than three times particle length and width
Flat and Elongated	Fe	Criteria for both flat and elongated are met

Table 16 - Soil Shape Descriptors

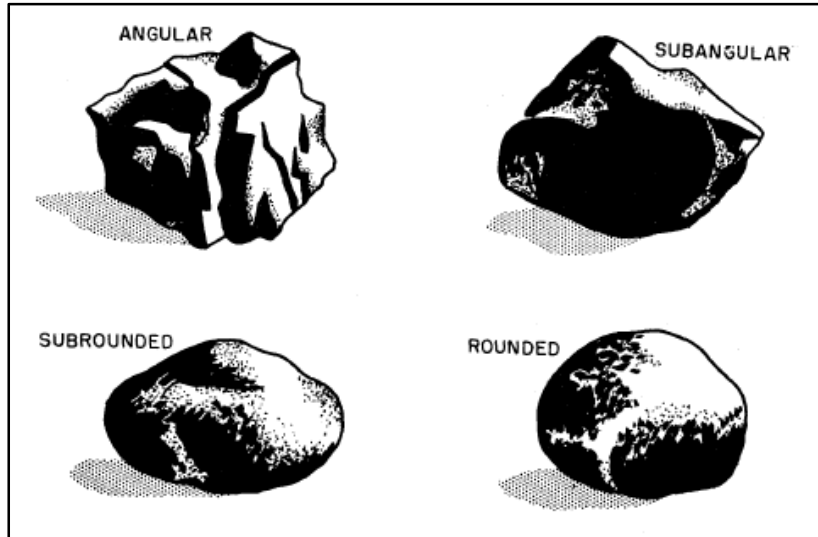

Figure 8 - Soil Particle Grain Shapes – Bulky Grains

Figure 9 - Criteria for Soil Particle Shape

Reference: Adapted from ASTM D 2488, Description and Identification of Soils

- (h) **Soil Plasticity:** Determine the plasticity of fine-grained soils using the field diagnostic procedures described in [Appendix K-3](#). The primary part of information in field classification of silts and clays, is the level of stickiness, or cohesion present in the soil. Use [Table 9](#) to assess the soil plasticity and record the proper descriptor.

- (i) **Soil Color Range:** Describe the basic color of each soil and modify if necessary, by adjectives such as light, dark, mottled, or banded. Use the standard colors shown in [Table 17](#). The table provides the standard colors and their abbreviations for both soil and rock.

Color is useful for correlating strata between borings, and for interpreting the relative amounts of organic matter in the mineral soil for classifying soils. Light soils (e.g., white, light gray, yellow) are typically low in organic matter; medium soils (brown) are moderate in organic matter content; and dark soils (e.g., black, dark brown, dark red) are often high in organics.

Standard Soil and Rock Colors and Abbreviations							
Black	Bk	Blue	Bu	Brown	Bn	Gray	Ga
Green	Gn	Olive	Ol	Orange	Or	Pink	Pk
Purple	Pr	Red	Rd	Silver	Sv	Tan	Tn
		White	Wh	Yellow	Yl		

Table 17 - Standard Color Descriptors

In addition to a basic color, there can be variations in color that further help delineate, describe, identify and correlate soil types. These variations are covered with two additional color descriptors: hue and color modifier. The hue helps further define the color of a soil sample by allowing the description of a secondary color description that better defines the color of a soil sample that is not a pure one color material, or the mineralogy provides a mix of colors. Separate the hue from the color with a hyphen. The color modifier permits further color definition in terms of the shade (lightness or darkness of a color) and color structure (mottled or banded). Mottling is the appearance of uneven spots of a distinctly different color or shade, while banding indicates distinct, repeating, changes in color, usually the result of some regular depositional variation. [Table 18](#) provides the standard soil and rock hues used to further define the color of a material, while [Table 19](#) provides the standard color modifiers.

Standard Soil and Rock Hues and Abbreviations							
Blue	Bu	Brown	Bn	Gray	Ga	Green	Gn
Olive	Ol	Orange	Or	Pink	Pk	Purple	Pr
		Red	Rd	Yellow	Yl		

Table 18 - Standard Hue Descriptors

Standard Soil and Rock Color Modifiers and Abbreviations		
Light	Lt	Lighter side of color range
Dark	Dk	Darker side of color range
Mottled	Mt	Irregularly marked with spots of different colors
Banded	Bd	Distinct alternating light and dark shades, or alternating colors

Table 19 - Standard Color Modifiers

- (j) **Depositional Environment:** Describe the sedimentary depositional environment to express in what way the soil was deposited using the descriptors in [Table 20](#). Soils derive their engineering behavior mostly as a result of the geologic depositional environment that controls their development. Residual deposits cover a major portion

of the Commonwealth as seen in the map of *Surficial Materials of Pennsylvania* in *Appendix F* and reflect the composition of the parent bedrock. Glacial deposits predominate in the northeastern and northwestern sections of the Commonwealth as seen in the map of *Glacial Deposits of Pennsylvania* in *Appendix F*.

Descriptor	Abbreviation	Description
Aeolian	Ae	Soil deposited by wind
Alluvium	Al	Soil deposited by flowing water
Colluvium	Co	Soil deposited by gravity
Glacial Outwash	Go	Soil deposited from glacial meltwater
Glacial Till	Gt	Soil deposited from unsorted glacial settlement
Residuum	Re	Insoluble material remaining from weathered rock
Fill	FI	Man-made deposit

Table 20 - Types of Soil Deposit

- (k) **Visual Soil AASHTO/USCS Classification:** The Inspector shall visually estimate in the field the AASHTO and Unified soil classifications on each soil strata encountered, and record the corresponding abbreviations, using lower-case letters, onto the field log. The visual classification must be conducted according to the guidelines for field classifications of soils presented in *Appendix D*. The results of any laboratory testing completed to formally determine the soil classifications shall also be recorded on the Final Engineer's Log and identified as such by using capitalized abbreviations. Laboratory classifications must reflect not just the specific sample that was tested from a zone of split-barrel samples, but the full length of any continuous run of material in a hole that is visually representative of the tested sample, provided that the test sample was obtained from the continuous run of material. Laboratory classifications cannot be applied to similar materials from other depths in a hole that are separated by a visually different material, or to similar materials in other bore holes (regardless of the proximity of the hole, depth of sample, or similarity of the material). However, lab classification can be used to revise an original field/visual classification of material in the same borehole or adjacent boreholes where the material is visually, texturally, and behaviorally equivalent to the lab classified material. Refer to *Figure 4* and *Chapter 3.6.2* for additional clarification.
- (l) **General Boring Remarks:** Provide important information relating to the drilling operations and any other information that may give assistance in defining the subsurface conditions in soil. If applicable, the remark(s) should be recorded at the nearest depth to which it was referred to on the boring log. Types of examples of possible remarks include, but are not limited to, the purpose for offsetting the location or change in elevation of a boring, multiple inspectors, any installed instrumentation or bag sample locations, spoon/auger refusal, poor recovery, no recovery, loss of soil sample, tool drops, and basis for unsampled advancement.
- (m) **General Soil Descriptions:** If applicable, include descriptive terms regarding the structure, origin, or other important characteristic of the sample at the end of the constituent description. Place terms within parentheses and record the specified depth. Types of examples could include organic matter (e.g., peat deposits, compost, manure), slag, shell fragments, foreign smells, striking colors, type of fill (embankment, uncontrolled, or subbase), signs of heat (combustion), or presence of large objects (e.g., concrete blocks, foundations, boulders).

### Examples of Field Soil Descriptions:

- fine SAND, some Silt, trace Gravel, medium dense, moist, poorly graded, rounded, brown, fill, a-2-4/sm
- SILT and CLAY, some Gravel, trace Sand, soft to medium, moist to wet, well graded, sub angular, high plastic fines, mottled yellow and light gray, glacial outwash, a-6/cl, (trace roots), (with sandstone fragments)
- fine SAND, some Clay, medium dense, moist, poorly graded, dark gray, fill, a-3/sp, (trace shell fragments)
- coarse GRAVEL, some Silt, loose, dry, uniformly graded, elongated, red-brown, glacial till, a-2-5/gm,
- fine SAND, some Gravel, little Silt, dense, moist, homogeneous, well graded, rounded, light brown, residuum, a-2-4/sm, (slight petroleum odor)
- fine GRAVEL and SAND, little Silt, trace Clay, micaceous, medium dense, damp, homogeneous, well graded, angular to sub-rounded, non-plastic, light brown to red-brown, fill, a-1-b/sw, (occasional fragments of brick and concrete)
- SILT, some fine Sand; stiff to soft, moist, poorly graded, low plastic, orange-brown to tan, alluvium, a-4/ml
- coarse GRAVEL and SILT, some Cobbles, contains cement concrete fragments, loose, damp, blocky, gap graded, angular to rounded, light gray-blue and tan, colluvium, a-1-a/gp, (striking red color)

### 3.6.4 Standard Descriptors for Rock Core

Rock is defined as an indurated mass of mineral aggregates that cannot normally be excavated by manual methods alone and that cannot be satisfactorily penetrated and sampled by standard soil boring and sampling techniques. Describe the characteristics for each rock stratum encountered according to the sequence shown in [Figure 10](#). The general (overall) rock deposit is described first, followed by the characteristics of any discontinuities of significance. For example, avoid giving a wide-ranging description for a rock unit as “very hard to soft”, rather, define the dominant character or the rock as “hard” with the subsequent description of the discontinuities or weathered zones as “soft”. Detailed guidance for describing discontinuities is found in [Chapter 3.6.5](#).

A complete full-word description is to be written in the description column. Abbreviations for various descriptors have been established for field use to aid in recording descriptions when space is limited. Use descriptive abbreviations only when necessary. When measurements are taken for a property such as RQD, the numerical values should always be recorded in the columns provided.

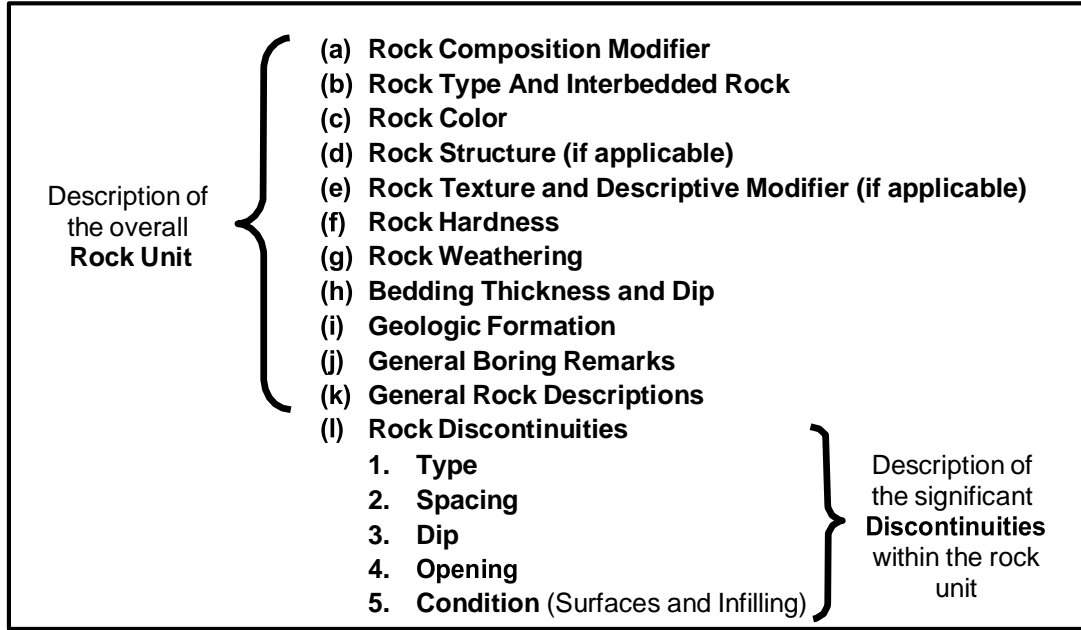

Figure 10 - Standard Rock Core Description Sequence

- (a) **Rock Composition Modifier:** To describe the lithology of the granular sediments and rocks in greater detail, the rock type (e.g., Shale) is often preceded by a major composition modifier (e.g., carbonaceous). Use major descriptive modifiers to describe mineral types that are present in the majority of the rock using [Table 21](#). Capitalize the entire rock type and, if applicable, the interbedded rock type. Do not capitalize any other standard descriptors. Place any supplemental descriptor(s) within parentheses, and locate in the description sequence where most appropriate, usually following the standard descriptors.

Descriptor	Abbreviation	Description
Argillaceous	Arg	Pertaining to a sedimentary rock which contains an appreciable amount of clay
Calcareous	Cal	Containing calcite; in particular rock in which grains are cemented with calcite
Carbonaceous	Car	Rich in carbon or organic matter
Dolomitic	Dol	Containing an appreciable amount of magnesium carbonate
Ferruginous	Fer	Containing iron oxides
Fossiliferous	Fos	Containing fossils; usually applied to rocks in which the fossils are abundant
Micaceous	Mic	Group of silicate minerals exhibiting perfect basal cleavage, which commonly forms flakes, scales, or sheets.
Pyritic	Pyr	Containing the mineral pyrite (iron disulfide – “fool’s gold”); may only be visible with a hand lens.

Table 21 - Rock Composition Modifier

- (b) **Rock Type and Interbedded Rock:** Identify the rock type encountered. The rock types listed in [Table 22](#) should cover nearly all rock types that may be encountered in Pennsylvania. If a rock type is encountered that is not listed in [Table 22](#), indicate the

specific rock type, its origin and then use the “Sedimentary – Other” graphic symbol for any sedimentary rock types not listed, and use the generic “Metamorphic” or “Igneous” graphic symbols for any metamorphic or igneous rocks identified but not listed. For interbedded rock, provide the secondary rock such that the term “interbedded with” is used (e.g., SANDSTONE interbedded with SHALE).

Rock Type	Abbreviation	Rock Origin	Graphic Symbol
Amphibolite	Am	Metamorphic	Metamorphic
Anorthosite (Gabbro)	An	Igneous	Igneous
Anthracite Coal	Co-A	Sedimentary	Coal
Argillite	Ar	Sedimentary	Argillite
Bituminous Concrete	BC	Man Made	Asphalt Concrete
Basalt/Metabasalt	Ba	Igneous	Igneous
Bituminous Coal	Co-B	Sedimentary	Coal
Breccia	Br	Sedimentary	Conglomerate
Cement Concrete	CC	Man Made	Cement Concrete
Chert	Ch	Sedimentary	Sedimentary - Other
Claystone	Cl	Sedimentary	Claystone
Coal	Co	Sedimentary	Coal
Conglomerate	Cn	Sedimentary	Conglomerate
Diabase (Gabbro)	Di	Igneous	Igneous
Dolomite	Do	Sedimentary	Limestone
Flint Clay	FIC	Sedimentary	Sedimentary - Other
Gabbro	Ga	Igneous	Igneous
Gneiss	Gn	Metamorphic	Metamorphic
Granite/Granodiorite	Gr	Igneous	Igneous
Hornfels	Hr	Metamorphic	Metamorphic
Igneous rock type not identified in this listing		Igneous	Igneous
Limestone	Lm	Sedimentary	Limestone
Marble	Mr	Metamorphic	Metamorphic
Masonry	MA	Man Made	Cement Concrete
Metamorphic rock type not identified in this listing		Metamorphic	Metamorphic
Orthoquartzite (Sandstone)	Or	Sedimentary	Sandstone
Pegmatite	Pg	Igneous	Igneous
Phyllite	Ph	Metamorphic	Metamorphic
Quartzite	Qr	Metamorphic	Metamorphic
Rhyolite/Metarhyolite	Rh	Igneous	Igneous
Sandstone	Sa	Sedimentary	Sandstone
Schist	Sch	Metamorphic	Metamorphic
Sedimentary rock type not identified in this listing		Sedimentary	Sedimentary - Other
Serpentinite	Sr	Metamorphic	Metamorphic
Shale	Sh	Sedimentary	Shale
Siltstone	Si	Sedimentary	Siltstone
Slate	Sl	Metamorphic	Metamorphic
Unsampled	Uns	N/A	Unsampled
Void	Vd	N/A	Void

Table 22 - General Rock Types in Pennsylvania

When not provided as a rock composition modifier (*Chapter 3.6.4(a)*), varieties of specific rock types such as variants of schist (e.g., garnet schist, etc.) would be described as the general rock type (i.e., schist) with the specific variant defined in the remarks section of the description.

- (c) **Rock Color:** Describe the rock color using the basic colors shown in *Table 17* for each rock type, and modify if necessary by hue color shown in *Table 18* and color modifiers in *Table 19*. Color is very noticeable and an obvious characteristic of a rock, but it is also the most difficult to interpret. Most rock colors are the result of iron staining, partially decayed organic matter, and/or mineral content.
- (d) **Rock Structure:** Determine the rock structure by identifying specific rock characteristics such as grain size, shape, cavities, foliation, secondary minerals, layering or banding, color of planar zones, and wearing of the rock surface. Also, observe the applicable rock origin type. This would include rocks that are sedimentary, igneous, or metamorphic in nature. If applicable, apply *Table 23* to determine the correct term to describe the rock structure.

Descriptor	Abbreviation	Rock Origin	Description
Amygdaloidal	Amg	Igneous	Vesicle which has been filled with secondary minerals
Concretions	Ccr	Sedimentary	Hard, compact masses formed by the precipitation of minerals
Cross Bedded	Crb	Sedimentary	Original depositional layering is inclined
Fissile	Fsl	Sedimentary	Splits easily along planes of weakness into thin sheets
Flow-Banding	Flb	Igneous	Bands or layers formed during original molten rock flow
Foliated	Fol	Metamorphic	Thin layering from alignment of constituent mineral grains
Gneissic Foliation	Gnf	Metamorphic	Planar zones of dark and light colored minerals
Graded Bedding	Grb	Sedimentary	Change in grain size from the base of the bed to the top; typically coarser sediments at base
Nodules	Nd	Sedimentary	Solid mineral replacement body generally rounded in shape
Non-Foliated	Nfo	Metamorphic	Absence of foliation
Oolitic	Olt	Sedimentary	Containing small round calcareous grains
Schistose	Sct	Metamorphic	Containing parallel arrangement of platy or prismatic minerals
Shaley	Sha	Sedimentary	Exhibiting shaley structure, fissility, or thin partings.
Slaty Cleavage	Scl	Metamorphic	Cleavage into thin layers or plates, like those of slate
Slickensided	Slk	All Rock Origins	Exhibiting polished, striated surface along which movement of rock has occurred
Vesicular	Vsc	Igneous	Containing small cavities called vesicles which formed when gases escaped from lava
Weakly Foliated	Wfo	Metamorphic	Exhibiting weak or less distinct foliation

Table 23 - Rock Structure Descriptors

- (e) **Rock Texture and Descriptive Modifier:** If applicable, describe the rock texture and add any rock descriptive modifiers. Texture refers to the sizes and shapes of grains, the relationships between neighboring grains, and the orientation of grains within a rock. Identify these distinguished characteristics and origin of the rock for use in [Table 24](#) to describe the rock texture. Use descriptive modifiers to designate the appearance or how it was formed using [Table 25](#).

Descriptor	Abbreviation	Rock Origin	Description
Aphanitic	Aph	Igneous	Contains crystals so fine that individual minerals cannot be distinguished with naked eye
Coarse-Grained	Cgr	Sedimentary	Consist of predominately coarse-grained particles
Crystalline	Crs	All Rock Origins	Consisting of or containing crystals
Fine-Grained	Fgr	Sedimentary	Consist of predominately fine-grained particles
Glassy	Gls	Igneous	Resembling glass in smoothness and shininess
Pegmatic	Peg	Igneous	Containing very coarse grains greater than 3 cm in length
Phaneritic	Pha	Igneous	Contains crystals roughly equal in size and individual minerals can be distinguished with naked eye
Phenocrystic	Phe	Igneous	Contains large conspicuous crystals
Pitted	Ptd	All Rock Origins	Contains numerous very small voids
Porphyritic	Prt	Igneous	Contains relatively large isolated crystals in fine texture matrix
Porphyroblastic	Pbl	Metamorphic	Contains large crystals embedded in a finer-grained matrix
Vitreous	Vit	All Rock Origins	Resembling glass, but with a vitreous (pearly) luster
Vuggy	Vug	All Rock Origins	Containing voids usually with a mineral lining of different composition

Table 24 - Rock Texture Descriptors

Descriptor	Abbreviation	Rock Origin	Description
Dull Luster	Dls	All Rock Origins	Dull earthy appearance
Evaporites	Evp	Sedimentary	Formed from evaporation of lake or sea water
Friable	Frb	All Rock Origins	Easily broken or crumbled
Glassy Luster	Gls	All Rock Origins	Having a glassy appearance
Metallic Luster	Mls	All Rock Origins	Having a surface appearance similar to or resembling metal
Mineral Veins	Mnv	Sedimentary	Having fractures that have been filled with mineral material (quartz)
Pearly Luster	Pls	All Rock Origins	Having a surface appearance similar to or resembling a pearl
Waxy Luster	Wls	All Rock Origins	Having a surface appearance similar to or resembling wax

Table 25 - Rock Descriptive Modifiers

- (f) **Rock Hardness:** Describe the apparent hardness of the rock core according to the diagnostic correlations given in [Table 26](#). The term “hardness” is generally understood as being the resistance of a material against abrasion of a body made of another material. Hardness is a function of the mineralogy of the rock, the strength, and the state of weathering. A rock consisting of hard minerals that are well connected with little weathering, will exhibit a high degree of hardness, while the same rock mass in a weathered state with weak cementing may diagnostically have a low degree of hardness. Hardness is used to help differentiate and describe rock.

Descriptor (Abbrev.)	Test Criteria for Hand Specimen	Typical PA Rock Type	Approx. Mohs Hardness Scale	Materials in Hardness Range
Very Soft (Vs)	Scratched by a wood dowel or fingernail	Gypsum, evaporites, some shale	1 – 2	PVC, fingernail
Soft (Sf)	Scratched by rubbing against the surface of a copper pipe or fitting, but not scratched by a wood dowel or fingernail	Schist, shale, most limestone	3 – 3.5	copper pipe
Medium Hard (Mh)	Scratched by rubbing against the surface of a common steel nail, but not scratched by rubbing against the surface of a copper pipe or fitting	Siltstone, sandstone, some limestone	5 – 5.5	common nail, glass
Hard (Hd)	Scratched by rubbing against a hardened steel file, but not scratched by rubbing against the surface of a common steel nail	Some sandstone, chert, granite, gneiss	7.5 - 8	hardened steel, porcelain
Very Hard (Vh)	Not scratched by rubbing against a hardened steel file	Some hornfels	> 8	corundum

Table 26 - Rock Hardness Descriptors

- (g) **Rock Weathering:** Describe the degree of weathering of the overall rock unit (deposit) according to the criteria given in [Table 27](#). Concentrate on the apparent degree of decomposition of the rock relative to that of the comparable fresh parent rock. Do not confuse hardness with weathering. While weathering tends to reduce hardness, a once hard rock type that has been weathered (such as weathered siltstone) may exhibit similar hardness as a weaker, un-weathered soft rock type (such as fresh claystone). Consider the deterioration of the sample in describing the weathered condition of the rock. Weathered rock masses generally have lower strength relative to a fresh mass of the same rock type.

Descriptor (Abbrev.)	Criteria
Fresh (Fw)	No visible decomposition, discoloration, or oxidation.
Slightly Weathered (Sw)	Slight decomposition, discoloration, or oxidation <b>impacting &lt; 20 % of the rock mass.</b>
Weathered (Ww)	Significant decomposition, discoloration, or oxidation <b>impacting 20 to 40 % of the rock mass.</b> Weaker minerals decomposed. Apparent strength less than fresh parent rock.
Moderately Weathered (Mw)	Moderate decomposition, discoloration, or oxidation <b>impacting 40 to 60 % of the rock mass.</b> Noticeable loss of strength relative to fresh parent rock.
Highly Weathered (Hw)	Major decomposition, discoloration, or oxidation <b>impacting &gt; 60 % of the rock mass.</b> Rock is significantly weakened relative to its un-weathered state. Less weathered components may be present in rock mass.

Table 27 - Rock Weathering Descriptors

- (h) **Bedding Thickness and Dip:** Observe and record the bedding thickness according to [Table 28](#) and determine the dip angle according to [Table 29](#) for sedimentary rock formations. If bedding is not apparent or indistinct, note as such. In the case of foliated metamorphic rock formations, knowing the orientation of foliations (alignment of platy or elongate minerals) may be very useful in understanding the structural character of a rock formation. Use Bedding/Discontinuity Dip description to characterize the orientation of foliation.

Bedding Thickness (Abbrev.)	Description
Indistinct Bedding ( <b>Inb</b> )	Bedding structure not clearly defined
Laminated Bedding ( <b>Lmb</b> )	Bedding thickness < 1/4 inch
Thin Bedding ( <b>Tnb</b> )	Bedding thickness 1/4 to 1 inch
Narrow Bedding ( <b>Nrb</b> )	Bedding thickness 1 to 3 inches
Moderate Bedding ( <b>Mob</b> )	Bedding thickness 3 to 9 inches
Medium Bedding ( <b>Meb</b> )	Bedding thickness 9 to 24 inches
Thick Bedding ( <b>Tkb</b> )	Bedding thickness 2 to 6 feet
Massive Bedding ( <b>Mab</b> )	Bedding thickness > 6 feet

Table 28 - Rock Bedding

Bedding/ Discontinuity Dip (Abbrev.)	Description
Flat Dip ( <b>Fld</b> )	Beds/Discontinuities dipping < 5 degrees
Shallow Dip ( <b>Sld</b> )	Beds/Discontinuities dipping from 5 to 15 degrees
Moderate Dip ( <b>Mdd</b> )	Beds/Discontinuities dipping from 15 to 30 degrees
Steep Dip ( <b>Std</b> )	Beds/Discontinuities dipping from 30 to 45 degrees
Very Steep Dip ( <b>Vsd</b> )	Beds/Discontinuities dipping from 45 to 60 degrees
Sheer Dip ( <b>Srd</b> )	Beds/Discontinuities dipping > 60 degrees

Table 29 - Bedding/Discontinuity Dip Descriptors

- (i) **Geologic Formation:** Research the location of the project site in Pennsylvania and refer to [Appendix E](#) and [Map 1, Publication](#) to determine and record the geologic formation, abbreviation, and period/epoch. [Map 1, Publication](#) is a 1:250,000-scale map of the bedrock geology of Pennsylvania compiled by T.M. Berg and others. A current geologic map of Pennsylvania can be found on the website of the Department of Conservation and Natural Resources (DCNR) and can be accessed through the following link:

[Map 1, Publication](#)

This information is for general project information and will have to be provided for each boring. The information is not required to be listed on field or Final Engineer's Logs.

- (j) **General Boring Remarks:** Provide important information relating to the drilling operations and any other information that may give assistance in defining the subsurface conditions in rock. If applicable, the remark(s) should be recorded at the nearest depth to which it was referred to on the boring log. Types of examples of possible remarks include, but are not limited to, estimated top of rock location, loss of rock sample, no recovery, the depth of loss and return of circulating water or an

increase in usage of drilling water, changes in color of drill return water, tool drops, drilling advancement rate, plugging during drilling, loss of fluid, rolled or recut pieces of core, and any other inconsistencies while coring.

- (k) **General Rock Descriptions:** If applicable, include descriptive terms regarding the structure, origin, or other important characteristic of the sample not already captured at the end of the rock description. These will be captured as general descriptions at a specified depth. Place terms within parentheses, and locate in the description sequence where most appropriate, usually following the standard descriptors. Some typical examples might be: foreign smells, striking colors, signs of heat (combustion), or presence or absence of large objects (e.g., concrete blocks, foundations), voids, mined-out coal seams, soil seams, infilling, limestone caverns, jointing, brokenness, highly weathered rock zones, solution cavities, etc.
- (l) **Rock Discontinuities** - Describe discontinuities according to [Chapter 3.6.5](#).

**Examples of Field Rock Descriptions:**

- fossiliferous BRECCIA, dark red-brown, very soft, fresh, medium bedding, steep dip, fracture zone, narrowly spaced discontinuity, sheer dip, narrow joint opening, (1/8-in thick, filled with calcite, very soft)
- micaceous SCHIST, brown with mottled yellow-brown, foliated, soft, highly weathered, jointed, medium spaced discontinuity, sheer dip, wide joint opening
- CLAYSTONE, gray and red-brown, metallic luster, soft, slightly weathered, moderate bedding, moderate dip, fracture zone, medium spaced discontinuity, sheer dip, (no infill)
- SILTSTONE, red-brown, medium hard, slightly weathered, medium bedding, flat dip, random fractures, widely spaced discontinuity, sheer dip, tight joints
- SANDSTONE interbedded with SHALE, gray and dark gray, hard to very hard, fresh, thin bedding, shallow dip, jointed, widely spaced discontinuity, shallow dip, tight joints
- dolomitic LIMESTONE, gray to blue-gray, vuggy, mineral veins, medium hard, slightly weathered to moderately weathered, moderate bedding, steep dip, bedding joint, moderately spaced discontinuity, moderate dip, narrow joint opening (slickensided)
- BASALT/METABASALT, black to green-black, flow banding, aphanitic, dull luster, hard, fresh, fracture zone, narrowly spaced discontinuity, sheer dip, tight joints

### 3.6.5 Standard Descriptors for Rock Core Discontinuities

The Certified Drilling Inspector shall observe and record descriptions of the following applicable characteristics of major or significant discontinuities in the rock core: **type**, **spacing**, **dip**, **opening**, and **condition**. The **condition** description may include characteristics of the **surface** roughness as well as the soil **infilling** thickness, constituents, and hardness. The Certified Drilling Inspector shall adequately describe these features using the descriptions outlined in this section. For additional guidance pertaining to describing rock cores, see the PennDOT [Publication 293, Geotechnical Engineering Manual](#), and the U.S. Department of the Interior, Bureau of Reclamation (USBR), [Engineering Geology Field Manual](#), 2001.

Identifying and describing the structure of rock masses is an important part of the test boring inspection and Final Engineer's Log. Rock bedding or discontinuities often create planes or surfaces within the rock mass which have considerably different engineering

properties than the intact parent rock specimens tested in the laboratory. Accordingly, discontinuities can control the properties and behavior of rock masses.

Definitions of terms describing rock structure:

**Bedding/Foliation:** For the purposes of the boring log description, bedding planes define the interface of rock deposits having notable or significant differences in character. The contacts between rock bodies of different lithology's are considered bedding planes, and described separately from other types of rock discontinuities discussed below. Bedding description is to be in accordance to [Table 28](#). Structural foliations (such as cleavage) which are planar or layered are characteristics of metamorphic rocks which can be structurally similar to the bedding features in sedimentary rocks.

**Discontinuity:** For the purposes of the boring log description, a discontinuity shall be a collective term used for joints, fractures, shears, and faults.

**Fracture:** A term used to describe an irregular or non-planar break in geologic material, excluding shears and shear zones. Additional fracture terminology is provided in [Figure 11](#).

**Shear:** A structural break where differential movement has taken place along a surface is termed a shear. Shearing is sometimes characterized by a slickenside or gouge. Often, the shear direction, amount of displacement, and continuity may not be known because of limited exposures or observations.

**Fault:** A shear with significant discontinuity that can be correlated between observations is a fault. Faults demonstrate high spatial continuity, and therefore occur over significant portions of given sites, foundation areas, or regions. The observed fault feature may be a segment of a fault or fault zone, as defined in the literature. The designation of a shear as a fault or fault zone is a site-specific determination.

**Shear/Fault Zone:** A shear or fault that exhibits significant width when measured perpendicular to the plane of the shear or fault. The zone may consist of multiple slickensides, gouge, striations, breccia, or many related faults or shears together with fractured and crushed rock between the shears or faults, or any combination of these.

**Soil Infilling:** Soil material that has migrated into an open rock joint or discontinuity. The deposit is most likely caused by the movement of water.

- (a) **Discontinuity Type:** Use a single description, or range of descriptors, to describe the discontinuities observed over the length of the reported fracture density. Refer to [Figure 11](#) for detailed criteria concerning discontinuity types.

		Description	Criteria
Joints	}	Jointed (Jtd)	 A series of repeating planar discontinuities
		Foliation Joint (Foj)	 Discontinuities/Joining along foliation planes
		Bedding Joint (Bdj)	 Discontinuities/Joining along bedding planes
Fractures	}	Fracture Zone (Frc)	 Numerous, close, often intersecting random fractures
		Random Fracture (Rnf)	 Non-planar/irregular discontinuities

Figure 11 - Standard Core Log Descriptors for Discontinuity Types

(b) **Discontinuity Spacing:** Measure the spacing between each discontinuity and record the measured values. Select a spacing descriptor which best describes the spacing according to [Table 30](#). For accurate understanding of what constitutes a discontinuity, refer to the definitions given in the beginning of this section.

Spacing	Abbreviation	Description
Laminated	Lmd	Discontinuity spacing < ¼ inch
Narrow	Nrd	Discontinuity spacing from > ¼ inch up to 1 inch
Close	Cld	Discontinuity spacing > 1 inch up to 3 inches
Moderate	Mod	Discontinuity spacing > 3 inches up to 9 inches
Medium	Med	Discontinuity spacing > 9 inches up to 2 feet
Wide	Wdd	Discontinuity spacing > 2 feet up to 6 feet
Massive	Mad	Discontinuity spacing > 6 feet

Table 30 - Discontinuity Spacing Descriptors

When a significant joint set can be distinguished (parallel or sub-parallel joints), true spacing shall be measured as shown on [Figure 12](#), and a representative description of

spacing shall be recorded. If apparent spacing is given, label as such. When complex jointing patterns are encountered, long written descriptions can be avoided by writing succinct descriptions that are supplemented with core sketches and/or photographs. Joint spacing affects block size and geometry in the rock mass. Spacing is a required input for several rock mass classification systems.

Figure 12 - Comparison of True and Apparent Spacing  
Reference: USBR Engineering Geology Field Manual

For each run of rock core, the total core recovery (REC), percent recovery, and rock quality designation (RQD) shall be recorded. Core recovery and RQD are important indicators related to the discontinuity spacing. Core recovery and RQD should be measured along the core centerline (refer to [Figure 13](#)). The RQD for each core run is determined by summing the total length of those pieces of core that are 4 inches in length or longer, and then dividing that length by the total length of core run and multiplying by 100 percent.

$$RQD = \left( \frac{\sum L \geq 4''}{L_{total}} \right) * 100$$

If the core is broken by handling or by the drilling process (e.g., machine or mechanical breaks, the fracture surfaces are fresh, irregular breaks rather than joint surfaces), the fresh broken pieces are fitted together and are counted as one piece. Therefore, machine or mechanical breaks are ignored. The Inspector should mark mechanical or irregular rock breaks by drawing three parallel lines across the break to indicate as such.

Figure 13 - Length Measurement of Core Recovery and RQD  
The RQD for pieces of rock core that are moderately to highly weathered, contain pores, are chemical altered, or are friable should be included in the calculation. Any

non-indurated sample such as a clay or soil seam encountered during drilling that exceeds 4-inches in length should not be included in the calculation of RQD.

- (c) **Discontinuity Dip:** Use the standards as indicated in [Figure 14](#) and [Table 29](#) to describe the magnitude of dip of discontinuities. If possible, measure strike and dip in bedrock exposures or from oriented core, report discontinuity dip in vertical core, and measure angle from core axis for angled borings. Report an average angle only if moderate variations are observed. Provide both a range and average if large variations in orientation are apparent. Observation of the magnitude of discontinuity dip made with non-oriented core is useful for anticipating various difficulties that may arise from advancing piles or shafts in rock masses that contain discontinuities that are oriented close to vertical.

Procedure for orienting and measuring rock core from vertical and angle borings:

**Vertical Boring:** The true dip magnitude is determined by the maximum angle measured between the discontinuity and the plane at the top of each core run that is perpendicular to the core axis. This angle is the steepest possible plunge along the plane, and is recorded as true dip (TD), e.g., TD = 35°. Note the dip-direction or strike cannot be determined from a non-oriented vertical core.

**Angled Boring:** The true dip magnitude and dip direction or strike direction of a discontinuity cannot be directly measured from a non-oriented angled boring. Measure the angle of the discontinuity relative to the plane at the top of each core run that is perpendicular to the core axis. Report the dip of the discontinuity as a relative dip (RD) RD = 30°. Where angle borings are completed for specific project investigation needs, indicate the boring angle from vertical, and the azimuthal bearing of the boring.

Figure 14 - Measurement of Discontinuity Dip Magnitude

- (d) **Discontinuity Opening:** Measure the opening of each discontinuity and record the measured value. Select a descriptor which best describes the opening according to [Table 31](#). For accurate understanding of what constitutes a discontinuity, refer to the definitions given in the beginning of this section.

Descriptor	Abbreviation	Description
Tight Joints	Tjo	No open space at discontinuities - fits together tight, but not a fresh break
Narrow Joint Opening	Njo	Open spacing up to 1/8 inch - aligned well but may have some evidence of weathering along discontinuity planes
Open Joints	Ojo	Open space > 1/8 inch up to 3/8 inch – usually weathering along discontinuity planes
Large Joint Opening	Ljo	Open space > 3/8 inch up to 1 inch – often significant weathering along discontinuity planes
Wide Joint Opening	Wjo	Open space > 1 inch – may have significant weathering or may have infilling

Table 31 - Discontinuity Opening Descriptors

- (e) **Discontinuity Condition:** Record a detailed description of an individual discontinuity only if the feature is known or suspected to be significant and persistent within the

rock mass of interest. If a significant discontinuity surface and/or soil infilling are present, describe its physical characteristics. Surfaces or fillings of similar character can be described and recorded as one general description for multiple discontinuities in a run, portion of run, or defined physical length. Characteristics such as roughness, thickness, texture, and hardness of the surfaces/infill are important in evaluating the shear strength of persistent discontinuities, and in modeling the deformability and stability of large-scale rock masses. Surface characteristics are less important only when low-strength materials (soils) comprise fracture fillings that would likely control the behavior of the rock mass.

For any significant discontinuity or similar group of discontinuities, record a description of any of the following notable characteristics that apply:

1. Describe the discontinuity **surfaces** as rough, smooth, or polished. The roughness (small-scale asperities) of fracture surfaces is critical for evaluating shear strengths. Roughness descriptors such as “striated” or “slickensided” should be used whenever observed. For oriented core or outcrops, the orientation of striations or slickensides should be recorded. The rake of striations or slickensides should be recorded when observed in core from vertical drill holes which have not been oriented.
2. Describe the discontinuity **infill** thickness, constituents, and hardness. Soil or crystalline mineral material can provide a significant tensile and shear strength to the discontinuity. The presence or absence of coatings or fillings, and characteristics of the filling material, may be as significant as fracture spatial relationships or planarity. Strength and permeability of fractures may be affected by fillings. Be mindful that infill may be present in situ only to be washed away in the drilling process and not recovered. Color changes in the returned drill fluid can give an indication of washed infill, while a sudden tool drop of the drill steel may indicate an open void has been encountered. If soil infilling is recovered, describe as outlined below.
  - **Infill Thickness:** Measure and record the thickness in inches. If no thickness is noted, discontinuity surfaces will be understood to be “tight”, or labeled as such (no infill or void).
  - **Infill Constituents:** Descriptors for infill texture is the same as those described in [Chapter 3.6.3](#) for soils and [Chapter 3.6.4](#) for intact rock.
  - **Infill Hardness:** Descriptors for infill consistency or density are the same as those described for soils, [Table 11](#) and [Table 12](#). Describe the discontinuity healing (or re-cementation) condition, if evident. Discontinuity healing can be observed when there is a color contrast with the bordering intact rock. Features referred to as “veins” are often healed discontinuities. In addition to an observation of the amount of the discontinuity that has been healed, the healing material should be observed and recorded. The amount and material of the healing is relevant to the estimation of discontinuity shear strength, discontinuity hydraulic conductivity, and to the ease with which the rock can be excavated (e.g., open excavation, drilled shaft, borehole).

### 3.6.6 Standard Final Engineer’s Log

The Department has made available PennDOT specific gINT libraries, templates, and examples to the Districts and Business Partners. Detailed information for obtaining gINT software and PennDOT’s gINT data template and library, and for integrating gINT into the

project development process can be accessed electronically on the [PennDOT gINT Webpage](#). With the adoption of gINT software, the [Final Engineer's Log](#) and [Engineer's Test Pit Log](#) is strictly standardized to facilitate efficient electronic data capture and reporting. Project files associated with gINT software will have the appropriate file naming convention, MPMS\_#####\_District\_XX (e.g., MPMS\_42195\_District\_02).

The Inspector's Field Logs are not strictly standardized. However, to record the required drilling data and material information in the field, the Inspector may use the [Inspector's Field Log](#) (recommended) or another similar log. Field Logs can be formatted as portrait or landscape; handwritten or PDA-generated; or almost any format that the PGE and DGE determine to be clear and efficient to the data collection and preparation of the final logs. If data is entered electronically in the field using the gINT Field Data Collection Tool, this data can be imported into a gINT project file to create the [electronic version](#) of an Inspector's Field Log.

As needed or when required by the PGM/PGE or DGE, use the log forms labeled [Supplemental Notes and Sketches](#) and [Borehole Grouting Log](#), to record supplemental information about the boring operations, sampling, or decommissioning of boreholes. The use of the supplemental sketch sheet is encouraged to record details that would otherwise be difficult to clearly describe using only written descriptions. Lengthy or unclear written descriptions can sometimes be avoided through the use of a simple sketch. Recording details concerning oriented test borings, unusual rock core features, or site conditions can often times be more clearly described using a supplemental drawing.

### 3.6.7 Standard Engineer's Test Pit Log

The following information shall be provided on the *Engineer's Test Pit Log*:

- Professional Engineer or Professional Geologist seal, signed and dated, of the project geotechnical manager (PGM) of record, attesting to the accuracy of all information on the log.
- Project identification, including ECMS#, state route or local designation, section, district, and county
- Test pit identification number
- Coordinates, state plane (northing and easting) and geodetic (latitude and longitude)
- Date of excavation and backfill
- Name of Drilling Inspector (District's or Engineer's Representative)
- Elevation of top of test pit
- Ease of excavation using the following descriptors:

Descriptor	By Equipment/Material
Easy	Small sized excavator (between 11 - 19 tons using a 2 ft. bucket)* excavates a full bucket of material consistently with little resistance; generally associated with very loose to loose or very soft to soft deposits
Moderate	Small sized excavator (between 11 - 19 tons using a 2 ft. bucket)* excavates full to half of a bucket of material consistently with greater resistance or need to loosen some material; generally associated with medium dense to dense or medium to stiff deposits
Difficult	Small sized excavator (between 11 - 19 tons using a 2 ft. bucket)* excavates material with much more resistance and more loosening of material; generally associated with very dense or very stiff to hard deposits
*Note: Excavator and bucket size may vary. Adjust accordingly based on material present.	

Table 32 - Ease of Excavation Descriptors

- Caving of sides and at what depth using the following descriptors:

Descriptor	Description
Stable	Test pit walls (sides) exhibit little or no signs of caving
Moderate	Test pit walls (sides) exhibit occasional calving (like breaking of iceberg face) or sloughing at various depths or locations
Unstable	Test pit walls (sides) exhibit caving in large amounts; significant sloughing, caving, bulging, spalling, or slope failure occurring throughout excavation

Table 33 - Caving Descriptors

- Location of the test pit relative to project reference line (e.g., segment, offset, offset from centerline) or other suitable reference points
- Type of and size of excavation equipment used
- Pit dimensions including depth, width, and length
- Seepage amount and elevation
- Depth to top and bottom of profile for each soil type
- Depth, type and condition of rock (if encountered)

- Bag number and depth of bag samples
- Pocket penetrometer or Torvane test results
- Description and identification of each soil and rock stratum (if encountered) as indicated in [Chapter 3.6.3](#), [Chapter 3.6.4](#), and [Chapter 3.6.5](#)
- Include any relevant information such as presence of boulders, reason for stopping excavation (e.g., caving sides, difficult excavation, limit of reach of backhoe), moisture condition, and relative density and consistency of soils.
- Included with the log, provide digital photographs (minimum 8-megapixel resolution, .jpg format) of each test pit, with location information (project number, station, test pit number, depths, etc.) clearly identified in photograph. A sufficient number of photographs shall be provided to clearly identify all details.

Use the standard [Engineer's Test Pit Log](#) provided with gINT software.

### 3.6.8 Graphic Symbols for Soil and Rock Deposits

Graphic representations are useful for showing the extent of different general deposit types. The symbology shown in *Figure 15*, *Figure 16*, and *Figure 17* is to be used on the Final Engineer's Log and when graphical representations are to be shown on Soil Profile plan sheets, or cross-sectional stick-logs.

The graphic symbols developed for soil and rock are designed to be simple and intuitive, so that anyone familiar with the system can easily and rapidly identify a rock or soil type by the symbol. Particles for gravel, sand silt and clay are identified as indicated in the legend below. They are identified by size and shape.

#### Legend for Soil Symbols

##### Primary or Secondary Soil Symbols

▲	or	▲	= Mechanically Broken Rock
◓	or	◓	= Gravel and/or Sand
●	or	○	= Silt
—	or	—	= Clay
∩	or	∩	= Organics

#### Legends for Rock Symbols

◓	= Conglomerate/Breccia
○	= Sandstone
●	= Siltstone
—	= Claystone

Since granular materials (gravels and sands) are the largest particle sizes, the largest symbol is for gravel-sand. The gravel-sand symbol consists of a pentagon. This shape was selected to help differentiate it from fine-grained silts and clays, and to provide dual representation for Conglomerate and Breccia. These two rock types are very similar, the only difference being the particle shape. Conglomerates contain generally rounded particles, while Breccia's contain very angular particles. The pentagon shape is somewhat between a rounded and angular particle, permitting the use of one symbol to represent both Conglomerate and Breccia. The mechanically broken rock symbol is represented by a triangle to designate the angular shape of broken rock

Silt is represented by an intermediate-sized circle. Clay is represented by flat line representing the very thin and flat, nearly two-dimensional, shape of a clay particle. Organics/Topsoil is represented by two curved lines and one straight line to represent vegetation (the source of organic material).

For the soil symbols, except for clay, when a grain symbol is shaded completely black it is to indicate that in a soil, that particle size is dominant. When clay is the dominant particle size, all other shapes lack the black shading. This provides for a simple and intuitive set of symbols for the various possible soil combinations.

When a soil symbol contains only one grain size symbol, the soil is comprised nearly exclusively of that grain size. The grain symbol will be accordingly shaded black. For mix grained soils, any grain size that is present in the matrix in visibly significant proportions (approximately 5 percent or greater), is represented in the soil symbol. Again, the predominant grain size will always be the one shaded black. As an example, a soil comprised primarily of silt but also having notable gravel, sand, and clay fractions may be identified as the following symbol:

A corresponding Final Engineer's Log description for this symbol may be "**SILT**, some **Sand**, some **Clay**, trace **Gravel**..."

## Graphic Symbols for Rock Deposits

	R - ARGILLITE Argillite; Pub. 222 Figure 3.6(o)		R - METAMORPHIC ROCK Amphibolite, Gneiss, Marble, Phyllite, Quartzite, Schist, Serpentine, Slate
	R - BITUMINOUS CONCRETE Bituminous Concrete		R - OTHER SEDIMENTARY Argillite, Chert
	R - CLAYSTONE Claystone		R - SANDSTONE Sandstone, Orthoquartzite (Sandstone)
	R - COAL Coal, Anthracite Coal		R - SHALE Shale
	R - CONCRETE Concrete		R - SILTSTONE Siltstone
	R - CONGLOMERATE / BRECCIA Conglomerate, Breccia		NO RECOVERY No recovery
	R - IGNEOUS ROCK Anorthsite, Basalt/Metabasalt, Diabase (Gabbro), Gabbro, Granite/Granodiorite, Hornfels, Pegmatite, Rhyolite/Metarhyolite,		OTHER Other material sampled; i.e., sandstone foundation block
	R - INTERBEDDED ROCK Interbedded Rock		UNSAMPLED Samples not taken/unsampled runs
	R - LIMESTONE / DOLOMITE Limestone, Dolomite		VOID Void

Figure 17 - Standard Graphic Symbols for Rock Deposits

All rock symbols (with the exception of coal, concrete, and bituminous concrete) are shaded gray so as to differentiate them from soil. A blank symbol represents no recovery (in rock or soil). A symbol with the letters "UNS" represent an unsampled run and a symbol with the word "VOID" represents a void within rock or soil.

All sedimentary rock types (again, the exception is coal) have a series of horizontal lines on a gray field. This indicates their origin from soil sediments, which are originally deposited in horizontal layers. The graphics with the symbol are set up similar to the soil symbols with some modifications as indicated in [Figure 17](#). Coal is simply shaded black. Coarse-grained sedimentary rocks, conglomerate, and breccia's contain the gravel and/or sand grain symbol. Sandstone, siltstone and claystone contain the silt and clay symbols respectively. Shale has many horizontal lines, representing its fissility or partings.

While limestone and dolomite are two different rock types (dolomite being a mineral and containing magnesium in addition to calcium carbonate), they are both carbonate rocks that are functionally similar. For this reason one symbol was selected to represent both rock types. Dolomite is more resistant to acid attack and solutioning, but both are ultimately a carbonate rock. Veining was added to the basic sedimentary symbol, representing the mineral veins often present in limestone.

A generic sedimentary symbol is used to indicate when one of the less common sedimentary rock types are encountered (e.g., argillite, chert). The symbol consists of the letter "S" imprinted on the basic sedimentary symbol of horizontal lines on a gray field. No differentiation is made between claystone and mudstone.

Igneous rocks are indicated by a series of vertical lines on the gray field. The vertical lines represent the origin of igneous rocks from the upward movement of magma into (plutonic) or through (volcanic - reaching the surface) the earth's crust. Metamorphic rocks are represented by a series of diagonal lines on a gray field, representing their origin from either sedimentary or igneous rocks that have been altered by heat or pressure.

Concrete and bituminous concrete are both man made materials that are represented separately. The concrete symbol contains dark outlined, triangular shapes of varying sizes that represent the composite material (concrete) which is composed of granular aggregate embedded in cement. The bituminous concrete symbol consists of white outlined, triangular shapes (representing the aggregate materials) accentuated in a black background to exemplify the distinctive black appearance of asphalt.

### 3.6.9 Graphics Shading for Soil and Rock

Graphic columns on the [Final Engineer's Log](#) are enhanced with use of standard shaded background accents. The use of shading enhances the visual interpretation of soil versus rock materials. Grayscale enhancement is provided on electronic versions of logs, and required on printed computer-generated versions, when utilizing gINT software approved and distributed by the Department. This software is developed to format the Final Engineer's Log with the shading indicated in [Table 34](#).

Shading Sample	Material Class	RGB Color Model		
		Red	Green	Blue
	Soil	255	255	255
	Rock	220	220	220
	Void	255	255	255

Table 34 - Standard Color Graphics for Soil and Rock

### 3.7 CORE BOX AND TEST PIT PHOTO LOGS

Included with the boring log, provide a 5 inch x 3.75 inch digital photograph of each open core box, with core samples, measurement device (e.g., tape measure, 6-foot ruler) placed adjacent to each core box, and information on inside of lid clearly visible (project number, station, boring number, depths, etc.). [Figure 18](#) shows an appropriate core box photograph, including proper spacing techniques, proper labeling of core box and soil samples, and correct orientation of the rock core (see [Chapter 3.8](#) and [Section 215](#)). Use an appropriate [Core Box Photo Log](#) for core box photos. Use an appropriate [Test Pit Photo Log](#) when necessary. The following information shall be provided:

- Project identification, including ECMS#, state route, section, district, and county
- Identification number for the test boring or test pit and box number
- Photographs that must meet one of the following specifications:
  - Photos taken in .jpg format with 8-megapixel resolution (minimum), with minimal compression (highest quality).
  - Photos taken in .png format with 8-megapixel resolution (minimum). The file must then be converted and saved in .jpg format.

Figure 18 - Sample Core Box Example

Project photo files associated with gINT software are to follow the appropriate file naming convention, MPMS\_#####\_District\_XX\_Boring Number\_Box\_X\_of\_Y (e.g., MPMS\_42195\_District\_02\_S-01\_Box\_1\_of\_3).

### 3.8 PACKAGING AND LABELING OF SAMPLES

The Inspector must place samples in the core box in the order shown in [Figure 30](#). The inspector must properly label all jar samples and all core boxes, according to the requirements in this publication. It is standard practice to begin each boring with a new core sample box. Unless the DGE directs otherwise, when two borings have minor amounts of recovered sample (such as very shallow and/or low recovery borings) it is permissible to place samples from both borings in a single core box. The box labeling must clearly indicate that the box contains samples from multiple borings.

Do not remove any sample(s) from the original field box for laboratory testing until the completed core box photograph is taken. The DGE or PGM shall give concurrence to the selection and removal of individual soil and rock samples needed for laboratory testing.

Split-Barrel Soil Samples: Place the most representative and least disturbed five-inch-long portion of each split-barrel soil sample in a glass sample jar. Place the sample in the jar such that the bottom-end of each five-inch sample is at the bottom of the jar. The jars supplied by the contractor include pre-printed and self-adhered labels as shown on [Figure 21](#), placed on the side and top of each jar to record the required information. Clearly, accurately, and permanently fill-in the required information on the lid and side of each jar. Place the jars in wooden core boxes, maintaining the correct sequence and orientation of the jars. The lid-end of the jar should always correspond with the top-end of the selected soil sample, and should be placed in the core box with that orientation.

Undisturbed Soil Samples: Clearly, accurately and permanently mark the side of the sample tube and the end caps as shown in [Figure 22](#). Metal or plastic tube caps shall be used. Unless specified otherwise by contract or directed by the PGM or DGE, undisturbed samples shall be packaged and transported according to [ASTM D 4220, Standard Practices for Preserving and Transporting Soil Samples](#), and delivered to the testing laboratory no later than one week after the sample is originally taken. Samples are to be handled, stored and shipped in the same orientation in which they were sampled. Samples are to be protected from bumping, dropping, rolling, etc. by properly packaging and cushioning. For all modes of transporting samples, the loading, transport, and unloading of sample containers should be monitored by the Inspector or other qualified person such as the PGE, geologist, or soils technician.

Rock Core Samples: Place rock cores in the sequence of recovery in well-constructed wooden core boxes as described in [Section 215.02\(a\)](#). Fill boxes from left-to-right, top-to-bottom. Orient and align the predominant discontinuity set such as bedding or jointing so they are observed at their steepest angle as depicted in [Figure 18](#). Fill in the information in the stenciled areas on the box lid and sides as shown in [Figure 19](#). Place wooden block spacers at the end of each core run and between rows and mark the depth from the surface of the boring to the top and bottom of the drill run on the wood blocks. When voids are encountered, place a wood block showing the depth to, and length of, void encountered at the approximate location of the void in the core run. When necessary to maintain proper confinement of the samples, use screws or nails to permanently fasten blocks in place. Screws can be toed-in at an angle through a box partition or side of box.

Upon completion of each boring, clearly, accurately and permanently mark the top, front side, and both ends of the core box as shown in [Figure 20](#). The left end of each core box shall be painted with white or light-colored paint. Use a permanent black marker to print the information on the box. Permanently mark the inside of the core box lid with the core run information which shall include run number, top and bottom depths of run, recovery length and rock quality designation (RQD), as shown in [Figure 20](#).

### 3.9 SAMPLE QUANTITY AND QUALITY

Inspectors who examine, package, and transport soil, rock, and water samples have an important role in ensuring the quality of the laboratory test results. When performing field investigations, the Certified Drilling Inspector shall be familiar with the procedures contained within this Publication and should also review applicable AASHTO and ASTM standards, such as the following:

- AASHTO R13 - Practice for Conducting Geotechnical Subsurface Investigations
- ASTM D 653 - Terminology Relating to Soil, Rock, and Contained Fluids
- ASTM D 1452 - Practice for Soil Exploration and Sampling by Auger Boring
- ASTM D 1586 - Test Method for Standard Penetration Test (SPT) and Split-Barrel Sampling of Soils
- ASTM D 1587 - Practice for Thin-Walled Tube Sampling of Soils for Geotechnical Purposes
- ASTM D 3550 - Practice for Thick Wall, Ring-Lined, Split Barrel, Drive Sampling of Soils
- ASTM D 4220 - Practices for Preserving and Transporting Soil Samples
- ASTM D 5434 - Guide for Field Logging of Subsurface Explorations of Soil and Rock
- ASTM D 6032 - Test Method for Determining Rock Quality Designation (RQD) of Rock Core
- ASTM D 6151 - Practice for Using Hollow-Stem Augers for Geotechnical Exploration and Soil Sampling

**Prior to drilling:** The Inspector shall seek clear instruction from the PGM or PGE as to the number and type of laboratory tests that are anticipated for a given project. The PGM or PGE typically makes the final selection of samples for lab testing once drilling is complete. For this reason, it is important that adequate quantity of materials have been recovered during the drilling operations.

**During drilling:** The Inspector and drilling contractor share in the responsibility to obtain the sufficient quality and quantity of sample material needed for testing. There are a variety of standard laboratory tests for soil and rock materials. To assist in this, [Table 35](#) and [Table 36](#) list guidelines for sample requirements for some of the more common individual laboratory tests. The minimum sample size needed to properly prepare a lab specimen of soil can be dependent upon the gradation of the soil. Depending upon the actual gradation of the soil, a larger or smaller quantity of material than is listed may actually be needed to prepare the specimen. If the drilling contractor cannot retrieve the amount of material listed, or if conditions differ than what was anticipated, the drilling Inspector shall contact the PGM or PGE for additional guidance on obtaining adequate sample quantities. Refer to [Figure 23](#) for proper bag sampling of soil for MTL (Materials Testing Laboratory) samples.

**After drilling:** The drilling Inspector shall conduct a quality check of their field notes and observations once back in the office. Sample descriptions and identifications shall be reviewed and revised as necessary to ensure that they are in compliance with the procedures presented in this section. Descriptors of sample properties that are subject to change due to time or environment, such as moisture or RQD, shall not be revised. Samples that are to be stored for laboratory testing or other purposes shall be inventoried to ensure correct labeling and accounting.

	Test or Property	Standard	Sample Type and Quantity (see Notes 1 and 2)	Additional Comments
<b>SOIL TESTS</b>	<b>Moisture Content</b>	AASHTO T 265	1 jar for max. particle size of 0.5 inch 3 jars for max. particle size of 2 inches	Place in air-tight jar or plastic bag.
	<b>Unit Weight</b>	ASTM D 7263	1 jar or 3-inch piece of Shelby tube or block sample (minimum 3 cubic inches). Sample must be intact with minimal disturbance.	Sample must have sufficient cohesion to maintain shape. Jar or plastic bag must be air tight to maintain natural soil moisture.
	<b>Specific Gravity</b>	AASHTO T 100	1 jar	
	<b>Particle Size Analysis</b>	AASHTO T 88	1 lb. (2 jars) for max. particle size of 0.375 inch. 4.5 lb. max. particle size of 1 inch. 9 lb. for max. particle size of 2 inches.	If inadequate sample is available for 1 inch and larger material, it is acceptable to use a minimum of 3 jars.
	<b>Liquid Limit, Plastic Limit, Plasticity Index</b>	AASHTO T 89 (Liquid Limit)	1 jar when sample is primarily fine-grained. 2 to 3 jars when sample contains coarse material.	Minimum of 0.2 lb. passing the No. 40 (0.425mm) sieve when both T-89 and T-90 performed.
		AASHTO T 90 (Plastic Limit)		
	<b>Consolidation</b>	AASHTO T 216	Portion (approx. 1 inch) of Shelby tube. Undisturbed sample required.	Min diameter. = 2 in. Min. height = 0.5 in., and min. diameter to height ratio of 2.5.
	<b>Unconfined Compression</b>	AASHTO T 208	Can be run on disturbed or undisturbed samples. 2 Shelby tubes needed. Typically 3 samples (approx. 6 inches high each) required for test. Soil must have sufficient cohesion to maintain shape. For disturbed/remolded sample, approx. 9 lb. sample required for test (additional sample needed if sample contains coarse material). See Note 3.	Min. sample diameter = 1.3 in., length to diameter ratio of 2 to 2.5. One Shelby tube generally does not contain sufficient testable sample.
	<b>Direct Shear</b>	AASHTO T 236	Can be run on disturbed or undisturbed samples. Portion (approx. 6 inches) of Shelby tube. Typically 3 samples (approx. 2 inches each) required for test. For disturbed/remolded sample, approx. 3 lb. sample required for test (additional sample needed if sample contains coarse material).	Min. sample diameter/width = 2.0 in. Min. diameter/width to thickness ratio is 2:1. Sample height must be at least 6 times max. grain diameter. Typical shear device uses 1 inch sample height.
<b>Triaxial Compression (Unconsolidated Undrained Shear)</b>	AASHTO T 296	Can be run on disturbed or undisturbed samples. 2 Shelby tubes needed. Typically 3 samples (approx. 6 inches high each) required for test. Soil must have sufficient cohesion to maintain shape. For disturbed/remolded sample, approx. 9 lb. sample required for test (additional sample needed if sample contains coarse material). See Note 3.	Min. diameter = 1.3 inch and height to diameter ratio between 2 and 2.5. Largest particle size must be smaller than 1/6 sample diameter. One Shelby tube generally does not contain sufficient testable sample.	

<b>SOIL TESTS</b>	<b>Triaxial Compression (Consolidated Undrained Shear)</b>	AASHTO T 297	Can be run on disturbed or undisturbed samples. 2 Shelby tubes needed. Typically 3 samples (approx. 6 inches high each) required for test. Soil must have sufficient cohesion to maintain shape. For disturbed/remolded sample, approx. 9 lb. sample required for test (additional sample needed if sample contains coarse material). See Note 3.	Min. diameter = 1.3 inch and height to diameter ratio between 2 and 2.5. Largest particle size must be smaller than 1/6 sample diameter. One Shelby tube generally does not contain sufficient testable sample.
	<b>California Bearing Ratio (CBR)</b>	AASHTO T 193	2 bags (75 lbs. total). See Note 3.	75 lbs. provides adequate sample to perform both CBR and Moisture-Density (PTM 106) tests.
	<b>Moisture-Density Relations (Compaction)</b>	PTM 106	1 bag (40 lbs.) recommended. Minimum of 12 lbs. of material finer than 3/4 inch sieve required. See Note 3.	
	<b>Hydraulic Conductivity (Permeability)</b>	ASTM D 5084	Can be run on disturbed or undisturbed samples. Portion (approx. 6 inches) of Shelby tube. For disturbed/remolded sample, approx. 3 lb. sample required for test (additional sample needed if sample contains coarse material).	Min. sample height and diameter of 1 inch. Largest particle size must be smaller than 1/6 sample diameter and height. ASTM D 2434 used for high permeability soils
	<b>Resistivity (soil)</b>	AASHTO T 288	5 jars (3.3 lbs.) of 2 mm or smaller particles.	If possible, obtain approx. 5 lb. bag sample to perform all 4 corrosion tests. Obtain additional material if sample contains particles greater than 2 mm. Keep sample in air-tight container and test as soon as possible.
	<b>pH (soil)</b>	AASHTO T 289	1 jar (0.2 lb.) of 2 mm or smaller material.	
	<b>Sulfate Ion (soil)</b>	AASHTO T 290	1 jar (0.55 lb.) of 2 mm or smaller material.	
	<b>Chloride Ion (soil)</b>	AASHTO T 291	1 jar (0.55 lb.) of 2 mm or smaller material.	
	<b>Organic Content ("Loss of Ignition" Method)</b>	AASHTO T 267	1 jar. Only small amount of material needed (i.e., 0.22 lb. of material passing 2 mm sieve).	Recommended to determine total organic content of soil.
<b>Notes:</b>				
<ol style="list-style-type: none"> <li>1. An equivalent amount of soil from an undisturbed sample (e.g., Shelby tube) can be used in place of a disturbed sample.</li> <li>2. One jar of soil will typically weigh approximately 0.5 lbs. Assumes sample with a 1.375 inch diameter, 5 inches long and unit weight of 110 pcf.</li> <li>3. When using remolded samples, it is preferred to use virgin material for each remolded sample. If adequate sample is not available, it is acceptable to re-use sample that was previously tested.</li> </ol>				

Table 35 - Soil Sample Sizes for Individual Laboratory Tests

	Test or Property	Standard	Sample Type and Quantity	Additional comments
<b>ROCK TESTS</b>	<b>Unconfined Compression</b>	ASTM D 7012, Method C	4 inch min. piece of NQ diameter or larger rock core. Min diameter = 1.85 inch, length to diameter ratio between 2:1 and 2.5:1. Typically several pieces should be tested from a rock stratum.	If required core length is not available, it is permissible to use length to diameter ratio less than 2:1 and correction factor in ASTM D 2938, 1979. See Note 1.
	<b>Point Load Strength</b>	ASTM D 5731	Minimum of 10 pieces of core with diameter between 1.2 and 3.3 inches, and length greater and 30% of diameter. Block and irregular samples can also be used. See test specification for sample size requirements for block and irregular samples.	Test is used as an index test for rock strength classification. It does not measure unconfined compressive strength. ASTM D 7012, Method C should be used when adequate samples are available.
	<b>Fizz Rating</b>	Sobek Method	See PennDOT Acid Bearing Rock Policy Guidelines for testing and sample size requirements. Typically core samples from entire length of coring should be tested, not just core suspected of being potentially acidic.	These three tests are required for Acid-Base Accounting (ABA). Samples are pulverized in lab to pass the 0.25 mm sieve.
	<b>Neutralization Potential</b>	Sobek Method (with Siderite Correction)		
	<b>Total Sulfur</b>	ASTM D 4239		
	<b>Slaking</b>	ASTM D 4644	Minimum 10 pieces of rock core. Each piece should weigh approx. 0.1 lb., which is equivalent to a piece of NQ core that is approx. 0.5 inch long.	Similar size pieces of rock fragments obtained from rock exposures (outcrops), test pits, etc. can also be used.
<b>WATER</b>	<b>Chloride</b>	ASTM D 512	Prior to obtaining samples, coordinate with laboratory that will be performing tests to determine required sample sizes, preservation and storage requirements, and time restrictions.	Lab that will perform tests should provide sample containers, buffering solutions etc.
	<b>Sulfate</b>	ASTM D 516		
	<b>pH</b>	ASTM D 1293		
	<b>Conductivity and Resistivity</b>	ASTM D 1125		
<b>Notes:</b>				
1. $C=C_a/(0.88 + (0.24b/h))$ , where C = computed compressive strength of an equivalent L/D=2 specimen, $C_a$ = measured compressive strength of the specimen tested, b = test core diameter, and h = test core height.				

Table 36 - Rock & Water Sample Sizes for Individual Laboratory Tests

- Use cloth or burlap type bag with sufficient durability to prevent tears and spills.
- Do not place more than 50 pounds of soil in one bag.
- When using large (18"x30") PennDOT canvas bags, a bag filled to the top of logo is approximately 50 pounds of soil.
- Tie bag tightly with string or a plastic zip-tie. Do not use duct tape.
- Use a plastic bag liner at least 3-mil thickness, unless otherwise directed.
- For moisture content samples, place soil in a zip-sealed plastic bag.
- Identify the sample by marking the bag with County, S.R. and Section number, Boring number, Station/Offset. Use permanent marker.
- When sending a bag sample to the MTL, attach a completed PennDOT [TR-447 Sample ID form](#). Blank forms and sample bags can be obtained by contacting any of the DGE offices.

Figure 23 - Proper Bag Sampling of Soil for MTL Samples

### 3.10 BACKFILLING AND PLUGGING OF BORINGS

Drilling Inspectors shall observe and document that borings are properly backfilled with grout in accordance to [Section 210](#) of the standard drilling specifications. Backfilling with cementitious grout serves to permanently stabilize and protect bore locations against environmental hazard such as; artesian flows, groundwater migration between separate aquifers, and vertical migration of possible contaminants into groundwater. Grouting also guards against the hazards of possible surface subsidence of the borehole. All borehole locations, even in remote areas, shall be properly and securely backfilled.

BLANK PAGE

## Chapter 4 - SBST CONTRACT ADMINISTRATION

### 4.1 PRIORITIES & OBJECTIVES

The PGM should remain aware of the overall objectives of the SBST contract, and make appropriate efforts to ensure that the following priorities and objectives are met:

- **Proper Scope.** Obtain adequate information to establish all design parameters with sufficient reliability and to address all subsurface problems that may arise in design or construction.
- **Proper Communication.** Ensure that the following Department personnel (as appropriate) are promptly informed of any conditions that may result in a change in the contract, or any unusual conditions that are encountered during exploration:
  - District Geotechnical Engineer
  - District Bridge Engineer (or Plans Engineer if no structure work is involved)
  - District Environmental Manager
  - Liaison Engineer or Project Manager
- **Proper Documentation.** The subsurface conditions determined by the operations are fully and accurately described in the logs and records.

## 4.2 CONTRACT MANAGEMENT

Projects drilled under Department contracts will be inspected by District personnel or the District's representative.

Projects drilled under Consultant design contracts will normally be inspected by Consultant personnel. Consultant-designed projects can be inspected by Department forces provided the Department inspector is certified and the DGE is a licensed P.E. or P.G. in the Commonwealth. In addition, the DGE must review the core boxes and check and initial the *Final Engineer's Log*.

For projects where the geotechnical Consultant (or a subsidiary company thereof) is also a Drilling Contractor, the Consultant may be permitted to provide the project drilling services and to inspect the work performed by their own Driller. See *Chapter 4.5* for more clarification on the requirements for this case.

All inspection will be the responsibility of the PGM. One full-time, certified inspector shall be assigned to each drill rig.

Any supervisor or inspector who does not demonstrate adequate proficiency or dependability at the project site, or engages in activities contrary to the best interest of the Department, as determined by the DGE, will be subject to removal from the project. A qualified replacement will be required before work will be permitted to resume. The DGE must complete a written evaluation (*Drilling Inspector Performance Evaluation*) of the Inspector, within three working days of removal. Upon completion, the evaluation must be submitted to the removed Inspector, with a copy to the CGE.

### 4.3 PREPARATION OF PROPOSAL/CONTRACT

Prepare a draft subsurface investigation plan and submit to the DGE for approval. The plan must include the proposed types, depths and locations of all borings, and the preliminary laboratory testing plan.

A proposal/contract for undertaking the necessary field work shall be prepared using the current SBST Contract. Submit the proposal/contract to the DGE for review and acceptance as directed.

Preparation of the Proposal shall include the following items:

- (a) **Property Owners.** Send notice to all affected property owners as detailed in [Subchapter 5E, Section 103.11](#).
- (b) **Railroad Right-of Way.** Consider entry onto railroad right-of-way.
- (c) **Overhead Utilities.** The requirements for working near overhead utilities are discussed in [Section 103.09\(b\)](#) of the Standard Specifications for SBST. When any part of the drill rig, including drill steel, is proposed to be located within 20 ft. of overhead power lines, the PGM/DGE shall contact the utility owner to determine the voltage in the line in order to ensure that the clearance distance requirement of [Section 103.09\(b\)](#) is met. In situations where clearance between overhead lines and drill equipment is less than required in [Section 103.09\(b\)](#), the PGM/DGE must coordinate this work with the appropriate utility company. Specific directions and necessary special provision(s) and pay item(s) to conduct this work must be prepared by the PGM/DGE and included in the contract.
- (d) **Methane and Carbon Monoxide Gases.** The requirements for working where methane gas or carbon monoxide gas may be encountered are discussed in [Section 103.09\(c\)](#) of the Standard Specifications for SBST. In situations where it is suspected that methane or carbon monoxide gas may be encountered (i.e., where deep mines are likely to be encountered, where drilling in the vicinity of deep mines, where mineable coal seams may be encountered) the PGM/DGE must include specific direction for methane and carbon monoxide monitoring in the contract. Typically, monitoring requirements are included in the schedule of drilling, and monitoring is incidental to the cost of drilling; however, special provisions or pay items may be warranted in certain situations where an atypical level of monitoring is needed. During the subsurface investigation, if an elevated concentration of methane or carbon monoxide is encountered which prevents drilling and grouting of boreholes, the PGM/DGE should be prepared to provide direction to the drilling contractor. The PGM/DGE may contact PA-DEP personnel, the CGE, and/or others for technical assistance.
- (e) **Anticipating the Method of Advancing Soil Borings.** The PGE shall consider if a specific method of advancing soil borings is required or preferred, based on the anticipated site conditions. The [Attachment I, Schedule of Proposed Borings](#), should typically indicate the anticipated method of hole advance for soil borings will be "Advanced by means selected by Contractor". By doing this, the Contractor is responsible to select the most effective means/methods to accomplish the work. If the method does not work, the method will have to be modified. If, when preparing the contract, the PGE decides a specific method of boring advancement is needed, that method should be specified (e.g., hollow-stem auger, drive casing). Hollow-stem augers are the commonly preferred choice of boring advancement; however other options such as steel casing are occasionally employed. In some cases, augers

cannot successfully advance – like cobbles/boulders, fills with obstructions, very dense tills, limestone ledges, cap rock above mine voids, etc.

- (f) **Contract Documents.** Prepare the SBST Contract documents in accordance with the investigation plan approved by the Department. Prepare a plan of the foundation layout indicating the location of the test borings and other pertinent information.
- (g) **Cost Estimate.** Prepare an Engineers Estimate of the cost of the work.
- (h) **Letter of Interest.** Prepare a draft letter of interest advertising solicitation of bids for the subsurface investigation contract. Inform potential bidders in the letter that a reply is required by the date indicated in the letter of interest, and advise that all replies must be sent back to the email address indicated using the response form supplied in the email (*Drilling Contractor Letter-of-Interest Response Form*). Except for cases as noted in *Chapter 4.5*, the letter is to be sent by email to all Drilling Contractors on the current list of PennDOT Prequalified Drilling Contractors. Include a copy of the *Drilling Contractor Letter-of-Interest Response Form* and Letter of Interest with the email to each prequalified Drilling Contractor. Include the following in the letter:
  - Provide the MPMS number for the proposed work.
  - Provide the anticipated type of borings, samples, and field tests with approximate quantities.
  - Provide the location of the holes (water or land).
  - State whether or not Maintenance and Protection of Traffic drawings will be provided or required.
  - State whether any boring or test pit locations are within 100 ft. of any domestic water supply well or spring box, and if so include the appropriate as required by *Section 219*.
  - State whether the railroad requires safety training prior to entry on its right-of-way; anticipated dates for bid opening and Notice to Proceed;
  - Attach a map that would allow anyone unfamiliar with the area to find the project.
  - Describe any other pertinent information.
- (i) **Cover Letter.** Prepare a draft of the letter to be used to transmit the SBST Contract documents to the Drilling Contractors who respond to item (h). Include in the letter the county, state route, and section numbers of the project; the date, time and location of the mandatory pre-bid meeting (if required); the date, time and location of the bid opening; the MPMS number for the project (to be used for input into gINT); and a reminder to follow the instructions in the Instructions to Bidders.
- (j) **Contract Documents.** Prepare and transmit the contract documents to the drilling contractors expressing interest. The cover letter and accompanying contract documents must be sent by way of certified mail or hand-delivery.

## DRILLING CONTRACTOR LETTER-OF-INTEREST RESPONSE

### Subsurface Investigation Contract for PennDOT Project

Attached is a "Letter-of-Interest" describing work to be conducted on the project indicated below. Please review the attached letter, and indicate whether you are interested in bidding on this work. To receive a bid package, you must respond by the date indicated in the letter of interest. If you have questions concerning this work, please contact the representative indicated.

<b>Project Information:</b> (To be completed by Consultant)	
District	
County	
SR	
Section	
Nearest Municipality	
Consultant Executing Contract	
Consultant Project Number

#### 4.4 FACILITATION OF CONTRACT BIDDING

The PGM shall ensure that the following requirements are completed during the bid process:

- (a) **Pre-Bid Meeting.** Conduct the mandatory pre-bid meeting unless indicated otherwise by the DGE. At this time all borings shall be staked on the project. Pre-bid meeting minutes must be sent to all contractors that attended the pre-bid meeting. Minutes may be sent via certified mail, email (with read receipt verification), or hand delivered). Sufficient time must be given to allow contractors to receive and review pre-bid meeting minutes prior to bidding date. Questions submitted by a contractor after the pre-bid meeting minutes have been distributed shall be responded to via email by replying with the question and answer to all contractors that attended the pre-bid meeting. Questions can be submitted up to 3 business days before the bid opening. If a response is provided, it must be emailed one business day (no less than 24 hours) prior to bid opening. If a question arises that impacts the scope of the project, a time extension to submit bids may be required, or as directed by the DGE.
- (b) **Bid Opening.** Attend the bid opening at the project District office, if practical. Alternately, bids may be opened at the consultant Engineer's office, provided that the DGE, or representative approved by the DGE, is present. Check the bid documents for completeness, correctness of quantities, and cost tabulations. Tabulate the bid results. Determine the low bidder. Obtain concurrence of the District Office in writing (email is acceptable) on the acceptability of the low bidder. In the case of a tie bid where the bids were required to be submitted electronically, the final electronic bid submission that was received the earliest of the tied bids will be the apparent low bid. In the case of a tie bid where the bids were submitted on paper, a coin toss between the tied bidders will determine the apparent low bidder. Otherwise, the project must be re-bid.
- (c) **Contractor Notification.** Notify all bidders of the results; send each a tabulation of the bids. Return all proposal guarantees except those of the two lowest bidders. Notify the lowest bidder to complete the forms in the bid package and furnish the required Contract Bond, Additional Bond for labor and Material, and insurance certificates. Notify the second lowest bidder that their proposal guarantee will be held until the lowest bidder completes the necessary paperwork.
- (d) **Notice to Proceed.** Review the lowest bidder's submissions for completeness. The insurance certificate shall name the Commonwealth of Pennsylvania as co-insured. When all submissions are complete, return the proposal guarantees and issue a Notice to Proceed. Notice to Proceed should clearly state the day on which the time charges will begin.
- (e) **DGE Notification.** Provide the DGE a copy of all correspondence at the time it is sent out. Only one copy of the advertisement letter is needed. Furnish a copy of all pages in the bidding package in which the contractor has filled in information, and copies of the bonds and insurance certificates.
- (f) **Statewide Notification.** Contracts let by the Department shall be advertised in either the *Engineering and Construction Management System (ECMS)*; or the *Supplier Relationship Management (SRM)* system, as appropriate.
- (g) **CGE Notification.** Upon award of contract to successful bidder the PGM (Consultant for consultant contracts, DGE for department contracts) must submit a completed copy of the "Form Of Proposal" ([Subchapter 5C](#)) to the CGE to the address shown in [Chapter 1.1](#). This includes work performed under provisions of [Chapter 4.5](#). Include

the completed copy of *Drilling Contractor Letter-of-Interest Response Form* for the successful bidder (or entity performing work when using *Chapter 4.5*).

## 4.5 ACCELERATED ACQUISITION OF DRILLING & TESTING SERVICES

### 4.5.1 Acquisition of Drilling & Sampling

Bid solicitation for drilling services during both Preliminary Engineering and Final Design may be simplified for consultant-designed projects where the Engineer's cost estimate for drilling is **\$30,000, or less**. In such cases, the District has the option to direct the project geotechnical consultant to obtain drilling services as follows:

- (a) The Consultant or sub-Consultant may perform the drilling services with their own forces if they (or their owned subsidiary doing the drilling) are a PennDOT Prequalified Drilling Contractor. In such cases, the DGE shall conduct a quality assurance field review of the drilling operations and complete a *Drilling Inspector Performance Evaluation* and also a *Drilling Contractor Performance Evaluation*. The DGE shall provide written concurrence to the Project Manager that the unit prices for drilling services are reasonable and competitive. If concurrence on reasonable and competitive unit prices cannot be reached, then follow the method described in *Chapter 4.5.1(b)*, below.
- (b) If the Consultant or sub-Consultant is not a PennDOT Prequalified Drilling Contractor, the drilling services may be provided by soliciting written quotes from at least three (3) PennDOT Prequalified Drilling Contractors. The DGE must consider the contractors as viable and likely to submit a bid for the work. In this case, 'viable' is defined as a driller who regularly performs services for Department projects and is located geographically such that it is reasonable to expect that they could competitively provide the required services and would have an expectation of being interested in pursuing this work under normal procedures. At least two bids should be received to justify a choice of a firm. In rare cases where only one bid is received, written documentation shall be on record showing at least two other viable firms were solicited but chose not to bid the work. The DGE shall provide written concurrence of the bid award to the Project Manager and indicate that the low-bid unit prices are reasonable and competitive.

If the Engineer's cost estimate for drilling is **more than \$30,000**, the Consultant shall prepare and send a letter of interest advertising solicitation of bids for the subsurface investigation contract to all Contractors on the current list of PennDOT Prequalified Drilling Contractors. The Consultant (or the Consultant's subsidiary) may not bid on the contract or perform drilling services with their own forces.

In all cases, the drilling and field testing services provided must follow the technical and performance provisions of this publication.

### 4.5.2 Acquisition of Laboratory Testing

Laboratory testing of soil and rock materials collected during the subsurface investigation must be performed by an AASHTO Materials Reference Laboratory (AMRL) that is accredited for each test method to be conducted (except where AMRL does not certify a specified test method). Proof of accreditations must accompany any Price Proposal.

The laboratory test results must be reviewed and attested by a Professional Engineer registered in the state of Pennsylvania.

According to the *PennDOT Policy and Procedures for the Administration of Consultant Agreements, Publication 93, Chapter 3.6.7*, laboratory testing is considered a “non-professional service”. The laboratory testing may be performed by the prime consultant’s AMRL certified laboratory. A project Price Proposal must be submitted by the consultant, and must include a schedule of unit prices (per test) for the laboratory tests proposed. The DGE shall review the Price Proposal and provide written concurrence to the Project Manager indicating the proposed unit costs are fair and reasonable. If fair and reasonable unit costs are not evident, obtain three written quotes or documented telephone quotes to justify a choice of laboratory testing provider. Sample transport costs and administrative costs shall be considered in the justification. Accordingly, it is usually most efficient (considering direct-costs and logistics) for the administering geotechnical consultant to perform the laboratory testing services with their own forces, provided they meet the AMRL certification requirements. If needed, more than one laboratory may be used to perform the AMRL certified tests for a project.

## 4.6 DEPARTMENT-LET CONTRACTS

Drilling contracts executed directly by a PennDOT District or County office must use the appropriate processes to procure drilling services and follow the technical and performance provisions of this publication (including Attachment II). Purchasers and Project Managers should include a requirement in procurement documents that vendors providing drilling services must appear on the approved list in **Publication 222**.

ECMS - PennDOT's Engineering and Construction Management System (ECMS) may be used for planned drilling services for design and construction projects only.

Examples:

- geotechnical test boring, sampling and testing,
- pavement coring, sampling and testing
- bridge design and replacement
- highway design and construction

SRM - The appropriate Supplier Relationship Management (SRM) End User Procedure, based on annual purchasing thresholds, should be followed to obtain on-call drilling services. On-call drilling services may be used for work not covered by an ECMS contract.

Examples:

- emergency repairs to highways and bridges due to rock slides or landslides
- occasions when drilling is needed while performing maintenance operations
- drilling projects to be completed prior to establishment of a specific ECMS contract

When using SRM for drilling services, the SRM purchasing and bid documents must provide clear specifications regarding the scope of work and geographic coverage area. It is acceptable to have multiple SRM Contracts or POs (purchasing documents), if a clear distinction is made as to what work or geographic area is covered by each purchasing document; however, there shall not be any overlap of work or geographic areas, if multiple purchasing documents are in place. Duplicate purchasing documents with no discernible difference in how work is assigned to multiple vendors under the same or similar contract are not acceptable.

Districts and Counties should ensure compliance with PennDOT [Procurement Directive 10-02](#) whenever drilling services are needed. If necessary, purchasers should contact the Bureau of Office Services, Procurement Help Desk at 717-346-9900 to discuss such contracts.

All drilling work completed under contract must be inspected by a certified drilling Inspector.

## 4.7 ENTRY ONTO RAILROAD RIGHT-OF-WAY

### 4.7.1 Temporary Railroad Right-Of-Entry Permit/Agreement

Entry onto Railroad right-of-way (property) may be required for construction activities as well as inspection, maintenance, survey, soil borings, engineering studies, etc. Therefore, in order to gain entry onto Railroad property a Department's contractor and/or their subcontractors or a Department's consultant and/or their sub-consultants may be required to enter into a temporary Railroad Right-of-Entry (ROE) permit/ agreement with the Railroad.

Because Railroad ROE permits/agreements have been determined to be a contract and they are not in compliance with the Commonwealth Attorneys Act, the Department **cannot** sign such documents. Only the Department's contractor or consultant who is performing the required work activities on the Railroad's property can sign a ROE permit/agreement. Refer to the latest edition of *Publication 371*, Chapter 7, Section 7.03 "Entry onto Railroad Property".

### 4.7.2 Department Scope of Work Details and Method of Payment

The following activities may be required by the Department's District Grade Crossing Engineer/Administrator (DGCE/A), District Project Manager (DPM), or District Liaison Engineer (DLE) regarding scope of work details and method of payment for design consultant projects.

- (a) The DGCE/A, DPE, or DLE shall consult the Railroad to determine any special requirements that the Railroad may have in order for the Department's contractor or consultant to gain access onto Railroad property.
- (b) Information obtained shall include but not be limited to Railroad insurance requirements, ROE permit/agreement fees, copies of applicable permits, time required to process permit, required safety training, Railroad specifications, and if necessary, associated flagging costs and necessary arrangements for flagging protection.
- (c) The DGCE/A, DPM, or DLE shall insure that all applicable Railroad ROE requirements are contained within the Department's scope of work/contract for the project.
- (d) The scope of work shall detail the method of payment for design consultant projects. If the method of payment is not included in the original consultant agreement, it shall be processed as a supplement.
- (e) For District in-house projects where geotechnical explorations are to be performed by Department personnel, the DPM, DLE, or DGE shall notify the DGCE/A so as to obtain all necessary Railroad ROE requirements and procedures, and method of payment prior to entry onto Railroad Right-Of-Way. Note that the Department cannot sign Railroad ROE permits/agreements, but if the Railroad requires a permit/agreement to be entered into with the Department, consult with the Department's Office of Chief Counsel before proceeding further.
- (f) The DPM, DLE, DGE, or DGCE/A shall make provisions for reimbursement of Railroad costs based on Department guidelines and procedures.

#### 4.7.3 Consultant/Contractor ROE Requirements and Method of Payment

The following activities may be required by the Department's consultant or contractor, including any sub-consultants or sub-contractors, (Applicant) in order to obtain a Temporary Railroad ROE permit/agreement and method of payment:

- (a) Contact Railroad to determine any special requirements the Railroad may have.
- (b) The consultant's technical and price proposal shall address all procedures required by the Railroad in order to obtain the necessary Temporary Railroad ROE permit/agreement and method of payment for Railroad invoices, permit fees, etc. This shall include, but not be limited to, ROE permit/agreement procedures with associated costs with Railroad turnaround time for processing permits/agreements, Railroad insurance, flagging costs, Railroad safety training, and required notifications to Railroad prior to entry onto Railroad right-of-way.
- (c) Information for each individual entry by Applicant shall be supplied to the Railroad in accordance with their specification and/or permit requirements when applying for the ROE permit. This shall include scope of work, exact location of the entry, estimated cost of work to be performed on the railroad property, distance from the outermost track where the activities will take place, anticipated date of entry, number of people, and length of time.
- (d) Applicant shall obtain a copy of the Railroad's Temporary ROE permit/agreement. The Applicant shall submit the completed and signed permit/agreement, with applicable supporting documentation and permit fees to the Railroad for execution. The Railroad shall forward the executed ROE permit/agreement to the Applicant. The Railroad will advise the Applicant of any necessary modifications required based upon Railroad's policies and procedures.
- (e) Prior to entry onto Railroad ROW an executed ROE permit/agreement must be in the possession of the Applicant.
- (f) Railroad will submit invoices directly to the Applicant for services rendered and payment shall be made by Applicant in accordance with Railroad's procedures.

#### 4.7.4 Entry onto Railroad Right-Of-Way

Prior to entry onto the Railroad Right-Of-Way (ROW) for the geotechnical exploration the following activities are required:

- (a) Determine an exact scheduled starting date and ending date for the entry onto Railroad ROW.
- (b) Incorporate these dates in the letter seeking bidder interest and the proposal.
- (c) Where District policy allows an alternative to a defined schedule, note the desired method of scheduling in the letter seeking bidder interest and in the proposal.
- (d) Notify the District of the scheduled starting date at least thirty (30) days before the start date and provide the Railroad the required notice in accordance with Railroad's specifications and/or permit requirements.

- (e) Comply with the Railroad's required safety training prior to entering.
- (f) Maintain an independent record of personnel making entry, date of entry, purpose of entry, railroad personnel and equipment present and their activities, etc. review and countersign railroad time sheet(s) daily; do not countersign if there is a disagreement - notify the District. Forward a copy of the time sheet(s) to the District within fifteen (15) days of their receipt.

#### 4.8 CONTRACT SPECIAL PROVISIONS

The standard specifications for SBST as shown in the test boring contract document shall apply to all subsurface investigation work performed for the Department including work performed under an *Engineering and Construction Management System (ECMS)* or *Supplier Relationship Management (SRM)* contract. If changes are required for a specific job, they shall be handled in a similar manner to special provisions and included in Attachment II of the test boring contract. The attachment is referred to as Modifications and Additions to Standard Specifications for SBST. It is in this section that modifications to the specifications can be made (which might include changes of method of payment, deletion of sections, modification of work, etc.) to suit various situations which may arise.

## 4.9 DISPOSITION OF SOIL AND ROCK SAMPLES, AND PROJECT RECORDS

Upon completion of drilling operations (or periodically during the drilling operations for larger projects), arrange for the contractor to deliver all samples and core boxes to the location designated in the SBST Contract ([Subchapter 5A, Article H](#)). If the designated location is not the District's storage facility, arrange for delivery to the District facility, after work (logging and lab testing) with the materials has been completed. Any delivery to a District facility requires a seventy-two (72) hour notice, and must be accompanied by a [PennDOT Form No. TR-440, Chain of Custody for Subsurface Boring Sample Boxes](#).

Sample specimens selected for laboratory testing shall be removed from the core boxes prior to delivery to the District's long-term storage facility. Accessing specimens from core boxes which have already been placed in long-term storage should only be done under unusual circumstances and will require coordination with the DGE. In all cases, when a soil or rock sample is taken from a core box for testing, a durable spacer (e.g., glass sample jar, wood block) shall be used to fill the space created. A written description of the sample and purpose for removal shall be placed in the glass jar, or securely fastened to the spacer.

### 4.9.1 Disposition of Test Boring Samples

Test boring samples from the soils investigation may be discarded after six (6) months have elapsed following the acceptance of the "[Notification of Final Quantities and Contract Settlement Amount](#)" by the Contractor, provided the Contractor has not notified the Department of any rejection, exception, or intention to file a claim relating to any matter. In the event of a claim, intent to file a claim, rejection, or exception either by the Contractor or the Department, the samples must be kept until authorization is received from the Office of Chief Counsel to discard.

### 4.9.2 Disposition of Paper Records

Paper records, including all logs; field and laboratory test results, and reports must be retained for seven (7) years from the date of final payment to the contractor, if it is a 100% State-funded project; for Federal-aid projects, seven (7) years from the date of final payment to the contractor or three (3) years from the date of final FHWA reimbursement, whichever is later. If a claim has been filed by the Contractor or the Department, these records will be retained until directed by the Office of Chief Counsel.

#### 4.10 WORK ORDERS AND DISPUTED WORK

Consult with the District Geotechnical and project Liaison Engineer (if applicable) prior to submitting a work order and when encountering a dispute on the type of work.

Submit work orders to the DGE or project Liaison Engineer, in letter form, explaining the reason for the work; quantity, type, unit prices, and money value for each item of work; include any sketch that may be necessary to explain or locate the work. Also submit a letter from the contractor agreeing to the quantity, type, unit prices, and money value for each item; include any other data that may be needed to justify the price. Both the work order and the contractor's letter should mention any agreed to time extension. Do not inform the contractor to proceed with the work until receiving written authorization from the District Executive.

Provide documentation of any disputed work.

#### 4.11 SUBMISSIONS TO THE DEPARTMENT

The project Geotechnical Consultant is responsible to assure the delivery of the following information to the Department's DGE in which the project is located:

- (a) **Field Logs.** Provide a copy of the Drilling Inspector's Log within forty-eight (48) hours of obtaining the last groundwater level reading. These may be hand-written or computer-generated logs.
- (b) **PennDOT Final Engineer's Logs.** Provide the Final Engineer's Logs for test borings and test pits, within fourteen (14) days of completing the investigation. Electronic logs must be in .pdf format via FTP site. Electronic logs and test results must be individually sealed by a P.E. or P.G., with signature and date, attesting to the accuracy of all information. The P.E. or P.G. must be the PGM or PGE of record and registered in the Commonwealth of Pennsylvania.
- (c) **PennDOT gINT Project File.** Provide the PennDOT gINT Project file(s) for test borings and test pits, and all field and laboratory tests, within fourteen (14) days of completing the investigation. The PennDOT gINT Project file(s) must be prepared in accordance with **Publication 222** and follow the project file naming convention specified in [Chapter 3.6.6](#). The PennDOT gINT Project file(s) are to be delivered via FTP site.
- (d) **Sample Photographs.** Provide all core box and test pit photographs utilized in the PennDOT gINT Project file(s) within fourteen (14) days of completing the project, or earlier if requested by the DGE. Individually photograph each completed core box in accordance with [Chapter 3.7](#). Submit photo files in .jpg format via FTP site and follow the photograph naming convention as specified in [Chapter 3.7](#).
- (e) **PennDOT Form TR-440.** The Consultant is responsible to forward a signed copy of the completed form(s) [TR-440, Chain of Custody for Subsurface Boring Sample Boxes](#) and [TR-440A, Tabulation Supplement](#), to the DGE within seven (7) days of delivery of boxes to the PennDOT storage facility. Blank TR-440 and TR-440A carbon forms can be obtained by contacting the DGE office.
- (f) **Other Records.** Provide a copy of any correspondence, records, notes, tabular forms, etc. developed during the investigation, and any other information that the Department considers necessary for its records. Provide electronic files via FTP site.

The Consultant shall submit the following electronic files on CD(s) or DVD(s) (submit via FTP, only when available and directed by CGE) to the Department's CGE within fourteen (14) days of completion of the investigation, testing, or report:

- (a) **PennDOT gINT Project File.** Include the PennDOT gINT Project file(s) for test borings and test pits.
- (b) **Logs and Material Tests.** Include the Final Engineer's Logs and all field and laboratory tests in .pdf format.
- (c) **Sample Photographs.** Include all test pit and core box photographs. Files must be in .jpg format and follow the file naming convention and format per [Chapter 3.7](#).
- (d) **Cover letter.** Include a paper cover letter and electronic file on disk that lists the full contents of the disk(s) in .pdf format. Letter must be sealed by a P.E. or P.G., with signature and date, attesting to the accuracy of all information. The P.E. or P.G. must be the PGM or PGE of record and registered in the Commonwealth of Pennsylvania.

## **Chapter 5 - SBST CONTRACT DOCUMENTS**

### SUBCHAPTER 5A - INSTRUCTIONS TO BIDDERS

**INSTRUCTIONS TO BIDDERS**

**SUBSURFACE BORING, SAMPLING, AND TESTING CONTRACT**

For

---

---

---

Issued by

---

---

---

Dated

---

**ARTICLE A - GENERAL**

**Section A-1** - The following instructions are for the information and guidance of Contractors submitting a proposal for the subject Subsurface Boring, Sampling and Testing Contract.

**Section A-2** - Definitions. The term "PGM" referred to in the Contract Documents is the party issuing these Instructions to Bidders and is under contract with the Pennsylvania Department of Transportation (hereinafter referred to as the "Department") in regard to the completion of the subject Subsurface Boring, Sampling, and Testing Contract. If issued by the Department, the Department will also be considered as the PGM. All other parties are as defined in the Standard Specifications for Subsurface Boring, Sampling, and Testing.

**Section A-3** - The Contract Documents shall consist of the Instructions to Bidders; the Form of Proposal; the Contract Agreement; the Standard Specifications for Subsurface Boring, Sampling, and Testing; the Plan and Location of Borings; the Attachments; and all subsequent addenda and modifications. These documents are essential parts of this Contract and are intended to be complementary and to describe and provide for the complete Work. A requirement occurring in one document is as binding as though occurring in all.

In case of discrepancy, the document requiring the most demanding and costly alternative for the Contractor shall be given priority when bidding.

**ARTICLE B - LOCATION OF BORINGS**

**Section B-1** - The test boring locations for the subject Subsurface Boring, Sampling, and Testing Contract are indicated in the attached plans entitled, "Plan and Location of Borings, \_\_\_\_\_", prepared by \_\_\_\_\_ and dated \_\_\_\_\_.

**ARTICLE C - SCOPE OF WORK**

**Section C-1** - The estimated work item quantities for this test boring program are set forth in *Attachment I, Schedule of Proposed Borings*, and in the Form of Proposal.

These quantities are estimates only. The quantities stipulated in the Form of Proposal have been issued for the purpose of comparing bids and, as such, are subject to change by the PGM.

The approximate locations of the test borings are presented in the Plan and Location of Borings referenced in *Section B-1* above. The actual locations and depths of undisturbed soil samples, special field tests, and/or borehole instrumentation will be determined by the PGM during the course of the drilling operations.

**Section C-2** - The Contractor will be required to provide no fewer than \_\_\_\_\_ and no more than \_\_\_\_\_ fully equipped, operating and manned drilling machines per work shift for work on this Contract with a minimum full-time crew of two persons per rig, including one qualified driller and one helper. The PGM and/or Contractor may request additional rigs if mutually agreeable. The maximum recall time will not exceed six (6) months.

**Section C-3** - The original handwritten driller's field log for each boring must be submitted to the PGM at the completion of the boring.

**ARTICLE D - SUBMISSION AND COMPARISON OF PROPOSALS**

**Section D-1** - Submit two (2) copies (both copies with original signatures) of the executed Form of Proposal and Contract Agreement to:

Commonwealth of Pennsylvania  
Department of Transportation  
District \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

before \_\_\_\_\_ a.m., p.m. prevailing time, on \_\_\_\_\_ . Proposals will be opened and read at \_\_\_\_\_ a.m., p.m. of the same day in the District Office of the Department. Seal the proposal in an envelope plainly marked with the Bidder's name and address, and as follows:

**BID DOCUMENTS:**

SUBSURFACE BORING, SAMPLING, AND TESTING CONTRACT FOR

\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

To be Opened: \_\_\_\_\_

At \_\_\_\_\_ a.m., p.m.

**Section D-2** - Enclose a proposal guaranty of ten (10) percent of the PROPOSED TOTAL COST OF CONTRACT, but not less than \$50.00, with the proposal as a guaranty that in the event the proposal is accepted and a Contract awarded, the Contract will be duly executed and its performance duly secured by the required Contract Bond and Additional Bond for Labor and Materials. The proposal guaranty shall be in the form of a Cashier's Check, a Treasurer's Check, a Certified Check, a Letter of Credit, or a Proposal Guaranty Bond with surety made out to \_\_\_\_\_, in the amount specified after the words "Amount of Proposal Guaranty" as shown in the Form of Proposal.

Where the bidder does not comply with their proposal and does not provide a Contract Bond and an Additional Bond for Labor and Materials within a period of thirty (30) calendar days, if award is made to them, the proceeds of the Cashier's, Treasurer's, or Certified check or Proposal Guaranty Bond submitted as a proposal guaranty with their proposal will be forfeited to the use of the PGM as liquidated damages. All proposal guarantees will be returned when the successful Contractor has executed a contract and has submitted a Contract Bond and an Additional Bond for Labor and Materials.

**Section D-3** - Execute and return with the proposal "Affidavit Accepting Provisions of the Workmen's Compensation Act" which is described in [Section J-3](#) and is included as [Attachment IV](#) of these Instructions to Bidders.

**Section D-4** - The bidder to whom the Contract is awarded will be required to execute a

"Contract Bond," covering satisfactory performance of the work contracted, in the penal sum of

1/2 (50%) of the amount of the Contract, and an "Additional Bond for Labor and Materials," covering the prompt payment in full for utility services rendered and for all materials furnished and/or labor supplied or performed in the prosecution of the work, also in the penal sum of 1/2 (50%) of the amount of the Contract. Both bonds must also be executed by a corporate surety satisfactory to the PGM. The same surety must execute both bonds and should any surety upon such bonds become unsatisfactory to the PGM, the Contractor must promptly furnish such additional security as may be required from time to time to protect the interests of the PGM, the Department and of persons, firms or corporations supplying utility services, materials, and/or labor in the prosecution of the work contemplated by the Contract. The cost of these bonds shall be entered as the Fee for Contract Bond and Additional Bond for Labor and Materials presented in the Form of Proposal.

**Section D-5** - The PGM reserves the right to reject any and all bids, to waive technical defects and to accept or reject any part of any bid, if in the PGM's judgment, the PGM's and Department's best interests will be served thereby. In acting on proposals, cash discounts will not be considered.

**Section D-6** - The proposal as made will be deemed an offer which may be accepted by the PGM at any time within sixty (60) days after bids are opened. When the proposal has been accepted by the PGM, the Contract Agreement will be executed by the PGM and the successful bidder shall be the "Contractor." No other Contract Documents will be executed by the PGM.

## **ARTICLE E - EQUAL EMPLOYMENT OPPORTUNITY AND NON-DISCRIMINATION**

**Section E-1** - The Contractor shall abide by the requirements for equal employment opportunity and non-discrimination set forth in [Publication 408](#), Appendix C, Designated Special Provisions 10, 11 and 12 (DSP 10, 11 & 12).

## **ARTICLE F - DISADVANTAGED BUSINESS ENTERPRISES**

**Section F-1** - In connection with the performance of the Contract, the Contractor will be required to take affirmative action in regard to utilization of disadvantaged business enterprises and will use their best efforts to ensure that disadvantaged business enterprises will have the maximum practicable opportunity to compete for subcontract work under this Contract. The Contractor shall abide by the requirements set forth in [Publication 408](#), Appendix C - Designated Special Provisions 7 and 10 (DSP 7 & 10)

## **ARTICLE G - IDENTIFICATION OF SAMPLES AND DOCUMENTS**

**Section G-1** - All samples, reports and other documents obtained or prepared as a part of this Contract will include the following identification on the label, front cover, or title page in addition to other information required in the Standard Specifications for Subsurface Boring, Sampling and Testing:

---

---

**ARTICLE H - DISPOSITION OF SAMPLES**

**Section H-1** - The contractor is required to remove, at their expense, all samples and core boxes from the job site at the end of each work shift and provide storage until such time as they are delivered by the contractor to the designated locations. The storage facilities must conform to the requirements set forth in the Standard Specifications for Subsurface Boring, Sampling, and Testing, [Section 215](#), Packaging, Protection and Shipment of Samples.

After completion of all test borings, the Contractor will be required to deliver, at their expense, all soil samples and rock core boxes to:

---

---

---

**Section H-2** - After completion of all test borings, and during the delivery procedures, each party responsible for identification and custody of the core boxes is required to fill out the appropriate section of the [PennDOT Form No. TR-440, "Chain of Custody for Subsurface Boring Sample Boxes"](#).

The PGM will be responsible to provide this form to the successful low bidder at the beginning of the project. The forms can be obtained from the PennDOT District office.

**ARTICLE I - MANDATORY PRE-BID MEETING**

Unless otherwise specified by the DGE, a drilling project requires a mandatory pre-bid field meeting. Only PennDOT prequalified drilling contractors who attend the mandatory pre-bid meeting may bid on the project. When the pre-bid meeting requirement is waived by the DGE, any PennDOT prequalified drilling contractor may bid on the project.

A representative of the PGM will be available to accompany the bidders on a field view of the project area on \_\_\_\_\_, at \_\_\_\_\_ a.m., p.m. prevailing time. The meeting location will be at \_\_\_\_\_. If you plan to attend this field view, please signify so by calling \_\_\_\_\_, at \_\_\_\_\_, before \_\_\_\_\_.

Pre-bid minutes and agenda will be provided to the drillers in attendance, no later than five (5) working days before the bid opening. Pre-bid minutes will be an addendum to the Contract.

## ARTICLE J - INSURANCE AND LIABILITY

**Section J-1 - Limits of Coverage.** The Contractor must procure and/or maintain at its expense the insurance coverage stipulated in the Standard Specifications for Subsurface Boring, Sampling, and Testing, all with limitations of not less than:

TYPE OF COVERAGE	LIMITS OF LIABILITY	REQUIRED MINIMUM COVERAGE
Bodily Injury	Aggregate	\$1,000,000
Property Damage	Aggregate	\$1,000,000
Automobile Liability (Bodily Injury)	Aggregate	\$1,000,000
Automobile Liability (Property Damage)	Aggregate	\$1,000,000
Workmen's Compensation	As Required By Applicable Law	
Employer's Liability	Aggregate	\$1,000,000
Umbrella Liability (Bodily Injury and Property Damage Combined)	Aggregate	\$1,000,000

**Section J-2 - Additional Insurers.** The PGM, \_\_\_\_\_, and the Department shall be named as additional insured under the above said Bodily Injury and Property Damage Insurance policies by endorsement thereto and such insurance shall be primary to any other insurance maintained by the PGM or the Department.

**Section J-3 - Workmen's Compensation.** Execute and return with the proposal the "Affidavit Accepting Provisions of the Workmen's Compensation Act" which is included as [Attachment IV](#) to these Instructions to Bidders, to signify acceptance of the provisions of the Workmen's Compensation Act.

## ARTICLE K - MODIFICATIONS TO THE STANDARD SPECIFICATIONS FOR SUBSURFACE BORING, SAMPLING, AND TESTING

**Section K-1 - [Attachment II](#)** to these instructions defines specific modifications or additions to be included as part of the Standard Specifications for Subsurface Boring, Sampling, and Testing for this Contract.

## ARTICLE L -SCHEDULE FOR WORK ON RAILROAD RIGHT-OF-WAY

**Section L-1 - [Attachment III](#)** to these instructions explains the requirements for a defined schedule for work on Railroad Right-of-Way. Borings and drilling quantities to be completed within the Railroad Right-of-Way should be included with the defined schedule.

## SUBCHAPTER 5B - CONTRACT ATTACHMENTS

ATTACHMENT I - Schedule of Proposed Borings

### **(3)ROCK DRILLING AND CORING**

- NX - NX or NQ rock coring
- B - \_\_\_\_\_-inch diameter rock coring`
- C - \_\_\_\_\_-inch diameter destructive rock drilling

\_\_\_ - \_\_\_\_\_

### **(4)SPECIAL INSTALLATIONS**

- P - Piezometer pipe
- PC - Protective casings
- PS - PVC Sensing Sections
- PT - Porous tube piezometer tips (indicate total)
- IC - Inclinator
- VW - Vibrating wire piezometer

\_\_\_ - \_\_\_\_\_

### **(5)BOREHOLE TESTING**

- CP - Cone penetration testing
- CP - Constant head permeability testing
- DR - Dilatometer testing
- FP - Falling head permeability testing
- HP - Hydraulic pressure testing
- PR - Pressuremeter testing
- T - Temperature measurement
- VS - Vane shear testing
- BC - Borehole camera investigation

\_\_\_ - \_\_\_\_\_

### **(6)OTHER**

- TP - Test pit
- TWS - Temporary water service
- W - Boring drilled on water
- E - Environmental precautions
- WR - Wetland requirements
- MPT - Maintenance and Protection of Traffic

\_\_\_ - \_\_\_\_\_

ATTACHMENT II - Modifications and Additions to Standard Specifications for SBST Contracts

*If necessary, any project-specific modifications or additions  
to the standard specifications are located here.*

ATTACHMENT III - Schedule for Work on Railroad Right-of-Way

The PGM and the Contractor recognize that they must complete work on Railroad right-of-way according to the defined schedule.

The Pennsylvania Department of Transportation will pay Railroad costs incurred by the Contractor due to work on Railroad right-of-way during the defined schedule. Those costs are limited to the entry fee, insurance, and protective services. The Department is not liable to compensate the Railroad for any damage caused by the Contractor's operations.

The Contractor will be liable for any Railroad costs incurred during work performed outside of the defined schedule. The two exceptions will be when the Contractor is prevented from working within the schedule due to the Railroad's operations, or when the Engineer increases the schedule by written notice to the Contractor. Costs incurred by the Contractor for work performed outside of the defined schedule will be deducted from the monies due the Contractor as Assessment Damages, not as a penalty.

The schedule defined below is the Contract Schedule unless the Contractor submits a revised schedule that is approved by the PGM and the Department. If necessary, the Contractor must submit the revised schedule with the Form of Proposal and Contract Agreement. The revised schedule must meet the following requirements:

1. The Railroad must concur in writing with the revised schedule.
2. The total contract amount will have an absolute ending date of: \_\_\_\_\_
3. The maximum contract days cannot exceed: \_\_\_\_\_ days
4. The maximum days of work on Railroad right-of-way: \_\_\_\_\_ days

SUBCHAPTER 5C - FORM OF PROPOSAL

**SUBSURFACE BORING, SAMPLING, AND TESTING CONTRACT**

FOR

MPMS #:

---

---

---

TO: \_\_\_\_\_ Date: \_\_\_\_\_

Attention: \_\_\_\_\_

The undersigned has carefully examined the premises and conditions affecting the Work, as well as the CONTRACT DOCUMENTS (including THE INSTRUCTIONS TO BIDDERS, the FORM OF PROPOSAL, the CONTRACT AGREEMENT, the STANDARD SPECIFICATIONS FOR SUBSURFACE BORING, SAMPLING, AND TESTING, the ATTACHMENTS, and the PLAN AND LOCATION OF BORINGS) for the subject Subsurface Boring, Sampling, and Testing Contract.

The undersigned agrees to furnish all tools, equipment, materials, supplies, transportation, labor, supervision, logs, records, and all other items necessary or proper for, and to perform all Work necessary and incidental to the drilling of test borings and making test pits, complete in every respect, subject to all of the terms and conditions set forth in the Contract Documents.

**ARTICLE A - COMPENSATION**

It is understood that the proposed bid price per unit specified in Article B herein shall govern and that the estimated number of items and estimated units of these items are only approximate, and are used herein only to obtain a total price for comparing proposals. Depending on soil and rock conditions encountered during the actual boring, sampling and testing operations in the field, the PGM reserves the right to increase or decrease the number of borings and total quantity of work in accordance with the General Provisions of the Standard Specifications for Subsurface Boring, Sampling, and Testing.

The award will be given within sixty (60) days of the letting unless the time is extended by the Bidder, and then execution and notice-to-proceed will be given within thirty (30) days of award unless the time is extended by the Bidder. The Contractor agrees that they will honor the proposed bid prices per unit quoted herein in Article B for the said sixty (60) day period.

## SUBCHAPTER 5D - CONTRACT AGREEMENTS

**CONSULTANT CONTRACT AGREEMENT**  
**SUBSURFACE BORING, SAMPLING, AND TESTING CONTRACT**  
**FOR**

\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

THIS AGREEMENT, made this \_\_\_\_\_ day of \_\_\_\_\_, 20\_\_\_\_, between:

\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_ (Name)  
\_\_\_\_\_ (Address)

hereinafter called the "Project Geotechnical Manager (PGM)" and

\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_ (Name)  
\_\_\_\_\_ (Address)

hereinafter called the "Contractor."

The PGM is performing engineering and design services and preparing plans and specifications for certain projects being undertaken by the Commonwealth of Pennsylvania, Department of Transportation, hereinafter referred to as the "Department."

Whereas, the PGM desires to subcontract to the Contractor for and in consideration of the payment or payments hereinafter specified and agreed to. The Contractor hereby covenants and agrees to perform all services and work, hereinafter referred to as the "Work," necessary to make test borings and/or test pits and to obtain related samples and furnish all tools, equipment, materials, supplies, transportation, labor, supervision, logs, records, and all other items necessary or proper for completion of said Work, not otherwise provided for.

Now, therefore, in consideration of the terms and conditions hereinafter set forth, it is mutually agreed by and between the parties hereto as follows:

1. The Contract Documents consist of the Instructions to Bidders, the Form of Proposal, this Contract Agreement, the Standard Specifications for Subsurface Boring, Sampling, and Testing, the Plan and Location of Borings, and all Addenda issued prior to execution of this Agreement and all Modifications issued subsequent thereto. These form the Contract, and all are as fully a part of the Contract as if attached to this Agreement or repeated herein.
2. The Contractor shall perform all Work required by the Contract Documents.

3. The Work to be performed under this Contract shall be completed within \_\_\_\_\_ calendar days from the date of notice from the PGM to proceed with the Work. The completion date may be extended with the prior written permission of the PGM for additional or extra work directed by the PGM which is in excess of the Work defined in the Contract Documents, or for suspensions directed by the PGM.
4. The PGM shall pay the Contractor for the Work completed and accepted in accordance with the Unit Prices or Lump Sums stipulated in the Contractor's Form of Proposal dated \_\_\_\_\_.
5. Payment for the completed Work will be made by the PGM in accordance with the terms and conditions for such compensation as stipulated in the Form of Proposal.
6. If the date of signature of this Agreement by either party is different than that first written above, the latest date of signature shall apply to the provisions of this Contract.

IN WITNESS WHEREOF, the parties hereto have caused these presents to be executed, attested and sealed by their proper officials, pursuant to due and legal action authorizing the same to be done, the day and year first above written.

## SECTION 100 - GENERAL PROVISIONS

### SECTION 101 - GENERAL INFORMATION AND DEFINITIONS

#### Minor Changes to the Publication 222

**101.01 GENERAL** – The following stipulations, requirements and descriptions of Work are hereby defined and described as the STANDARD SPECIFICATIONS FOR SUBSURFACE BORING, SAMPLING, AND TESTING, and all shall apply to the Purchase Order unless specifically waived in the Instructions to Bidders.

These specifications are generally written in the imperative mood. In sentences using the imperative mood, the subject, "the Contractor," is implied. Also implied in this language are "shall," "shall be," or similar words and phrases. In the Technical sections, the subject may also be a Vendor, Fabricator, or Manufacturer, who may be supplying material, products, or equipment for use on the project. The word "will" generally pertains to decisions or actions of the Department and/or Project Geotechnical Manager (PGM).

In these specifications or on the drawings, the following words or similar words refer to actions of the Department and/or PGM, unless otherwise stated: "directed," "required," "permitted," "ordered," "designated," "prescribed." Also, the words "approved," "accepted," "acceptable," "satisfactory," "considered," or words with similar intent, mean by or to the Department and/or PGM, subject in each case to the final determination of the Secretary, and subject to further review, as permitted by law or permitted elsewhere in these specifications.

In these specifications, reference to a subsection of the specifications includes all general requirements of the section of which the subsection is a part.

In these specifications, the words "or equal," referring to a product, material, or process, mean "equal as determined by the Department and/or PGM."

In these specifications, the words, "as indicated," or "indicated" mean "as indicated or indicated in the prepared Purchase Order Documents."

**101.02 POINTS NOT COVERED BY STANDARD SPECIFICATIONS** – Any aspects of the work not clearly defined by these specifications will be governed by the rules of the best prevailing practice for that class of work.

#### **101.03 DEFINITIONS**

ADDITIONAL WORK – ~~Delete~~

AWARD – The Department's and/or PGM's written acceptance of a proposal.

BIDDER – Any individual, firm, partnership, corporation or a joint venture, submitting a proposal for the work contemplated and acting either directly or through an authorized representative.

PURCHASE ORDER DOCUMENTS – Includes the Instructions to Bidders; Bid Proposal; the Standard Specifications for Subsurface Boring, Sampling, and Testing; the Plan and Location of Borings; Purchase Order; and the Contract Agreement.

**PURCHASE ORDER/CONTRACT TIME** –The duration specified in the Purchase Order Agreement, commencing with the date of Notice-to-Proceed, over which the work is to be completed.

**CONTRACTOR** – A person, persons or corporation who has agreed to perform the work by their signature on the Purchase Order Agreement. Also, the Contractor's authorized representative at the site of the work.

**CONTRACTOR'S REPRESENTATIVE** – Individual authorized by the Contractor to be in charge of the work.

**DEPARTMENT** – Pennsylvania Department of Transportation.

**ENGINEERING DISTRICT** – Geographic division of the Department for the purposes of management, design, construction, and maintenance.

**ENGINEER'S REPRESENTATIVE** – The individual authorized by the Engineer to administer the Subsurface Boring, Sampling and Testing Contract (SBSTC).

**EXTRA WORK** – Delete

**FIELD SUPERVISOR** – The individual authorized by the Contractor to be in charge for Work completed on-site.

**IN WRITING** – Communication between parties delivered or sent, and received, in the form of a written letter, e-mail, facsimile, or telegram.

**INSPECTOR** – Person representing the PGM during drilling at the site to make inspections of contract performance and of material furnished.

**LOCAL TRAFFIC** – Vehicular traffic that originates or terminates within the project limits.

**NOTICE-TO-PROCEED** – Written notice, issued by the Engineer, to authorize the Contractor to commence work.

**NOTICE-TO-PROCEED DATE** – The date, established in writing by the Department, on which work is to begin.

**POTABLE WATER** – Water for human consumption that meets the biological and chemical standards of 25 PA Code § Chapter 109, Safe Drinking Water Act

**PROJECT GEOTECHNICAL MANAGER (PGM)** – The person, persons or corporation responsible on behalf of the Department for geotechnical work. For purposes of the SBST Contract, the authorized representative which has entered into the Purchase Order with the Contractor.

**PROPOSAL** – The offer of a bidder, on the Bid Proposal, to perform the work at the prices bid or predetermined.

ROCK – Indurated mass of mineral aggregates that cannot normally be excavated by manual methods alone and that cannot be satisfactorily penetrated and sampled by standard soil boring and sampling techniques.

SECRETARY – The Secretary of Transportation or a Deputy Secretary of Transportation of Pennsylvania.

SOIL – Unconsolidated material derived from physical, chemical and biological degradation of rock that can normally be excavated by manual methods alone and that can be satisfactorily penetrated and sampled by standard soil boring and sampling techniques.

SUBCONTRACTOR – Any individual, partnership, firm, corporation, or joint venture, who/which undertakes, with prior consent of the Department, part of the work under the terms of the Purchase Order, with and responsible to the prime Contractor by virtue of an agreement.

SURETY – A corporate body, which is bound with and for the Contractor, for the satisfactory performance of the Contractor's work and for the prompt payment in full for material, labor, equipment rentals, and utility services, as provided in the bonds.

TRAFFIC CONTROL PLAN – A developed method or scheme for safely and efficiently moving traffic through or around a highway work zone in accordance with [67 Pa Code, Chapter 212](#).

WORK – The furnishing of all tools, equipment, materials, supplies, transportation, labor, supervision, logs, records, and all things necessary or incidental to compliance with the requirements of the Purchase Order Documents.

## SECTION 102 - BIDDING REQUIREMENTS AND CONDITIONS

### Minor Changes to Publication 222

**102.01 INTERPRETATION OF APPROXIMATE ESTIMATE OF QUANTITIES** - The estimates of quantities, shown in the Instructions to Bidders and Bid Proposal are approximate and are shown only as a basis for the calculation upon which the Purchase Order award is to be made. The Department and PGM do not assume any responsibility that the estimated quantities will actually be required, nor will the Contractor be allowed to plead misunderstanding or deception because of the quantity estimates or because of the character of the work, the location, or other conditions. The Department and/or PGM reserve the right to increase, to decrease, or to omit any of the quantities of work. An increase or decrease of the quantities of the items will not be sufficient grounds for granting an increase in the unit prices bid.

**102.02 INSPECTION OF SITE BY BIDDER** – It is expected that the contractor visit work sites prior to commencement of drilling activities. The Department accepts no responsibility for time delays due to improper preparations by the contractor

## SECTION 103 - GENERAL PURCHASE ORDER/CONTRACT CONDITIONS AND REQUIREMENTS

### Major Changes to Publication 222

**103.01 PURCHASE ORDER TIME** - Complete all work within the time period specified in the Purchase Order Agreement. The Purchase Order time will be calculated in calendar days from the date of Notice to Proceed.

**103.02 Delete**

**103.03 Delete**

**103.04 Delete**

**103.05 LIQUIDATED DAMAGES** - Any work that remains uncompleted after the time specified in the Purchase Order Agreement for project completion, the sum of \$800 per inspector per 8-hour day (plus \$80/hour for any amount of time over 8-hours on that day), unless otherwise stated in the proposal, will be deducted from money due or to become due. This deduction will not be assessed as a penalty, but as liquidated damages. Liquidated damages are only calculated to recover losses incurred by the Department or fees paid by the Department. The liquidated damages minimum rate is compensation for salary, overhead, and expenses incurred for late delivery or untimely performance of the particular Purchase Order. A Purchase Order time extension may be made, at the discretion of the PGM, as applicable beyond the period specified in the Purchase Order, when the Contractor is not responsible for the delayed completion of the work. In such cases, the Contractor is liable for liquidated damages for delays commencing from the date on which the extended period expires.

In the event the Contractor is declared in default and the Purchase Order is terminated in accordance with the provisions of [Section 103.06](#), liquidated damages will be charged as provided by this section, and such amounts, if any, will be deducted from money due or to become due to the Contractor or the surety. If the total amount chargeable as liquidated damages exceeds the amount payable to the Contractor or the surety, the excess is to be paid to the PGM by the Contractor or the surety.

**103.06 SUSPENSION OF WORK** – Work may be suspended by the PGM, wholly or in part, for the following reasons:

- failure to carry out orders;
- failure to perform any provisions of the Purchase Order; or
- unforeseen conditions not anticipated in estimating the Purchase Order time required for the completion of the work.

Written notification will be given of the action to be undertaken and the reason for the actions. After receipt of notice of suspension, take all reasonable steps to minimize the further incurrence of costs or expenses under the Purchase Order. Payment will be made for the work actually accomplished up to date of suspension, and accepted by the PGM, at the unit prices set forth in the Bid Proposal. Payment will also be made for any minimum and reasonable costs and expenses agreed to by the DGE, the PGM and Contractor in writing that may be required to permit the maintenance of equipment in standby condition so that services may be resumed if conditions so warrant in the opinion of the DGE.

**103.07****TERMINATION OF PURCHASE ORDER/CONTRACT –**

(a) Termination Due to Delay, Neglect, or Default. The Contractor may be declared in default for the following reasons:

- **Failure to cooperate and meet schedules presented by the engineer.**
- failure to perform the work with sufficient labor, equipment, or material to insure the completion of the specified work in accordance with the Purchase Order terms;
- unsatisfactory performance of the work;
- failure or refusal to remove material or remove and replace any work rejected as defective or unsatisfactory;
- insolvency or bankruptcy;
- commission of any act of bankruptcy or insolvency;
- assignment made for the benefit of creditors;
- failure or refusal within ten (10) days after written notice by the PGM, to make payment or show cause why payment should not be made, of any amounts due for material furnished, labor supplied or performed, for equipment rentals, or for utility services rendered, as covered by the Additional Bond for Labor and Materials;
- failure to protect, to repair, or to make good any damage or injury to property; and/or
- work not carried on in an acceptable manner for any cause.

The PGM, after giving ten (10) days written notice of default will have the power and authority, without violating the Purchase Order, to:

- declare the Contractor in default;
- take the completion of the work out of the hands of the Contractor
- appropriate or use any or all materials assembled for the project;
- enter into a contract or contracts with others for the completion of the work; or
- use such other methods that will be expedient for the completion of the Purchase Order in a satisfactory manner.

- (b) Termination for Convenience. With approval from the DGE, the PGM, after giving ten (10) days' written notice, will have the power and authority, without violating the Purchase Order, to cause termination of the Purchase Order for the convenience of the PGM and the Department.
- (c) Payment. Subsequent to Purchase Order termination, payment will be made at the unit prices specified in the Bid Proposal for work completed and accepted by the PGM. No other payment will be made.
- (d) Disposition of Documents and Samples. In the event of termination for any reason, all finished or unfinished documents, all soil and rock samples, and other materials, at the option of the PGM become the property of the Department.
- (e) Completion of Work Terminated Due to Default. In the event of default and Purchase Order termination, the PGM may have the work required under the Purchase Order completed in such manner as, in the PGM's judgment, will best serve the interests of the Department. The Contractor will be liable for and shall pay to the PGM any excess in cost expended over and above the cost specified in the Bid Proposal, as well as any expenses caused the PGM and Department, by the failure of the Contractor to comply with the terms of the Purchase Order.

**103.08 LAWS, ORDINANCES, REGULATIONS AND PERMITS** - Comply with all laws, ordinances, rules and regulations of the Federal and State governments, or of any political subdivision thereof, which are applicable to the work to be performed under the Purchase Order. Obtain all permits and licenses necessary to the prosecution of the work, except for work on railroad property, as described in [Section 103.12](#), at no additional cost to the PGM or Department.

**103.09 PATENTS AND PERMITS** - Pay all royalties and indemnify and save harmless the PGM and the Department from any claims for infringement by the reason of the use of any patented designs, device, material or process to be performed or used under the Purchase Order.

**103.10 SAFE PRACTICES IN DRILLING -**

- (a) Responsibility. Follow generally accepted drilling practices and be responsible for all matters dealing with safety in performing the work, including safety of all persons and property during performance of the work, employees and any and all employees of subcontractors which may perform work. This requirement will apply continuously regardless of time or place, and will in no way be altered because the PGM gives general directions as to the location where samples should be taken. Additionally, the drilling contractor should not perform any work that the drill operator considers unsafe. In the event of any disputes, these must be addressed with the DGE. This does not relieve the contractor of the responsibility to thoroughly inspect the site, and come prepared to the job with equipment necessary to conduct work in a safe manner, as per [Section 102.02](#). Pre-bid meetings are the primary mechanism that potentially unsafe drilling conditions that were not recognized by the PGM or the Department, can be identified by drilling contractors. If a pre-bid meeting is not conducted, such conditions must be addressed by the contractor to the PGM prior to bid, or any costs associated with mitigating the unsafe conditions may be the responsibility of the contractor.

(b) Occupational Safety and Health Regulations. Comply at all times with applicable Federal, State, and local laws, provisions, and policies governing safety and health, including the *Federal Construction Safety Act (Public Law 91-54)*, *Federal Register Chapter XVII, Part 1910 "Occupational Safety and Health Standards"* and *Part 1926 "Occupational Safety and Health Regulations for Construction"* of *Title 29 Code of Federal Regulations*, and subsequent publications updating these regulations.

(c) Deep Mine Safety Monitoring Equipment. Borings which intercept deep mines or coal may encounter methane gas and/or carbon monoxide gas during the drilling and grouting process. Provide a monitor for the measurement of methane, carbon monoxide, and oxygen. Provide a monitor with a minimum range of measurement as follows: methane from 100 ppm (0.01%) to 50,000 ppm (5.0%); carbon monoxide from 10 ppm (0.001%) to 1,000 ppm (0.10%). Provide an operating monitor at the location of each boring where deep mines are known or suspected of being encountered; where indicated in the Purchase Order; or as directed by the PGM. Obtain readings directly above the boring and within 12 inches of the boring opening. Maintain monitors in good operating condition, including calibration, for the life of the project. Have a monitor available to the PGM for inspection of the boring and any previously drilled holes on the project.

Repair or replace monitors within twenty-four (24) hours of notice from the PGM and /or DGE. Drilling of borings in deep mined areas will not be permitted if the monitor is not present and operating as specified.

If methane above 12,500 ppm (1.25%) or carbon monoxide above 10 ppm (0.001%) is detected immediately stop work and allow the boring to naturally vent. If after 24 hours or more methane above 12,500 ppm or carbon monoxide above 10 ppm is detected, employ industry standard methods to vent the borehole. Drilling may continue if venting reduces the methane to below 12,500 ppm and carbon monoxide below 10 ppm. If after venting for at least 24 hours the methane remains between 12,500 ppm and 25,000 ppm or carbon monoxide remains between 10 ppm and 30 ppm, grout the boring. If at any time methane above 25,000 ppm (2.5%) or carbon monoxide above 30 ppm (0.003%) is detected, evacuate the area and contact the PGM.

(d) Delete

(e) Encountering Contaminated Material. If the drilling contractor, Inspector or PGM encounters potentially contaminated material not previously suspected, during any phase of the geotechnical investigations, the operation must be halted in a safe and controlled manner, and the PGM will immediately contact the DGE. The DGE should contact the District Environmental Manager.

In such cases, the drilling contractor is required to secure the site until appropriate personnel can enter the site to complete decontamination efforts. Securing the site includes containerizing all suspected contaminated materials including the suspected samples, fluids used to clean the sampling devices, and any materials (towels, gloves, etc.) used in the containment process. If securing these materials cannot be performed in a manner that provides reasonable safety to the drilling personnel, or the suspected contaminated material is causing physical distress (e.g., due to odors), then the area should be guarded at a safe distance until properly equipped personnel arrive to containerize the materials and secure the site.

Due to the potential for encountering contaminated material, the drilling contractor shall have available for every project, at least one 55-gallon drum, incidental to the project, to containerize contaminated material for initial site securing. As many sites do not allow

for safe and secure storage, the contractor shall provide additional provisions for sitting a trailer, providing a fenced area, or other temporary measures to securely store the drum, as required. The method of storing the drum must provide secure, lockable, containment.

If necessary, containerized materials may be transported off-site prior to receipt of analyses. This material may be relocated to the closest appropriate Department maintenance facility, only as a last resort. This option must be coordinated with and approved by the Department. The responsible Department maintenance facility official must be notified before any potentially contaminated samples are transported to the facility. The PGE/PGM (Project Geotechnical Engineer/Project Geotechnical Manager), or DGE if an in-house project, will make the appropriate arrangements to contact a company permitted to transport the hazardous material as required. All geotechnical samples obtained from a suspected waste site will require proper labeling in addition to those specified in [Section 215](#) of this publication.

Under no circumstances should site workers perform activities they are not trained and capable of performing, or that compromise personal safety.

- (f) **All contractor employees must wear hard hats and vests at all job sites.**

**103.11 LOCATION OF UTILITIES AND UNDERGROUND STRUCTURES** – The Contractor shall be responsible for knowing the location of all underground utilities, overhead utilities, pipes, cables and underground structures that their employees could potentially come in contact with while on-site. It shall be the Contractor’s responsibility to perform the work under the safest possible conditions, and to employ the necessary precautions to avoid these features during completion of boring, sampling and testing operations.

- (a) **Underground Utilities.** If it is established that the location of a boring is such as to cause interference with an underground facility or structure, advise the PGM. At their discretion, the PGM may designate a new location for the boring or authorize its omission.

Before the work begins, comply with the Pennsylvania Underground Utility Line Protection Law, Act 287 of the General Assembly of Pennsylvania, 1974 as amended or superseded, which defines the procedures for notification to Public Utilities prior to excavation, drilling or demolition work by use of powered equipment or explosives. The law requires the use of the PA One-Call System to locate all utilities. In addition, the Contractor must coordinate with the public or private land owners to locate non-public underground utilities such as buried electric lines, communication cables, drainage pipes, etc. The boring location(s) shall be adequately offset where the hole location(s) conflicts with utilities and other structures in the project area including those not covered by the PA One-Call system (as indicated above). PA One-Call contact information is as follows:

**PA One-Call Phone:** dial **8-1-1**  
or call **1-800-242-1776**  
On-line: [pa1call.org](http://pa1call.org)

- (b) **Aboveground Utilities.** In order to determine the required minimum distance to stay away from overhead power lines, the PGM will contact the utility company to determine voltage in the line. For voltage to ground of 50kV or less, the minimum clearance between overhead power lines and any part of the drill rig, including any drill steel, is 10 ft. For voltages to ground over 50kV, the minimum clearance distance is 10 ft. plus 4 inches for every 10kV over 50kV. For overhead lines not containing power (e.g., cable, telephone) the minimum clearance between the lines and any part of the drill rig, including drill steel, is 10 ft. In situations where clearance between overhead lines and drill equipment is less than required above, the requirements of **1910.333(c)** of the OSHA regulations indicated above must be followed. Any work in these conditions must be coordinated by the PGM with Contractor and the appropriate utility company(ies). The Contractor shall arrange with the public utility to shield adjacent overhead power lines, as required, at no additional cost to the Engineer or Department.

**103.12 WORK ON PUBLIC AND PRIVATE PROPERTY -**

- (a) **Permission for Access.** General permission to enter public or private property on which borings or test pits are located, or over which access is required, will be obtained by the PGM. The PGM will provide a copy of the “Notice of Intent to Enter” (NOITE) letter to the driller awarded the Purchase Order (at the time of awarding the bid). In addition to the NOITE letter, the PGM will contact property owners in person or by phone at least 3 days but not more than 2 weeks prior to entering their property.

Obtain prior approval from the PGM before entering any property within the work area. Do not drill, construct an access route, or stage on any property where personal contact

has not been made until given permission in writing from the Department. Any cost incurred, including but not limited to property damage, delays, or down time caused by entering any property without prior approval of the PGM, shall be borne solely by the Contractor.

- (b) Arrangements for Access. Prior to entering any property, make specific arrangements for property access (including schedule, access route, etc.) with the owners of properties on which borings are located or over which access is required to perform work. Property owner information (name, address, telephone number, etc.) will be provided by the PGM. Provide all the information discussed with the property owner to the drilling Inspector. The drilling Inspector will prepare and provide the Department with written documentation of this contact if requested.

If access is denied to any property for which general permission to enter has been obtained, notify the PGM in writing. The PGM will contact the DGE if access to any property is denied.

**103.13 Delete**

- 103.14 PROTECTION OF WORK, PERSONS AND PROPERTY** - Provide and maintain any barricades, lights or other safety devices necessitated by hazardous conditions or required by local authority at no additional cost to the PGM or Department.

The Contractor shall take all necessary precautions to prevent or minimize discharge of water on any roadway. Perform sweeping and salting operations of the work during drilling operations, as necessary, to prevent icy, wet, slippery, or dusty conditions which could pose undue hazards or inconvenience to property owners, pedestrians, or vehicular traffic, at no additional cost to the PGM or Department.

- 103.15 INJURY TO PERSONS AND DAMAGE TO PROPERTY** - Promptly repair all physical damage to property resulting either directly or indirectly from the SBST operations. Every effort practical and reasonable must be made to prevent damage to property. This includes, but is not limited to, using plywood over lawn areas and soft ground, avoiding fences where possible, staying clear of structures and prepared landscaping, and minimizing trimming of trees.

Upon completion of the work, furnish satisfactory evidence that all claims arising from injury to persons or damage to property resulting from the boring, sampling and testing operations have been resolved. The acceptability of evidence that claims have been resolved will be determined by the PGM.

**103.16 INSURANCE AND LIABILITY**

- (a) General. Obtain and pay for such insurance as will protect the Department and the PGM from claims under the Workmen's Compensation Act and from any other claims for damages for personal injury including death, or for damages to property, both real and personal, which may arise from operations under the Purchase Order, whether such operations be by the Contractor or by anyone directly or indirectly employed by the Contractor.
- (b) Coverage. Effect and maintain for the duration of the Purchase Order the following insurance in companies or through agents, with minimum limits of coverage as specified in the Instructions to Bidders, at no additional cost to the PGM or Department:
- 1) WORKMEN'S COMPENSATION INSURANCE including Employers' Liability Insurance in accordance with the laws of the Commonwealth of Pennsylvania.
  - 2) GENERAL LIABILITY INSURANCE for Bodily Injury and Property Damage, including explosion, collapse, and underground hazards coverage.

- 3) AUTOMOBILE INSURANCE for Bodily Injury and Property Damage covering all automotive vehicles owned or hired by the Contractor and used on this Purchase Order not otherwise so covered by insurance, and including automatic coverage for additions to the schedule of vehicles.
- 4) RAILROAD INSURANCE any additional or special insurance required by the railroad.
- (c) Certificates of Insurance. Deliver to the PGM, before starting the work, certificates from insurance companies or their agents, in duplicate, stating that such insurance is in force and will not be canceled during the conduct of the work without thirty (30) days written notice to the PGM. The certificate of liability insurance will include as additional named insurers, the PGM and the Department, in respect to the work to be performed by the Contractor.
- (d) Additional Taxes and Insurance. Report and pay all Old Age Benefit and Social Security Taxes and other insurance as required by State and Federal Laws.
- (e) Reduction of Coverage. In the event that, during the course of the work, the above limits of coverage should be reduced for any reason, the PGM and/or the Department reserve the right to terminate the Purchase Order without waiving any other rights it may have under the law. Such termination will be effected by giving written notice thereof to the Contractor, in accordance with [Section 103.06](#).

- (f) Liability. In no event will the PGM or the Department, their officers, employees, or representatives be liable in any way for consequential damages of any kind. By signature on the **Purchase Order**, the PGM and the Department are released from any liability for damage to property howsoever caused in connection with the performance of the work to the extent coverage is in force for such damage under a physical damage insurance policy. If any of the physical damage insurance policies do not permit release of other persons or firms from liability before a loss, obtain endorsement to such policies from the respective insurance carriers as may be necessary to affect a waiver of the right of subrogation by such insurance carriers against the PGM and the Department.
- (g) Indemnification. Without limiting any other provision of the **Purchase Order**, fully indemnify, save harmless, and at the PGM's request, defend the PGM and its subsidiaries, affiliated companies, agents and employees, and the Department and its officers, agents and employees, from and against any and all suits, actions, legal proceedings, claims, demands, damages, costs and expenses of whatsoever kind or character, including but not limited to attorneys' fees and expenses, arising out of or by reason of:
- 1) any liability or obligation in any manner caused or occasioned or claimed to be caused or occasioned by, any act, omission, fault, or negligence of the Contractor or anyone acting on their behalf, including but not limited to vendors, their sub-contractors and sub vendors, and the employees and agents of any of the foregoing, in connection with or incident to the **Purchase Order** or the work to be performed hereunder; and/or
  - 2) any injuries (including death) or damage to any person or entity employed by or acting on the Contractor's behalf under the **Purchase Order**.

**103.17 EQUAL OPPORTUNITY AND NON-DISCRIMINATION** – In connection with the execution of the Purchase Order, do not discriminate against any employee or applicant for employment because of race, religion, color, sex, or national origin consistent with the Commonwealth of Pennsylvania Nondiscrimination Clause. Take affirmative action to ensure that applicants are employed, and that employees are treated during employment, without regard to their race, religion, color, sex, or national origin.

Comply with the Regulations of the U.S. Department of Transportation relative to non-discrimination in federally assisted programs of the Department of Transportation (Title 15, Code of Federal Regulations, Part 8(a)(b)(c)).

**103.18 INTEREST OF PUBLIC OFFICIALS** – No member, official, or employee of the Department or of another state or local public body during their tenure or for one year thereafter is permitted to have any interest, direct or indirect, in the Purchase Order or the proceeds thereof.

**103.19 INTEREST OF MEMBERS OF CONGRESS** – No Member of or Delegate to the Congress of the United States is permitted to have any share or part of this Purchase Order or to any benefit arising therefrom.

**103.20 SUBLETTING OR ASSIGNMENT OF PURCHASE ORDERS/CONTRACTS** – Do not sublet, sell, transfer, assign, or otherwise dispose of the Purchase Order or any portion or rights, title, or interest, without the written consent of the PGM.

If consent is given, subletting a portion of the Purchase Order will be permitted. However, do not sublet a portion equal to, or exceeding 50 percent (50%), of the original total Purchase Order price.

"Specialty Items," as identified in the proposal, may be performed by subcontract. The cost of any specialty items performed by subcontract may be deducted from the original total Purchase Order price before computing the amount of work permitted to be performed by subcontract. Subcontracts or transfer of Purchase Order will not release Contractor liability under the Purchase Order and bonds.

**103.21 DISSEMINATION OF INFORMATION** - Any reports, information, data, etc., given to or prepared or assembled under this Purchase Order may not be made available to any individual or organization without prior written approval of the Department.

**103.22 PUBLICATION, REPRODUCTION AND USE OF MATERIAL** - No material produced in whole or in part under this Purchase Order will be subject to copyright in the United States or in any other country. The Department will have unrestricted authority to publish, disclose, distribute, and otherwise use, in whole or in part, any reports, data, or other materials prepared under this Purchase Order.

**103.23 AUDIT, INSPECTION OF RECORDS, AND OWNERSHIP OF MATERIALS** - Permit the authorized representatives of the Commonwealth of Pennsylvania to inspect and audit all data and records relating to performance of work under the Purchase Order. Retain records for a period of at least three (3) years after completion of the Purchase Order. At the end of three (3) years, provide the records to the Department or obtain written permission from the Department to dispose of the records.

Provide free access of the duly authorized representatives of the Department at all reasonable times to such books and records and the right to examine and audit the same and to make such transcripts there from as necessary to allow inspection of all work data, documents, proceedings, and activities.

Documents, drawings, design data, and reports used or prepared in the performance of this Purchase Order belong to and become the property of the Department in perpetuity.

**103.24 CONTINGENT FEES** - If requested by the PGM, provide a sworn affidavit certifying that no company or person other than a bona fide employee was retained to solicit or secure the Purchase Order, and that no payment or agreement to pay has been made to any company or person other than a bona fide employee, any fee, gifts, or any other consideration contingent on or resulting from the award of the Purchase Order.

**103.25 GOVERNING LAW** - The Purchase Order will be governed by the laws of the Commonwealth of Pennsylvania, and applicable federal and local laws as they may from time to time be in effect.

**103.26 MISCELLANEOUS PROVISIONS**

- (a) Construction Bidding. Neither the Contractor nor its member companies or their affiliated companies may bid on or perform any direct construction work in connection with this project.
- (b) Clean Air Act of 1970. Comply with all orders, applicable standards or regulations issued pursuant to the Clean Air Act of 1970.

## SECTION 104 - CONTROL AND PERFORMANCE OF WORK

### MAJOR CHANGES FOR PUBLICATION 222

**104.01 SUPERVISION, PERSONNEL AND MANNER OF PROSECUTION OF WORK** - Designate in writing, at the beginning of work, a competent field supervisor or foreman who will be present at the site of the work at all times and will be responsible for supervision and performance of the work. Directions given them by the PGM will be binding on the Contractor, and such directions will be confirmed in writing when so requested. Any driller who begins work under the Purchase Order must continue to work on the project until its completion, unless the PGM requests their transfer in writing. A driller may not be transferred without the written approval of the PGM.

Prosecute the work in a manner that will promote rapidity in execution, secure safety of life and property and satisfy the objectives of the project in accordance with the Purchase Order Documents.

**104.02 INSPECTION OF WORK** - Perform no work unless the representative of the PGM is present unless the work is off the roadway and requires no traffic control, and does not involve work that must be witnessed and logged by the Inspector. In such case, prior written authorization from the PGM is required. Provide full opportunity at all times for inspection of the work by the PGM. Immediately remedy any work not completed in accordance with the Purchase Order Documents to the satisfaction of the Purchase Order Documents and the PGM at no additional cost to the PGM or Department.

**104.03 WORK SCHEDULE** – Work will not be performed unless directed by the Engineer in special circumstances on the following holidays:

New Years Day	Columbus Day
Martin L. King Jr. Day	Veteran's Day
President's Day	Thanksgiving Day
Memorial Day	Day After Thanksgiving
Fourth of July	Christmas Day
Labor Day	

Or when a Holiday is celebrated by the Department

Work restrictions on limited access highway during major holidays and the following:

No Lane Restrictions are permitted between 8 am and 8 pm on S.R. 70 from Chestnut Street, Exit 15, and East; and S.R. 79 from Laboratory, Exit 33, and North.

Contact the following at least 2 weeks prior to any Traffic Control Devices being placed on the Interstates:

- (a) Valerie Peterson, PennDOT District 12-0 Community Relations Coordinator at 724-439-7375 and
- (b) Adam Smith, PennDOT Washington County Maintenance Manager at 724-223-4480 or
- (c) Tom Boyle, PennDOT Westmoreland County Maintenance Manager at 724-832-5357 and
- (d) Washington County Pennsylvania State Police Commanding Officer at 724-223-8500 or
- (e) Westmoreland County Pennsylvania State Police Commanding Officer at 724-832-3288

Adhere to the following restriction:

Cease all operations at noon of the normal workday prior to the beginning of the holiday period and do not commence until noon of the day after the holiday period has ended. The Engineer will notify the Contractor of the exact dates and duration of each holiday restriction.

MAJOR HOLIDAYS – New Years Day, Easter, Memorial Day, Fourth of July, Labor Day, Thanksgiving Day, and Christmas Day.

**104.04 LOCATION OF BORINGS AND SURVEY** - The PGM will establish in the field suitable points, lines, marks, locations and elevations as required to locate test borings and/or test pits. Where possible, borings are to be located a minimum of 100 ft. from domestic water supply wells. If borings must be located within the 100 ft. distance then those locations should be indicated on the Plan and Location of Borings and discussed at the pre-bid meeting. Do not drill any borings within a radius of 10 ft. from any domestic water supply well or spring box. Furnish, without additional compensation, such labor, temporary structures and materials as may be required by the PGM to establish and maintain such points, lines, marks, locations and elevations.

The approximate locations of the required borings and/or test pits will be provided on a plan or staked in the field with segments and offsets provided for each specific job. The exact location of the individual borings will be determined and staked by the pre-bid meeting. If boring locations have not been approved by the pre-bid meeting then the borings will be placed as close as possible to the expected locations. These borings will be identified as approximate locations.

The final locations of some borings may be modified in the field by the PGM, depending upon topographic features and subsurface conditions encountered during progress of the work.

Borings on land may be offset from the designated location by the PGM to avoid surface obstructions or impracticable working conditions. Test borings on water shall be located within a radius of five (5) feet from the designated locations.

**104.05 NUMBER AND DEPTH OF BORINGS** - The number of borings and hours of work may be increased or decreased at the discretion of the engineers. Extend all borings to the depth elevations of conditions specified unless the engineer specially directs otherwise in the field.

**104.06 SEQUENCE OF BORINGS** - The PGM reserves the right to designate the sequence in which borings will be made. Any such specific sequencing must be provided in Attachment II of the bid document.

**104.07 ABANDONED BORINGS** - No payment will be made for any boring which has been abandoned before reaching the depth, elevation or condition specified on the Plan and Location of Borings and/or in the Instructions to Bidders, unless the PGM approves and accepts the borings as being completed.

Afford the PGM the opportunity to measure the depth of any boring and to inspect samples of materials recovered before abandonment and removal of casing and drilling equipment.

**104.08 WATER FOR DRILLING OPERATIONS** – The contractor will be responsible for securing water for drilling operations. Make necessary arrangements with appropriate private property owners of Governmental Agencies for use of water supplies for drilling. No additional payment for water will be made by the Engineer or the Department for hauling or securing water

supplies.

Use only potable water for drilling water if drilling operations are conducted within 100 ft. of domestic water supply wells or spring boxes. Potable water should be supplied in a clean container free of debris and/or foreign matter

Wetlands that can be used as a source of drilling water will be noted in *Attachment II*. The Department will provide a Wetland Usage Plan; detailing access, procedure of water removal, and recharge and restoration of disturbed areas.

Areas that may be wetlands but are not noted as such cannot be used without Department approval. The Department must be notified prior to using such areas. The Department will determine whether the wetland can be used as a source of water. Revision to the above plan, as noted above, will be provided for areas determined to be wetlands from which water can be obtained. Allow sufficient time for the Department's review in the scheduling of operation so that the allowable Purchase Order time is not exceeded.

**104.09 RESTORATION OF DISTURBED AREAS** - Restore ground areas disturbed by personnel and equipment as nearly as possible to their original condition. Any agreement to modify the restoration to original-condition is strictly an agreement between the Contractor and the property owner and is to be at no additional cost to the Department. Prior to starting the work, submit repair methods for PennDOT facilities to the Department. Exercise particular care in the restoration of property such as shrubs, lawns, fences, walls, gardens, and pavements which are damaged, and restore all property to its original or like-original condition before leaving the site. **This includes seeding and mulching of disturbed areas.** No additional payment will be made by the PGM or the Department for restoration of disturbed areas.

**104.10 PROTECTION OF ENVIRONMENT** – Add the following section: During all phases of work, the contractor shall conduct his operations to minimize:

- (a) Disturbance to trees and other forms of vegetation/
- (b) The contractor shall be responsible for wrapping any trees that must be used for winching.
- (c) The contractor shall restrict his activities to the immediate vicinity of the boring locations as much as practical.
- (d) Each rig shall be equipped with a push broom and rock salt to avoid creating unsafe roadway conditions.
- (e) At no time, shall truck mounted drill rigs be permitted in or crossing wet areas. The contractor shall not perform any activities in wetlands except for those directly related to wetland borings and for obtaining drill water if no other source of water is available, as described under Section 104.08.
- (f) In performing borings in wetlands, and yards, or as directed, the contractor shall access the individual borings from the upland side as much as practical. Drill rigs shall be moved by skidding or tracking rigs across a continuous layer of plywood sheeting of appropriate thickness to the boring location. Access across wetlands shall be kept to wetland, boring, irregularities in the ground surface (ruts, etc.) shall be smooth to the satisfaction of the Engineer.

**104.11 TREE CUTTING** - When cutting or trimming of trees is necessary to access boring locations, provide competent personnel and use proper arboricultural practices, tools, and personal protective equipment (PPE) to safely and efficiently perform the work. Use proper PPE such as hand protection, (*29 CFR 1910.266 (d)(1)(iii)*); hard hat, ANSI standards Z89.1-1989 or Z89.2-1971, (*29 CFR 1910 Subpart I*); safety glasses and face shields, ANSI Z87.1-1989, (*29 CFR 1910.266(d)(1)(vii)(A)&(B)*); hearing protection, leg protection, APA guidelines, (*29 CFR*

[1910.266 \(d\)\(1\)\(iv\)](#)); safety footwear, Z41-1991 compliant, ASTM F1818, Standard Specification for Foot Protection for Chain Saw Users, ([29 CFR 1910.266 \(d\)\(1\)\(v\)](#)); and first-aid kits ([29 CFR 1910.266 \(d\)\(2\)\(i\)](#)).

Conduct tree cutting operations from off the travel lanes. Promptly remove any tree trimming debris to maintain a safe work area. Clear roadway drainage ditches/swales of any debris associated with this work.

Unless otherwise specified or directed, trimmed tree limbs should be removed back to the branch collar. Trees on Department's right-of-way that require 2/3 or more of canopy removal must be removed to ground level. Removal to ground level must be no higher than three inches above the ground surface, cut parallel to the ground surface. Trees on private property that require 2/3 or more of canopy, can be removed completely at the property owner's discretion. If trees are required to be removed from maintained lawns, the stumps shall be removed to a minimum 6 inches below existing ground level, debris removed, and backfilled with topsoil, seeded and mulched.

Be mindful of the Department's right-of-way lines and any required work limits. If tree cutting work is required off the Department's right-of-way, contact affected property owners in writing informing them of the proposed work and offering them any resulting wood. Use PennDOT [Form M-689](#) for this purpose. Document any attempted property owner contacts, indicating the date, time, and type (personal or written). When a property owner agrees to retain the cut wood, obtain the [Form M-689](#) agreement and submit a copy to the DGE. Cut wood to the agreed lengths and place on private property at the right-of-way line as per Department policy.

**104.12**        **SITE CLEANUP** – After completing field operations, promptly remove all equipment mobilized and material brought to the site and restore the site to its original condition, as described under [Section 104.09](#). The work will not be considered complete until site cleanup has been completed and accepted by the PGM.

## SECTION 105 - PAYMENT

### Minor Changes for Publication 222

**105.01 GENERAL** - Perform all work for the compensation set forth in the Form of Proposal except as noted under *Section 105.03*. The compensation thus set forth includes the cost of all insurance, bonds, and other incidentals, as well as all taxes and premiums payable under Federal, State, and Local laws applicable to labor, materials, supplies furnished, or work performed.

The basis of measurement and payment is as set forth under the Technical Provisions of these Standard Specifications for Subsurface Boring, Sampling, and Testing, or as specified in the Form of Proposal, with the latter taking precedence.

For service calls, on the days when services (including any of the items on the Bid Proposal) are requested and provided but no work is started because of Department equipment/personnel breakdown, a two-hour service charge will be paid at the rate for mobilization. Days when work activity is started and Department equipment breakdown occurs after 2 hours, but before noon, four hours will be paid. Days when work activity is performed before noon and Department equipment/personnel breakdown occurs afternoon, eight hours will be paid.

Normal working hours will be between 7:00 A.M. and 5:00 P.M. Monday thru Friday not to exceed 8 hours per day although workdays may be longer depending on the operation.

**105.02 UNIT PRICES** - Except for lump sum prices which are fixed and invariable, the proposed bid price per unit specified in the Bid Proposal will govern. The estimated quantities of these items are only approximate as indicated under *Section 102.02*. Depending on soil and rock conditions established during the actual boring operations in the field, the PGM reserves the right to increase or decrease the number of borings and total units of work. If the final quantities are greater or less than the estimated units listed in the Bid Proposal, additions to or deductions from the indicated proposed total price will be made based upon the proposed bid price per unit, except as noted in *Section 103.03* for changes in scope of work which will be paid for as indicated in *Section 105.03* as additional or extra work.

**105.03 Delete**

**105.04 INVOICING** – Submit two (2) copies of each monthly invoice to the engineer for work completed and accepted each month. Also, send original invoice to Pennsylvania Department of Transportation Comptroller's Office, Accounts Payable. During the course of the Purchase Order, provide as a minimum, the following information in each invoice.

1. Project name, SAP P.O number, location, date work ordered, date work began, date work completed, state project # if available, and cost per project.
2. Total units of each bid item completed and accepted during the invoice period, together with the bid price per unit for each bid and an extension of the total cost for each, i.e. the amount of payment request.
3. A cumulative total of the completed and accepted units for each of the bid items.
4. A cumulative total of the amount of payment.
5. A cumulative total of the amount of money remaining in the Purchase Order.

**105.05 PAYMENT OF RETAINAGE** – Delete

the drill pipe and out through ports in the chopping bit to carry cuttings up and out of the boring. Water ports in the bit must be arranged so that there is no jetting action on the drill water ahead of the bit. Do not extend the cleaning operation beyond the lower limit of the casing or hollow-stem auger unless directed by the Engineer. Use the minimum amount of water necessary to carry away the cuttings to avoid disturbance to the bottom of the boring. Omit casing or hollow-stem augers only at the direction or with the permission of the Engineer, where sampling operations without the casing or hollow-stem augers will not entrain soils from an elevation higher than the depth at which field testing or sampling is to be made.

Maintain all drilling equipment in good working order at all times throughout the duration of the work. If, in the opinion of the Engineer, the equipment supplied is inadequate for proper completion of filed boring, sampling and testing operations or installation of field instrumentation, replaces the inadequate equipment immediately with suitable equipment at no additional cost to the Engineer or the Department.

When very soft, cohesive or water-bearing granular soils are encountered below the water table, maintain the hole full with water or at a level higher than the ground water level at all times before, between and after sampling and testing operations to reduce the possibility of solid flowing upward into the casing. During the removal of the wash pipe, chopping bit and assembly, and insertion of the sampling barrel for standard penetration testing, maintain a positive inflow of water at the top of the casing. When necessary, increase the density of the drill water in the casing by adding bentonite or driller's mud to the drill water, but only with prior approval of the Engineer. After completing each soil boring, backfill in accordance with Section 210. Do not backfill borings in a mine fire area until after completion of the temperature monitoring program.

(b) Optional Procedures.

An alternate method of advancing the boring (such as with solid-flight augers or oversize sampling spoons) or of maintaining an open borehole (such as driller's mud) may be required or permitted if it can be shown that a clean hole will be maintained for the field testing and sampling operations and that the samples obtained are truly representative of the soil in place. Before proceeding with an alternate method of advancing the boring, obtain the written permission of the Engineer.

Where extremely compact material, boulders or other obstructions prevent further advance of the boring by driving casing, use boulder busters, augers, cutting bits, fish tails, or other under reaming bits to drill ahead of the drive casing to continue the boring if directed or authorized by the Engineer. Do not advance the under-reaming operation below the next scheduled sampling depth. Use drilled casing as an alternative to drive casing to continue the boring, if authorized by the Engineer. Perform blasting with small explosive charges to facilitate advancing the boring through boulders and other small obstructions only after obtaining written approval by the Engineer. Blasting must be performed by a licensed blaster in accordance with the regulations of the Pennsylvania Department of Environmental Protection and other applicable laws or ordinances. Pull casing up to an elevation at least 5 feet above the elevation of the charge before detonation to avoid damage to the casing. Note the size of charge and time of detonation on the boring logs. After completing each soil boring, backfill in accordance with Section 210.

(c) Procedure for unsampled boring.

Where it is necessary to advance a soil boring without sampling, such as for installing piezometers, slope indicator casing or other filed installations, or for boring of the diameter requested by the Engineer by methods described in Section 202.02, or by using a tricone roller bit. In all cases, maintain an open hole to the depth required. Do not use driller's mud to support and unsampled boring without written permission of the Engineer. After completing each unsampled soil boring, backfill in accordance with Section 210.

(a) General. Conduct standard penetration tests and obtain split-barrel samples in accordance with *ASTM D 1586, "Standard Test Method for Standard Penetration Test (SPT)"* and *"Split-Barrel Sampling of Soils"*, at every change of strata within a continuous stratum at intervals to be specified by the Engineer, with the top of the first sample at the ground (soil) surface in the boring.

(b) Equipment. For equipment not specified herein, meet the requirements of *ASTM D- 1586*.

(1) Split-Barrel Sampling Device. Provide, for each drill rig, at least two, 2 inch outside diameter split-barrel samplers with inside diameters of 1-3/8 inch at least 24 inch long. Provide other diameter split-barrel samplers if **requested by the Engineer**. The inside of each split-barrel must be flush with the inside of the drive shoe. Other split-barrel samplers are permitted only with the prior written approval of the PGM.

The **shoe** of the sampler must be sharpened to form a cutting edge at its inside circumference. Maintain the beveled edge of the drive shoe in good condition and, if worn, reshape the edge to the **satisfaction of the Engineer**. Replace the drive shoe of the sampler if damaged in such a manner as to cause projections within the interior surface of the shoe. Provide a minimum of two drive shoes in good condition for each sampling device.

Furnish on the boring log a complete description of the sampler, giving inside and outside diameters and length of barrel.

Fasten the sampler to its drive pipe by a connection embodying a check valve arranged so as to permit the ready escape of water entrapped above the soil sample as the spoon is driven down into the soil, but which will close as the soil sample and sampler are withdrawn, thus preventing the development of hydraulic pressure on top of the soil sample. Confirm a check valve is used as required.

Install a spring-type sample retainer in the tip of the sampler when necessary to prevent loss of the sample. If the standard split-barrel sampler fails to recover a soil sample on the second trial, as in granular soils, use a sampler with a flap valve or sand trap, or other approved device, to recover the sample. Do not use trap doors of the flap type protruding at any point into the inside diameter of the sampler without prior approval of the PGM.

(2) Hammer. Provide a solid rigid metallic hammer having a mass of 140 pounds + or– 2 pounds, with a hammer drop system meeting the requirements of *ASTM D1586, Standard Test Method for Standard Penetration Test (SPT) and Split-Barrel Sampling of Soils*, which can apply blows at a rate of 20 to 40 blows/minute. Automatic, Safety, and Donut hammers are permitted. Automatic and Safety hammers are expected to have an efficiency rating (ER) of not less than 60%. If a Donut hammer is to be used, the Contractor shall provide a hammer efficiency calibration of the hammer performed within the previous 12 months. Hammer efficiency calibration is to be measured as specified in *ASTM D4633, Standard Test Method for Energy Measurement for Dynamic Penetrometers*.

(c) Procedure. After cleaning the boring to remove all loose materials, remove the center bit assembly from the hollow stem auger. Gently lower the split-

barrel sampler to the bottom of the hole. If, due to insufficient cleaning, the sampler remains more than six (6) inches above the specified sampling depth, remove the sampler and provide additional cleaning. Drive the sampler with the guided hammer into undisturbed soil below the bottom of the boring. Permit the hammer to fall freely through a height of 30 inches. The guide must be marked to facilitate easy measurement of the hammer drop. Observe and record the number of blows required to drive the sampler each 6 inch increment for a total penetration of 18 inches. **Do not overdrive the sampler.** Clearly record the number of blows for each 6 inches of penetration. Cumulative blows will not be accepted. Record the actual amount of penetration to the nearest 0.1 ft. Remove the sampler and advance the casing to the next scheduled sampling depth, or as directed by the PGM.

Drive the sampler with blows from the 140 pound hammer following the refusal criteria in [Figure 24](#).

If a soil sample is lost or is found unsatisfactory as to size or condition, make a second attempt to obtain a satisfactory soil sample before advancing the boring to a lower elevation. Wash samples will not be accepted.

Immediately upon removal from the hole, carefully disassemble the sampler and record the soil description and amount of sample recovery. Remove the most representative and least disturbed portion of the sample, measuring 5 inches in length, and place into an air-tight glass jar of the dimensions specified in [Section 215](#). Do not push or wedge additional material into the sample jar. Where a change in strata occurs within the spoon sampler, place a sample of each material in a separate jar. Record the depth of the change. Securely fasten the lid of each jar. If the length of sample recovered is insufficient to provide a sample 5 inches long, place the entire sample in the sample jar.

Describe soil samples and record borings, sampling and testing data in accordance with [Section 214](#). Package, ship, and store the samples in accordance with the requirements of [Section 215](#).

<b>SPT Refusal Criteria and Action</b>			
<b>Condition</b>	<b>Primary Action</b>	<b>Results</b>	<b>Consequential Action</b>
<b>Condition "A":</b> SPT results of N = 50/0.1 ft. for one interval <b>OR</b> N ≥ 50/0.3 ft. for two consecutive intervals <b>(see Note 4)</b>	Attempt 2 ft. core run	Encounter rock with REC ≥ 80%	Begin continuous coring at 5 ft. runs
		Encounter rock with REC < 80% but ≥ 20%	Continue continuous coring at 3 ft. runs <b>(see Note 1)</b>
		Rock REC < 20%	Go to Condition "B" <b>(see Notes 2 and 3)</b>
<b>Condition "B"</b>	Attempt auger to next SPT elevation. Describe cuttings. Attempt SPT. <b>(see Note 4)</b>	Auger Refusal	Go to Primary Action in Condition "A"
		N = 50/0.1 ft. for one interval <b>OR</b> N ≥ 50/0.3 ft. for two consecutive SPT intervals	Go to Primary Action in Condition "A"
		N < 50/0.3 ft.	Continue SPT

**Notes:**

- 1) If recoveries remain below 80% and encountering softer or weaker rock (e.g., claystone, shale, weak siltstone) or highly weathered rock, maintain continuous coring at 3 ft. runs. If harder and/or un-weathered or slightly weathered stronger rock is encountered, may switch to continuous 5 ft. core runs after two consecutive 3 ft. core runs.
- 2) When drilling conditions indicate the recovered material was encountered at the bottom of the core run, or there is clear indication that conditions are improving, a second 2 ft. core run may be attempted.
- 3) Unless site or project specific conditions or subsurface conditions indicate otherwise, if after a second cycle through Condition "A", rock core recoveries continue to remain less than 20%, switch to continuous coring at 3 ft. runs.
- 4) Do not describe SPT or auger cuttings recovered from weathered or weak rock as a soil or provide a soil classification. Describe consistent with the material encountered (e.g., shale fragments, highly weathered sandstone).
- 5) Whenever results from subsurface investigations (whether SPT or rock coring) indicate a change in subsurface conditions, follow the appropriate consequential action indicated above.
- 6) SPT = standard penetration test, N = SPT blow count, REC = Recovery

Figure 24 - SPT Refusal Criteria

## 202.04 MEASUREMENT AND PAYMENT

(d)	Borings on land	Linear Foot
(e)	Unsampled borings	Linear Foot
(f)	Slide borings	Linear Foot

Payment will be made per foot for each boring satisfactorily completed, regardless of diameter of sampling interval. The payment per lineal foot will be considered full payment for all costs associated with the boring and standard sampling and testing including all required labor, equipment, and materials, and all logging, labeling, shipping and storage of samples, and site restoration.

## SECTION 203 - UNDISTURBED SOIL SAMPLING

### Minor Changes for Publication 222

**203.01 DESCRIPTION** - This work consists of recovering undisturbed soil samples from soil borings.

**203.02 EQUIPMENT** –

Use equipment specified in *ASTM D 1587, Standard Practice for Thin-Walled Tube Sampling of Soils for Geotechnical Purposes*, as directed by the Engineer.

Provide thin-walled tubes of 16-gauge seamless brass or hard aluminum, or 16- or 18-gauge seamless steel, with a minimum total length of 30 inches and with outside diameter of 3 inches, unless otherwise indicated by the PGM. Use only new, clean, un-corroded tubes removed from the manufactures' packaging at the job site. Used sample tubes are not permitted. All equipment will be subject to inspection and approval. Provide all sample tubes with a

machine-prepared, sharp cutting edge having a flat bevel to the outside wall of the tube and drawn in to provide an inside clearance beyond the cutting edge of 0.015 inch  $\pm$  0.005 inch.

**203.03 PROCEDURE** - Obtain samples in accordance with the procedures of *ASTM D 1587*, unless otherwise specified herein or by the PGM.

(a) Location - Complete borings as directed by the Engineer. Do not attempt undisturbed samples in these borings. Drill an unsampled soil boring in accordance with *Section 202.02(b)* approximately 3 to 5 feet away from the standard soil boring to a depth specified by the PGM.

(b) Method. Recover undisturbed soil samples by means of thin-walled tube samplers. When the sampling depth is reached, remove all loose and disturbed materials. Clean out, in such a manner, that the soil immediately above the top of the sample is as nearly undisturbed as possible. Advance and clean out hole as per *Section 202*. Connect the sampling device to the drilling rod, lower slowly to the bottom of the hole, and advance into the soil for a distance of 6 inches less than the total length of the sampling tube. If obstructions, such as gravel particles, prevent the full penetration of the sampler, obtain undisturbed soil samples of a lesser length with approval of the PGM.

Advance thin-walled tubes in a continuous downward motion at a rate of 3 to 5 seconds/ft. using the rig hydraulics without rotation, or otherwise as specified, approved or directed by the PGM. Do not drive the sampler unless the character of

the soil is such that driving with the hammer is absolutely necessary and is approved by the PGM.

Permit the sample tube with its contained soil sample to remain in place for a minimum of 15 minutes. After this time period, rotate the drill rod through two complete revolutions to shear the soil immediately below the sample. Carefully remove the sample from the boring and detach from the sample rods. Do not extrude the sample from the tube.

Remove any disturbed material in the upper end of the tube and measure the sample recovery. Remove ½-inch to 2 inches of material from the lower end of the tube for use in sample description. Completely fill the lower end of the tube, and at least 2 inches in the upper end of the tube immediately above the sample with a hot (melted) sealing wax consisting of paraffin wax, beeswax, microcrystalline wax, or some combination of these wax types. Tightly pack the remaining space in the upper end of the tube with paper, cloth or other approved material. Close the ends of the tube with snug-fitting plastic caps and secure caps in place with adhesive or friction tape. Dip the ends of the tube in hot wax several times to provide an air-tight seal.

During sampling in very soft soils, if directed by the PGM, use a weighted drilling mud, to maintain a pressure on the soil as nearly equal as possible to that existing before the drilling operations.

(c) Records. Record each undisturbed sampling tube in accordance with [Section 214](#). The boring number for the sample shall be the standard soil boring number with the addition of the suffix "A". A separate, complete boring log shall be prepared for each boring made for obtaining samples, whether or not samples are successfully obtained. Package, ship, and store samples in accordance with [Section 103](#).

## 203.04 MEASUREMENT AND PAYMENT - Delete

### SECTION 204 - ROCK CORE DRILLING

#### Major Changes for Publication 222

**204.01 DESCRIPTION** - This work consists of securing intact samples of rock from borings by diamond core drilling to determine the true nature, arrangement and thickness of rock strata and discontinuities as they exist in the ground, and of advancing unsampled borings through rock.

#### 204.02 PROCEDURES FOR ADVANCING BORINGS IN ROCK

(a) Perform rock coring in accordance with *ASTM D 2113, Standard Practice for Rock Core Drilling and Sampling of Rock for Site Investigation*, except as modified by these specifications, to obtain rock core of the size **NX or NQ** where the soil boring has refused further penetration by split-barrel sampling. Drill each boring to the final boring depth indicated, or to the depths directed by the PGM. Sample soft or decomposed rock with a driven sampler in accordance with [Section 202](#) when possible.

(b) Equipment. If not specified herein, meet the requirements of [ASTM D 2113](#).

(1) Drill. Use a drill having hydraulic feed type or similar mechanism having the capability of drilling vertical and angle holes. Maintain the drill in efficient

operating condition. Must be a combination type drill, which is capable of the auguring and coring.

- (2) Core Barrel. Use a Series "M" swivel-type, double-tube core barrel with a diamond bit and a reaming shell, or a wire-line core barrel with a diamond bit. If approved by the CGE, triple tube core barrels may be used. Maintain the core barrel and bit in efficient operating condition, and replace if damaged or worn. A split inner barrel must be used in all borings, **unless otherwise directed by the Engineer.**
  - (3) Drill Rods. Provide drill rods having an inside diameter that will permit flow of drilling fluid through the rods in a quantity sufficient to provide an upward velocity of the fluid between the rod and the hole wall so as to remove the cuttings effectively. Do not drill with drill rods that are not straight.
  - (4) **All drilling water is to be recycled unless otherwise directed by the Engineer.**
  - (5) Disposal of drill water must be conducted in an environmentally appropriate manner as directed by the PGM. Ensure that any potentially damaging or harmful materials are collected and disposed of in a manner that result in any impact to local environmental conditions.
- (c) Procedure for Rock Coring. Make all test borings through appropriate size casing or hollow-stem augers installed to the bottom of soil borings. Advance the casing or hollow-stem augers to rock and seal into the rock surface to prevent seepage from or sloughing of soil overburden into the bore hole to be cored. Follow length of core runs as prescribed in [Figure 24](#).

When coring rock, including shale, claystone and coal, control the speed of the drill and the drilling pressure, amount and pressure of water, and length of run to give the maximum possible recovery from the rock being drilled. Maximum length of first coring run is two (2) feet. Do not permit grinding of core. Maintain and observe pressure gauges to detect any blocking of core in the barrel, and at any suspicion that such is occurring, immediately cease drilling, remove the barrel from the hole and remove the core. Do not continue coring until care has been taken to see that the core barrel, bit and other equipment are in satisfactory operating condition. If poor recovery is experienced due to failure to consider the above factors, re-drill and core the hole at no additional cost.

If soft or broken rock is encountered that cause broken pieces of rock to fall into the hole and cause unsatisfactory coring, or if voids of any type including mined-out coal seams or limestone caverns are encountered that endanger the continued downward progress of the boring, ream and case the hole with flush-joint casing to a point below the broken or open zone. Use a size of flush-joint casing which will permit securing of the specified core size. Repeat this procedure as many times as necessary to keep the hole clean. The use of standard wire line tools of the specified size is a preferred alternative procedure.

Make individual drill runs in the coring operation of not more than 5 ft. Where soft or broken rocks are encountered or anticipated, reduce the length of runs as indicated in [Figure 24](#), or less as directed by the PGM, to reduce the core loss and keep core disturbance to a minimum. Make every effort to obtain maximum core recovery and record in the boring log all significant actions of the drill tools and reasons for loss of core.

Discontinue core drilling if, in the opinion of the PGM, observations of the drill tool indicate that softer materials have been encountered, and standard split-barrel

sampling may be resumed. When drilling in carbonate formations, if soil filled voids are encountered, attempt a split-barrel sample to determine the nature of the material contained in the void.

Failure to comply with the foregoing procedures when ample warning of unusual subsurface conditions has been received in advance, will constitute justification for the PGM or DGE to require redrilling of any boring from which core recovery is unsatisfactory, at no additional cost. When, in the opinion of the PGM, the rock is in either a soft or broken condition, take precautions to keep the core intact as much as possible. Dismantle the split inner barrel horizontally and remove the core with care.

Exercise particular care in recording water losses, artesian pressures, rod jerks, changes in rate of advancement or any other unusual coring experiences which will supplement the core record and further document the nature and extent of fracturing or voids. Mark fractures and their estimated widths in the core boxes and clearly indicate the location of voids.

Immediately upon removal of the core barrel from the hole, carefully remove the rock core sample from the barrel, place the rock in core boxes in accordance with [Section 215](#). Describe the rock samples, measure the rock recovery, and prepare the driller's log of each rock boring in accordance with [Section 214](#).

After completing each rock boring, install groundwater monitoring according to [Section 209](#). After completion of groundwater monitoring, and when the hole is not required for long-term groundwater monitoring or instrumentation, backfill in accordance with [Section 210](#).

Package, ship, and prepare the rock core for storage in accordance with [Section 213](#) and [Section 215](#).

- (d) Procedure for Unsampled Rock Drilling. Where it is necessary to advance a rock boring without securing rock core, such as for installing piezometers, slope indicator casing or other field installations, or for performing field tests at a predetermined depth, advance the boring by methods described in [Section 204.02\(c\)](#), air rotary methods, or by using a tricone roller bit. When the hole is not required for long-term groundwater monitoring or instrumentation, backfill in accordance with [Section 210](#).

## 204.03 MEASUREMENT AND PAYMENT

(a) Borings on Land	Linear Foot.
(b) Unsampled Borings	Linear Foot
(c) Slide Borings	Linear Foot.

Payment will be made per foot after satisfactory completion of the following:

- (a) Backfilling – In accordance with Section 210
- (b) Site Restoration – In accordance with Sections 104.09 and 104.10
- (c) Delivery of legible handwritten Driller's Logs and Core Boxes as directed by the District Geotech Engineer – In accordance with Sections 214 and 215.
- (d) Rock coring along with bituminous and concrete pavements will be cored NQ/NX or HQ and will be paid at the same price per lineal foot as borings on land, unless otherwise directed by the Engineer, Section 202.04(a).
- (e) Unsampled rock drilling will be paid at the same price per lineal foot as unsampled borings, Section 202.04(b).

## SECTION 205 - CONCRETE/MASONRY DRILLING AND CORING

Payment will be made in accordance with Section 204.03

## Section 206 - STANDPIPE PIEZOMETERS

Delete

## SECTION 207 - INCLINOMETER CASINGS

### Major Changes for Publication 222

**207.01 DESCRIPTION** - This work consists of installing inclinometer casing in a boring to permit monitoring of lateral movement of the ground.

**207.02 PROCEDURE AND MATERIALS** – For procedures and/or materials not specified herein, meet the requirements of AASHTO T-254, "Standard Method for Installing, Monitoring and Processing Data of the Traveling Type Slope Inclinometer." Inclinometer installation details are shown in Figures 207(a) and 207 (b).

Drill the boring to the depth indicated by the Engineer in the specified manner in accordance with Sections 202, 204 and/or 205

For standard NX diameter borings, using NW (3 in. inside diameter) drive casing, provide ABS plastic inclinometer casing having dimensions of 2.75 inches maximum outside diameter and 2.32 inches inside diameter, having four (4) machined longitudinal grooves equally spaced around the inside circumference, with standard self-aligning ABS plastic couplings, and ABS plastic top and bottom plugs.

Cement each casing joint and bottom plug with ABS cement, and rivet each joint at the quarter points around the casing, between grooves, with pop rivets to guarantee against separation and to maintain the alignment of the longitudinal grooves throughout the entire length of the installation. If quick connect type couplings are used, use the provided shear wires to connect casings; do not use cement or rivets.

Install the casing to a minimum of 10 feet into rock or 20 feet below the zone of suspected movement. Where the bottom of the inclinometer casing is higher than the bottom of the boring, backfill the lower portion of the boring by tremieing a grout mixture, through a pipe placed at the bottom of the boring, or, with the prior direction or written approval of the Engineer, by placing and tamping bentonite pellets. To prevent premature compression when using telescoping casing and couplings, do not allow the casing to rest on the bottom of the borehole. If placing casing in a water-filled hole, it may be necessary to load the casing with clean water to provide the necessary ballast to lower the casing.

Backfill that annular space surrounding the inclinometer casing using methods and materials as directed by the Engineer for each particular installation, to position the casing and prevent any lateral shifting. Whenever possible, backfill the installation before or during removal of the casing or hollow stem augers. The use of fabricated grout valves placed at the bottom of the casing will be permitted. Flushing of the casing may be required if the ball-check type valve is used. When grout backfill is used, tape all joints prior to casing installation. When ground water measurements are required, do not use grout backfill.

Backfill with a cement bentonite mix, as specified in Section 210.02 (b) or if directed, with dry, vibrated sand.

**Figure 207 (a) Inclinometer Installation**

See page 5-62

**Figure 207 (b) Inclinometer Installation (Plan and Detail)**

See page 5-63

**Figure 207 (c) Inclinometer Above Ground; (d) Flush Installation**

See page 5-64

Install a protective steel or cast-iron protective casing over the completed inclinometer casing. Set the protective casing in a cement grout mix as specified under Section 210.02 (c), and extend to a depth of at least 2 feet below the ground surface. For above ground installations [Figure 201 (c)], extend the protective casing (4 inch minimum diameter) 2 feet above the surrounding ground surface, provide a lockable lid with lock and key. Installations above the ground surface must have the inclinometer casing extend a minimum of 2.75 inches below the top of the protective casing

**207.03 MEASUREMENT AND PAYMENT**

(a) Inclinometer Casing	Linear Foot.
(b) Protective Casing, Above-ground	Each.
(c) Borings on land	Linear Foot
(d) Unsampled Borings	Linear Foot
(e) Backfill Borings	Linear Foot

Masterlock Pro Series or equivalent padlocks keyed alike will be supplied with protective casings and be considered incidental to this item. Labeled keys will be supplied to the Engineer and others, as needed.

Payment per linear foot for inclinometer casing installed will be considered full payment for all costs associated with installation of inclinometer casing in borings including all labor, equipment, and backfill materials. Inclinometer casing will be measured inside the casing from the top of the casing to the top of the bottom cap.

Figure 27 - Inclinometer Installation (Typical) N.T.S.

Figure 28 - General Inclinometer Coupling Installation N.T.S.

Figure 29 - Inclinometer Protective Casing (Typical) N.T.S.

## SECTION 208 – SPECIAL INSTALLATIONS AND FIELD TESTING

This section has been deleted. Specifications for special installations or testing should be added on a project-specific basis as a Purchase Order Special Provision.

## SECTION 209 - GROUNDWATER OBSERVATIONS

**209.01 DESCRIPTION-** This work consists of observing and measuring groundwater during the subsurface boring, sampling, and testing operations.

**209.02 PROCEDURES -** Measure groundwater levels and record on the field logs for all completed borings. Measure groundwater levels to the nearest 0.1 ft. using an electronic water level indicator with an audible or visual signal. Record completely in the boring logs any unusual water conditions and depths at which there is a gain or loss of water, or return of water after a loss during boring operations. Record the depths at which water under excess pressure is observed. When water under excess pressure is observed, stop the drilling operation and extend the casing above the ground surface so as to contain the flow of water, or temporarily attach a low-pressure gauge at the top of the boring to permit measurement of water pressure. Measure and record the height of water above the ground surface or the water pressure at the top of the boring. Measure and record groundwater levels immediately after pulling casing or removing hollow-stem augers (0-hr reading); and twenty-four hours later (24-hr reading). **Set temporary 1 inch PVC pipe from the existing ground surface to the bottom of each vertical boring to facilitate acquisition of 24 hour water readings. Install the temporary pipe with slotted end section into the boring prior to extracting casing or hollow stem augers.**

Before pulling casing or removing hollow stem augers, install temporary 1-inch ID (minimum or larger if required for sampling purposes) PVC pipe to permit the measurement of groundwater levels. Provide a sensing section in the bottom 5 ft. consisting of PVC pipe having staggered 1/8-inch wide slots or 3/8-inch diameter holes that are cut at maximum 6-inch center-to-center spacing. This pipe will also be used to tremie grout the hole when closing the boring in accordance with [Section 210](#). Accordingly, do not place a permanent cap or plug on the bottom of the pipe.

If more than one (1) day is required to complete a boring, take groundwater readings at the end of each days operation and immediately prior to the resuming of drilling operations and record on the drilling log in the remarks section.

If drilling mud was used to advance the boring, install temporary PVC casing at the completion of drilling. After installation of temporary casing, flush the hole with clean water to remove the drilling mud from the boring. Inject water at the bottom of the boring and continuing flushing until only clean water exits at the top of the boring to ensure all drilling mud is displaced. After flushing, record 0-hour and 24-hour groundwater levels. Note that drilling mud is not permitted to be used if any water sampling for testing, including electrochemical or environmental, is to be performed in the boring.

**209.01 MEASUREMENT AND PAYMENT -** No separate measurement or payment for this work.

## SECTION 210 - BACKFILLING AND PLUGGING BORINGS

**210.01 DESCRIPTION** – This work consists of backfilling all completed borings which do not contain instruments (such as piezometers or inclinometer casing) and backfilling below the bottom of instruments.

### 210.02 PROCEDURES AND MATERIALS

- (a) **General.** Temporarily plug or cap each boring immediately upon completion of the boring. Remove covers and permanently backfill with grout and plug each boring flush with the ground surface after all information and data is obtained from the hole and recorded, as directed by the Engineer. The backfilling and plugging of borings will be in accordance with the appropriate procedure specified under *Section 210.02(b)*, *Section 210.02(c)*, *Section 210.02(d)*, or *Section 210.02(e)*.
- (b) **Boring Through Soil and Rock.** Backfill the boring to the ground surface using a grout mix of 80L water, 1 bag cement (42.6kg) and 9Kg bentonite. All borings will be backfilled with grout pumped to the bottom of the boring through a grout pipe, unless otherwise directed by the Engineer. Raise the grout pipe periodically during grouting, but maintain the tip of the pipe at a minimum depth of 5 feet below the top of grout in the boring or at the bottom of the boring, whichever is shallower, until grouting is complete.
- (c) **Grouting of Protective Casing.** Backfill around the outside of the protective casing with a TYPE-1 grout mix as shown in *Table 38*, or an alternative grout mix approved by the DGE.
- (d) **Boring Through Mine Voids(s) or Limestone Cavern(s).** Install a grouting basket or plug in the boring immediately above the top of the mine or cavern, and place a 5 foot plug of Type-A fine aggregate meeting *Publication 408, Section 703.1* on top of the basket or plug. Backfill the boring as described in *Section 210 (a) and (b)*

In the event multiple voids (mines or caverns) are penetrated by a boring, backfill the boring with grout in stages. In the first stage, backfill from the bottom of the boring to the bottom of the lowest void as described above. In the second stage, backfill the rock strata between the lowest void and the void above it by supporting a grout basket on a 1-1/4 inch (minimum) diameter pipe with the bottom of the pipe on the bottom of the lowest void and the grout basket located in the rock strata above the lowest void. With the grout basket in place, grout the portion of the boring between the two lowest voids as described above. If NX standard wire line equipment is used to core the rock, extract the NX casing to the top of the zone being backfilled in the second stage and maintain in place until the second stage of grouting is completed.

Allow each stage of grouting to set a minimum of twelve (12) hours before proceeding with the next stage. Perform the third and subsequent stages of grouting as specified for the second stage. Perform the final stage of grouting to the ground surface as specified above for a boring penetrating one mine or cavern.

- (e) **Boring Through Pavement, Sidewalk, Bridge Deck, Floor Slab or Wall.** Backfill the boring with grout as described in *Section 210 (a) and (b)* to the bottom or back of the pavement, sidewalk, floor slab or wall.

In concrete or asphalt, pavements or slabs, plug the boring at the top with a non-ferrous, non-shrink, fast-setting cement-based grout of a strength and thickness equal

to the original structure, pavement or slab. Use grout which exhibits no shrinkage when tested in accordance with *ASTM C 827/C 827M, Standard Test Method for Change in Height at Early Ages of Cylindrical Specimens of Cementitious Mixtures.*

In plugging borings through bridge decks, provide temporary support or forming for the plug, acceptable to the DGE.

In concrete structures, grout the boring for the full depth of the boring with a non-ferrous, non-shrink, fast setting cement based grout of a strength equal to the original structure, but not less than 3,000 pounds per square inch.

- (f) Temporary backfill in roadway and sidewalk areas. If it is determined by the contractor that a boring in a roadway or sidewalk area cannot be completed by the end of the workday, cease advancement of the boring. The contractor will utilize flush joint casing with flush joint end plug or hollow stem augers to maintain borehole overnight or approved equivalent method. The flush joint end plug, hollow stem auger cap, or plywood covering must not be within 6 inches of the pavement surface and the top 6 inches will be temporarily plugged flush with the pavement surface with "cold patch" or equivalent material approved by the engineer. On the next workday, remove the surface plug and complete boring to the required depth. Backfill the completed boring as specified. Refer to Figure 210 (a) "Temporary Backfill Detail for Borings in Roadway", located in SECTION K-1, ATTACHMENT II of the SPECIAL PROVISIONS

In no case will augers, or casing remain in borehole within 0.15 meters of pavement surface metal plates, metal or wooden plugs will not be used to temporarily plug or cover borings left overnight in roadway areas. See Figure No. 210 (a)

- (g) Additional backfilling operations requiring cement as backfill will be as directed by the Engineer.

### **210.03 MEASUREMENT AND PAYMENT**

- |   |             |
|---|-------------|
| (a) Backfilling Borings through Soil and Rock         | Linear Foot |
| (b) Grouting Basket or Plug.                          | Each        |
| (c) Fast Setting Non-Shrink Cement Grout 22.7kg, bag. | Each        |
| (d) Temporary backfill in Roadway and Sidewalk areas. | Each        |

No additional payment for placement or removal of temporary plug or backfill.

Payment for each listed item, completed and accepted, will be considered full payment for all labor, equipment and materials associated with backfilling and plugging borings.

## SECTION 211 - TEST PITS

Delete

SECTION 212 - STANDBY FOR BORINGS

**DELETE**

## SECTION 213 - STORAGE AND PROTECTION OF CORE BOXES

**213.01 DESCRIPTION** - This work is the installation of durable coverings for core boxes to protect from the weather.

### 213.02 PROCEDURE

Once core boxes are delivered to the storage site indicated in the Purchase Order, stack boxes on pallets in layers of alternating directional pattern. Stack boxes four wide and eight high on each pallet. Unless otherwise directed, limit stacking of pallets to a maximum of two high.

Cover stacks with tarp to protect the top and all four sides, **if directed**. Secure the tarp with minimum 3/16 inch diameter polypropylene rope, laced through the grommets and fastened tightly.

Label the contents of the pallet(s) on the top and all four sides of the tarp. Print directly on the tarp with a permanent, waterproof, black marker. Print legibly and provide at a minimum the project SR and Section, boring numbers and box numbers as indicated below:

SR_____ , Section_____.
Boring No._____ Boxes_____ through_____.
Boring No._____ Boxes_____ through_____.
Boring No._____ Boxes_____ through_____.

### 213.03 MEASUREMENT AND PAYMENT

**(a)** Incidental to Purchase Order

## SECTION 214 - RECORDS AND REPORTS

**214.01 DESCRIPTION** – This work consists of maintaining and confirming detailed records of the subsurface boring, sampling, and testing operations.

**214.02 SYSTEM FOR DESCRIBING SOIL AND ROCK**

(a) Soil Description. Describe the following characteristics of each soil stratum encountered:

- Texture – For coarse-grained soil, describe the primary or predominant texture of a as either a gravel size or a sand. For fine-grained soil, describe the primary or predominant texture as either silt or clay. Describe supplementary textures by the use of the adjectives (e.g., gravelly, sandy, silty, clayey). Use all that apply, with the most prominent first and the least prominent last.
- Color - Describe the basic color of each soil, such as yellow, brown, tan, red, gray or black and modify, if necessary, by adjectives such as light, dark, mottled, banded or mixed.
- Moisture - Describe the amount of moisture present in each soil sample in terms of wet, moist, damp or dry.

(b) Rock Description. Describe the following characteristics of each rock stratum encountered.

- Type - Identify the basic rock type encountered such as limestone, dolomite, calcite, shale, sandstone, siltstone, claystone, coal, conglomerate, chert, marble, slate, phyllite, quartzite, quartz schist, gneiss, diabase, and granite.
- Color - Describe the basic color of each rock type, such as brown, red, tan, gray, pink or black, and modify, if necessary, by adjectives such as light, dark, banded or mixed
- Unusual Conditions or Difficulties – Note any additional information (such as changes in the color of drill return water, tool drops, drilling advancement rate, obstructions, caving, boulder, etc.).

**214.03 BORING LOGS** - Keep a continuous and current field record of the operation of each boring. Use the *Driller's Boring Log*, or an equivalent form approved by the PGM. Make the boring log available to the PGM at all times for review. Upon the completion of each boring, submit the original driller's log to the PGM. **Typed copies of the driller's boring log will be submitted to the Engineer within two (2) days of the completion of the boring, if directed by the engineer. In all other cases, typed driller's boring logs will be submitted to the Engineer prior to payment of the driller's monthly invoice.** As a minimum, record the following information on each boring log:

General Information:

1. The project identification, including route, section and county.
2. The test boring identification number.
3. The date on which the boring was begun and the date on which the boring was completed.

4. The name of the Contractor, driller and helper.
5. The name of the PGM's field representative (Inspector).
6. The elevation of the top of the test boring (if available).
7. The location of the test boring relative to project reference line (e.g., segment, offset and offset from centerline) or other suitable reference points.
8. The type of drill rig used.
9. The drilling method used to advance the boring in soil.
10. The inside and outside diameter and depth of any casing used.
11. The type and weight of hammer and free fall used to advance the split-barrel sampler, the number of rope turns on the cathead (1-3/4 or 2-1/4), and the diameter of the sampler. Note whether the hammer is automatic (high efficiency) or manual (standard, low efficiency).
12. Hammer Efficiency Rating (ER), if known.
13. The length of the split-barrel sampler.
14. The drilling method used to advance the boring in rock.
15. The type and size of core barrel used and bit designation.

Specific Boring, Sampling and Testing Information:

1. The depth, type, number and recovery of each soil sample. Number soil samples sequentially with an "S-" prefix.
2. The blows per 6 inches or less to advance the split-barrel sampler.
3. The length of core run and length of recovered core for each run of rock core. Number rock core runs sequentially with an "R-" prefix.
4. A description of each soil and rock strata encountered, the depth to the top and bottom of each stratum, and discontinuities in each strata.
5. Depth to groundwater level, elapsed time after completion of drilling and date on which observation was made.
6. Depths at which undisturbed samples are taken.
7. Difficulties in drilling (obstructions, caving, boulders, rising of sand into bottom of boring, etc.) including the basis for any loss of soil sample or rock core.
8. Depth of loss and/or return of circulating water and increase in usage of drilling water.
9. Any additional information (such as changes in the color of drill return water, tool drops, drilling advancement rate, etc.) which may be of assistance in defining the presence of strata changes, boulders, voids or other subsurface conditions.

**214.04 DAILY DRILLING QUANTITY SUMMARIES** - The Contractor **may** maintain and update daily a record for each drill rig of the work completed including footage of drilling in soil and rock. The record will document the quantity of each pay item listed in the **Bid** Proposal completed during the day, and will be summarized weekly. The record will also indicate, for each day, the driller's name, the helper's name and the hours worked. The Driller and Inspector shall review and sign the record daily to indicate agreement with the quantities listed as complete, and note any disagreement with the listed quantities. Provide data to the Inspector/PGM as needed to facilitate accurate documentation of the work on the record. **If prepared**, one copy of the record will be made available to the Inspector/PGM at the end of each work day.

**214.05 MEASUREMENT AND PAYMENT** - No separate measurement or payment for this work.

## SECTION 215 - PACKAGING, PROTECTING AND SHIPPING SAMPLES

### Minor Changes for Publication 222

**215.01**      **DESCRIPTION** - This work consists of packaging, protecting and shipping soil and rock samples in a manner that will facilitate sample identification and minimize the potential for sample disturbance or damage.

### **215.02**      **PACKAGING OF SAMPLES**

- (a) Samples Boxes. Provide new or refurbished wooden core boxes as shown in [Figure 30](#) for packaging, shipping and storing of split-barrel soil samples and rock core samples. Boxes must be stenciled in black paint according to **Publication 222, Figure 20**. Construct the core boxes and partitions so as to restrain the sample jars and rock cores against shifting during transport. Assist as necessary to properly place core samples in the core boxes. **Also, construct wooden core boxes capable of storing 6" to 8" diameter size samples, as directed, using materials specified in [Figure 30](#) with boxes no longer than 4' in length.**

Unless the PGE or DGE directs otherwise, when two borings have minor amounts of recovered sample (such as very shallow and/or low recovery borings) it is permissible to place samples from both borings in a single core box.

- (b) Sample Jars. Provide new glass sample jars approximately 5 inches high and approximately 2 inches inside diameter at the mouth, and with an inside diameter of not more than ¼-inch larger than that at the mouth. Provide the jars with a metal screw cap containing a rubber or waxed paper gasket. Provide self-adhesive, printed labels placed on the side of each jar to record the required information as shown in **Publication 222, Figure 21**.

### **215.03**      **PROTECTION AND SHIPMENT OF SAMPLES**

- (a) Split-Barrel Soil and Rock Core Samples. Provide suitable dry storage for all samples until completion of all required subsurface exploration sampling and testing Purchase Order work items. At the completion of work, carefully ship all samples to the location indicated in the Instructions to Bidders, or as directed by the PGM. No payment will be made for boring and sampling operations associated with samples that are damaged or missing as a result of Contractor negligence.
- (b) Undisturbed Soil Samples. Unless specified otherwise by Purchase Order or directed by the PGM or DGE, undisturbed samples shall be packaged and transported according to "Group D" sample procedures given in [ASTM D 4220, Standard Practices for Preserving and Transporting Soil Samples](#). These procedures include protecting the undisturbed soil samples from vibration, impact, bumping, dropping, rolling, etc. by proper packaging and cushioning. Samples are to be handled, stored and shipped in the same orientation in which they were taken. Protect samples from freezing or excessive heat. Metal or plastic tube caps shall be provided and used to seal the sample tubes. Provide wood, metal, or other suitable type of shipping container that adequately cushions and insulates the undisturbed samples. Deliver or ship the undisturbed samples in a timely manner to the location indicated in the Instructions to Bidders, or as directed by the PGM. For all modes of transporting samples, the loading, transport, and unloading of sample containers will be monitored by the Inspector or other qualified person such as the PGE, geologist, or soils technician. No payment will be made for boring and sampling operations associated with samples that are damaged or missing as a result of Contractor negligence.

**215.04** **MEASUREMENT AND PAYMENT** - No separate measurement or payment for this work

**BILL OF MATERIALS:**

MEMBER	QTY	DIMENSIONS	TYPICAL LUMBER
Lid	1	3/4" x 11-1/2" x 48"	Lumber No. 2 Pine, Exterior Plywood
Bottom	1	3/4" x 11-1/2" x 48"	Lumber No. 2 Pine, Exterior Plywood
Sides	2	3/4" x 2-1/2" x 48"	Lumber No. 2 Pine, Exterior Plywood
Ends	2	3/4" x 2-1/4" x 10"	Lumber No. 2 Pine, Exterior Plywood
Partitions	3	1/4" x 2" x 46-3/4"	Lumber, Spruce or Hardboard

Note: All dimensions above are neat measure.

Pine Block Spacers (5-3/4" x 2-3/16") are to be included with each box.

**Specifications:**

All lumber is to be No. 2 Pine or approved equal (except partitions).

End pieces and bottom are to be slotted to permit recessing of ends and bottoms of partitions.

Slots are to be of sufficient dimensions to provide rigidity to partitions and easy removal.

All lumber members are to be firmly secured by appropriately sized screw-type nails.

Metal hinges are to be recessed sufficiently to insure closure of the lid and secured by appropriate sized wood screws.

Box dimensions must be sufficient to accommodate sample jars.

HARDWARE	QTY
2" Hook & Eyelet	1
Eyelet	1
1/2" x 2" Metal Hinge	2
Screw-type Nails	(As needed)
Hinge Screws	(As needed)

Figure 30 - NX Core Box Construction

## SECTION 216 - MAINTENANCE AND PROTECTION OF TRAFFIC

**216.01 DESCRIPTION** - This work consists of maintain and protecting traffic in and adjacent to the area where subsurface exploration, sampling and testing operations are being performed

**216.02 MATERIAL** - Furnish material and traffic control devices necessary for the maintenance and protection of traffic, and conforming to the Traffic Control Plan, the National Manual on Uniform Traffic Control Devices (MUTCD), the [67 Pa. Code, Chapter 212](#), and the Pennsylvania Department of Transportation [Publication 213 – Traffic Control Guidelines](#).

**216.03 PROCEDURES** - Comply with the requirements of [Section 103.13](#) and [67 Pa. Code, Chapter 212](#).

Install and maintain the traffic control devices as required or directed. Schedule operations to permit movement of traffic with minimum interference. If traffic interruptions become too frequent, cease operations in the area concerned, as directed. Take satisfactory remedial action to correct the situation before continuing operations.

Provide personnel, equipment, and material in accordance with the Pennsylvania Department of Transportation [Publication 408](#), the [67 Pa. Code, Chapter 212](#), and the Pennsylvania Department of Transportation [Publication 213](#) to control traffic through work zones and to provide safety for the work force. Submit traffic control plan for approval.

Maintain a minimum of one (1) lane in each direction at all times on four (4) lane highways. Maintain a minimum of one (1) alternating lane of traffic on two (2) lane highways. The Department reserves the right to dictate hours and days of work when traffic restrictions are imposed.

### 216.04 MEASUREMENT AND PAYMENT

- |     |   |         |
|-----|---|---------|
| (a) | Maintenance and Protection of Traffic with two (2) Flagman.                     | Hourly. |
| (b) | Flashing arrow panel and shadow vehicle with truck mounted attenuator.          | Hourly. |
| (c) | Flashing arrow panel and shadow vehicle with truck Mounted attenuator at night. | Hourly. |

This item will be measured and paid for at the Purchase Order unit price per hour. The payment per hour will be considered full payment for all costs associated with maintenance and protection of traffic including two (2) flagmen and all other labor, equipment and supplies according to Publication 213.

SECTION 217 - AUGER BORING FOR BULK SOIL SAMPLES

217.01 Delete

SECTION 218 - CONTRACTOR RECALL

218.01 Delete

## SECTION 219 - TEMPORARY POTABLE WATER SUPPLY

- 219.01 DESCRIPTION-** Provide temporary potable water service to any impacted property owner when directed by the DGE or their Representative.
- 219.02 MATERIALS** Provide all necessary equipment such as supply truck, storage tank, piping, parts, connections and valves to connect to the property owner's water supply system. Provide storage tank of sufficient volume. Protect storage tank from freezing and pressurize if necessary.
- 219.03 PROCEDURE** The PGM will immediately notify the Contractor of any property owner having a water supply potentially impacted by drilling. Within 8 hours of direction from the PGM, provide a sufficient quantity of potable bottled water to the affected property owner. Provide sufficient quantities of bottled water for each permanent resident in the impacted dwelling, sufficient defined as one gallon per day of drinking water for each individual and five gallons per day for cooking and personal hygiene per each impacted dwelling. Within 36 hours of direction from the PGM/PGE, install a functioning temporary water service and supply at least 100 gallons of water per day per resident affected. Maintain continuous operation of the temporary water system until directed by the PGM that adverse effects are abated or within the limits defined in the Purchase Order, whichever is sooner. Notify the PGM and the impacted property owner prior to connection and disconnection of the temporary water service. It is the responsibility of the Contractor to provide suitable/reliable temporary potable water service (i.e. supply) that replaces the impacted property owner's water supply well due to negative impacts from drilling operations.
- 219.04 MEASUREMENT AND PAYMENT**
- (a) Hookup and Disconnect of Temporary Potable Water Supply. Lump Sum  
The lump sum payment includes all bottled water supplied, and the hookup and disconnect of the temporary supply.
- (a) Temporary Potable Water Supply. Week  
A unit payment will be made for each week (consecutive 7 days), and any remaining portion thereof, that the temporary pressurized water supply is connected and functioning. Payment includes all quantities of pressurized water supplied.

SUBCHAPTER 5G - ADDITIONAL BOND FOR LABOR AND MATERIALS

ADDITIONAL BOND FOR LABOR AND MATERIAL  
(Consultant)

KNOW ALL MEN BY THESE PRESENTS, That we \_\_\_\_\_  
of \_\_\_\_\_

\_\_\_\_\_ as principal, and \_\_\_\_\_

\_\_\_\_\_ a corporation incorporated under the laws of the State of \_\_\_\_\_ as surety, are held and firmly bound unto \_\_\_\_\_ for the use of any and every person, co-partnership, association, or corporation interested, in the full and just sum of \_\_\_\_\_ dollars (\$ \_\_\_\_\_), lawful money of the United States of America, to be paid to the said obliges or its or their assigns, to which payment well and truly to be made, we bind ourselves, our heirs, executors, administrators, successors and assigns jointly and severally, firmly by these presents.

Sealed with our respective seals and dated this \_\_\_\_\_ day of \_\_\_\_\_ A.D. 20 .

WHEREAS, The above bounded principal has entered into a contract with \_\_\_\_\_, bearing even date herewith, for certain subsurface test borings, at location indicated on plans and as directed in accordance with "Standard Specifications for Subsurface Boring, Sampling, and Testing," which are attached to this contract and made a part hereof, situated in \_\_\_\_\_ County, Route \_\_\_\_\_ Section \_\_\_\_\_ Borough \_\_\_\_\_ Township \_\_\_\_\_ City, Commonwealth of Pennsylvania for the approximate sum of \_\_\_\_\_ dollars (\$ \_\_\_\_\_).

and

WHEREAS, It was one of the conditions of the award of the obligee, pursuant to which said contract was entered into, that these presents should be executed.

NOW, THEREFORE, The condition of this obligation is such that if the above bounded principal shall and will promptly pay or cause to be paid in full all sums of money which may be due any person, co-partnership, association, or corporation for all material furnished and labor supplies or performed in the prosecution of the work, whether or not said material or labor enter into and become component part of the work or improvement contemplated, and for rental of equipment used and services rendered by public utilities in, or in connection with the prosecution of such work, then this obligation is to be void, otherwise to remain in full force and effect.

The principal and surety hereby jointly and severally agree with the obligee herein that every person, co partnership, association or corporation, who, whether as subcontractor or otherwise, has furnished material or supplied or performed labor or rental equipment in the prosecution of the work as above provided and any public utility who has rendered services in, or in connection with the prosecution of such work, and who has not been paid in full therefore, may sue in assumpsit in this Additional Bond in the name of the obligee for their, or its use, prosecute the same final judgment for such sum or sums as may be justly due them, or it, and have execution thereon. Provided, however, that the obligee shall not be liable for the payment of any cost or expenses of such suit.

Recovery by any person, co partnership, association, or corporation hereunder shall be subject to the provisions, of the Act of June 22, 1931, P.L. 881, which Act shall be incorporated herein to the extent it has not been repealed by the Act of December 20, 1967, P.L. 869, the Public Works Contractors Bond Law, and is made a part hereof, as fully and completely as though its provisions were fully and at length herein recited.

It is further provided that any alterations which may be made in the terms of the contract or in the work to be done or materials to be furnished or labor to be supplied or performed under it or the giving by the obligee of any extension of time for the performance of the contract or any other forbearance on the part of either the obligee or the principal to the other, shall not in any way release the principal and the surety or sureties or either or any of them, their heirs, executors, administrators, successors, or assigns from their liability hereunder, notice to the surety or sureties of any such alteration, extension, or forbearance being hereby waived.

IN WITNESS WHEREOF, The said principal and surety have duly executed this bond under seal the date and year first above written:

ADDITIONAL BOND FOR LABOR AND MATERIAL  
(PennDOT)

KNOW ALL MEN BY THESE PRESENTS, That we, \_\_\_\_\_

\_\_\_\_\_ of \_\_\_\_\_  
as principal, and \_\_\_\_\_

\_\_\_\_\_ a corporation incorporated under the laws of the State of \_\_\_\_\_ as surety, are held and firmly bound unto the Commonwealth of Pennsylvania, for the use of any and every person, co partnership, association, or corporation interested, in the full and just sum of \_\_\_\_\_ dollars (\$ \_\_\_\_\_), lawful money of the United States of America, to be paid to the said obliges or its or their assigns, to which payment well and truly to be made, we bind ourselves, our heirs, executors, administrators, successors and assigns jointly and severally, firmly by these presents.

Sealed with our respective seals and dated this \_\_\_\_\_ day of \_\_\_\_\_ A.D. 20 \_\_\_\_\_ .

WHEREAS, The above bounded principal has entered into a contract with the Commonwealth of Pennsylvania by and through the Secretary of Transportation, bearing even date herewith, for certain subsurface test borings, at location indicated on plans and as directed in accordance with "Standard Specifications for Subsurface Boring, Sampling, and Testing," which are attached to this contract and made a part hereof, situated in \_\_\_\_\_ County, Route \_\_\_\_\_ Section \_\_\_\_\_ Borough \_\_\_\_\_ Township \_\_\_\_\_ City, Commonwealth of Pennsylvania for the approximate sum of \_\_\_\_\_ dollars (\$ \_\_\_\_\_).

and

WHEREAS, It was one of the conditions of the award of the Secretary of Transportation acting for and on behalf of the Commonwealth of Pennsylvania, pursuant to which said contract was entered into, that these presents should be executed.

NOW, THEREFORE, The condition of this obligation is such that if the above bounded principal shall and will promptly pay or cause to be paid in full all sums of money which may be due any person, co-partnership, association, or corporation for all material furnished and labor supplies or performed in the prosecution of the work, whether or not said material or labor enter into and become component part of the work or improvement contemplated, and for rental of equipment used and services rendered by public utilities in, or in connection with the prosecution of such work, then this obligation is to be void, otherwise to remain in full force and effect.

The principal and surety hereby jointly and severally agree with the obligee herein that every person, co partnership, association or corporation, who, whether as subcontractor or otherwise, has furnished material or supplied or performed labor or rental equipment in the prosecution of the work as above provided and any public utility who has rendered services in, or in connection with the prosecution of such work, and who has not been paid in full therefore, may sue in assumpsit in this Additional Bond in the name of the Commonwealth for their, or its use, prosecute the same final judgment for such sum or sums as may be justly due them, or it, and have execution thereon. Provided, however, that the Commonwealth shall not be liable for the payment of any cost or expenses of such suit.

Recovery by any person, co partnership, association, or corporation hereunder shall be subject to the provisions, of the Act of June 22, 1931, P.L. 881, which Act shall be incorporated herein to the extent it has not been repealed by the Act of December 20, 1967, P.L. 869, the Public Works Contractors Bond Law, and is made a part hereof, as fully and completely as though its provisions were fully and at length herein recited.

It is further provided that any alterations which may be made in the terms of the contract or in the work to be done or materials to be furnished or labor to be supplied or performed under it or the giving by the Commonwealth of any extension of time for the performance of the contract or any other forbearance on the part of either the Commonwealth or the principal to the other, shall not in any way release the principal and the surety or sureties or either or any of them, their heirs, executors, administrators, successors, or assigns from their liability hereunder, notice to the surety or sureties of any such alteration, extension, or forbearance being hereby waived.

IN WITNESS WHEREOF, The said principal and surety have duly executed this bond under seal the date and year first above written:

## SUBCHAPTER 5H - CONTRACT APPENDICES

Contract appendices are developed on a project-specific basis and typically include necessary supplemental and supportive information such as:

- Project Location Map
- Boring Location Plan
- Proposed Detour Routes
- Required Maintenance and Protection of Traffic Figures

## APPENDIX B - Glossary of Geological and Geotechnical Terms

---

A-line – The line on the plasticity chart that divides clays from silts.

AASHTO Soil Classification System – A soil classification system, typically used for highway design and construction that classifies soils into eight groups (A-1 through A-8 and includes several subgroups).

Activity – The ratio between plasticity index and the percent by weight of clay. The activity value is related to clay particle size, the higher the activity, the smaller the particle size.

Adhesion – The shear resistance between soil and a structure (steel, concrete, timber).

Alluvial Fan – A sloping mass of sediment, often granular, deposited at a point along a river or stream where there is a decrease in gradient.

Alluvium – Accumulations of sediment (i.e., clay, silt, sand, gravel, other rock material) transported by flowing water and deposited in riverbeds, floodplains, lakes, shores, and alluvial fans at the base of mountain slopes.

Amygdaloidal – A volcanic rock texture containing mineral-filled, elliptically shaped vesicles.

Angle of Internal Friction – For a given soil, the angle on the graph of the shear stress versus normal effective stress at which shear failure occurs.

Angle of Repose – The steepest angle at which loose granular material remains stationary without sliding downslope.

Anisotropic – A mass of soil having different properties in different directions; refers to permeability or stress-strain characteristics.

Aphanitic – An Igneous rock texture containing crystals that are too small for individual minerals to be seen with unaided eye.

Aquiclude – An impermeable bed that hinders or prevents groundwater movement.

Aquifer – A rock or unconsolidated sedimentary unit or group of units that is capable of supplying water to wells in accessible quantities.

Argillaceous – Pertaining to a sedimentary rock which contains an appreciable amount of clay (e.g., argillaceous limestone).

Atterberg Limits – The water contents of a soil mass corresponding to the transition between a solid, semi-solid, plastic solid or liquid determined through laboratory testing to distinguish the plasticity of clay and silt particles.

Bearing – The horizontal angle between a line and a specified coordinate direction, usually north or south.

Bearing Capacity – A foundation load per unit area that a soil can support without shear failure.

Bedding – The arrangement of rock in layers, strata, or beds resulting from differences in texture, composition, or color to the original sediment; the most characteristic structure in sedimentary rocks.

**Bedrock** – Solid rock that underlies soil or other surficial material or is exposed locally at the surface.

**Bentonite** – Soft, plastic clay composed of sodium montmorillonite (clay minerals) derived from weathering of volcanic ash.

**Calcareous** – Refers to rock containing calcite; in particular, rock in which grains are cemented with calcite (e.g., calcareous shale).

**California Bearing Ratio (CBR) Test** – A laboratory test that is used to determine the suitability of a soil for use as a subbase in a pavement section.

**Capillary Rise** – The height at which water will rise above the water table due to negative pore water, pressure, or capillary action of the soil.

**Carbonaceous** – Rock or soil which is rich in carbon or organic matter.

**Cementation** – A process in which sedimentary rocks are lithified. As material precipitates from water that percolates through sediment, open spaces are filled and particles are joined into a solid mass.

**Clay minerals** – Very tiny crystalline substances evolved primarily from chemical weathering of certain rock-forming minerals; very small colloidal size crystals (diameter less than 2  $\mu\text{m}$ ). Chemically, they are hydrous aluminosilicates plus other metallic ions.

**Cleavage** – Type of foliation characteristic of slates; parallel arrangement of fine-grained minerals giving the rock the tendency to split along definite, parallel, closely spaced planes. Slaty cleavage may be parallel with or at an angle to original bedding. Basal cleavage is exhibited on a horizontal plane of a mineral by way of its base and is exhibited by the mica group.

**Coarse-Grained Soils** – Sandy and gravelly soils containing particles larger than No. 200 sieve (0.075mm) according to the Unified Soil Classification System.

**Coefficient of Consolidation** – The rate at which the volume changes during primary consolidation.

**Cohesion** – A force that holds together like particles within a soil.

**Cohesionless Soil** – Granular soils (silt, sand and gravel) which do not exhibit cohesion.

**Cohesive soil** – Clay type soils which exhibit cohesion.

**Colluvium** – Loose, heterogeneous, structureless, soil deposits or rock fragments transported by gravitational forces or mass wasting which usually collect at the base of a slope.

**Compaction** – Volume change in soils where air is expelled from the voids while the water content remains constant; may occur due to vibration and/or self-weight; achieved by rolling, tamping, or vibrating fill soils during construction.

**Conchoidal Fracture** – A type of fracture that produces a smooth curved surface; a diagnostic feature of quartz.

**Concretion** – A spherical, ellipsoidal, or irregularly shaped mineral mass precipitated from an aqueous solution in pores or cavities in sedimentary rock.

Cone Penetration Test – A penetration test in which a cone that has a 60° point is pushed into the ground at a continuous rate to measure resistance by correlating the depth penetrated with the force applied.

Confined Aquifer – An aquifer overlain by a confining layer of low permeability.

Consistency – The degree of adhesion between soil particles that can resist deformation or rupture.

Consolidation – Volume change in fine-grained soils due to the dissipation of excess pore pressure (reduction of water content) from static loads. The rate at which consolidation occurs is dependent upon the permeability of the soil.

Contact – A surface between two different types or ages of rocks (i.e., between two adjacent formations or members).

Contact Metamorphism – Changes in rock caused by heat from a nearby magma body.

Creep – The slow downhill movement of soil and regolith.

Cross-bedded – A sedimentary structure in which relatively thin layers or laminae are deposited at an inclined angle to the main bedding; formed by wind or water.

Cryptocrystalline – Comprised of submicroscopic crystals (e.g., Chert).

Crystalline – Consisting of crystals or fragments of crystals.

Debris Slide – A slide involving downslope movement of relatively dry unconsolidated material and rock debris; slide mass does not exhibit backward rotation as in a slump or rotational failure, but slides or rolls forward.

Degree of Saturation – The proportion of the volume of water to the total volume of voids for a given mass of soil.

Density – The ratio between the total mass and the total volume of a unit of soil or rock usually expressed as a unit weight.

Desiccation – The process of shrinkage or consolidation of the fine-grained soil produced by the increase of effective stresses in the grain skeleton and the development of capillary stresses in the pore water.

Dike – A tabular or sheet-like shaped intrusive igneous body that is often steeply inclined and cuts through the surrounding rock.

Dilatancy – An increase in the bulk volume during deformation caused by the change of a closely packed structure to an openly packed structure.

Dip – The angle between the horizontal plane and the structural surface (bedding, a joint, fault, foliation or other planar feature). The direction of dip is at a right angle to the strike of the planar feature.

Direct Shear Test – A laboratory test used to determine the relationship of shear strength to consolidation stress. Shear strength values, cohesion, and the angle of internal friction are determined from the test.

Disappearing Stream – A stream that disappears into an underground channel and does not reappear in the same or even adjacent drainage basin. In areas underlain by carbonate bedrock, streams commonly disappear into sinkholes and follow channels through caves.

Discontinuity – A structural break (fractures, joints, planes of weakness, and shear zones or faults) in geological materials that controls the strength, deformation, and permeability of geologic materials and their engineering properties. Discontinuities are unhealed and have zero to low tensile strength.

Dissolution – The removal of rock material by solution leaving behind a space, cavity, or film of insoluble residue.

Dolomitic – Rock that contains an appreciable amount of magnesium carbonate  $\text{CaMg}(\text{CO}_3)_2$  (e.g., dolomitic limestone).

Drawdown – The amount the water level in a well is lowered due to the removal of water.

Erosion – The processes that loosen sediment and move it from one place to another on the earth's surface by wind, water, ice, and/or gravity.

Evaporite – A sedimentary mineral formed of material deposited from solution by evaporation of water (e.g., gypsum, halite).

Excess Pore Pressure – The increment of pre-water pressures greater than hydro-static values, produced by consolidation stresses in compressive materials or by shear strain; dissipates during consolidation.

Exfoliation – A weathering process where concentric shells, slabs, or sheets, are successively broken loose and stripped away from a rock mass.

Expansive Clays – Clays that are sensitive to water causing them to swell or expand (e.g., montmorillonite).

Extrusive Rock – A rock formed from a mass of magma that flowed out on the surface of the earth.

Fault – A fracture in rock or other material across which there is a total loss of cohesion and along which there has been significant movement parallel to the surface of failure. In rock cores, a fault can sometimes be recognized by the displacement of mineral veins.

Feldspar – A general name for a common group of rock forming minerals of alkali-aluminum silicate composition (e.g., Na- plagioclase, Ca- plagioclase and K-feldspar).

Felsic – Light colored; also refers to feldspar and silica minerals in rocks.

Ferromagnesian Minerals – A variety of silicate minerals containing abundant iron and magnesium (e.g., olivine, amphibole and pyroxene).

Ferruginous – Rock and soil which contain iron oxide minerals (e.g., hematite).

Fine-Grained soils – Silt and clay soils containing particles smaller than No. 200 sieve (0.075 mm) according to the Unified Soil Classification System.

Fines Content (fraction) – Soil grains smaller than No. 200 sieve (0.075 mm).

Fissility – The property of rock or minerals to split easily into thin layers along closely spaced, parallel surfaces (e.g., bedding planes in shale).

Fissured Clay – A clay having an internal network of narrow cracks or separations in which the width and depth tends to increase upon drying.

Flaggy – Having the tendency to part or split into layers suitable for flagstone, (0.4 to 2 in.) thick.

Flow Rate – The total volume of water flowing during a particular unit of time.

Foliation – The alignment of platy or elongate minerals that gives some metamorphic rocks a banded appearance; the result of heat and pressure the rock is subjected to during metamorphism. Three major types of foliation are recognized: slaty cleavage, schistosity, and gneissic layering.

Formation – A mappable body of rock of distinctive lithology or lithology's and unique stratigraphic position.

Fossiliferous – Describes rocks that usually contain an abundant amount of fossils.

Fracture – Breakage in rock where no appreciable movement has taken place and may be parallel with or at an angle to banding, bedding, cleavage, foliation or lamination (e.g. faults, joints). Shear and shear zones are excluded.

Fragipan – A dense layer of soil, containing silt and sand with no organic matter and very little clay; extremely hard and impermeable which is primarily due to compaction.

Friable – Describes rocks which are easily crumbled or broken with manual pressure.

Gap Graded – A soil in which a band or range of particle sizes are not well represented or are missing.

Geologic Cross Section – A diagram showing the structure and arrangement of soils and or rock as they would appear in a vertical plane below the earth's surface.

Glacial Erratic – A large boulder carried by glacial ice to an area far removed from its point of origin.

Glacial Lake Clay – Clay rich sediments deposited in a pro-glacial lake environment. The lake deposits are mostly varves which are comprised of alternating layers of silt and clay.

Glacial Outwash – stratified sand and gravel size sediments washed out from a glacier by meltwater streams; deposits typically form terraces along the flanks of the Susquehanna River valley. The overall stratification is horizontal with individual strata showing crossbeds, ripples, and clast-supported imbrication.

Glacial Striations – Scratches and grooves in bedrock caused by glacial abrasion.

Glacial Till – An unsorted or poorly-sorted, unconsolidated glacial deposit; deposited by ice that contains a wide range of particle sizes from clay to boulder size with rounded and or angular fragments; unstratified to crudely stratified.

Glassy –Describes the texture of certain igneous rocks that contain no crystals; resembling glass in smoothness and shininess

Gneissic Foliation (gneissosity) – Type of foliation resulting from alternating layers of light and dark colored minerals.

Goethite – A yellowish, reddish to brownish black mineral of iron and hydroxide, the most common form of natural rust.

Gouge – Soft, uncemented, pulverized, clay-like material found along some faults.

Graded Bedding – Bedding that displays a gradual or progressive change in particle size (i.e., from coarse at the base to fine at the top).

Grain Size Distribution – Soil particle sizes that are determined from a representative sample of soil that is passed through a set of sieves of consecutive smaller openings (see sieve analysis).

Grains – A mineral or rock particle generally less than a few millimeters in diameter.

Gravel Bar – An elongate gravel deposit on a streambed or riverbed.

Groundmass – The matrix of relatively fine-grained material between phenocrysts in a porphyritic rock.

Hardness – A mineral's resistance to scratching and abrasion, determined on a comparative basis as described in this document. (Refer to [Table 26](#))

Hematite, Hematitic – A common iron oxide mineral (the principle of iron ore).

Heterogeneous Soil – A mass of soil containing different engineering and index properties.

Homogeneous Soil – A mass of soil containing one characteristic that has the same engineering and index properties.

Hydraulic Conductivity – The capacity of a porous medium to transmit water. The rate at which fluid can move through a permeable medium depends on properties of the fluid and properties of the medium.

Hydraulic Gradient – Rate of change in total head per unit distance of flow in a given direction.

Hydrometer Test – A laboratory test used to determine the amount of distribution of finer particles (silts or clays) of a soil sample.

Igneous rock – Rock (including volcanic and plutonic rock) formed by cooling and solidification of molten silicate minerals (magma).

Imbrication – The orderly, overlapping arrangement of flattened or sub-spheroidal grains in the direction of flow.

Indurated – A property of a compact rock hardened by pressure, cementation, and especially heat.

Infiltration – The movement of surface water into rock or soil through cracks and pore spaces.

In-situ – In place; undisturbed, existing field conditions.

Instrumentation – Geotechnical instruments (e.g., inclinometer, piezometer, extensometer) used to monitor conditions such as deformations, pressures, loads, etc.

Interbedded – Describes layers of rock lying between beds or alternating with beds of a different rock type.

Intermittent stream – A stream through which water flows only part of the time.

Isotropic – A soil mass having the same properties in all directions; refers to permeability and stress strain characteristics.

Joint – A planar fracture in rock along which there is little to no visible movement or displacement parallel to the fracture.

Karst – The topography of a region which is underlain by limestone, dolomite, gypsum, or marble and can be affected by dissolution; characterized by surface depressions into which

water is intercepted and diverted underground into caverns. (Karst features include caves, disappearing streams, closed depressions, and sinkholes).

Lamination – Very thin layering (may be a result of physical or chemical variations) in rock that is less than 0.25 in. and may be parallel with bedding or at an angle to bedding (cross laminations) in sedimentary rock.

Landslide – A relatively rapid type of movement (e.g., debris flow, debris slide, rockslide, and slump).

Limonite, Limonitic – An iron oxide mineral of variable composition; a common weathered product of other iron minerals.

Liquid Limit (LL) – The water content above which the soil will flow like a liquid but below which will have a plastic consistency.

Lithification – The process (e.g., cementation, compaction, recrystallization) by which loose sediment becomes rock.

Lithology – The character of a rock described in terms of color, structure, mineral composition, grain size and arrangement of its component parts.

Luster – The reflection of light on a given mineral's surface classified by intensity or quality.

Mafic rock – An igneous rock containing more than 50% ferromagnesian minerals.

Magnesian – A rock or mineral containing an appreciable amount of magnesium.

Massive bedding – Thick bedded strata that are homogeneous and lacks significant internal structures; bedding thickness greater than 6 ft.

Matrix – The fine-grained portion of some sedimentary rocks (e.g., conglomerate, sandstone) in which the coarser particles are embedded. The matrix may not be cemented.

Member – A part, or subdivision of a formation in which the rocks are distinctly different from the rocks of the rest of the formation (e.g., Sherman Creek Member of the Catskill Formation).

Metamorphic Rock – Rock formed by the alteration of pre-existing rock deep within the earth by heat pressure, and or chemically active fluids.

Mica, Micaceous – A group of silicate minerals exhibiting perfect basal cleavage, which commonly forms flakes, scales, or sheets.

Mineral – A naturally occurring inorganic substance, usually having an internal crystal structure.

Mohs scale – A series of ten minerals used as a standard in determining hardness.

Moisture Content – The ratio between the mass of water and mass of soil solids.

N-Value – The number of blows required to drive a split-barrel sampler during a standard penetration test a distance of 12 inches after the initial penetration of 6 inches.

Nodule – A small, irregular, surfaced rock body that differs in composition from the rock that encompasses it; formed by the replacement of the original mineral matter (quartz in the form of flint or chert is the most common component). Most commonly occurs in limestone and dolomite.

Non-foliated – Metamorphic rocks which do not exhibit foliation

Normally Consolidated Soil – A soil whose pre-consolidation pressure equals the existing overburden pressure.

Oolite – A sedimentary rock (generally limestone) composed of ooliths (small round grains of calcium carbonate in concentric layers).

Organic Soils – Soils comprised of organic material, dark in color, and having an organic odor such as peat.

Quick Condition – The condition of a soil when effective stresses within the soil mass is zero; caused by an increase in seepage force transmitted to the soil which overcomes the gravitational force acting on the soil.

Overburden Soil – Overlying soil of a desirable soil or rock stratum.

Over Consolidated Soil – A soil whose pre-consolidation pressure is greater than the existing overburden pressure.

Parting – The surface of a rock mass along which the rock splits easily (e.g., bedding surface, fracture surface).

Peat – An accumulation of partly carbonized plant material containing approximately 60% carbon and 30% oxygen.

Pegmatitic – Describes igneous rocks dominated by crystals greater than 3 cm. in length.

Perched Water Table – A localized zone of saturation above the main water table created by an impermeable layer.

Permeability – The property of a soil or a porous or fractured rock for transmitting a fluid; measures the relative ease of flow under unequal pressure.

Phaneritic – An igneous rock texture in which the crystals are roughly equal in size and large enough so the individual minerals can be identified with the unaided eye.

Phenocryst – An obviously large crystal embedded in a matrix of finer-grained crystals

Piezometer – An instrument used to measure in-situ pore water pressures.

Pinnacle – A column of rock extending above the surrounding bedrock, completely or nearly so with regolith; commonly present in carbonate geologic settings.

Plagioclase – A series of sodium, calcium, aluminum, and silicate minerals in the feldspar group.

Plastic Limit (PL) – The moisture content in which the soil will have a plastic consistency.

Plasticity – The property of a soil that allows it to deform continuously; usually a mass of clay size particles. A plastic (cohesive) soil will hold its shape when molded, unlike a cohesionless soil (sand).

Plasticity Index (PI) – Range in water content between the liquid limit and the plastic limit,  $PI = LL - PL$ .

Poorly-graded Soil – Soil that contains either an excess or deficiency of certain particle sizes.

Pore Pressure – The pressure exerted by the fluid within the pores or voids in a porous material. In saturated soil, the pore pressure is the pore water pressure.

Porosity – The percentage of the bulk volume of a soil or rock that is occupied by void space.

Porphyritic – An igneous rock texture characterized by two distinctively different crystal sizes, larger crystals are called phenocrysts, and the matrix of the smaller crystals, are termed the groundmass.

Porphyroblast – A large crystal of a mineral such as garnet or staurolite set in a matrix of much, finer-grained minerals in a metamorphic rock.

Proctor Test – A laboratory test that provides results of maximum dry density and optimum moisture content of soils used to determine relative density in the field using in-place density tests.

Pyrite – An iron disulfide, pale yellowish brown to brass yellow and often tarnished with iron oxide with a hardness of 6 to 6.5; “fool’s gold”.

Red Beds – A sedimentary sequence that is predominantly red in color because of the presence of significant hematite.

Regolith – The layer of soil and loose rock fragments overlying the bedrock.

Residuum – Soil formed in place by weathering of the underlying rock on which it lies; no relict rock structure is present.

Rider Coal – A thin seam of coal overlying a thicker seam of coal.

Saprolite – Soil derived primarily from Igneous and Metamorphic parent rock; maintains structure of parent bedrock but with only a trace of the original bond strength; often micaceous; present throughout the Piedmont Physiographic Province.

Schistosity – Type of foliation characteristic of coarser-grained Metamorphic rocks; commonly produced by the parallel or sub parallel orientation of flaky or prismatic minerals such as micas or hornblende.

Sedimentary Rock – Rock formed from the weathered products of pre-existing rock that have been transported, deposited, and lithified.

Sensitivity – A measure of the change in ultimate strength of clays between undisturbed and disturbed samples.

Settlement – The gradual downward movement of a foundation due to the compression of soil below the foundation.

Shear strength – The internal resistance per unit area that the soil mass can offer to resist failure and sliding along any plane inside it.

Siderite – A brownish iron carbonate mineral; commonly found in nodules in shale from the Pennsylvania Appalachian Plateaus Province; an ore of iron.

Sieve Analysis Test – A laboratory test where a representative sample of soil is passed through a set of sieves of consecutively smaller openings to determine the sizes and amount of the separated soil particles.

Sill – A tabular igneous intrusion that parallels the planar structure of the surrounding rock.

Sinkhole – A shallow or deep depression formed by dissolution of carbonate rock and the collapse of overlying material into the cavity.

Site Investigation – Process of methodically sampling, characterizing, and testing soil and rock to delineate and evaluate subsurface materials and conditions relative to the design of proposed highway facilities.

Slickenlines – Parallel striations on a slickensided surface along which movement of rock has occurred.

Slickenside – A polished surface along which movement of rock has occurred; commonly producing slickenlines, which indicates direction of movement.

Slump – A type of mass movement in which material moves along a curved surface of rupture.

Sphalerite – A brown or black (may also be yellow or green) mineral of zinc and iron sulfide; an ore of zinc.

Specific Gravity ( $G_s$ ) – The ratio between the density of the solid particles and the density of water at 4°C.

Standard Penetration Test (SPT) – A field test that measures the resistance of the soil to penetration of a standard split-barrel sampler that is driven for three successive increments of six inches (1.5 ft. total) with a 140 pound hammer dropped from a height of 30 inches. The N-value is derived from this test.

Stiffness – A measure of the resistance offered by an elastic body to deformation.

Streak – The color of a mineral in its powdered form; usually obtained by rubbing the mineral against an unglazed porcelain tile to see the mark it makes.

Strike – The compass direction of the line of intersection created by a structural surface (dipping bed or fault) and a horizontal surface. Strike is always perpendicular to the direction of dip.

Talus – Rock fragments that accumulate at the base of a ridge, cliff or cut slope.

Texture – The size, shape, and arrangement of particles that make up a rock.

Toughness – The property of a soil that is able to absorb stress by plastic deformation.

Triaxial Stress Test – A laboratory shear strength test in which drainage conditions can be controlled (e.g., unconsolidated-undrained (UU), consolidated-undrained (CU), and consolidated-drained (CD)).

U-line – The line on the plasticity chart that marks the approximate upper limit of the relationship between the plasticity index and the liquid limit for natural soils.

Unconfined Compressive Strength Test – A laboratory test similar to the unconsolidated-undrained test performed on plastic soils, usually clay. From this test, the undrained shear strength is calculated as  $\frac{1}{2}$  of the unconfined compressive strength.

Underclay – A rootworked claystone occurring below a coal seam; sometimes called soft clay or plastic clay.

Unified Soil Classification System – A system of soil classification based on grain size (coarse-grained soils), liquid limit and plasticity (fine-grained soils).

Unit Weight ( $\gamma$ ) – The weight of soil plus water per unit volume.

Vane Shear Test – A field test used to measure the shear strength of a soil that is low-strength, homogeneous, and cohesive.

Varved clays – Alternating thin layers of silt and clay, a pair of silt and clay layers is called a couplet and represents an annual cycle (summer-silt; winter-clay) of deposition in a glacial lake. The light layer usually comprises the coarser silt and fine sand. The darker layer is typically comprised of fine clay (see Glacial Lake Clay).

Vein – A fracture that has been filled with mineral material (e.g., quartz, calcite).

Vesicular – Describes igneous rocks that contain small cavities called vesicles, which form when gases escape from lava.

Visual Classification – A field test that is used to estimate soil characteristics (e.g., the range of particle sizes, plasticity of fine-grained soils).

Vitreous – Resembling glass, but with a vitreous (pearly) luster

Void Ratio – The ratio between the volume of voids and the volume of solids (soil grains).

Vuggy – Small cavity or hole in rock that often contains mineral linings that differ from the surrounding matrix (e.g., calcite vugs in limestone, dolomite).

Water content – The ratio between the mass of water and the mass of soil solids.

Well Graded Soil – A soil with a good representation of particle sizes over a wide range.

## APPENDIX C - Generic Health and Safety Plan for Remedial Investigation Activities

---

This is a generic Health and Safety Plan (HASP) which can be used by PennDOT as an example HASP outline for future review of project-specific HASP documents submitted by the contractor.

Included in the Health and Safety Plan are explicit requirements relative to the site such as, but not limited to: employee training; personal protective equipment projected for the site; medical surveillance particular to potential site exposure; frequency and types of air monitoring, personnel exposure to hazardous substances by zonation of the site operations according to areas of contamination and procedures for site emergencies; safe work practices and identification of medical assistance; decontamination procedures to minimize personnel contact with hazardous substances and equipment thereof; emergency response plan necessary to effectively handle anticipated emergencies prior to an actual emergency, (e.g., lines of authority, evacuation, critique, emergency equipment) confined space entry procedures; and spill containment procedures should transfer, transport, or disposal of hazardous material be deemed necessary.

# HASP SIGN-OFF SHEET

The following personnel have read and fully understand the contents of the HASP.

Section 13	Standard Operating Procedures

## SECTION 1 – INTRODUCTION

This Health and Safety Plan has been prepared for \_\_\_\_\_ to be conducted by \_\_\_\_\_ field personnel within \_\_\_\_\_. The plan has been prepared in accordance with 29 CFR 1910.120 Hazardous Waste Operations and Emergency Response, Final Rule. The information included in this plan has been collected from all available sources pertaining to potential hazards within \_\_\_\_\_.

### 1.1 Scope of Work

---

---

---

---

### 1.2 Site Description

---

---

---

---

### 1.3 Site Map

1.4 Site Communications

---

---

---

---

1.5 Emergency Signal:

---

---

---

---

### SECTION 3 – SITE HEALTH AND SAFETY RISKS

The health and safety risks at the site included chemical hazards listed in Table \_\_\_\_\_ and physical health hazards involved with heavy sampling equipment.

---

---

---

---

---

---

---

Standard operating procedures listed in Appendix III include machinery and mechanized equipment safety. In addition to these procedures, the following guidelines will be observed during drilling operations.

1. Prior to drilling, adequate site preparation should be performed to accommodate the drill rig and supplies and provide a safe working environment.
2. Overhead and buried utilities must be located prior to start-up of drilling activities.
3. All on-site personnel should stand clear of the drill rig immediately prior to and during starting of the engine.
4. Organic vapor monitoring will be conducted continuously in the workers' breathing zone during drilling operations.
5. Immediately following the completion of drilling operations, the entire work area will be monitored to determine if vapor concentrations have returned to background levels. If elevated levels are detected, the source will be determined and the appropriate action will be taken.

## SECTION 4 – WORK ZONES AND SITE CONTROL

Various activities will be conducted throughout the project area in separate work locations. Each work location will have its own work zones. The exclusion zone is the area of anticipated contamination and will be designated as the specific reconnaissance, soil gas survey, sampling, or drilling area.

---

---

---

---

---

---

---

A decontamination station will be established for each work as needed. Support areas will be located in areas free of known contamination where administrative, communication, and other support activities can be freely conducted.

## SECTION 5 – AIR MONITORING

### AIR MONITORING EQUIPMENT

Air monitoring will be conducted during all on-site activities. A flame ionization detector (FID), photoionization detector (PID), and a combustible gas indicator/oxygen meter (CGI) will be utilized for air monitoring. In addition, Drager pump and colimetric tubes will be utilized on an as-needed basis.

The FID and PID will monitor for total organic vapors in exclusion zones. These instruments will be calibrated daily and operated by trained personnel only. Readings from these instruments will be used to set appropriate levels of protection for on-site personnel.

The CGI will be utilized to monitor combustible gas and oxygen levels in exclusion zones.

---

---

### AIR MONITORING ACTION LEVELS

#### Lower Explosive Limits (LEL) Reading

10-25% LEL

Limit all activities in the area to prevent sparks; proceed with extreme caution.

25% LEL

All personnel will withdraw immediately to the contamination reduction area or another designated safe area.

#### Oxygen (O<sub>2</sub>) Reading

19.5% O<sub>2</sub> and below

Air supplied respiratory protective equipment (Level B) is needed  
(Note: LEL's are not valid in atmospheres with 0.5% O<sub>2</sub>)

25% O<sub>2</sub> and above

All personnel withdraw immediately.

#### Inorganic/Organic Gases and Vapors

Action level depends on TLV/PEL/REL.

Consult specific industry reference manual and Table\_\_\_\_\_.

### CONDITIONS MODIFYING LEVELS OF PROTECTION

#### Level C

0-50 PPM above background on FID or PID

Other (describe)

#### Level B

50-500 PPM above background on FID or PID

O<sub>2</sub> Less than 19.5%

**SECTION 6 – PERSONAL PROTECTIVE EQUIPMENT PPE**

LOCATION	ACTIVITY	LEVEL OF PROTECTION

**PERSONAL PROTECTION EQUIPMENT (PPE)**

Level D

- Hardhat
- Coveralls
- Safety boots
- Gloves (optional)
- Safety glasses (optional)

Level C

- Hardhat
- Air purifying respirator, full or half-face (with safety glasses) with appropriate cartridges
- Chemical resistant overalls
- Chemical resistant gloves, inner, and outer
- Chemical resistant safety boots with disposable boot covers

Level B

Level B consists of Level C protective equipment plus use of pressure-demand, full face piece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator with escape SCBA.

Levels of protection will be modified as site conditions warrant. These modifications will only be made with the approval of the Project Manager (PM) and the SSO (see Section 5 - Air Monitoring)

## **SECTION 7 – DECONTAMINATION**

All personnel and equipment leaving exclusion zones will be thoroughly decontaminated. The following decontamination equipment will be available: plastic sheeting, collection containers, wash tubs soap, potable and deionized water, acid solvent, and scrub brushes.

All boots and gloves will be decontaminated using soap and water solution and scrub brushes. Outer boots, outer gloves, and chemical resistant suit will then be removed. When respirators are used, all respiratory equipment will be decontaminated and sanitized daily.

Sampling equipment decontamination consists of washing with soap and water solution, acid rinse (if needed), solvent rinse (if needed), and deionized water rinses to remove contaminants.

If heavy equipment is used, decontamination procedures will be implemented to prevent hazardous materials from leaving the site.

All decontamination fluids and all disposable clothing will be collected and disposed of in accordance with all applicable federal, state, and local regulations.

**SECTION 8 – EMERGENCY RESPONSE**

Location of Nearest Telephone: \_\_\_\_\_

Medical Emergency:

Ambulance: \_\_\_\_\_  
\_\_\_\_\_

Hospital: \_\_\_\_\_  
\_\_\_\_\_

Directions to Hospital: \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

**EMERGENCY TELEPHONE NUMBERS:**

AGENCY	TELEPHONE
_____	_____
_____	_____
_____	_____
_____	_____

Emergency Signal:

Example:

Repeated intervals of three short beeps of an automobile horn will be the signal for all on-site personnel to immediately report to the support area.

Emergency Evacuation:

The following emergency evacuation routes and regrouping areas are designated for use in emergency situations.

\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

Decontamination following an emergency evacuation will be directed by the SS and the SSO. In all situations, when an on-site emergency results in evacuation of the site, personnel shall not re-enter until:

1. the conditions created in the emergency have been corrected;
2. the hazards have been reassessed;
3. the HASP has been reviewed; and
4. site personnel have been briefed on any changes in the site safety plan.

#### Site Security and Control:

See Sections 4 and 9.

#### Emergency Equipment and PPE:

In case of an emergency, the following equipment will be maintained on site:

Basic emergency and first aid equipment will be available in the Support Zone or the Contamination Reduction Zone. Such equipment shall include a first aid kit, emergency eyewash, fire extinguishers, and safety-related equipment.

#### Emergency Identification and Response:

Should any contaminants or suspected hazardous material be encountered on-site which were not identified in the Site Safety Plan, all further on-site activities will be suspended and all on-site personnel evacuated at the discretion of the SS and the SSO.

#### Information to Report to Emergency Response Agency:

- Name of person reporting incident
- Location and phone number of person reporting
- Nature of emergency, incident
- Name of person injured or exposed
- Date, time, and location of incident
- Action taken.

On-site personnel should report as much information as possible concerning the substance to the SS or the SSO. If the substance cannot be identified, the SS and SSO will use whatever resources are available to better characterize the unknown. The SS and SSO should also determine:

- appropriate control methods to prevent further spread/release of the hazard;
- potential impacts of the substance to on-site personnel, the surrounding population, and the environment;
- resources necessary to contain, stabilize, and cleanup/remove the hazard;
- appropriate authorities to notify.

#### Accidents:

The following standard emergency procedures will be used on-site personnel in the event of an accident. The PM or the SSO shall be notified and will be responsible for ensuring that the appropriate procedures are followed.

Personnel injury in the Exclusion Zone. Upon notification of an injury in the Exclusion Zone, the designated emergency signal shall be sounded. All site personnel shall assemble at the Support Zone (Contamination Reduction Zone). The rescue team will enter the Exclusion-Zone (if required) to remove the injured

person. The SS and the SSO should evaluate the nature of the injury, and the affected person should be decontaminated to the extent possible prior to movement to the Support Zone. Appropriate first aid shall be administered, and contact should be made for an ambulance and with the designated medical facility (if required). No persons shall reenter the Exclusion Zone until the cause of the injury or symptoms are determined. The accident will be documented in the daily log book.

Personnel injury in the Support Zone: Upon notification of an injury in the Support Zone, the SS and the SSO will assess the nature of the injury and take appropriate action. If the cause of the injury or loss of the injured person does not affect the performance of the site personnel, operations may continue. If the injury increases the risk to others, the designated emergency signal shall be sounded and all site personnel shall move to the Support Zone/Contamination Reduction Zone for further instructions. Activities on-site will stop until the added risk is removed or minimized.

Fire/Explosion: Upon notification of a fire or explosion on-site, the designated emergency signal shall be sounded and all site personnel assembled at decontamination line. The Fire Department shall be alerted and all personnel moved to a safe distance from the involved area.

Personal Protection Equipment Failure: If any site worker experiences a failure of alteration of protective equipment that affects protection factor, that person, their buddy shall immediately leave the Exclusion Zone. Re-entry shall not be permitted until the equipment has been repaired or replaced.

Other Equipment Failure: If any other equipment on-site fails to operate properly, the SS and SSO shall be notified and then determine the effect this failure on continuing operations on-site. If the failure affects the safety of personnel or prevents completion of the Work Plan tasks, all personnel shall leave the Exclusion Zone until the situation is evaluated and appropriate actions taken.

#### Natural Disasters:

Earthquakes, Tornadoes, High Winds, Floods, and Thunderstorms: Should any of these events be forecasted or occur, all work activities should be terminated immediately and all personnel should evacuate the site via designated routes.

#### Emergency Response Follow-Up:

Following activation of the Emergency Response Plan, \_\_\_\_\_ will submit a written report documenting the incident. The \_\_\_\_\_ field log book will be maintained in such a manner that the report can be prepared from the log book entries. The report may indicate that an update of this plan is necessary.

#### Emergency Response Pre-Planning:

Prior to commencing on-site work activities, the PM and the SSO will review the Emergency Response Plan with all site personnel.

## SECTION 10 – EMPLOYEE TRAINING AND MEDICAL SURVEILLANCE

All on-site personnel shall meet the training and medical surveillance requirements established by the Occupational Safety and Health Administration (OSHA), which are listed in the Code of Federal Regulation, 29 CFR Part 1910.120 (e) training and (f) medical surveillance. Written training certificates and a physician's written opinion shall be retained for all on-site personnel. All personnel will be given a site specific briefing by the SSO prior to conducting on-site activities.

## SECTION 11 – CONFINED SPACE ENTRY

Any confined space entry that may be required must first be authorized by the PM. The basic requirements for entry into a confined space are to:

- Test the atmosphere prior to entry for oxygen and toxic and combustible levels of gases, or vapors. If the oxygen content is less than 19.5%, the personnel will have to wear supplied air respirators while in the area. If the toxic levels of chemicals are present, appropriate personal protective equipment will be necessary. If combustible gas levels are above 10% of the lower explosive limit, entry should be delayed until the level falls below 10%. Forced ventilation can be used to lower the concentration of toxic or combustible gasses and raise the oxygen content. However, what chemicals will be removed from the space and where they will go should be evaluated before starting ventilation.
- Establish a system to mark a confined space unsafe should tests indicate it is unsafe to enter. Markings are to remain in place until tests indicate entry is safe.
- Lockout, block, or otherwise deactivate all mechanical, electrical, liquid, and gas systems relating to the confined space that may create a hazard during entry if they are put in motion or otherwise activated.
- Develop emergency procedures for rescue inside the confined space. This included a person on standby outside the confined space to observe the worker and provide help in an emergency. Any rescue personnel entering the confined space will need, as a minimum, the same protective equipment that the person inside is using. A lifeline should be attached to any worker to aid in pulling them out.

## SECTION 12 – CHEMICAL HAZARDS

Include copies of Material Safety Data Sheets for any potentially hazardous chemicals used in the drilling and sampling activities. Tabulate the various data sheet titles on the following table for quick reference.

Chemical IDENTITY <i>(as Used on Label and List)</i>	Used for

## SECTION 13 – STANDARD OPERATING PROCEDURES

### GENERAL SAFETY MEASURES

#### Personal Practices

At the very least, hands and face must be thoroughly washed upon leaving the site and before eating, drinking, breaks, or any other off-site activity. During instances when outer garment decontamination procedures are in effect, entry team members shall thoroughly shower as soon as possible following the removal of protective garments.

Such activities as eating, drinking, chewing gum or tobacco, smoking or any other practice which increases the tendency for hand-to-mouth contact, shall be prohibited within contaminated zone(s) and prior to washing hands, and face within the contamination reduction corridor or decontamination reduction corridor or decontamination line.

The use of respiratory protective equipment shall be in accordance with currently accepted policies and procedures governing such devices. Air purifying respirator cartridges should be changed at least once each work day on-site. Spent cartridges should be discarded before breaking for lunch and again at the end of each day's activities. As a recommended minimum, respirator or gas mask canisters should be discarded at the end of each day's activities. More frequent changes shall occur at the first sign of breakthrough based on contaminant warning properties or when indicated by an end of service indicator. In all cases, only NIOSH/MSHA approved respirators shall be used and no canisters shall be used beyond their expiration dates.

No excessive facial hair or any other obstruction, which interferes with a satisfactory fit of the mask-to-face piece seal, is allowed on personnel required to wear respiratory protective equipment. Similarly, the wearing of contact lenses is prohibited when wearing respiratory protective devices.

The use of medicine and alcohol has the potential to mask the effects from exposure to toxic chemicals. Alcohol, caffeinated products, and certain medications can contribute and exacerbate the effects of heat stress. Prescribed drugs should not be taken by personnel during response activities when the potential for absorption, inhalation, or ingestion of toxic substances exists, unless specifically approved by a qualified physician. Similarly, over-the-counter medications should only be used with a physician's approval and in accordance with package limitations and warnings. The intake of alcoholic or caffeinated beverages should be avoided during response activities.

Contact with surfaces known or suspected of being contaminated should be avoided during on-site activities. Whenever possible, avoid walking through puddles, mud, or discolored surfaces; kneeling on ground; leaning, sitting or placing equipment, drums, containers, or vehicles on ground.

Levels of protection shall be established for a given site and shall be based upon the best available information regarding known or suspected hazards associated with the site and the types of activities to be accomplished. Site activities shall then be performed in accordance with those site-specific levels of protection. Changes in the site-specific levels of protection should be made when the level of site specific information improves sufficiently to warrant any change. When sufficient site-specific information is lacking or when the conditions of a site are unknown or in doubt, all site entries and on-site activities will be performed in Level B protection, as a minimum, until the knowledge of site-specific hazards has improved.

## GENERAL HOUSEKEEPING

All stairways, passageways, gangways, and access/ways will be kept free of materials, supplies, and obstruction at all times.

Loose or light material will not be stored or left on roofs or floors that are not closed in, unless it is safely secured.

Tools, materials, extension cords, hoses, or debris will be located so as not to cause tripping or other hazards.

Tools, materials, and equipment subject to displacement or falling will be adequately secured.

All storage and construction sites will be kept free from the accumulation of combustible materials. Weeds and grass will be kept down.

Rubbish, brush, long grass, or other combustible material will be kept from areas where flammable and combustible liquids are stored, handled or processed.

All spills of flammable and combustible liquids will be cleaned up immediately.

## FIRE PREVENTION

### General

Fires and open flame devices will be controlled by a strict permitting system.

Smoking will be prohibited in all areas where flammable, combustible, or similar hazardous materials are stored, except in those locations specifically provided for such purpose and approved by the appointed Project Safety Officer (PSO).

All major motorized equipment will be equipped with a fire extinguisher of a type and make approved by the National Board of Fire Underwriters.

### Access

Fire lanes will be maintained free of obstruction to provide access to all areas.

Material will be stockpiled or staged to minimize the spread of fire internally and to permit access for firefighting.

Within 200 ft. of each portable tank or flammable/combustible liquid container stored outdoors, there will be a 13 ft. wide access way for fire control apparatus. Clearance will be maintained around lights and heating units to prevent ignition of combustible materials.

### Flammable and Combustible Liquids

All tanks, containers, and pumping equipment, portable or stationary, used for the storage of handling of flammable and combustible liquids will be list by UL or FM or approved by the Mine Safety and Health Administration (MSHA).

All sources of ignition will be prohibited in areas where flammable liquids are stored, handled, or processed. Suitable NO SMOKING signs will be posted in all such areas.

Flashlights and electric lanterns used during handling of flammable liquids will be the type listed by the Underwriters' Laboratories or other nationally recognized testing laboratory for use in such hazardous areas.

Shipment storage and handling of all flammable liquids will be in containers approved for shipment of such materials and tagged or labeled in accordance with regulations of the U.S. Department of Transportation.

Drums, barrels, and other flammable liquid containers will be tightly capped. Safety cans or other portable service containers of flammable liquids having a flashpoint at or below 73 °F will be painted red with a yellow band around the can and/or the name of the contents conspicuously painted or stenciled on the container in yellow.

Dispensing systems will be electrically bonded and grounded.

Storage tanks will be equipped with relief vents. Tank vents will not be located close to open flames, stacks, heating apparatus, or any other source of ignition. Water draw-off valves will be antifreeze type or insulated to prevent freezing.

Areas in which flammable or combustible liquids are transferred, in quantities greater than 5 gallons from one tank or container to another will be separated from other operations by 26 ft. or by construction having a fire resistance of at least one (1) hour. Drainage or other means will be provided to control spills. Natural or mechanical ventilation will be provided to maintain the concentration of flammable vapor at or below 10 % of the lower flammable limit.

All tanks, hoses, and containers of 5 gallons or less will be kept in metallic contact with flammable liquids while being transferred. Transfer of flammable liquids will not be attempted until containers are electrically interconnected (bonded) and, if necessary, grounded.

Workers will be required to guard carefully against any part of their clothing becoming contaminated with flammable or combustible fluids. They will not be allowed to continue work when their clothing becomes so contaminated.

## ELECTRICAL SAFETY

### General

All electrical wiring and equipment will be of a type listed by UL or Factory Mutual Engineering Corporation for the specific application.

All installations will comply with the National Electrical Safety Code (NESC), National Electrical Code (NEC) or U.S. Coast Guard Regulations.

All work will be by personnel familiar with code requirements and qualified for the class of work to be performed.

Live parts of wiring or equipment will be guarded to protect all persons or objects from harm.

Electric wire passing through work areas will be covered or elevated to protect it from damage by foot traffic, vehicles, sharp corners, projections, or pinching

Before beginning work, the person in charge will ascertain by inquiry, direct observation, or by instruments, whether any part of an electric power circuit, exposed or concealed, is so located that the performance of the work may bring any person, tool, or machine into physical or electrical contact therewith. Whenever possible, de-energize all equipment and/or circuits before work is started. Additionally, all personnel should adhere to applicable clearance procedures and be protected by grounding.

When it is necessary to work on energized lines and equipment, rubber gloves and other protective equipment or hotline tools meeting the provisions of the American National Standards Institute (ANSI) J-6 series will be used.

Patched, oil soaked, worn, or frayed electric cords or cables will not be used.

Extension cords or cables will not be fastened with staples hung from nails, or suspended by bare wire.

Portable and semi-portable electrical tools and equipment will be grounded by a multi-conductor cord having an identified grounding conductor and a multi-contact polarized plug-in receptacle.

Semi-portable equipment, floodlights, and work lights will be grounded. The protective ground of such equipment will be maintained during moving unless supply circuits are de-energized.

Driven rod electrodes will have a resistance to ground not to exceed 25 ohms.

#### Temporary Wiring

Temporary wiring will be guarded, buried, or isolated by elevation to prevent accidental contact by workers or equipment.

Flexible cord sets will be of a type listed by the UL. Flexible cord sets used on construction sites will contain the number of conductors required for the service plus an equipment ground wire. The cords will be Type ST, STO, SJT, SJTO, S, SO, SEO, W, or G.

Exposed empty light sockets and broken bulbs will not be permitted.

Portable electric lighting used in confined wet and/or hazardous locations such as drums, tanks, vessels, and grease pits will be operated at a maximum of 12 volts.

#### Operations Adjacent to Overhead Lines

Overhead transmission and distribution lines will be carried on towers and poles which provides safe clearance over roadways and structures.

Clearances will be adequate for the movement of vehicles and for the operation of construction equipment.

Ladders, elevated work platforms, manlifts, drill rigs, or any other aerial extensions will be established so there is no possibility of accidental contact with any electrical transmission line or device, or lines and devices will be deactivated and certified as such.

### HAND AND POWER TOOLS SAFETY

All hand tools will be in good repair and used only for the purpose for which designed.

Tools having defects that will impair their strength or render them unsafe will be removed from service.

When work is being performed overhead, tools not in use will be secured or placed in holders.

Throwing tools or materials from location to another, from one person to another, or dropping them to lower levels, will not be permitted.

Only non-sparking tools will be used in locations where sources of ignition may cause a fire or explosion.

Power tools will be inspected, tested, and determined to be in safe operating condition prior to use. Continued periodic inspections will be made to assure safe operating condition and proper maintenance.

Rotating or reciprocating portable power tools will have a constant pressure switch that will shut off the power when the tool is released by the operator. A portable power tool may have a lock-on control provided turn-off can be accomplished by a single motion of the same finger or fingers that turned it on.

Blends of hydraulic fluid used in powered tools will be chosen so that they retain their operating characteristics at the most extreme temperatures to which they will be exposed.

Manufacturers' safe operating pressures for hydraulic hoses, valves, pipes, filters, and other fittings will not be exceeded.

All hydraulic or pneumatic tools which are used on or around energized lines or equipment will have non-conducting hoses having adequate strength for the normal operating pressures.

Loose and frayed clothing, loose long hair, dangling jewelry, rings, chains, and wrist watches will not be worn while working with any power tool or machine.

All woodworking tools and machinery will meet applicable requirements of ANSI 01.1, Safety Code for Woodworking Machinery.

## MACHINERY AND MECHANIZED EQUIPMENT SAFETY

Train personnel in proper operating procedures.

Install adequate on-site roads, signs, lights, and devices.

Install appropriate equipment guards and engineering controls on tools and equipment. These include roll-over protective structures, seat belts, emergency shutoff in case of rollover, and backup warning lights and signals.

Provide equipment such as cranes, derricks, and power shovels with signs saying "unlawful to operate this equipment within 10 ft. of all power lines".

Use equipment and tools that are intrinsically safe and not capable of sparking, and pneumatically and hydraulically driven equipment.

Where portable electric tools and appliances can be used, (i.e., where there is no potential for flammable or explosive conditions), use three-wire grounded extension cords to prevent electric shocks.

In hydraulic power tools, use fire-resistant fluid that is capable of retaining its operating characteristics at the most extreme temperatures.

At the start of each work day inspect brakes, hydraulic lines, light signals, fire extinguishers, fluid levels, steering, and splash protection.

Keep all non-essential people out of the work area.  
Prohibit loose-fitting clothing or loose long hair around moving machinery.

Keep cabs free of all non-essential items and secure all loose items.  
Do not exceed the rated load capacity of a vehicle.

Instruct equipment operators to report to their supervisor(s) any abnormalities such as equipment failure, oozing liquids, unusual odors, etc.

When an equipment operator must negotiate in tight quarters, provide a second person to ensure adequate clearance.

Have a signalman direct backing as necessary.

All on-site internal combustion engines should have spark arrestors that meet requirements for hazardous atmospheres. Refuel in safe areas. Do not fuel engines while vehicle is running. Prohibit ignition sources near a fuel area.

Lower all blades and buckets to the ground and set parking breaks before shutting off the vehicle.

Implement an ongoing maintenance program for all tools and equipment. Inspect all tools and moving equipment regularly to ensure that parts are secured and intact with no evidence of cracks or areas of weakness that the equipment turns smoothly with no evidence of wobble, and that is operating according to manufacturer's specifications. Promptly repair or replace any defective items. Keep maintenance and repair logs.

Store tools in clean, secure areas so that they will not be damaged, lost, or stolen.

Keep all heavy equipment that is used in the Exclusion Zone in that zone until the job is done. Completely decontaminate such equipment before moving it into the clean zone.

## MEDICAL AND FIRST AID PROCEDURES

Prior to start of work, arrangements will be made for medical facilities, ambulance service, and medical personnel to be available for prompt attention to the injured and consultation on occupational health.

Communication and transportation to effectively care for injured workers will be provided.

Where any part of the body may be exposed to toxic or corrosive materials drenching and/or flushing activities will be provided in the work area for immediate emergency use.

On activities requiring a first aid station or an infirmary, the facilities and equipment will be determined by the proximity and quality of available medical services and will be in accordance with the recommendation of a licensed physician.

Alternate facilities which provide the quantity and quality of services outlined in this operating practice may be utilized if approved.

## POTABLE WATER AND SANITARY FACILITIES

### General

An adequate supply of drinking water will be supplied from sources approved by federal, state, or local health authorities. Drinking water will be dispensed by means which prevent contamination between source and the consumer.

The common cup is prohibited. A sanitary container for the paper cups and a waste receptacle for the used cups will be provided. Containers for drinking water will be clearly marked as to contents and not used for other purposes.

There will not be any cross-connection, open or potential, between a system furnishing potable water and a system furnishing non-potable water.

### Washing Facilities

Washing facilities will be provided as needed to maintain healthful and sanitary conditions. Each washing facility will be maintained in a sanitary condition and provided with water, soap, individual means of drying, and metal-covered receptacles for waste.

 APPENDIX D - UNIFIED and AASHTO Soil Classification System References  
 -----

**AASHTO Classification of Soils and Soil-Aggregate Mixtures**  
 (from AASHTO M 145)

<b>Classification of Soils and Soil-Aggregate Mixtures</b>											
General Classification	<b>Granular Materials</b> (35% or less passing No. 200 sieve)							<b>Silt-Clay Materials</b> (> 35% passing No. 200 sieve)			
Group Classification	A-1		A-3 <sup>a</sup>	A-2				A-4	A-5	A-6	A-7
	A-1-a	A-1-b		A-2-4	A-2-5	A-2-6	A-2-7				A-7-5 A-7-6
Sieve Analysis (Percent Passing):											
No. 10	50 max.	--	--	--	--	--	--	--	--	--	--
No. 40	30 max.	50 max.	51 min.	--	--	--	--	--	--	--	--
No. 200	15 max.	25 max.	10 max.	35 max.	35 max.	35 max.	35 max.	36 min.	36 min.	36 min.	36 min.
Characteristics of fraction passing No. 40:											
Liquid Limit	--		--	40 max.	41 min.	40 max.	41 min.	40 max.	41 min.	40 max.	41 min.
Plasticity Index	6 max.		N.P.	10 max.	10 max.	11 min.	11 min.	10 max.	10 max.	11 min.	11 min. <sup>b,c</sup>
Usual Types of Significant Constituent Materials	Stone Fragments, Gravel, and Sand		Fine Sand	Silty or Clayey Gravel and Sand				Silty Soils		Clayey Soils	
General Rating as Subgrade	Excellent to Good							Fair to Poor			
<sup>a</sup> The placing of A-3 before A-2 is necessary in the "left to right elimination process" and does not indicate the superiority of A-3 over A-2  <sup>b</sup> for A-7-5, PI ≤ LL - 30  <sup>c</sup> for A-7-6, PI > LL - 30											

## AASHTO Liquid Limit and Plasticity Index ranges for Silt-Clay Materials (from AASHTO M 145)

(Note: A-2 soils contain less than 35% finer than the No. 200 sieve.)

### Comparison of AASHTO to UNIFIED Soil Classifications

Reference: Das, B.M. *Principles of Geotechnical Engineering*. Boston: PWS, 1994.

Soil group in AASHTO system	Comparable soil groups in UNIFIED system		
	Most Probable	Possible	Possible but Improbable
A-1-a	GW, GP	SW, SP	GM, SM
A-1-b	SW, SP, GM, SM	GP	--
A-3	SP	--	SW, GP
A-2-4	GM, SM	GC, SC	GW, GP, SW, SP
A-2-5	GM, SM	--	GW, GP, SW, SP
A-2-6	GC, SC	GM, SM	GW, GP, SW, SP
A-2-7	GM, GC, SM, SC	--	GW, GP, SW, SP
A-4	ML, OL	CL, SM, SC	GM, GC
A-5	OH, MH, ML, OL	--	SM, GM
A-6	CL	ML, OL, SC	GC, GM, SM
A-7-5	OH, MH	ML, OL, CH	GM, SM, GC, SC
A-7-6	CH, CL	ML, OL, SC	OH, MH, GC, GM, SM

## UNIFIED Classification System Soil Classification Charts

Reference: *ASTM D 2487*

<b>COARSE-GRAINED SOILS have &lt;50% passing the No. 200 sieve</b>				
			Group Abbreviation	Group Name
<b>Gravels</b> <50% of coarse fraction passing the No. 4 sieve	Clean Gravels (<5% fines)	-	<b>GW</b>	<b>Well-graded GRAVEL</b>
		-	<b>GP</b>	<b>Poorly-graded GRAVEL</b>
	Gravels with Fines (>12% fines)	fines classify as ML or MH	<b>GM</b>	<b>SILTY GRAVEL</b>
		fines classify as CL or CH	<b>GC</b>	<b>CLAYEY GRAVEL</b>
<b>Sands</b> >50% of coarse fraction passing the No. 4 sieve	Clean Sands (<5% fines)	-	<b>SW</b>	<b>Well-graded SAND</b>
		-	<b>SP</b>	<b>Poorly-graded SAND</b>
	Sands with Fines (>12% fines)	fines classify as ML or MH	<b>SM</b>	<b>SILTY SAND</b>
		fines classify as CL or CH	<b>SC</b>	<b>CLAYEY SAND</b>

- In the UNIFIED system, a soil is considered coarse-grained if it contains fewer than 50% fines.
- Coarse-grained particles will not pass through a No.200 sieve.
- Gravel is material retained on the No.4 sieve.
- Sand is material passing the No.4 sieve but retained on the No. 200 sieve.
- Soil is classified as GRAVEL if the %-gravel is estimated to be greater than the %-sand.
- Soil is identified as SAND if the %-gravel is estimated to be equal to, or less than, the %-sand.

<b>FINE-GRAINED SOILS have &gt;50% passing the No. 200 sieve</b>			
		Group Abbreviation	Group Name
<b>Silts and Clays</b> Liquid Limit <50	Inorganic	<b>CL</b>	<b>LEAN CLAY</b>
		<b>ML</b>	<b>SILT</b>
	Organic	<b>OL</b>	<b>ORGANIC SOIL</b>
<b>Silts and Clays</b> Liquid Limit ≥50	Inorganic	<b>CH</b>	<b>FAT CLAY</b>
		<b>MH</b>	<b>ELASTIC SILT</b>
	Organic	<b>OH</b>	<b>ORGANIC SOIL</b>

- In the UNIFIED system, a soil is considered to be fine-grained if it contains 50% or more fines.
- Particles that pass through a No. 200 sieve are identified as fine-grained.

<b>HIGHLY ORGANIC SOILS</b>		
	Group Abbreviation	Group Name
Primarily organic matter, dark in color, and organic odor	<b>PT</b>	<b>PEAT</b>

## UNIFIED Liquid Limit and Plasticity Index ranges for Silt-Clay Materials

**Equation of "A-Line":** Horizontal at  $PI=4$  to  $LL=25.5$ , then  $PI=0.73(LL-20)$

Plastic soils plot above the A-Line on chart.

Non-plastic or slightly plastic soils plot below the A-Line on chart

**Equation of "U-Line":** Vertical at  $LL=16$  to  $PI=7$ , then  $PI=0.9(LL-8)$

The U-Line represents the approximate upper limit for natural soils.

Correct tests never plot above U-line.

## Comparison of UNIFIED to AASHTO Soil Classifications

Reference: Das, B.M. *Principles of Geotechnical Engineering*. Boston: PWS, 1994.

Soil Group in UNIFIED System		Comparable soil groups in AASHTO system		
		Most Probable	Possible	Possible but Improbable
<b>GW</b>	Well graded gravel Well Graded gravel with sand	A-1-a	--	A-2-4 A-2-5 A-2-6 A-2-7

## Unified Soil Classification System (USCS)

Criteria for Assigning Group Symbols and Group names Using Laboratory Tests				Soil Classification	
				Group Symbol	Group Name <sup>B</sup>
COARSE- GRAINED SOILS More than 50% retained on No. 200 sieve	Gravels More than 50% of coarse fraction retained on No. 4 sieve	Clean Gravels Less than 5 % fines <sup>C</sup>	$Cu \geq 4$ and $1 \leq Cc \leq 3^E$	GW	Well-graded gravel <sup>F</sup>
			$Cu < 4$ and/or $1 > Cc > 3^E$	GP	Poorly graded gravel <sup>F</sup>
		Gravels with fines More than 12 % fines <sup>C</sup>	Fines classify as ML or MH	GM	Silty gravel <sup>F,G,H</sup>
			Fines classify as CL or CH	GC	Clayey gravel <sup>F,G,H</sup>
	Sands 50% or more of coarse fraction passes No. 4 sieve	Clean Sands Less than 5 % fines <sup>D</sup>	$Cu \geq 6$ and $1 \leq Cc \leq 3^E$	SW	Well-graded sand <sup>I</sup>
			$Cu < 6$ and/or $1 > Cc > 3^E$	SP	Poorly graded sand <sup>I</sup>
		Sand with fines More than 12 % fines <sup>D</sup>	Fines classify as ML or MH	SM	Silty sand <sup>G,H,I</sup>
			Fines classify as CL or CH	SC	Clayey sand <sup>G,H,I</sup>
FINE-GRAINED SOILS 50% or more passes the No. 200 sieve	Silts and Clays Liquid Limit less than 50	Inorganic	PI > 7 and plots on or above "A"line <sup>J</sup>	CL	Lean clay <sup>K,L,M</sup>
			PI < 4 and plots below "A"line <sup>J</sup>	ML	Silt <sup>K,L,M</sup>
	Silts and Clays Liquid Limit 50 or more	Organic	$\frac{\text{Liquid limit - oven dried}}{\text{Liquid limit - not dried}} < 0.75$	OL	Organic clay <sup>K,L,M,N,O</sup>
			Inorganic	PI plots on or above "A"line	CH
		PI plots below "A"line		MH	Elastic silt <sup>K,L,M</sup>
		Organic	$\frac{\text{Liquid limit - oven dried}}{\text{Liquid limit - not dried}} < 0.75$	OH	Organic clay <sup>K,L,M,P,O</sup>
HIGLY ORGANIC SOILS	Primarily organic matter, dark color, and organic color			Pt	Peat

## Unified Soil Classification - Notes

<p><sup>A</sup> Based on the material passing the 3-in (75-mm) sieve.</p> <p><sup>B</sup> If field sample contained cobbles or boulders, or both, add “with cobbles or boulders, or both” to group name.</p> <p><sup>C</sup> Gravels with 5 to 12 % fines require dual symbols :              GW-GM well graded gravel with silt              GW-GC well graded gravel with clay              GP-GM poorly graded gravel with silt              GP-GC poorly graded gravel with clay</p> <p><sup>D</sup> Sands with 5 to 12 % fines require dual symbols :              SW-SM well graded gravel with silt              SW-SC well graded gravel with clay              SP-SM poorly graded gravel with silt              SP-SC poorly graded gravel with clay</p>	${}^E Cu = D_{60} / D_{10} \quad Cc = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ <p><sup>F</sup> If soil contains <math>\geq 15\%</math> sand, add “with sand” to group name.</p> <p><sup>G</sup> If fines classify as CL-ML, use symbol GC-GM, or SC-SM</p> <p><sup>H</sup> If fines are organic, add “with organic fines” to group name.</p> <p><sup>I</sup> If soil contains <math>\geq 15\%</math> gravel, add “with gravel” to group name.</p> <p><sup>J</sup> If Atterberg limits plot in hatched area, soil is a CL-ML, silty clay.</p> <p><sup>K</sup> If soil contains 15 to 29 % plus No. 200, add “with sand” or “with gravel,” whichever is predominant.</p> <p><sup>L</sup> If soil contains <math>\geq 30\%</math> plus No. 200, predominantly sand, add “sandy” to group name.</p>	<p><sup>M</sup> If soil contains <math>\geq 30\%</math> plus No. 200, predominantly gravel, add “gravelly” to group name.</p> <p><sup>N</sup> <math>PI \geq 4</math> and plots on or above “A” line.</p> <p><sup>O</sup> <math>PI &lt; 4</math> and or plots below “A” line.</p> <p><sup>P</sup> <math>PI</math> plots on or above “A” line.</p> <p><sup>Q</sup> <math>PI</math> plots below “A” line.</p>

# GEOLOGIC MAP OF PENNSYLVANIA

COMMONWEALTH OF PENNSYLVANIA  
DEPARTMENT OF  
CONSERVATION AND NATURAL RESOURCES  
BUREAU OF TOPOGRAPHIC AND GEOLOGIC SURVEY  
[www.dcnr.state.pa.us/topogeo](http://www.dcnr.state.pa.us/topogeo)

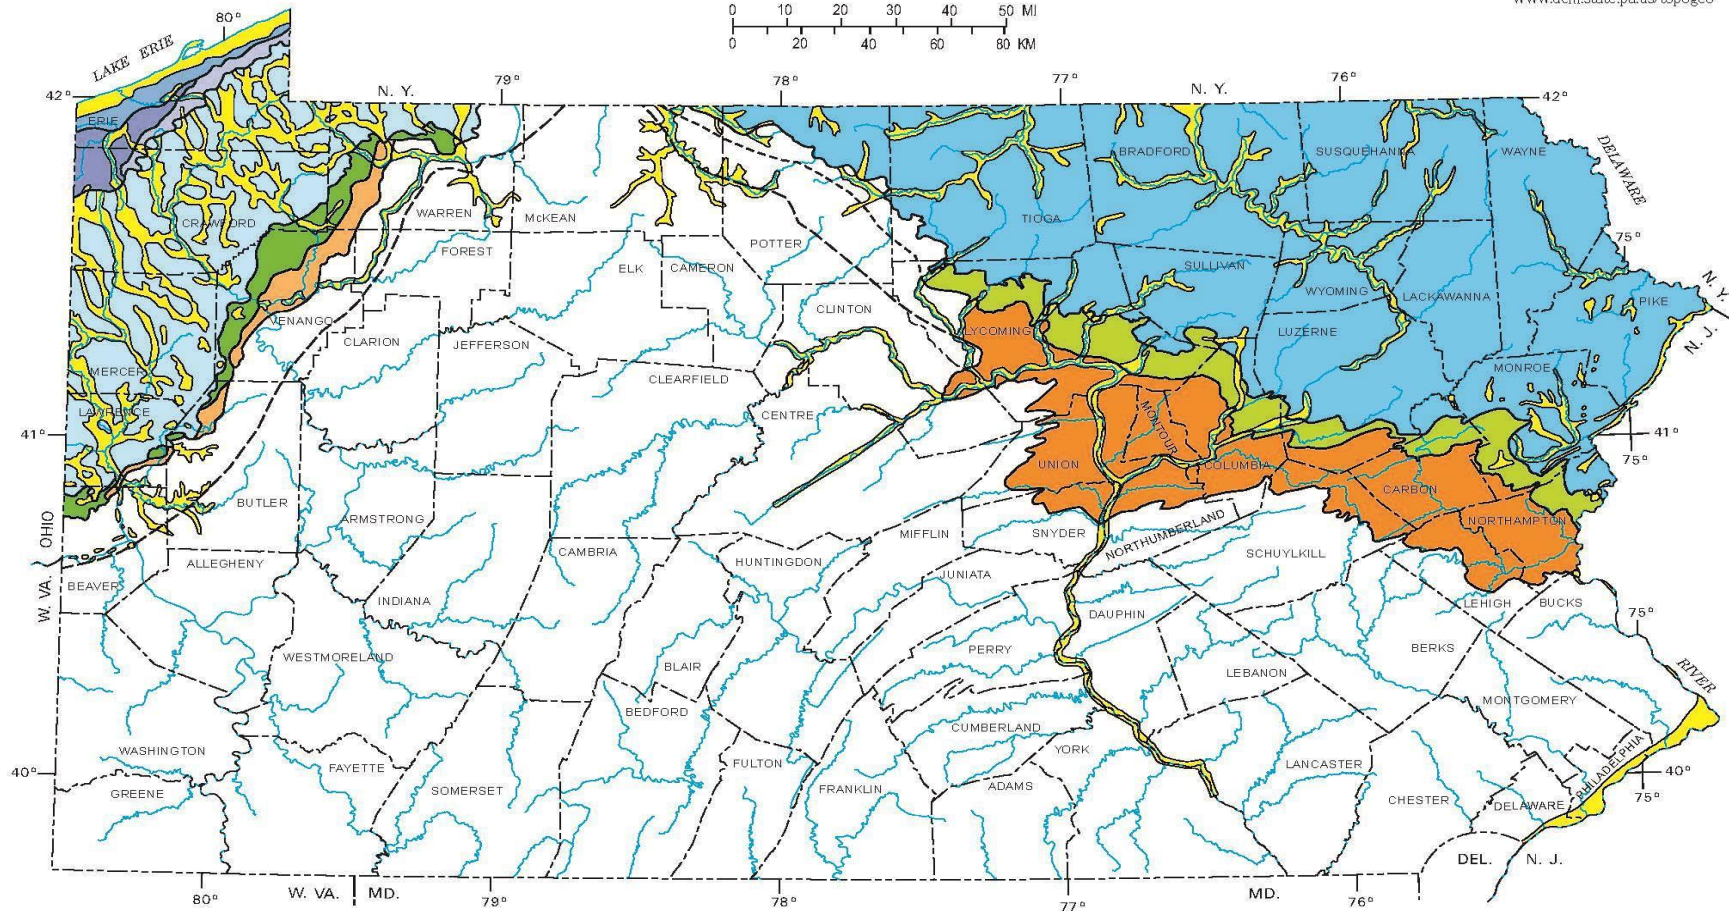

### EXPLANATION

<b>QUATERNARY</b> (0-1.8 mil. yrs.) Sand, gravel, and silt. Sand and gravel.	<b>TERTIARY</b> (1.8-65 mil. yrs.) Sand, gravel, silt, and clay. Sand and gravel.	<b>JURASSIC AND TRIASSIC</b> (144-248 mil. yrs.) Red sandstone, shale, and conglomerate (green), intruded by diabase (red). Building stone, iron.	<b>PERMIAN</b> (248-290 mil. yrs.) Cyclic sequences of shale, sandstone, limestone, and coal. Lime, clay.	<b>PENNSYLVANIAN</b> (290-323 mil. yrs.) Cyclic sequences of sandstone, red and gray shale, conglomerate, clay, coal, and limestone. Coal, clay, lime, building stone.	<b>MISSISSIPPIAN</b> (323-354 mil. yrs.) Red and gray sandstone, shale, and limestone. Flagstone, limestone, clay.	<b>DEVONIAN</b> (354-417 mil. yrs.) Red sandstone, gray shale, black shale, limestone, and chert. Flagstone, silica sand, clay, lime.	<b>SILURIAN</b> (417-443 mil. yrs.) Red and gray sandstone, conglomerate, shale, and limestone. Lime, building stone.	<b>ORDOVICIAN</b> (443-490 mil. yrs.) Shale, limestone, dolomite, and sandstone. Slate, limestone, zinc, clay.	<b>CAMBRIAN</b> (490-570 mil. yrs.) Limestone, dolomite, sandstone, shale, quartzite, and phyllite. Lime, building stone.	<b>LOWER PALEOZOIC</b> (443-570 mil. yrs.) Metamorphic rocks (metasedimentary and meta-igneous); schist, gneiss, quartzite, serpentine, slate, and marble. Building stone, talc.	<b>PRECAMBRIAN</b> (older than 570 mil. yrs.) Gneiss, granite, anorthosite, metabasalt, metarhyolite, and marble. Building stone, graphite, sericite.

\*Cretaceous rocks, which are present in small areas of southern Montgomery County, cannot be shown at the scale of this map. Prepared by Bureau of Topographic and Geologic Survey, Third Edition, 1998, Fourth Printing, Slightly Revised, 2007.

www.dnr.state.pa.us/topogeo

### EXPLANATION

### SYMBOLS

#### RECENT TO LATE ILLINOIAN (0-198,000 yrs.)

**STRATIFIED DRIFT**  
Sand and gravel in eskers, kames, kame terraces, and outwash, principally in valleys; silt and clay in lake deposits in formerly ice-dammed valleys; lake clays and beach sands and gravels along Lake Erie; thin (Recent) to thick (late Illinoian) soils.

**ASHTABULA TILL**  
**HIRAM TILL**  
**LAVERY TILL**  
**KENT TILL**

#### WISCONSINAN (17,000-22,000 yrs.)

Thick, gray, clayey to silty to sandy till covering over 75 percent of the ground; topography is mainly gently undulating, but there is also some knob-and-kettle topography; thin soil.

**OLEAN TILL**  
Moderately thick, gray to grayish-red, sandy till covering 25 to 50 percent of the ground; very thin till covers an additional 25 percent of the ground; topography reflects the underlying bedrock; thin soil.

#### LATE ILLINOIAN (132,000-198,000 yrs.)

**TITUSVILLE TILL**  
**UNNAMED TILLS**  
Thin, gray (Titusville) to brown and grayish-red (unnamed), clayey to sandy till covering 10 to 25 percent of the ground; topography reflects the underlying bedrock; moderately thick, well-developed soil.

#### PRE-ILLINOIAN (>770,000 yrs.)

**MAPLEDALE TILL**  
**UNNAMED TILLS**  
Thin, gray, clayey to silty till in patches covering up to 10 percent of the ground; topography reflects the underlying bedrock; thick, well-developed soil, commonly having a yellowish-red color.

Southern limit of glacial advance  
 Approximate limit of Illinoian advance  
 Approximate limit of pre-Illinoian advance

# LIMESTONE AND DOLOMITE DISTRIBUTION IN PENNSYLVANIA

COMMONWEALTH OF PENNSYLVANIA  
 DEPARTMENT OF  
 CONSERVATION AND NATURAL RESOURCES  
 BUREAU OF TOPOGRAPHIC AND GEOLOGIC SURVEY  
[www.dcnr.state.pa.us/topogeo](http://www.dcnr.state.pa.us/topogeo)

**EXPLANATION**

Area where limestone, dolomite, or both are at the surface. Layers are usually strongly folded and steeply dipping. Includes economically important high-calcium limestones of the Kinzers, Annville, Benner, and Keyser Formations and the Cockeysville Marble, as well as the high-magnesian dolomites of the Ledger Formation and the Cockeysville Marble. This area is most susceptible to sinkhole development.

Area underlain by flat-lying, generally thin, but locally thick, limestone beds, which are discontinuous in places and are commonly interbedded with shale.

Area underlain by the generally flat lying Pennsylvanian Vanport Limestone, a high-calcium limestone. This limestone is generally overlain by less than 100 feet of sedimentary rocks, except in the southern part of the area.

---

Refer to the Rock Type Identification Charts to aid in identifying:

*Metamorphic Rocks*

*Igneous Rocks*

*Sedimentary Rocks* (Two Pages)

Refer to the Pennsylvania Diagnostic Flow Charts to aid in identifying:

*Metamorphic Rocks*

*Igneous Rocks*

*Sedimentary Rocks*

**Note:** The charts are intended for use in identifying most metamorphic, igneous, and sedimentary rocks in Pennsylvania and therefore do not include all rock types.

## Rock Type Identification Chart for Metamorphic Rocks <sup>(1)</sup>

Texture	Dominant Mineral Constituent	Description, Composition, and Diagnostic Features	Color (other variations possible)	Rock Type	Parent Rock	Example Map Unit/Locality <sup>(2)</sup>
Foliated <sup>(3)</sup> (a planar rock fabric with preferred orientation of mineral grains as a result of heat and pressure)	mica, quartz, feldspar, chlorite	Microscopic to fine-grained (<0.04 to 1/32 in.) <sup>(4)</sup> ; well foliated (slaty cleavage); dense;	variable, gray, red, and green	Slate	Shale, claystone, siltstone	Peach Bottom Slate/York Co. Pen Argyl Member/Lehigh Co.
	mica, quartz, feldspar, chlorite					
	chlorite, mica, garnet, quartz, feldspar, amphibole	medium to coarse-grained (1/32 to 3/8 in.); schistose texture; platy minerals predominate; frequently contains distinct crystals (porphyroblasts common);	usually appears silvery-gray, to brown due to abundant mica content	Schist	Phyllite	Peters Creek and Marburg Schist/York Co.
	quartz, feldspar, hornblende, mica, garnet	Banded	alternating bands of light and dark minerals; medium to coarse-grained (1/32 to 3/8 in.); well foliated;	gray, pink, darker layers foliated, lighter layers granular in texture	Gneiss	Schist, Granite
Non-Foliated (rock fabric is uniform or massive)	calcite, dolomite, phlogopite mica	reacts with 10% HCl; often distinctly crystalline or granular; sugary-textured; massive; can be scratched with a knife or nail;	typically white to light gray	Marble	Limestone, Dolomite	Cockeysville Marble/Lancaster and Chester Co.
	Quartz, muscovite, biotite	very hard – scratches glass and mild steel; massive; glassy appearance; vitreous; grains are fused when visible; grains more apparent on weathered surfaces	variable pale colors – white, reddish-pink, light gray, light brown	Quartzite	Sandstone	Setters Quartzite and Chickies Formation/York, Lancaster and Chester Co.
	quartz, feldspars, epidote, pyrite, magnetite	microscopic to fine-grained (<0.04 to 1/32 in.); very hard – scratches glass and mild steel; massive; dense; randomly arranged minerals; will scratch glass and mild steel;	dark colors – brown, dark gray, purplish black,	Hornfels <sup>(5)</sup>	most commonly Shale, Claystone, Siltstone <sup>(6)</sup>	small areal extent, located adjacent to igneous diabase intrusions/ York and Adams Co.
	serpentine, chlorite, amphibole, mica, magnetite	Fine-grained (0.04 to 1/32 in.); greasy or silky feel; waxy luster; commonly veined; generally soft but varies depending on silica content; can easily be scratched with knife or nail;	greenish-gray, black, yellowish green	Serpentinite	Peridotite	small areal extent, mapped within granitic gneiss and gneiss/southern Lancaster and Chester Co.
Foliated or Non-foliated	hornblende, plagioclase, quartz, mica	medium to coarse-grained (1/32 to 3/8 in.); well foliated or schistose texture may be present but mineral grains can be randomly oriented; dense;	brown, black, dark gray	Amphibolite	Basalt, Gabbro	small areal extent, occurs within the Wissahickon Formation/Chester and Delaware Co.

Notes: <sup>(1)</sup> Nearly all exposed Metamorphic Rocks of Pennsylvania are located in the Piedmont Province, or the South Mountain and Reading Prong Sections. See Glossary of Geologic and Geotechnical terms for further clarification of terms used in this chart.

<sup>(2)</sup> Example map unit/locality is a typical example for the rock type listed, the rock type can be found at other locations in Pennsylvania

<sup>(3)</sup> Foliation is not to be confused with bedding or fissility which are characteristics of sedimentary rocks

<sup>(4)</sup> Rock grain-size descriptors and diameters: Source: USBR Engineering Geology Field Manual, (2001)

<sup>(5)</sup> Hornfels is a contact metamorphic rock which primarily occurs adjacent to igneous Diabase intrusions

<sup>(6)</sup> Associated with contact metamorphism; Some references indicate additional parent rock types

## Rock Type Identification Chart for Igneous Rocks <sup>(1)</sup>

<u>Mode of Occurrence</u>	<u>Dominant Mineral Constituent</u>	<u>Description, Composition, and Diagnostic Features</u> <sup>(2)</sup>	Color <sup>(3)</sup>	Rock Type	Example Map Unit/Locality <sup>(4)</sup>
Intrusive (Igneous rock which formed from magma below surface of earth, cooling slowly allowing minerals to be visible with unaided eye)	quartz, potassium feldspar, plagioclase, biotite, minor hornblende	medium to coarse-grained (1/32 to 3/8 in.) <sup>(7)</sup> ; with at least 2/3 light colored minerals by volume	grayish white, light pink, gray	Granite/Granodiorite <sup>(5)</sup>	Springfield Granodiorite and Ridley Park Granite/Philadelphia and Montgomery Co.
	quartz, potassium feldspar, mica, minor hornblende	very coarse-grained (>3/8 in.); highly variable grain size and mineral distribution	grayish white, light pink, gray	Pegmatite	small areal extent, most pegmatites occur as dikes/ Chester Co.
	calcium plagioclase, quartz, biotite, hornblende	medium to coarse-grained (1/32 to 3/8 in.); with at least 2/3 dark colored minerals by volume	gray to dark gray,	Anorthosite/Gabbro <sup>(6)</sup>	Anorthosite/Chester Co.
	plagioclase, pyroxene, magnetite,	medium to coarse-grained (1/32 to 3/8 in.); hard to very hard	black, dark gray, green	Diabase/Gabbro <sup>(6)</sup>	occurs as dikes and sheets in Adams and York Co
Extrusive from molten rock on or near	quartz, feldspar, hornblende	aphanitic to fine-grained (<0.04 to 1/32 in.); commonly contains phenocrysts (larger crystals in a finer matrix); hard; dense	Bluish gray, grayish red, reddish, purple	Rhyolite/ Metarhyolite <sup>(8)</sup>	Metarhyolite/Adams and Franklin Co.
	feldspar, amphibole, chlorite,	fine to medium grained (0.04 to 3/16 in.); porphyritic; commonly amygdaloidal; and vesicular	green, greenish gray, gray	Basalt/Metabasalt <sup>(8)</sup>	Metabasalt/Adams and Franklin Co.

Notes: <sup>(1)</sup> Nearly all exposed Igneous Rocks of Pennsylvania are located in the Piedmont Province, or the South Mountain and Reading Prong Sections. See Glossary of Geologic and Geotechnical terms for further clarification of terms used in this chart.

<sup>(2)</sup> Igneous rocks do not exhibit foliation

<sup>(3)</sup> Other color variations are possible

<sup>(4)</sup> Example map unit/locality is a typical example for the rock type listed, the rock type can be found at other locations in Pennsylvania

<sup>(5)</sup> Granodiorite is typically darker in color, contains a higher percentage of plagioclase and lower percentage of potassium feldspar than Granite. Granite/Granodiorite located in Pennsylvania has undergone metamorphism and therefore exhibit varying degrees of foliation, a characteristic of metamorphic rocks.

<sup>(6)</sup> Diabase is a type of Gabbro that occurs as dikes and sheets within the Gettysburg-Newark Lowland Section, Anorthosite is also a type of Gabbro but does not occur as dikes and sheets and is located primarily in the Piedmont Upland Section.

<sup>(7)</sup> Rock grain-size descriptors and diameters: Source: USBR Engineering Geology Field Manual, (2001)

<sup>(8)</sup> Extrusive igneous rocks, (Rhyolite and Basalt) in Pennsylvania have undergone low grade metamorphism and therefore retain their igneous classification. These rocks are primarily located in the South Mountain Section and Piedmont Province.

**Rock Type Identification Chart for Sedimentary Rocks (1)**

Origin	Textural Features and Particle Size (2)	Description, Composition, and Diagnostic Features	Color (3)	Rock Type	Example Map Unit/Locality (4)
Inorganic Detrital Materials (detrital materials result from erosion and transport of pre-existing rock)	rounded to subrounded particles greater than two millimeters in diameter	primary identifying feature: large grains (> 2mm) in matrix of finer cemented material; >30% of grains are >2mm in a cemented matrix of smaller particles; particles typically consist of chert, quartz, quartzite	variable, contrasting colors which include red, gray, brown, white	Conglomerate	comprises portion of Pottsville Group/Schuylkill Co. and Gettysburg Formation York Co.
	angular particles greater than two millimeters in diameter			Breccia	occurs as interbeds in Gettysburg Formation York Co.
	comprised of predominately (>50%) sand-size (1/16 to 2 millimeter diameter) granular particles	rough or gritty feel; grain sizes < 2mm; comprised mostly of quartz, feldspar, or chert and may be cemented with silica or iron oxides	variable, may include red, gray, brown, tan	Sandstone	Bald Eagle Formation and Burgoon Sandstone/Blair Co./numerous other formations
		rough or gritty feel; grain sizes < 2mm; comprised mostly of quartz, feldspar, or chert with a calcite matrix or cement; reacts with 10% HCL		Calcareous Sandstone	Decker Formation/Monroe Co./ numerous other formations
	Comprised of predominately of sand-size (1/16 to 2 millimeter diameter) granular particles	compositionally the rock is a sandstone but contains > 95% quartz grains with a silica cement; very hard	white to light gray, red	Quartz arenite (Sandstone)	Tuscarora Formation/Juniata and Perry Co.
	comprised of >66% silt size particles (1/16 to 0.0039 millimeter diameter)	> 66% of the particles are silt size; feels slightly gritty; will scratch flat surface of a copper pipe; non-fissile; contains more quartz than shale	variable	Siltstone	present in numerous formations throughout PA
		> 66% of the particles are silt size; it feels slightly gritty; non-fissile; reacts with 10% HCL		Calcareous Siltstone	
	comprised of 33% - 66% silt size particles (1/16 to 0.0039 millimeter diameter and 33% - 66% clay size particles (less than 0.0039 millimeter diameter)	usually well stratified or laminated which imparts fissility (breaks into layers or sheets); can be scratched with a copper pipe	variable	Shale	present in numerous formations throughout PA
		usually well stratified or laminated which imparts fissility (breaks into layers or sheets); reacts with 10% HCl; can be scratched with a copper pipe; calcium carbonate often interbedded with limestone	variable	Calcareous Shale	Onondaga and Wills Creek Formations/ numerous other formations
		contains carbon indicated by black to dark gray color; fissile (breaks into layers or sheets); can be scratched with a copper pipe; commonly associated with coal seams	dark gray, black	Carbonaceous Shale	Marcellus Shale/ Lycoming Co.
comprised of >66% clay size particles (less than 0.0039 millimeter diameter)	>50% of the particles are clay size; typically smooth appearance; non-fissile; can be scratched with a wood dowel; very soft; rock has soapy feel when wet	variable	Claystone	Pittsburgh red beds within the Conemaugh Group/Western PA	
comprised mainly of silt and clay size particles (1/16 to < 0.0039 millimeter diameter)	Non-fissile; compact; not easily scratched with knife; well indurated; massive; less clearly laminated than shale; will break into hard angular fragments	reddish brown, grayish red	Argillite	Lockatong Formation, Bucks Co.	

**Rock Type Identification Chart for Sedimentary Rocks (continued) <sup>(1)</sup>**

<u>Origin</u>	<u>Textural Features and Particle Size</u> <sup>(2)</sup>	Description, Composition, and Diagnostic Features	<u>Color</u> <sup>(3)</sup>	<u>Rock Type</u>	<u>Example Map Unit/Locality</u> <sup>(4)</sup>
Inorganic Chemical Precipitates	grain size ranges from small, visible crystals, to grains too small to see individually	contains at least 50% (by weight) calcium carbonate; reacts freely with 10% HCl; can be scratched with a knife or nail; cannot scratch glass; may contain calcite veins; often interbedded with dolomite; may contain fossils	typically light gray to black, tan when weathered	Limestone	Annville Formation/Lebanon Co. Rockdale Run Formation/Cumberland Co.
	grain size ranges from small, visible crystals, to grains too small to see individually	contains at least 50% (by weight) calcium magnesium carbonate; rock in powder form reacts with 10% HCl; can be scratched with knife or nail; often interbedded with limestone; may contain chert; slightly harder than limestone; may contain fossils	typically gray, to white	Dolomite	Ledger and Vintage Formations/Lancaster Co.
Organic Detrital Materials	fine-grained, dense	composed of carbon formed by accumulation of plant matter; dull luster; frequently soft	black	Bituminous Coal	Pittsburgh Coal within the Monongahela Group, Freeport, Kittanning Coal within the Allegheny Group/ Western PA
	fine-grained, dense	composed of carbon formed by accumulation of plant matter; lustrous; harder than bituminous coal	black	Anthracite Coal <sup>(5)</sup>	Coal seams within the Llewellyn Formation/Schuylkill Co

Notes: <sup>(1)</sup> Sedimentary Rocks occur throughout Pennsylvania. See Glossary of Geologic and Geotechnical terms for further clarification of terms used in this chart.

<sup>(2)</sup> Rock particle size diameters: Source: USBR Engineering Geology Field Manual, (2001)

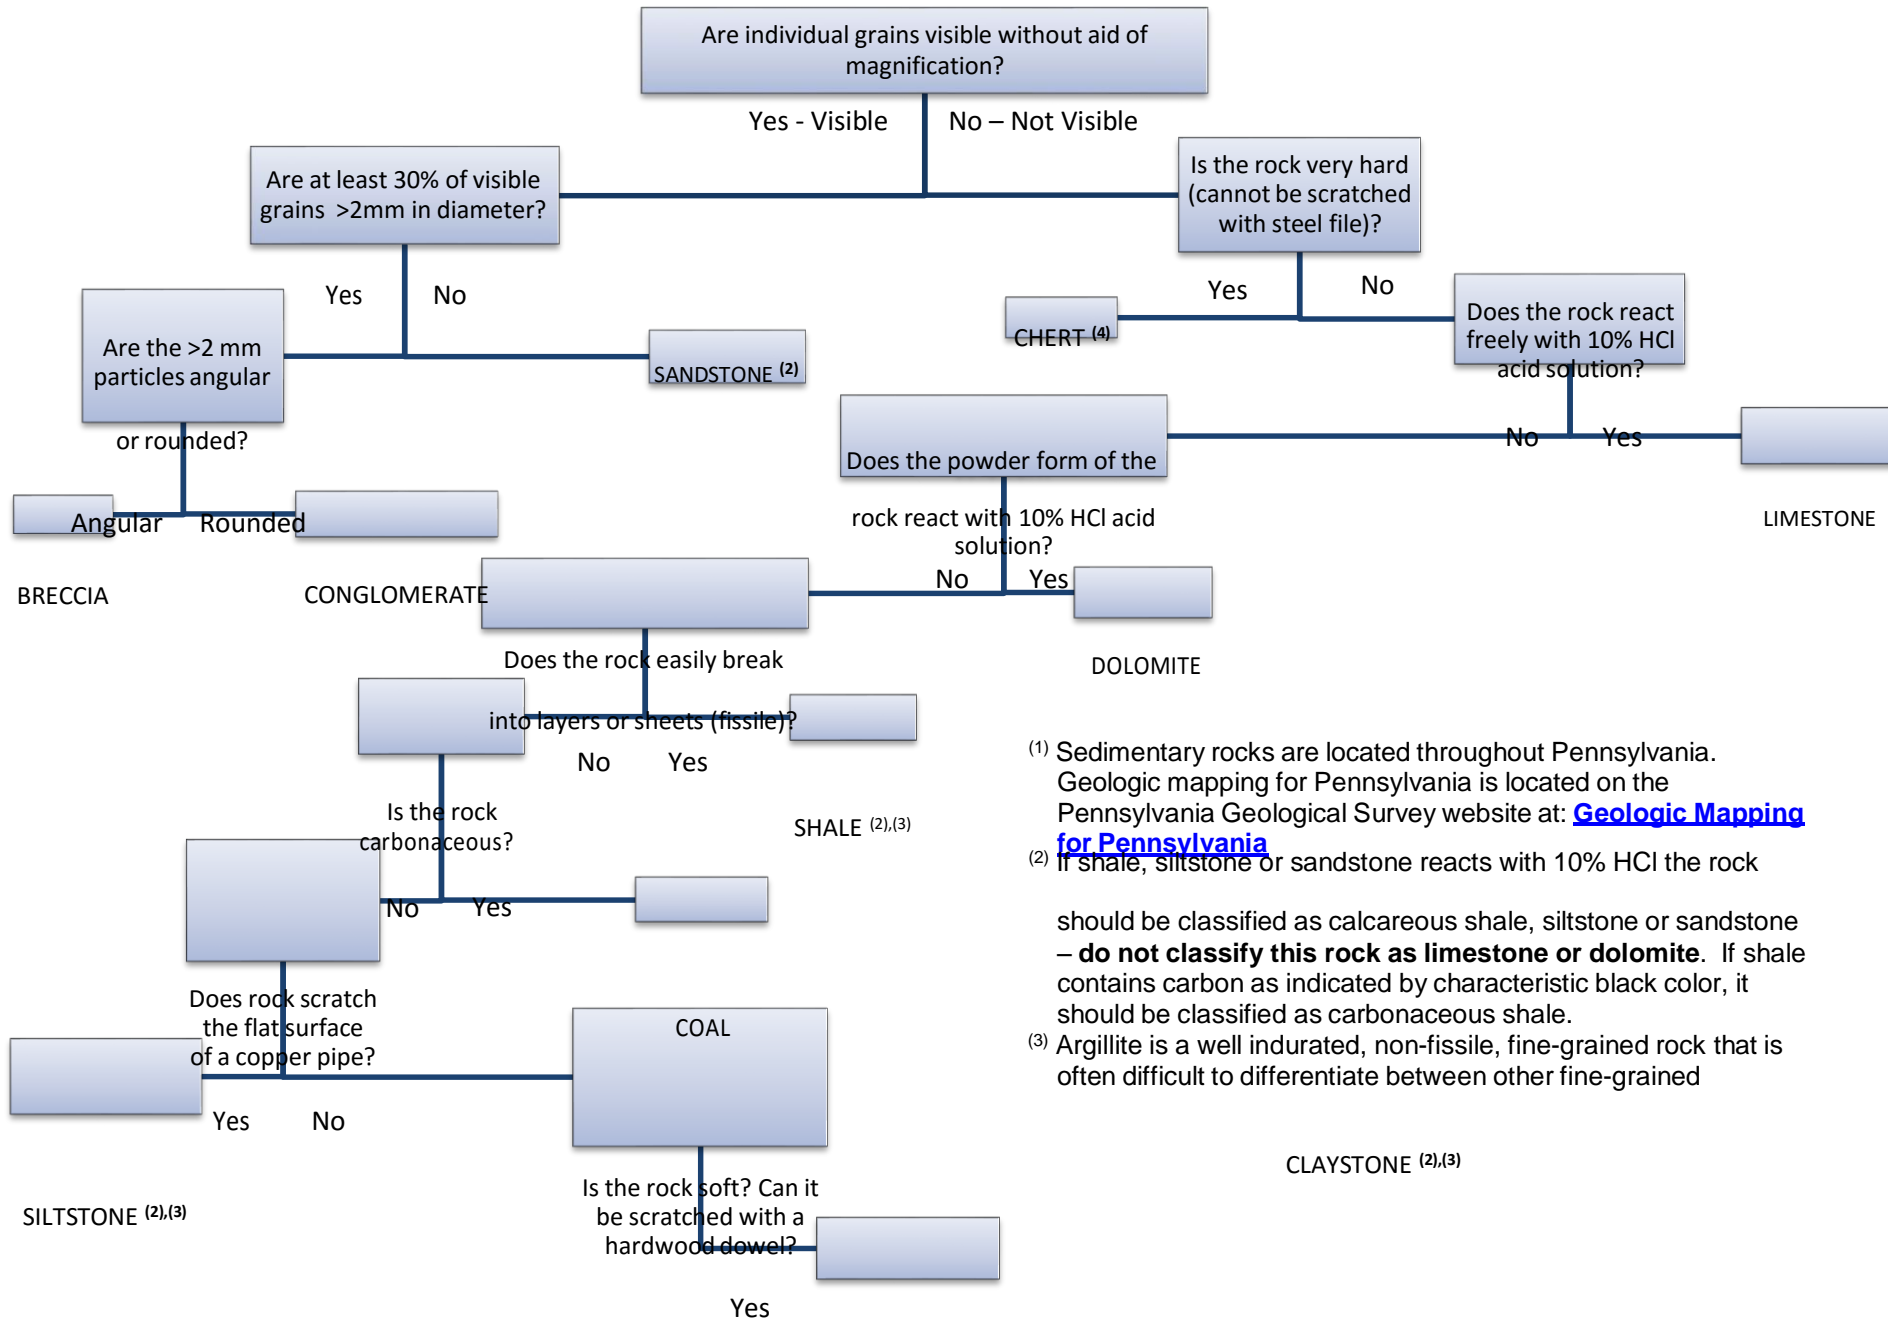

<sup>(3)</sup> Other color variations are possible

<sup>(4)</sup> Example map unit/locality is a typical example for the rock type listed, the rock type can be found at other locations in Pennsylvania

<sup>(5)</sup> Anthracite coal is classified as sedimentary by some references and as a low grade metamorphic by other references. For the purpose of rock identification, it has been included in the sedimentary rock table because in PA it is primarily found in sedimentary rock formations. Anthracite coal is located only in the anthracite fields of eastern and northeastern Pennsylvania

## Diagnostic Flow Chart for Sedimentary Rocks found in Pennsylvania <sup>(1)</sup>

(1) Sedimentary rocks are located throughout Pennsylvania. Geologic mapping for Pennsylvania is located on the Pennsylvania Geological Survey website at: [Geologic Mapping for Pennsylvania](http://www.pennsylvania.gov/geology)

(2) If shale, siltstone or sandstone reacts with 10% HCl the rock should be classified as calcareous shale, siltstone or sandstone – **do not classify this rock as limestone or dolomite**. If shale contains carbon as indicated by characteristic black color, it should be classified as carbonaceous shale.

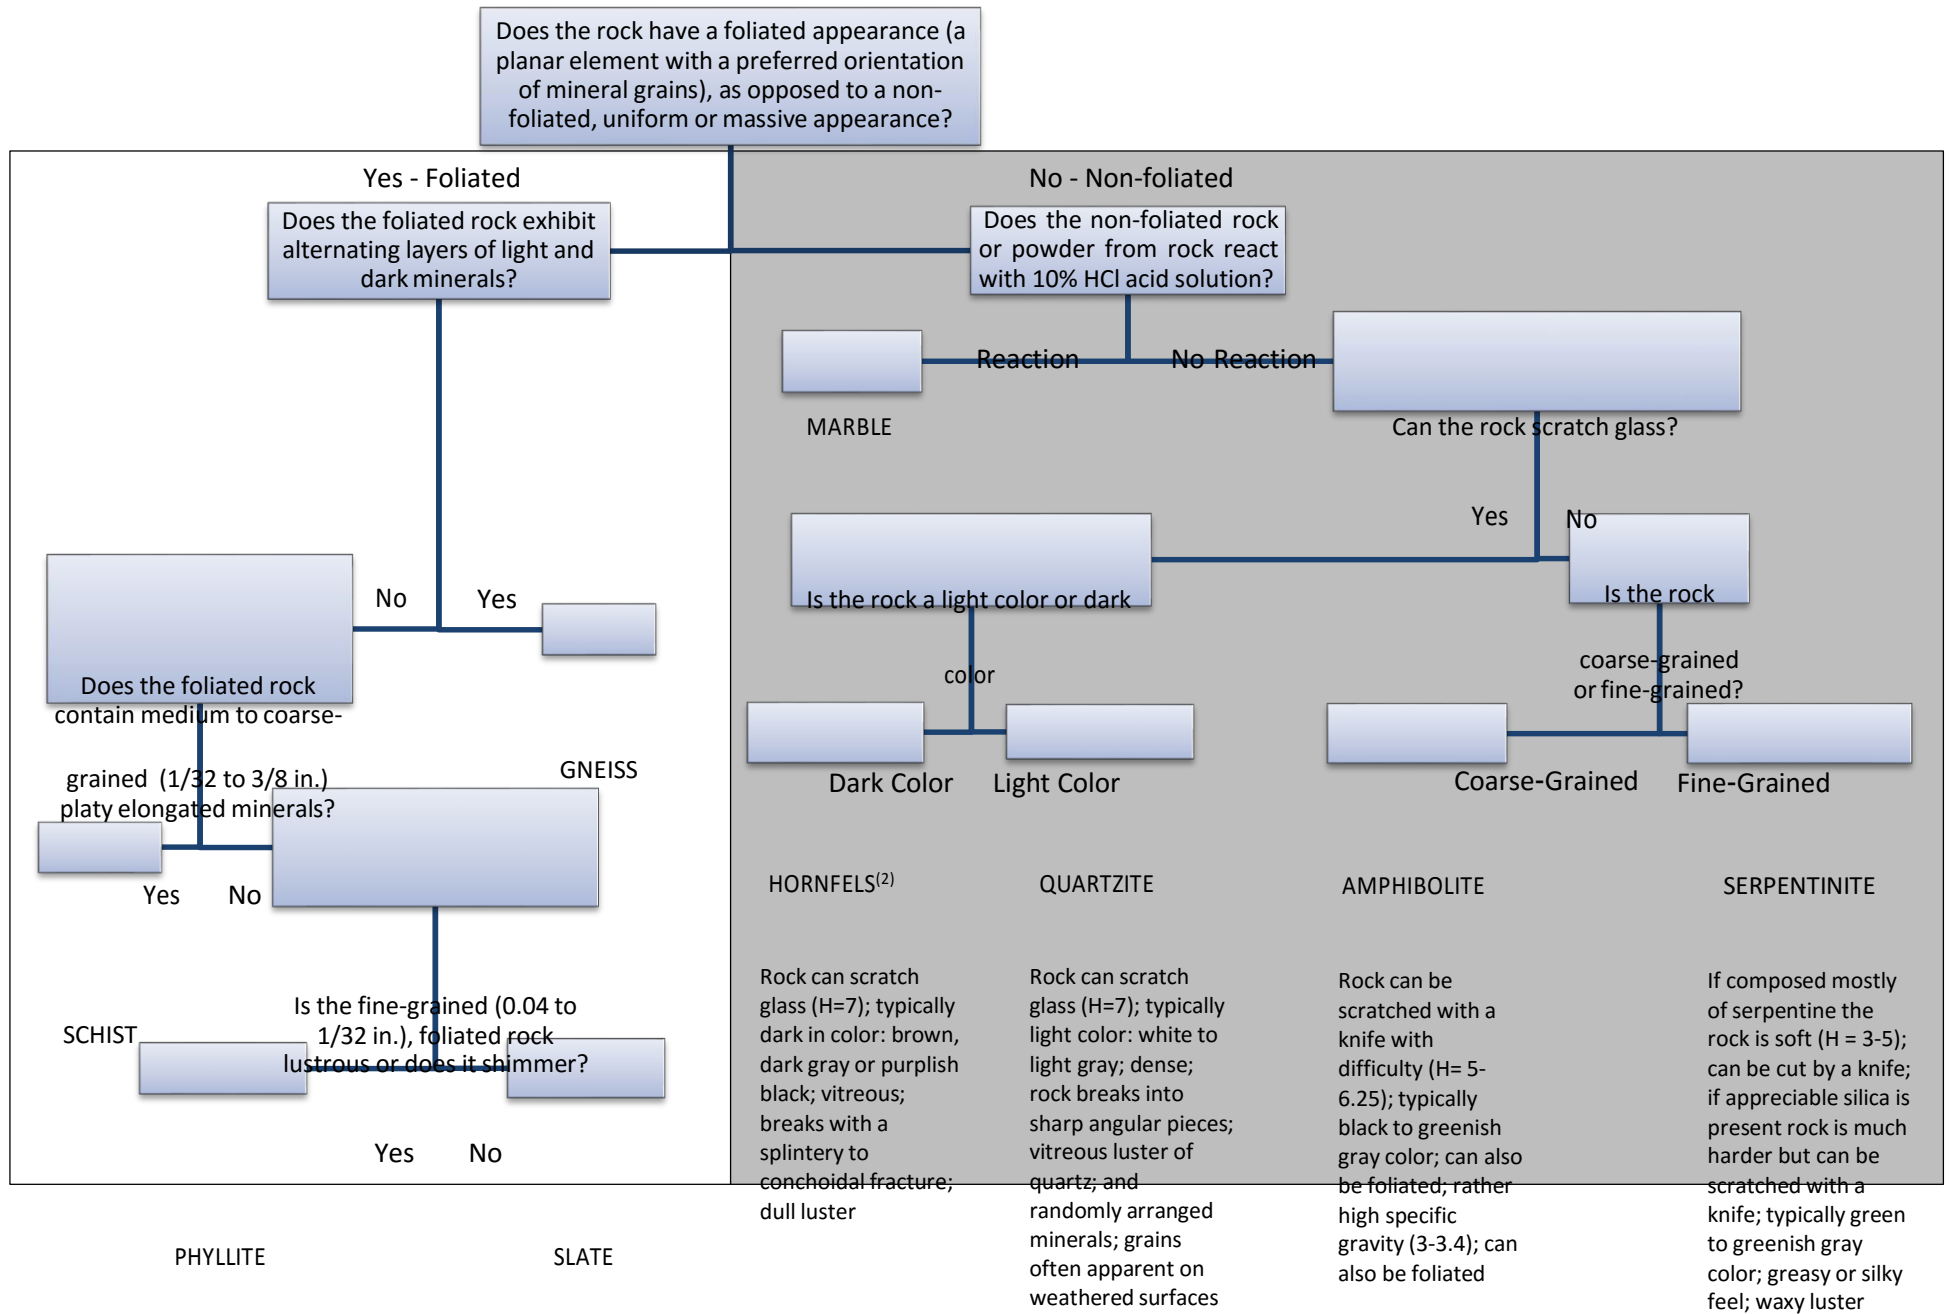

(3) Argillite is a well indurated, non-fissile, fine-grained rock that is often difficult to differentiate between other fine-grained

secondary rocks. Argillite is harder than shale and claystone, cemented by silica, and typically contain

nsigher claystone.  
(4) Chert, is comparatively

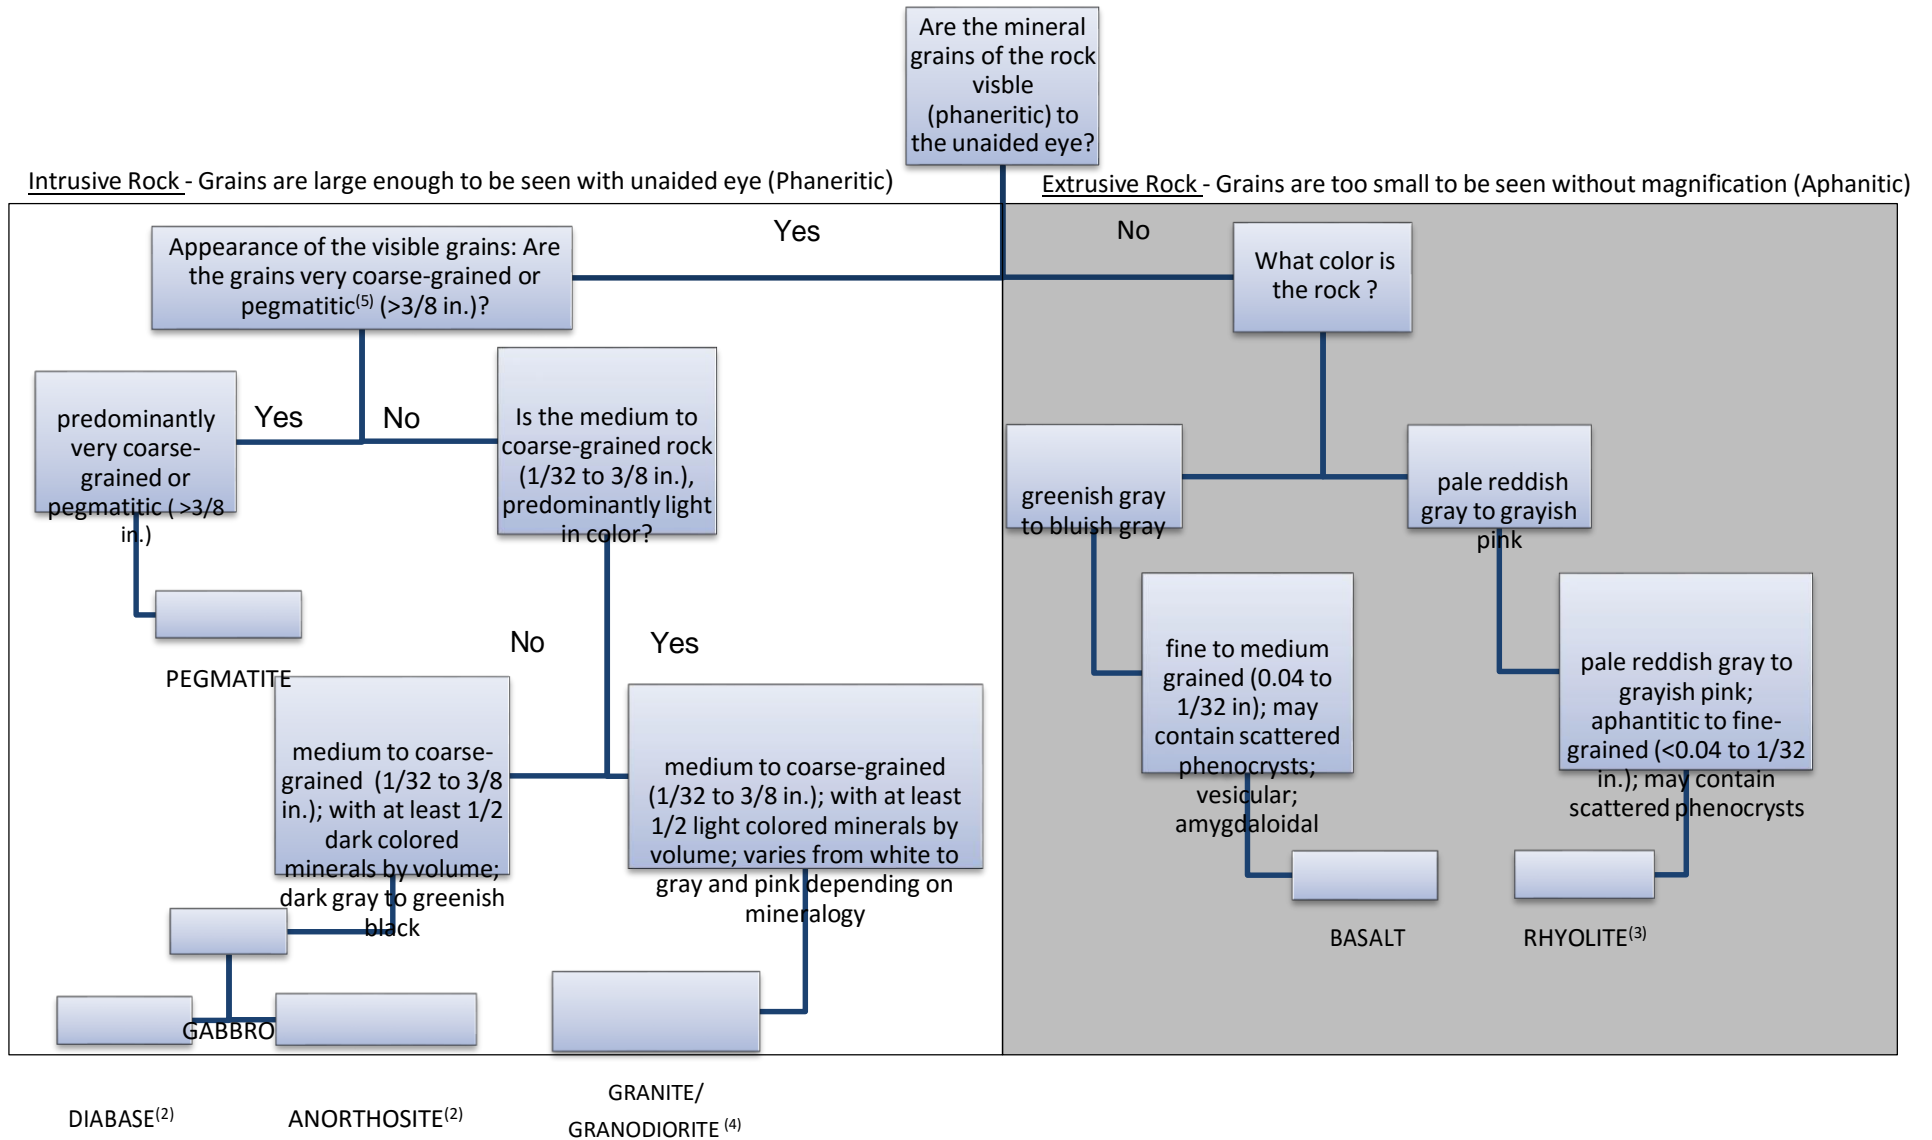

used of cryptocrystalline quartz crystals and can be found as nodules or thin beds in limestone, dolomite, or shale.  
Note: Rocks are generally comprised of multiple minerals each exhibiting a distinct hardness; therefore a composite hardness test should be completed to determine the hardness of the rock being tested.

# Diagnostic Flow Chart for Metamorphic Rocks found in Pennsylvania <sup>(1)</sup>

- (1) The flow chart is intended for use in identifying most metamorphic rocks in Pennsylvania and therefore does not include all metamorphic rock types. Nearly all metamorphic rocks in Pennsylvania are located in the Piedmont Province, or the South Mountain and Reading Prong Sections. Geologic mapping for Pennsylvania is located on the Pennsylvania Geological Survey website at: [Geologic Mapping for Pennsylvania](#)
- (2) Hornfels is a contact metamorphic rock which primarily occurs adjacent to igneous Diabase intrusions.
- Note: Rocks are generally comprised of multiple minerals each exhibiting a distinct hardness; therefore a composite hardness test should be completed to determine the hardness of the rock being tested.

## Diagnostic Flow Chart for Igneous Rocks found in Pennsylvania <sup>(1)</sup>

<sup>(1)</sup> The flow chart is intended for use in identifying most igneous rocks in Pennsylvania and therefore does not include all igneous rock types. Nearly all igneous rocks in Pennsylvania are located in the Piedmont Province, or the South Mountain and Reading Prong Sections. The most commonly encountered igneous rocks in PA are Diabase and Granite. Geologic mapping for Pennsylvania is located on the Pennsylvania Geological Survey website at: [Geologic Mapping for Pennsylvania](#)

<sup>(2)</sup> Diabase and Anorthosite are types of Gabbro identified on geologic mapping published by the Pennsylvania Geological Survey. Diabase occurs as dikes and sheets, within the Gettysburg-Newark Lowland Section, is medium to fine-grained and occurs in Adams, York and Lancaster Co and other locations. Anorthosite does not occur as dikes and sheets, is located in the Piedmont Upland Section, is coarse to medium grained, is less common than Diabase and occurs primarily in Chester Co.

<sup>(3)</sup> Basalt and Rhyolite in Pennsylvania have undergone low-grade metamorphism and are typically described as Metabasalt and Metarhyolite and occur in the South Mountain Section.

<sup>(4)</sup> Granite units identified on geologic mapping published by the Pennsylvania Geological Survey have undergone some degree of metamorphism and therefore exhibit varying degrees of

foliation, a characteristic of metamorphic rocks.

<sup>(5)</sup> Pegmatitic describes a rock texture containing grain sizes from 3/8 to several inches in size; common minerals are quartz, orthoclase, and mica.

Note: Rocks are generally comprised of multiple minerals each exhibiting a distinct hardness; therefore a composite hardness test should be completed to determine the hardness of the rock being tested.

**Quartzite versus Sandstone – Images of Quartzite and Sandstone Structure at 30x Magnification**

Quartzite at 30x Magnification – Note fusing of grains, low appearance of grain structure, more massive appearance and glassy texture; Other quartzite sample may exhibit a more coarse grained structure, but grains would be fused, with glassy texture and samples would fracture predominantly through grains as opposed to along grain faces.

Quartzite at 30x Magnification along Weathered Face – Note more distinct appearance of grains as opposed to an unweathered face.

Sandstone at 30x Magnification – Note cementing of grains and fracture along grain faces

Sandstone at 30x Magnification – Note cementing of grains and fracture along grain faces

## APPENDIX J – Delineation Maps for Acceptable Non-Department Boring Inspection

---

See the following Delineation Maps that define the borders within or along surrounding states where borings may be determined to be acceptable for Non-Department boring inspection requirements.

*Composite State Border and Roadway Map*

*Composite Physiographic Province Map*

*Composite Geology Map*

Abbreviations:

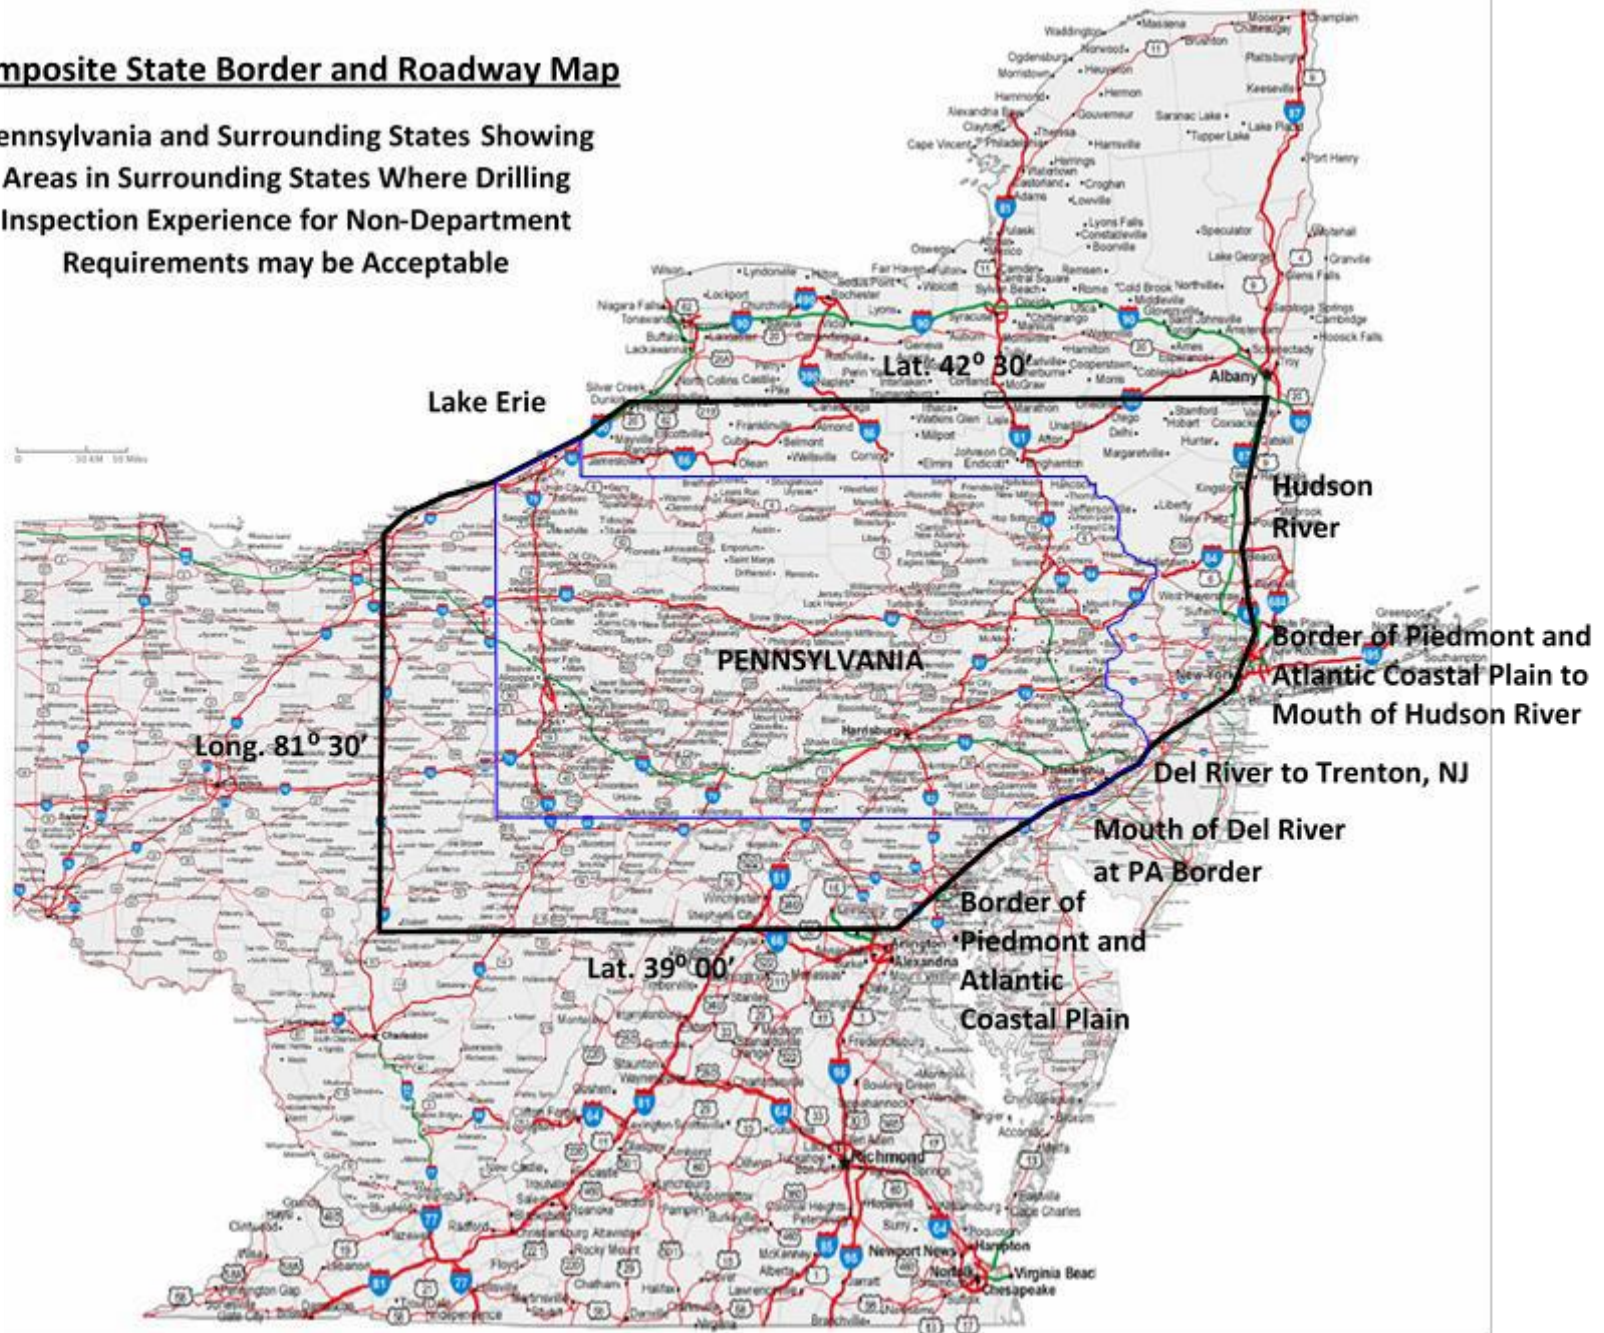

Piedmont = Piedmont Physiographic Province  
ACP = Atlantic Coastal Plain Physiographic Province  
Long. = Longitude  
Lat. = Latitude

Borders are as follows, starting from Lake Erie near Cleveland Ohio:

- 1) Head south in Ohio east of Long.  $81^{\circ} 30'$
- 2) Continue heading south staying east of Long.  $81^{\circ} 30'$  to Lat.  $39^{\circ} 00'$
- 3) Head east staying north of Lat.  $39^{\circ} 00'$  to the border of the Piedmont and ACP
- 4) Head northeast staying north of the Piedmont/ACP border up to the mouth of the Delaware River at the PA state border.
- 5) Continue north along the Delaware River (staying in PA) to Trenton, NJ
- 6) From Trenton, NJ head northeast staying north of the Piedmont/ACP border to the mouth of the Hudson River at Staten Island, NY
- 7) Head north staying west of the Hudson River to Lat.  $42^{\circ} 30'$
  
- 8) Head west from Hudson River staying south of Lat.  $42^{\circ} 30'$  to Lake Erie.

## APPENDIX K - Field Sheet Summaries of Soil and Rock Descriptors

---

The next four pages of this appendix are intended to be an aid to field Inspectors. Making two double-sided laminated copies of each of these references will make convenient and durable reference sheets for use during logging of borings.

***Soil Description Reference Sheet***

***Rock Description Reference Sheet***

Soil Description Sequence	
1	Soil Constituents, Fractions, and Modifiers
2	Soil State: Consistency/Relative Density
3	Soil Moisture Range
4	Soil Structure
5	Soil Gradation
6	Soil Particle Shape/Plasticity
7	Soil Color Range
8	Depositional Environment
9	AASHTO/USCS
10	General Remarks/Additional Information

1a Table 7 - Descriptors for Grain Material based on Grain Size

Constituent	Primary Descriptor	Grain Sizes	
		inches	sieve
Coarse-Grained	Boulders	≥ 12	-
	Cobbles	≤ 42 to > 3	-
	Coarse Gravel	≤ 3 to > 1	≤ 3" to > 1"
	Gravel	≤ 1 to > 3/8	≤ 1" to > 3/8"
	Fine Gravel	≤ 3/8 to > 5/64	≤ 3/8" to > #10
	Coarse Sand	-	≤ #10 to > #40
Fine Sand	-	≤ #40 to > #200	

Fine-

Descriptor	Abbreviation	Typical Consistency	Est. Unconfined Compressive Strength		SPT-N <sub>60</sub> (blows per ft.)
			Tons/Sq. Ft.	(MPa)	
Very Soft	Vsf	Extruded between your fingers when squeezed	≤ 0.25	(≤ 0.025)	≤ 2
Soft	Sf	Molded by light finger pressure	≥ 0.25 - 0.5	(0.025 - 0.05)	3-4
Medium	Md	Molded by strong finger pressure	> 0.5 - 1.0	(0.05 - 0.1)	5-8
Stiff	St	Readily indented by thumbs but penetrated with great effort	> 1.0 - 2.0	(0.1 - 0.2)	9-15
Very Stiff	Vst	Readily indented by thumbnail	> 2.0 - 4.0	(0.2 - 0.4)	16-30
Hard	Hd	Indented with difficulty by thumbnail	> 4.0	(> 0.4)	≥ 31

Descriptor	Abbreviation	Appearance
Dry	Dr	Absence of moisture, dusty, completely dry to the touch
Damp	Dp	Slight moisture perceptible by touch, fine-grained soils are usually firm, granular soils usually have very little apparent cohesive binding
Moist	Ms	Sample visibly wet but no visible free water, sample cool to the touch, at or above optimum moisture, granular soil may exhibit slight apparent cohesive binding
Wet	Wt	Visible free water throughout sample, usually soil is below water table, contains significantly more moisture than moist soil, fine-grained soils usually soft or very soft, granular soils exhibit no apparent cohesive binding

Table 13 - Standard Moisture Descriptors

Descriptor	Abbreviation	Description
Blocky	Bl	Cohesive soil that can be broken down into small angular blocks which resist further breakdown
Fissured	Fi	Soil tends to break along definite planes of fracture with little resistance to fracturing
Homogeneous	Ho	Similar color and texture throughout
Heterogeneous	He	Composed of dissimilar parts throughout
Laminated	La	Alternating very thin layers of varying material or colors with the layers less than 1/4" thick
Lensed	Le	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay

1b Table 8 - Soil Fraction Descriptors

Descriptor (Abbrev.)	Relative Amount (based on total sample volume)
Trace (Tr)	Content < 10%
Little (Lt)	Content ≥ 10 to < 20%
Some (Sm)	Content ≥ 20 to < 35%
And (An)	Content ≥ 35%

Descriptor	Abbreviation
Contains ash and cinders	Ash
Contains organics	Org
Contains rock fragments	Rfg
Contains slag	Slg
Micaceous	Mic
Contains bituminous concrete fragments	Bcf
Contains cement concrete fragments	Ccf
Contains brick fragments	Cbf

Table 10 - Composition Modifiers

Descriptor	Abbreviation	SPT-N <sub>60</sub> (blows per ft.)
Very Loose	Vls	≤ 4
Loose	Ls	5-10
Medium Dense	Md	11-30
Dense	Dn	31-50
Very Dense	Vdn	≥ 50

Table 12 - Relative Density of Granular Coarse-grained Soils

Descriptor	Abbreviation	SPT-N <sub>60</sub> (blows per ft.)
Very Loose	Vls	≤ 4
Loose	Ls	5-10
Medium Dense	Md	11-30
Dense	Dn	31-50
Very Dense	Vdn	≥ 50

1c Figure 6 - Visual Estimation of Coarse Fragments

Table 15 - Soil Gradation Descriptors

Descriptor	Abbreviation	Description
Well Graded	Wg	Having a good distribution of particle sizes. Lacking good representation of particle sizes within the maximum to minimum particle size range of the material. Use this term when the gradation is not well distributed, but sufficiently different from a uniform or gap graded material.
Poorly Graded	Pg	Particles are nearly all the same size (or fall within a tight range of sizes).
Uniformly Graded	Ug	Gradation is missing a band or range of particle sizes.
Gap Graded	Gg	

Table 16 - Soil Shape Descriptors

Descriptor	Abbreviation	Description
Angular	An	Particles have irregular shape with crisp angular edges
Sub Angular	Sa	Particles have irregular shape with weathered or rounded angular edges
Sub Rounded	Sr	Particles have an irregular shape with well rounded edges
Rounded	Ro	Particle has a generally smooth rounded shape
Elongated	El	Particle length is more than three times particle width
Flat	Fl	Particle thickness is less than three times particle length and width

Saprolitic	Sa	Soil composed of completely weathered rock that retains the fabric and appearance of the original rock but with only a trace of the original bond strength
Slickensided	Sl	Contains shear planes that appear striated, polished and/or glossy
Stratified	St	Alternating thin layers of varying material or color with layers at least or greater than 1/4" thick
Varved	Va	Layered soil having a repetitive structure of contrasting color (often alternating between fine sand and silt or clay), resulting from variations in annual seasonal deposition

6b) Table 9 - Descriptors for Fine-Grained Materials Based on Behavior

Fine-Grained Constituent	Plasticity Description/ Abbreviation	Estimated Plasticity Index (PI)	Smallest Thread Diameter	Physical Behavior							
				Thread	Workability to	Moldability	Dilatancy	Adhesion	Appearance and	Drying	
Predominately Silt ↑ Silt More Silt ↓ ↓ More Clay Predominately Clay	Non-plastic (Np)	0% - 2%	Ball cracks	Characteristics Dries rapidly when rolling; a 1/8-inch thread cannot be rolled at any water content  Feels powdery when	reach Plastic Limit  Not applicable, thread cannot be rolled	Moldability  Does not mold well	Dilatancy  Moist soil ball sheds water when shaken giving a glossy appearance	Adhesion  Non-sticky	Appearance and  or Texture Rough or gritty texture, dull smear btw. thumb and forefinger  Rough to smooth	Drying  Time Rapid	Dry Residue  Very powdery residue when dry
	Low Plastic Fines (Lp)	3% - 10%	1/4 to 1/8 - inch	drying out during rolling; The thread can barely be rolled; the thread is weak and soft  The thread cannot be	Thread can barely be rolled	Moldable under small range of water content	Moist soil ball retains water or sheds water slowly when shaken	Slightly sticky	texture, dull smear btw. thumb and forefinger	Moderate	Powdery residue when dry
	Medium			The thread cannot be					Smooth texture,		Generally
	Plastic Fines (Mp)	>10% - 20%	1/16 -inch	reroled after reaching plastic limit; the thread has medium stiffness  The thread can be	Short working time to reach plastic limit	Very moldable		Moderately sticky	dull to shiny smear btw. thumb and forefinger	Slow	little powdery residue when dry

Predominately Clay Clay	High Plastic Fines (Hp)	>20%	1/32 -inch	reroled after reaching the plastic limit; the thread has very high stiffness  The thread can be	Very long working time to reach plastic limit	over a wide range of water content	Moist soil ball retains water when shaken	Very sticky	Slick texture, very shiny or waxy appearance	Very slow	Very little powdery residue when dry
----------------------------	-------------------------	------	------------	---	---	------------------------------------	---	-------------	--	-----------	--------------------------------------

**Procedure for Determining Dry Strength –**  
 The dry strength test is performed on material passing the No. 40 sieve. The test is made on a soil sample about 0.5 inch thick and about 1.5 inches in diameter. Mold the sample until it has the consistency of putty, adding water if necessary. Allow the test specimen to dry in air, or sun or by artificial means. Upon drying, test the strength of the test specimen by crushing between fingers. Note the strength as none, low, medium, high, or very high in accordance with the criteria in Table A.

Table A – Criteria for Describing Dry Strength	
Description	Criteria/Test Result
None	The dry sample crumbles into a powder with mere pressure of handling.
Low	The dry sample crumbles with some finger pressure.
Medium	The dry sample breaks into fragments or crumbles with considerable finger pressure.
High	The dry sample cannot be broken with finger pressure. Sample with break into fragments between thumb and hard surface.
Very High	The dry sample cannot be broken between thumb and a hard surface.

**Procedure for Determining Dilatancy –**  
 The dilatancy test is performed on material passing the No. 40 sieve. The test is made on a soil sample about ¾ inch in diameter. Mold the material, adding water if necessary until it has a soft but not sticky consistency. Smooth the ball of soil in the palm of the hand and shake horizontally, while striking the side of the hand against the other hand several times. Note the reaction of water appearing on the surface of the soil. Squeeze the sample by closing the hand or pinching the soil between the fingers, and note the reaction as none, slow, or rapid in accordance with the criteria in Table B.

Table B – Criteria for Describing Dilatancy	
Description	Criteria/Test Result
None	No visible change in the sample.
Slow	Water slowly appears on the surface of the sample during shaking and does not disappear or disappears slowly upon squeezing.
Rapid	Water quickly appears on the surface of the sample during shaking and disappears upon squeezing.

**Procedure for Determining Toughness –**  
 The toughness test is performed on material passing the No. 40 sieve. The test is made on a soil sample about ¾ inch in diameter. The sample is rolled by hand on a smooth surface or between the palms into a thread about 1/8 inch in diameter. Fold the sample threads and re-roll repeatedly until the thread crumbles at a diameter of 1.8 inch when the soil is near the plastic limit. Note the strength of the thread. After the thread crumbles the pieces should be lumped together and kneaded until the lump crumbles. Note the toughness as low, medium, or high in accordance with the criteria in Table C.

Table C – Criteria for Describing Toughness	
Description	Criteria/Test Result
Low	Only slight pressure is required to roll the thread near the plastic limit. The thread and lump are weak and soft.
Medium	Medium pressure is required to roll the thread to near the plastic limit. The thread and the lump have medium stiffness.
High	Considerable pressure is required to roll the thread to near the plastic limit. The thread and lump have very high stiffness.

7a) **Standard Soil and Rock Color Modifiers and Abbreviations (Table 19)**

Light	Lt	Lighter side of color range
Dark	Dk	Darker side of color range
Mottled	Mt	Irregularly marked with spots of different colors
Banded	Bd	Distinct alternating light and dark shades, or alternating colors

8) Table 20 - Types of Soil Deposit

Descriptor	Abbreviation	Description
Aeolian	Ae	Soil deposited by wind
Alluvium	Al	Soil deposited by flowing water
Colluvium	Co	Soil deposited by gravity

- Examples of Field Soil Descriptions:**
1. fine SAND, some Silt, trace Gravel, medium dense, moist, poorly graded, rounded, brown, fill, a-2-4/sm
  2. SILT and CLAY, some Gravel, trace Sand, soft to medium, moist to wet, well graded, sub angular, high plastic fines, mottled yellow and light gray, glacial outwash, a-6/cl, (trace roots), (with sandstone fragments)
  3. fine SAND, some Clay, medium dense, moist, poorly graded, dark gray, fill, a-3/sp, (trace shell fragments)
  4. coarse GRAVEL, some Silt, loose, dry, uniformly graded, elongated, red-brown, glacial till, a-2-5/gm,
  5. fine SAND, some Gravel, little Silt, dense, moist, homogeneous, well graded, rounded, light brown, residuum, a-2-4/sm, (slight petroleum odor)
  6. fine GRAVEL and SAND, little Silt, trace Clay, micaceous, medium dense,

Glacial Outwash	Go	Soil deposited from glacial meltwater
Glacial Till	Gt	Soil deposited from unsorted glacial settlement
Residuum	Re	Insoluble material remaining from weathered rock
Fill	Fl	Man-made deposit

1 Table 21 - Rock Composition Modifier

Descriptor	Abbreviation	Description
Argillaceous	Arg	Pertaining to a sedimentary rock which contains an appreciable amount of clay
Calcareous	Cal	Containing calcite; in particular rock in which grains are cemented with calcite
Carbonaceous	Car	Rich in carbon or organic matter
Dolomitic	Dol	Containing an appreciable amount of magnesium carbonate
Ferruginous	Fer	Containing iron oxides
Fossiliferous	Fos	Containing fossils; usually applied to rocks in which the fossils are abundant
Micaceous	Mic	Group of silicate minerals exhibiting perfect basal cleavage, which commonly forms flakes, scales, or sheets.
Pyritic	Pyr	Containing the mineral pyrite (iron disulfide – "fool's gold"); may only be visible with a hand lens.

3c Standard Soil and Rock Color Modifiers and Abbreviations (Table 19)

Light	Lt	Lighter side of color range
Dark	Dk	Darker side of color range
Mottled	Mt	Irregularly marked with spots of different colors
Banded	Bd	Distinct alternating light and dark shades, or alternating colors

Unsampled	Uns	N/A	Unsampled
Void	Vd	N/A	Void

Orange Or Pink Pk Silver Sv Tan Tn Pink Pk Purple Pr

Descriptor	Abbreviation	Rock Origin	Description
Amygdaloidal	Amg	Igneous	Vesicle which has been filled with secondary minerals
Concretions	Ccr	Sedimentary	Hard, compact masses formed by the precipitation of minerals
Cross Bedded	Crb	Sedimentary	Original depositional layering is inclined
Fissile	Fsl	Sedimentary	Splits easily along planes of weakness into thin sheets
Flow-Banding	Fib	Igneous	Bands or layers formed during original molten rock flow
Foliated	Fol	Metamorphic	Thin layering from alignment of constituent mineral grains
Gneissic Foliation	Gnf	Metamorphic	Planar zones of dark and light colored minerals
Graded Bedding	Grb	Sedimentary	Change in grain size from the base of the bed to the top; typically coarser sediments at base
Nodules	Nd	Sedimentary	Solid mineral replacement body generally rounded in shape
Non-Foliated	Nfo	Metamorphic	Absence of foliation
Oolitic	Olt	Sedimentary	Containing small round calcareous grains
Schistose	Sct	Metamorphic	Containing parallel arrangement of platy or prismatic minerals
Shaley	Sha	Sedimentary	Exhibiting shaley structure, fissility, or thin partings
Slaty Cleavage	Scl	Metamorphic	Cleavage into thin layers or plates, like those of slate
Slickensided	Slk	All Rock Origins	Exhibiting polished, striated surface along which movement of rock has occurred
Vesicular	Vsc	Igneous	Containing small cavities called vesicles which formed when gases escaped from lava
Weakly Foliated	Wfo	Metamorphic	Exhibiting weak or less distinct foliation

Descriptor	Abbreviation	Rock Origin	Description
Aphanitic	Aph	Igneous	Contains crystals so fine that individual minerals cannot be distinguished with naked eye
Coarse-Grained	Cgr	Sedimentary	Consists of predominately coarse-grained particles
Crystalline	Crs	All Rock Origins	Consisting of or containing crystals
Fine-Grained	Fgr	Sedimentary	Consists of predominately fine-grained particles
Glassy	Gls	Igneous	Resembling glass in smoothness and shininess
Pegmatic	Peg	Igneous	Containing very coarse grains greater than 3 cm in length
Phaneritic	Pha	Igneous	Contains crystals roughly equal in size and individual minerals can be distinguished with naked eye
Phenocrystic	Phe	Igneous	Contains large conspicuous crystals
Pitted	Ptd	All Rock Origins	Contains numerous very small voids
Porphyroblastic	Pbl	Metamorphic	Contains large crystals embedded in a finer-grained matrix
Porphyritic	Prt	Igneous	Contains relatively large isolated crystals in fine texture matrix
Vitreous	Vit	All Rock Origins	Resembling glass, but with a vitreous (pearly) luster
Vuggy	Vug	All Rock Origins	Containing voids usually with a mineral lining of different composition

5b Table 25 - Rock Descriptive Modifiers

Descriptor	Abbreviation	Rock Origin	Description
Dull Luster	Dls	All Rock Origins	Dull earthy appearance
Evaporites	Evp	Sedimentary	Formed from evaporation of lake or sea water
Friable	Frb	All Rock Origins	Easily broken or crumbled
Glassy Luster	Gls	All Rock Origins	Having a glassy appearance
Metallic Luster	Mls	All Rock Origins	Having a surface appearance similar to or resembling metal
Mineral Veins	Mnv	Sedimentary	Having fractures that have been filled with mineral material (quartz)
Pearly Luster	Pls	All Rock Origins	Having a surface appearance similar to or resembling a pearl
Waxy Luster	Wls	All Rock Origins	Having a surface appearance similar to or resembling wax

Table 26 - Rock Hardness Descriptors

Descriptor (Abbrev.)	Test Criteria for Hand Specimen	Typical PA Rock Type	Approx. Mohs Hardness Scale	Materials in Hardness Range
Very Soft (Vs)	Scratched by a wood dowel or fingernail	Gypsum, evaporites, some shale	1 - 2	PVC, fingernail
Soft (Sf)	Scratched by rubbing against the surface of a copper pipe or fitting, but not scratched by a wood dowel or fingernail	Schist, shale, most limestone	3 - 3.5	copper pipe
Medium Hard (Mh)	Scratched by rubbing against the surface of a common steel nail, but not scratched by rubbing against the surface of a copper pipe or fitting	Siltstone, sandstone, some limestone	5 - 5.5	common nail, glass
Hard (Hd)	Scratched by rubbing against a hardened steel file, but not scratched by rubbing against the surface of a common steel nail	Some sandstone, chert, granite, gneiss	7.5 - 8	hardened steel, porcelain
Very Hard (Vh)	Not scratched by rubbing against a hardened steel file	Some hornfels	> 8	corundum

7 Table 27 - Rock Weathering Descriptors

Descriptor (Abbrev.)	Criteria
Fresh (Fw)	No visible decomposition, discoloration, or oxidation.
Slightly Weathered (Sw)	Slight decomposition, discoloration, or oxidation <b>impacting &lt; 20 % of the rock mass.</b>
Weathered (Ww)	Significant decomposition, discoloration, or oxidation <b>impacting 20 to 40 % of the rock mass.</b> Weaker minerals decomposed. Apparent strength less than fresh parent rock.
Moderately Weathered (Mw)	Moderate decomposition, discoloration, or oxidation <b>impacting 40 to 60 % of the rock mass.</b> Noticeable loss of strength relative to fresh parent rock.
Highly Weathered (Hw)	Major decomposition, discoloration, or oxidation <b>impacting &gt; 60 % of the rock mass.</b> Rock is significantly weakened relative to its un-weathered state. Less weathered components may be present in rock mass.

8b Table 29 - Bedding/Discontinuity Dip Descriptors

Bedding/Discontinuity Dip (Abbrev.)	Description
Flat Dip (Fld)	Beds/Discontinuities dipping < 5 degrees
Shallow Dip (Sld)	Beds/Discontinuities dipping from 5 to 15 degrees
Moderate Dip (Mdd)	Beds/Discontinuities dipping from 15 to 30 degrees
Steep Dip (Std)	Beds/Discontinuities dipping from 30 to 45 degrees
Very Steep Dip (Vsd)	Beds/Discontinuities dipping from 45 to 60 degrees

Table 30 - Discontinuity Spacing Descriptors

Descriptor	Abbreviation	Description
Laminated	Lmd	Discontinuity spacing < 1/4 inch
Narrow	Nrd	Discontinuity spacing from > 1/4 inch up to 1 inch
Close	Cld	Discontinuity spacing > 1 inch up to 3 inches
Moderate	Mod	Discontinuity spacing > 3 inches up to 9 inches

Medium	Med	Discontinuity spacing > 9 inches up to 2 feet
Wide	Wdd	Discontinuity spacing > 2 feet up to 6 feet
Massive	Mad	Discontinuity spacing > 6 feet

Table 31 - Discontinuity Opening Descriptors

Descriptor	Abbreviation	Description
Tight Joints	Tjo	No open space at discontinuities - fits together tight, but not a fresh break
Narrow Joint Opening	Njo	Open spacing up to 1/8 inch - aligned well but may have some evidence of weathering along discontinuity planes
Open Joints	Ojo	Open space > 1/8 inch up to 3/8 inch - usually weathering along discontinuity planes
Large Joint Opening	Ljo	Open space > 3/8 inch up to 1 inch - often significant weathering along discontinuity planes
Wide Joint Opening	Wjo	Open space > 1 inch - may have significant weathering or may have infilling

Table 28 - Rock Bedding

Bedding Thickness (Abbrev.)	Description
Indistinct Bedding (Inb)	Bedding structure not clearly defined
Laminated Bedding (Lmb)	Bedding thickness < 1/4 inch
Thin Bedding (Tnb)	Bedding thickness 1/4 to 1 inch
Narrow Bedding (Nrb)	Bedding thickness 1 to 3 inches
Moderate Bedding (Mob)	Bedding thickness 3 to 9 inches
Medium Bedding (Meb)	Bedding thickness 9 to 24 inches
Thick Bedding (Tkb)	Bedding thickness 2 to 6 feet
Massive Bedding (Mab)	Bedding thickness > 6 feet

Figure 11 - Standard Core Log Descriptors for Discontinuity Types

Category	Descriptor	Description	Criteria
Joints	Shear Dip (Srd)	Beds/Discontinuities dipping > 60 degrees	
	Foliation Joint (Foj)	Discontinuities/jointing along foliation planes	A series of repeating planar discontinuities
	Bedding Joint (Bdj)	Discontinuities/jointing along bedding planes	
Fractures	Fracture Zone (Frc)	Numerous, close, often intersecting random fractures	
	Random Fracture (Rnf)	Non-planar/irregular discontinuities	

Examples of Field Rock Descriptions:

1. fossiliferous BRECCIA, dark red-brown, very soft, fresh, medium bedding, steep dip, fracture zone, narrowly spaced discontinuity, sheer dip, narrow joint opening, (1/8-in thick, filled with calcite, very soft)
2. micaceous SCHIST, brown with mottled yellow-brown, foliated, soft, highly weathered, jointed, medium spaced discontinuity, sheer dip, wide joint opening
3. CLAYSTONE, gray and red-brown, metallic luster, soft, slightly weathered, moderate bedding, moderate dip, fracture zone, medium spaced discontinuity, sheer dip, (no infill)
4. SILTSTONE, red-brown, medium hard, slightly weathered, medium bedding, flat dip, random fractures, widely spaced discontinuity, sheer dip, tight joints
5. dolomitic LIMESTONE, gray to blue-gray, vuggy, mineral veins, medium hard, slightly weathered to moderately weathered, moderate bedding, steep dip, bedding joint, moderately spaced discontinuity, moderate dip, narrow joint opening (slickensided)
